WAGE DIFFERENTIAL AND TEACHERS' JOB PERFORMANCE IN NIGERIA

Ijeoma OGONOR
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

The study examined the impact of wage differentials on teacher's job performance. Wage differentials refers to the disparities in salaries and benefits among teachers with similar qualification, grade levels, subject area allowances, years of service, and salary increment in steps. The study investigated how wage differentials affect teacher's motivation, job satisfaction, and overall performance. The findings suggest that wage differential can have both positive and negative effects on teacher's job performance with higher wages motivate teachers to perform better while wage differential can lead to demotivation, decrease performance and job dissatisfaction. The study concluded that fair compensation, performance based-pay, professional development opportunity, and a supportive work environment are essential for promoting teachers job satisfaction and performance. The study recommended that the Ministry of Education should as a matter of urgency, priorities teachers wages to ensure quality service delivery, the government should work towards teachers promotion and increase wages proper consideration to ensure teacher quality service delivery in schools.

Keywords: Wage Differential, Teachers, Job Performance, Public, Primary Schools, Rivers State.

INTRODUCTION

In other to survive in life, continuously individuals are engaged in different jobs, it could be in private or government owned establishments. These jobs and services have a reward which is referred to as 'wage'. Wage differentials bear a direct relationship to the diversity in occupation and industries that exist in the economic sphere of activity in a country. A certain job requiring a certain skill is paid more or less than another job requiring a different skill either in the same or some other industry.

There is a need to understand the reasons for these differences as in many cases there is a constant adjustment taking place in order to maintain the existing disparity, for instance, between the skilled and unskilled or semiskilled workers; between the officers and the supervisory or clerical staff and so on.

When there is a variation in workers' skills, i.e., highly skilled, skilled, semi-skilled and unskilled, their wage rates will differ. The variance is due to the complexity of the skill acquired,

its scarcity, and the time taken in training to acquire it. The unskilled category which requires none of these is relatively less well paid.

There are certain jobs which involve physically heavy work, others which are strenuous but may not require very high degree of other skills, and yet again, there are certain jobs which require the workmen to work in unpleasant and dangerous conditions, like coal miners, who have to work underground with poor ventilation and safety hazards. Yet they may not get high rates. Salary differentials play pivotal role in a planned economy in the regulation of wages and development of national wage policy by allocating the skilled human force on priority basis. Development of new skills, knowledge etc., is an essential part of human resource development.

Shortage of technical and skilled personnel is not only a problem for industries but it creates bottlenecks, in the attainment of planned goals. Thus, wage differentials to certain extent, are desirable from the view point of national interest. As such, they probably become an essential part of national wage policy. Complete uniform national wage policy is impracticable and undesirable.

In this era of modern industrial organizations, wage differentials that show the differences in the rate of wages among workers working in the same unit, different units, different occupations, different regions and the like have emerged as a common feature of labour markets in various countries. It may be the difference in wages between workers with different skills working in the same industry or workers with similar skills working in different industries or regions.

In simple term, wage can be said to be the money you earn, that is paid according to the amount in hours, days or weeks that you work. Teachers like all other workers, spend almost half of their lives at work, hence, their performance reflects in their wage. Wages across occupations has never been uniform. Different workers are paid different wages in their jobs or in their level of performance. Wage differential can be seen or occur in job risks, Qualification, experience and location. These are the causes of wage differential.

Economists have identified two types of wage differentials: The efficacy wage differential and the relative deprivation (Fajana, 2003). The efficiency wage refers to a situation where earning is greater than expectation. The relative deprivation occurs where earning is less than expectation. These differences over time take its toll on the performance level.

Performance can be accessed in terms of the objectives that have been achieved. However, performance in education is the measurement of the student's achievement across various subjects. Teachers' performance is measured in terms of Students Academic Performance. For example; if teachers are given bonus pay based on the population of the class, the effect is that class size will grow, but when a test is conducted it will be negative. This is because, if performance is measured only as an output, it can be counterproductive in education.

Recent research carried out by researchers have regularly found out that teacher's performance is the most important component of a school as it affects students learning and there is a considerable dissimilarity in teachers' performance within and across schools (Rocoff, 2004). Teachers, significantly impact student's achievement, yet the variations in teacher performance is still cloudy because researchers are yet to measure the parameters that truly affect performance.

In getting or acquiring high performance, Rive and Byars (in Tabotndip, 2009) Confirms that good wage is the secret for high performance. In the school system, it is quite hard to identify the exact level of performance per teacher. In a working condition where incentives are

given in group and not individual, it is difficult to measure performance, due to the nature of education where team work and the effort and attitudes of other teachers are involved.

At the Primary school level an individual teacher is expected to teach all the subject in a particular class and performance is measured mainly by the academic performance of the pupils in internal and external examinations. In 2004, the Federal Government set objectives of the Primary education as it is in the National Policy on Education as Follows:

- The inculcation of permanent literacy numeracy and the ability to communicate effectively.
- The laying of a sound basis for scientific and reflective thinking.
- Citizenship education as a basis for effective participation in and contribution to the life if the society.
- Character and moral training and the development of sound attitude.
- Developing in the child the ability to adapt to his changing environment.
- Giving the child the opportunity for developing manipulative skills that will enable him function effectively in the society, within the limits of his capacity.
- Providing basic needs for further educational advancement including preparation for the trades and crafts of the locality.

The achievement of these objectives' rests solely on the teachers. The importance of teachers as key agents of an educational programme implementation was recognized by the National Policy on Education (FRN, 2004), which states that "teachers education will continue to be given a major emphasis in all our educational planning because, no education system can rise above the quality of teachers". This means that the quality of education depends to a large extent on the quality of teachers available. A school where the teachers teach in a conducive environment with all the learning aid available, good social environment and good incentives, teachers are bound to be motivated, this will be reflected in pupil's academic achievement and high teacher performance. Teacher performance is measured by how much the goals of education is being achieved through the performance on the job. The Performance may be high or low, it all depends on the input. Performance can be determined or ascertain through job evaluation and appraisal, to assess the extent to which the objectives of education has been achieved.

Linking wage differential between public primary school teachers in Rivers State, one can attest to the fact that the wage is not the same as it is contained in the Civil service structure. The average wage of an NCE holder is from ₦52,211.05 to ₦72,000.46 monthly depending on the Grade level and step. Based on this, the Study will establish link between an NCE, B.Ed. and M.Ed. teacher and their performance and different wages in Schools.

The increase in the demand of education has brought about the need for more teachers with different qualifications. The demand for different category of teachers has brought about differences in teachers wages and also the quality of education that is provided. It is also assumed that teachers with higher qualifications tend to be more productive and earn higher wages.

It is believed that a large wage will motivate effective teaching and learning. However, it is not certain that the difference in wage earnings of teachers in the school system will enhance performance. Therefore, the study wishes to know how wage differentials relate to performance of teachers with similar qualifications and how wage differentials and teachers' performance relate to teachers with highest qualifications in schools.

CONCEPTUAL CLARIFICATION

This work is centred on wage differential and its effects on teacher's performance in Public Primary Schools, particularly at this time when waged appear to be the most important thing in every work. Setting the school inclusive.

The equity theory if motivation propounded by Adams (1995) in Weihrich and Kootnz (2005) is deemed appropriate for the study. This theory states that when people believe that they have been treated unfairly in comparison to others, they try to eliminate the discomfort and restore in perceived sense of equity to the situation. According to Weihrich and Koontz (2005), the essential aspect of theory may be expressed as follows: Outcome by a person-input by a person; Outcome by another person-input by another person. An important motivational Factor is whether individual perceived reward structure is being fair. if people feel they are inequitably rewarded, they may be dissatisfied, they may reduce the quantity or quality of output or they may even leave the Organization, if people feel the rewards are equitable, they probably will continue at the same level of output. If people feel that the reward is greater than what is considered equitable, they may work harder.

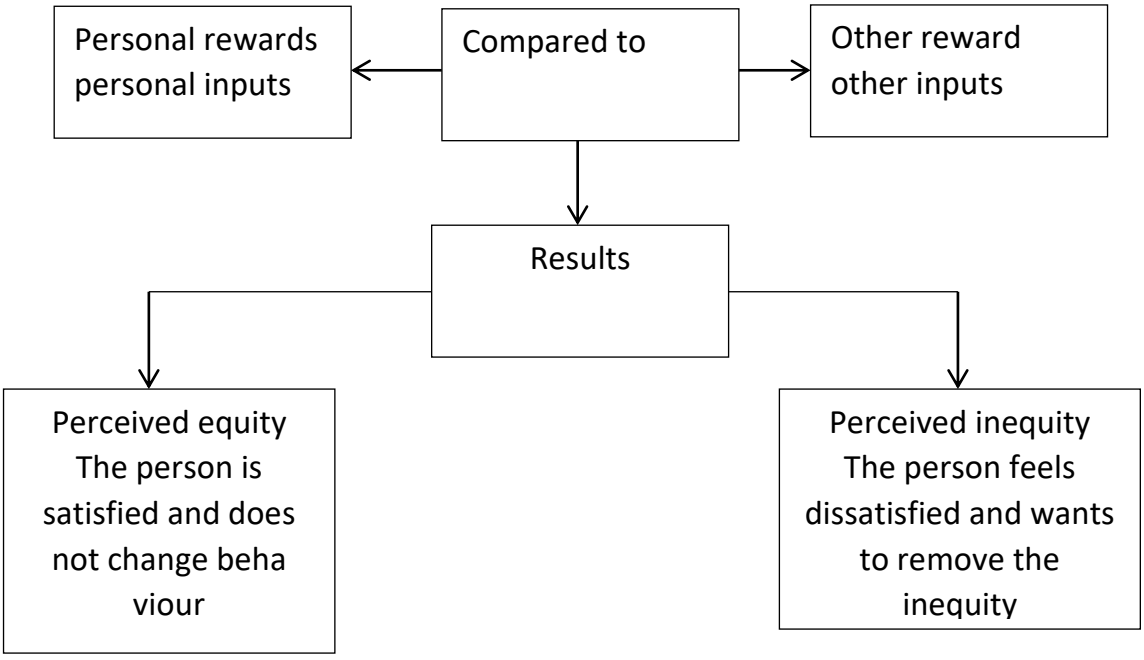

Figure 1: Equity theory and the role of social comparison. Source: McCluddy, (2004) in Babalola (2008): Motivational principles and Practice. London: John Wiley & Sons.

Another theory that was found to be appropriate to this study was Vrooms Expectancy theory (1964). The Theory holds that an individuals' performance on the job is greatly influenced by the persons perceptions and expectations. Two Fundamental assumptions are central to the expectancy theory. Firstly, individuals in an Organisation decide how to behave anticipating further events to access expected personal gains that would result from their actions and then, choose how to behave. Secondly, individuals values and attitudes interact with environmental components such as role expectation to influence behaviour.

The equity theory and the expectancy theory has influenced management practices by drawing attention of government agencies to the potential significance of the intrinsic characteristics of workers in developing strategies for improving performance and job performance. To narrow it down to what happens in primary schools in Rivers State, one way of analysing it, is that when teachers are satisfied with the job conditions, they respond to perceived negative inequity by changing work inputs and performance is lowered.

The justification for Vroom's theory is based on the fact that teachers would naturally tend to be more productive in anticipation of some sort of reward for their effort.

Wage Differentials

Wage refers to all the payments made to the employee of an Organisation, parastatals, government agencies and departments, whether paid by hour, week or month (Robert, 2006) These are monetary incentives/rewards paid to workers for performing certain duties over a period of time. The amount of payment id related to time and sometimes level of work done. Wages are important factor in workers satisfaction in considering the role of money and a reward for performance, it is important to state that money, has influencing roles on workers behaviour and performance.

Wage differential connotes disparity in the earnings of workers in an organisation, several important factors cause wage differentials in an organisation, such as qualification, experience, level of output (performance) etc. People with more education in terms of high Qualification, have higher average earnings than those with less education, the same is applicable to those with experience and level of output or performance on the job. A sound wage/salaries and best working conditions in an organisation cannot guarantee satisfied and contended worer, on the other hand, how wage/salary or poor wage policies will almost certainly produce labour unrest are to avoided. Mare and Andrew (1982, p.52) Outlined three major factors affecting wage policy:

- Workers to object to how wage levels, they can even object more to inequalities in wage payment, the structure of wages in a firm must be consistent and just.
- When a number of workers are employed on the same job, the question arises. Whether they are all to be paid the same, obviously, some workers perform better that others and if management wants to recognize this difference and reward the better workers by higher wage payment, some systems must be devised for measuring performance and determining the amount of payment.
- Wages and salaries may be paid on the basis of time or on the basis of output. When time payment are used, the basis may be hours, days, weeks or months and the rate is set for the individual time unit. When output is considered, the worker is paid on a fixed income for unit of his production.

Wage differentials or variation in earnings is a situation whereby people who are employed in an organisation with the same qualification or level of experience are paid different wages and salaries. Variation in earnings is more obvious when comparing the educated and the uneducated (illiterates), the skilled and the unskilled, people with more education tend to have higher average earnings than the ones with less education, irrespective of the two groups being employed in the same occupation category" (Blaug in Ebong, 2006, p.116). Differentials occur

due to promotion and productivity levels in an organisation. According to Mare and Andrew (1982), the degree of inequality in the distribution of wages in the civil service ranges from one grade level to another. The best thing is for government to decide on how to allocate and distribute salaries and wages equitably within the civil service by applying a justified and more impartial criterion policies on how wages should be allocated or formulated to ensure that the development of various components are geared towards achieving overall objectives of the organisation. However, different sectors both public and private run different salary scale according to their employment policy or personal initiatives.

Reasons for Wage Differential

Ebong (2006, 118-119) outlined reasons why variations occur in worker's salary as:

- Level of education
- Age and years of experience
- Level of output (Productivity)
- Risk level of job
- Type of organisation or establishment
- Nationality or immigration status

Workers in the public sector in Nigeria, rivers state inclusive salary structure. The Federal Government of Nigeria fixed the official minimum wage of ₦18,000 per the least worker on grade level 01 step 01. Meanwhile this minimum wage was further re-negotiated by states depending on how buoyant the revenue of a particular state is. The Federal workers were not affected by this arrangement.

The management of private schools do not have a formal structure of wage/salary payment. The wages or salaries determined by the level of output, qualification, availability fund etc. At the primary school level, the wages of teachers are paid monthly and certain amount of money deduced from duty within the month. The Public sector or primary school system are guided system are guided by the civil service rules which provides a uniform salary structure for all category of staff.

When a number of workers are employed on the same job, the question arises, whether they are all to be paid the same, obviously some workers perform better than others and, if management wants to recognise this difference and reward the better worker by higher wage payment some systems must be devised for measuring performance and determining the amount of payment. Wages and salaries may be paid on the basis of time or on the basis of output, when time payment are used, the base may be hours, days, weeks or months and the rate is set for the individual time unit. When output is the basis, the worker is paid a fixed sum for each unit of his production. Generally, government does not just give wage to any worker without an objective, these wages are given to change the worker behaviour and services or to control reinforcement.

Wancerich (1979) asserted that reward practices constitute a major area of policy making, it influences management decisions in motivating, job performance, retaining qualified teachers or workers and reducing absenteeism and attracting qualified job applicants to the organisation.

Teachers Job Performance

Performance is considered to be a construction (Quinn and Rohrbaugh, 1983; Venkatraman and Ramanujam, 1986; Henri, 2004) and the purpose of defining this concept is to determine its properties and dimensions. The notion of performance has an abstract character and its definition is made by reference to other concepts, on which we believe that performance is built. A concept is itself an abstraction of observable or measurable facts; certain concepts are at a high level of abstraction, and their explanation is achieved through other concepts, so they are called constructions (Quinn and Rohrbaugh, 1983). Since 1950, studies in organizational theory are based on the concept of effectiveness, and the terms of efficiency and performance are considered interchangeable (Venkatraman and Ramanujam, 1986), because issues related to defining, measuring and explaining them are identical (Dalton et al., 1980, Thomson and Abernethy, 2000; Henri, 2004).

In addition, early studies on firms did not analyzing performance, but organizational behaviour (Dalton et al., 1980), which demonstrates, on the one hand, the dynamic nature of the concept, and on the other hand, all the variables related to organizational behaviour. Moreover, performance is difficult to define, but it can have at least three meanings or connotations: (1) a successful outcome of an action or the action itself; (2) performance shows the ability to move, thanks to the constant efforts; (3) he word performance is the carrier of an ideology of progress, effort, always make better (Bourguignon, 1997). This definition of Bourguignon (1997) assimilates performance with an "action", with a certain "behaviour" (in terms of a dynamic view, meaning "to perform") and not just as a "result" (in terms of a static view). A result is nothing if considered alone, because it cannot be separated from means of its activities and objectives: performance is based on logical action stages, starting with the intention and going till the actual result. Furthermore, we can make a distinction between "performance" and "being efficient" (Vilain, 2003), due to the fact that performance can be described more as a result of the past, while being efficient means to achieve the objectives in the future.

According to Folan's theory, performance is influenced by the environment, the objectives to be achieved and the relevant and recognizable features. Folan uses several definitions for the concept of performance as it should be analysed and quantified from several points of view. Neely (2002) believes that performance should consider quantifying the efficiency and effectiveness of actions. This quantification can be expressed both qualitatively and quantitatively. According to the definition of Neely and other authors, performance is closely related to efficiency and effectiveness. Kane (1996) argues that the performance is ″something that a person leaves behind and which exists outside the said purpose″.

According to Kane, performance is defined at the level of each individual within the organization or at organization level. It is perceived as an understanding of the achieved results. The author emphasizes the particular nature of the definition and the impossibility of outlining a general definition. Therefore, we can speak of an accuracy of the definition at particular level and an ambiguity of it at general level. Bernadin (1995) points out that ″performance should be defined as the sum of the effects of work, because they provide the strongest relationship with the organization's strategic objectives, the customer's satisfaction and the economic contributions″. As the author says, performance must take into account both inputs (the effort put in) and outputs (the result of the effort put in). This definition equates performance with the ″sum of the effects of work″. Performance is achieved when all efforts are focused towards achieving the set objectives and meeting customer's satisfaction. Objectives and customer satisfaction cannot however be accurately measured. A more comprehensive definition of performance is given by Brumbach (1988), which refers to both behaviour and results. Performance means both

behaviours and results. Behaviours are emanating from the performer and turn the performance of an abstract concept into a concrete action. Not being just tools of obtaining some results, behaviours are by themselves outcomes the product of the physical and cerebral exercise submitted for the execution of tasks and can be judged apart from results. Thus, the author defines performance closely related to behaviour and outcomes. When we talk about the performance of teams and individuals, we must take into account both inputs (behaviour) and outputs (results).

According to Hartle (1995), this is the ″Mixed model″ of performance management, covering both skill levels and achievements, and goal setting and analysis of the results. Brumbach's definition is ambiguous, to some extent, since it does not specify what kind of result is referred to and what exactly is meant by behaviour; the more so since the definition speaks of ″behaviour emanating from the performer″, which makes us think only of certain types of behaviour. Philippe Lorrino (1997) states that: ″Performance in the enterprise is what contributes to improving cost-value couple and not just what helps to reduce the cost or increase the value″.

The first stage of the ″translation″ of the cost value couple in concrete ″pilotable″ elements is to describe in global terms how the enterprise creates and will create value. It is, therefore, about defining ″value″ in the view of future developments. To design the value of tomorrow is to define a strategy. The first stage is therefore to translate the cost-value couple in strategic objectives. The above definition of performance can be translated into another equivalent definition: ″Performance in the enterprise represents all that contributes to the achievement of strategic objectives″. For the enterprise, performance is only what improves the cost-value couple, which is what contributes to value creation. A company is efficient if it has the ability to create economic value added, that is, a positive value after the remuneration of all factors, including equity. Bates and Holton (1995) define the concept of performance as ″a multidimensional abstract concept whose measurement depends on a variety of factors″. Performance may refer to enterprise ″organizational performance″ and an activity / a department / a manager / a performer. The authors say it is important to determine whether the measurement objective is to assess the effects of performance or the performing behaviour. The drawback of this definition is that it does not contain a rating that would have a downwards applicability. The general definition given by Bates and Holton to performance underlines its ambiguous nature, whose measurement depends on a variety of factors. Annick Bourguignon (1997) fails to define the concept of performance in one way and therefore identifies three main senses of the word performance:

- Performance is success. Performance does not exist in itself. It varies by representations of the ″success″ of businesses or actors.
- Performance is the result of action. This meaning contains only value. Performance measurement is understood as an assessment of achieved outcomes, in the course of a process, an activity.
- Performance is action. In this regard, performance is a process, and not a result that occurs at a particular time. Performance is achieving organizational objectives, according to Annick Bourguignon's definition.

This definition is applied in all fields of management (management control, general politics, human resources management). Performer is the one that reaches its objectives. Thus, performance depends on the objective/purpose. Performance is multidimensional when goals are

manifold; performance is a subset of action; performance is subjective because it is the product of operation, which, by its subjective nature, consists of approaching a reality to a desire. As defined by Annick Bourguignon (2019), performance is closely linked to the objectives, which makes it impossible to isolate a uniform definition of this concept. Thus, the fulfilment of any objective/purpose involves reaching a certain level of performance. We should mention that since there is no default classification of the objectives, the concept of performance cannot be clearly defined. According to Bourguignon, performance can only be achieved when targeted objectives are reached.

Contextual Definition of Performance

Teaching is generally recognised as one of the most important and challenging occupation in contemporary society. This Profession is responsible for their students' academic achievement as well as social and emotional development (Elias and Arnold, 2006). Given the Heavy demand and expectation in terms of students' development, teachers' job performance, which is tied to student's outcome (Hwang *et al.*, 2017) is of crucial concern for a variety of stakeholders including policy makers, principals, Parents and society at large. Ebong (2006), asserted that teacher's performance could be measured, to find out the extent to which educational objectives are attained. It deals with a number of inputs. Agabi (2002) states that "education as a production system is connected with input process quality output, management, cost effectiveness of the production which indicates the feedback from those who attained requirements from a from particular fields of endeavours". To measure the job performance of teachers, two things seen most plausible, student satisfaction and student achievement. However, Ebong (2006) views three basic indices which economists use to measure educational outputs which are academic index, length of schooling index and economic index. Also, Ferris, Bergin and Wayne (2012) identified teachers job performance on seven performance dimensions; these are:

- Preparation and Planning
- Effectiveness in presenting Subject matter
- Poise
- Relationship with students
- Self-Improvement
- Relationship with other staff
- Relationship with parents
- Relationship with community

Looking from another angle, being teacher with high job performance does not take anything away from the students rather, it gives more to students in less time, and being more efficient in teaching. Teacher's performance is a measure of how much the goals of the educational system is achieved through the commitment of the teacher on the job. The performance may high or low, it depends on the teachers' output.

Job performance is something done by the employee. It must be directed towards organisational goals that are relevant to the job or role (Campbell, 2000). Performance of teachers mainly depends on the teacher's characteristics such as: Knowledge base, Sense of responsibility and inquisitiveness; the student characteristics such as opportunity to learn, and academic work; the teaching factors such as lesson structure, and communication; the learning

aspects such as involvement and success; and the classroom phenomena such as environment and climate, and organization and management. If the teachers take care of these factors, their performance can be enhanced to the optimum level (Rao& Kumar, 2004).

Several analysts have argued that performance-based pay schemes improve the administration of schools. Under a performance-based pay scheme, principals must know the quality of teachers in all classrooms (Hoerr, 1998). This type of evaluation, it is argued, means principals must summative evaluate teachers, rather than formatively evaluate, and so more objective decisions about teacher quality are made. Research showing that in performance-based systems, many principals report they evaluated teachers more harshly than they would have in a non-performance-based system (Murnane and Cohen 1986, 9) is used to support this argument. As a safety precaution, Solomon and Podgursky (2001) advocate principals becoming recipients of school wide performance-based rewards, to ensure they remain objective in their evaluation.

It is also argued that a movement to school-based rewards can increase the precision of resource allocation by encouraging resource alignment from top down, by setting organizational goals, and from the bottom up, as teachers are gaining feedback, and benefiting from better resource allocation and policy coherence (Kelley, 1999). This can occur because school goals are clarified in a performance-based reward system, and teachers have an increased incentive to share information with administrators since they benefit from improved outcomes.

David (2011) perceived teaching as the teachers' performance, the pupils' performances and the effective classroom discipline. He went further by saying that, teaching is influenced by the teachers' judicious application of psychological strategies in making the students wish to learn. In the same vein, Smith Sarason and Sarason (2011) perceived learning as a change in behaviour or in potential behaviour that occurs as a result of experience. In learning/teaching situation, the materials to be transformed is the child, and the people involved in the transformation are academically qualified personnel, qualified teachers are also made heads of department of schools to oversee the work of his subordinate teachers at work. By so doing, this makes teachers to be more effective in the discharge of their duties.

Teaching effectiveness is an area of research which involves the relationship between the characteristics of teachers, teaching acts and their effects on the learning outcome in classroom teaching. The attitude of the teacher toward teaching is an important variable. The primary attribute of a good teacher is the ability to create a warm, friendly atmosphere in the classroom environment. He/she must teach with conviction. He must negate any barrier to effective teaching.

The present study will be significant because it would provide a base to improve the teaching and learning process. If we control the factors that influence teachers' performance at secondary school level such as the teachers' qualification, experience, economic status and mode of instruction; the quality of education and teaching learning process as a whole would become more effective and also improve the teachers' job performance at all levels.

Indicators of Teachers Job Performance

Performance in education is the measurement of the student's achievement across various subjects. Teacher's performance is measured in terms of Students Academic Performance. Garret and Poole (2005) Posit that measuring performance in schools require a measure of both efficiency and effectiveness. To a large extent, most definition of performance in education are related to output. Ajayi and Afolabi, (2012) observed that researchers' criteria for rating

productivity include principals rating, Teacher-peer group rating, self-rating, students rating of their teachers and student's academic performance. Ten qualities of an effective teacher have been identified, they are:

- Loves to teach;
- Demonstrate a caring attitude;
- Can relate to their students;
- Is willing to think outside the box;
- Is a good communicator;
- Is proactive rather than reactive;
- Works to be better;
- Uses a variety of media in the lessons;
- Challenges their students;
- Understands the content that they teach and knows how to explain that content in a manner that their students understands.

The assessment of educational performance is hedged by serious conceptual and practical difficulties. The first is lack of identification and agreement on the goals of education owing to the fact that goals change over time. Secondly, there are inadequate ways to measure the attainment of complex academic skills and affective outcomes; thirdly, research has thus far failed to establish many valid connections between inputs and the outcome of education.

Despite all these difficulties there still appears to be some indices of productivity. One of such is the student outcome through examinations. Assessment of the pupils via examination is part of the teaching-learning process. Hence, Teaching cannot be said to have succeeded until assessment proves so. Nwanna (1979) posits that no matter how effective the teacher, how intelligent the pupil, if no provision is made for some evaluation of progress the leaving process may be completely invalidated. Darling-Hammond, Wise and Peace (1983) identified the use of test score as one of the ways to evaluate a performing teacher. Other approaches include: classroom observation, parent rating, self-rating, competency test and other indirect measures.

In education, the ultimate concern is student learning. In view of this, Ebel (1980) maintain that evaluating of assessing teachers through student achievement data is the most legitimate procedure. This school of thought is however controversial as soar, Medley and Coker (1983) show concern about the validity and reliability of students' achievement scores derived from standardized and teachers made test tend to provoke questions which bother on the following: are teachers in complete control of the teaching-learning situation in order to be considered the sole determinants of learning outcome? How about intervening variables such as IQ, interest, background, aptitude? Can one really be sure of what student score indicates or measures in terms of student knowledge, skills and affective outcomes? These are some of the concerns and issues expressed about using student scores solely for ascertaining teachers job performance.

Glassman and Pauline (1982) carried a study and found that teacher's receptivity to evaluation practices was dependent on their perceived control of the components being evaluated. If teachers do not feel they have control over a part of their teaching such as student performance, then they do not want to be evaluated by such measures.

Commitment is an indication of teacher performance. Nakpodia (2000) observed that in any educational arrangement, the success lies in the commitment of the teachers. This is evident

by punctuality, acting as in-loco parentis, covering the scheme of work for the term, taking up responsibilities within and outside the classroom.

Dimensions of Wages Differentials

Teacher's Years of service and teachers job performance

Studies on the effect of teacher years of service on student learning have found a positive relationship between teacher effectiveness and their years of service, but not always a significant or an entirely linear one (Kitgaard& Hall, 1974; Murnane & Philips, 1981). Similarly, Wanderi (2015) pointed that there are conflicting findings. Some studies suggested that teachers with more years of service show fewer positive attitudes towards inclusion, while others found that teachers' years of service with pupils with special education needs increased so did their confidence. Teachers' years of service is found to be a significant contributing factor towards teachers' attitudes regarding inclusion. The evidence currently available suggests that while in years of serviced teachers are less effective than more senior teachers, the benefits of years of service appear to level off after a few years (Rivkin, Hanushell, 2000). The relationship between teacher years of service and student achievement is difficult to interpret since this variable is highly affected by market conditions or motivation to work during child rearing period. Harris and Sass (2007) point to a selection bias that can affect the validity of drawing conclusions about the effects of teachers' years of service. If less effective teachers are more likely to leave the profession, this may give the mistaken appearance that years of service raises teacher effectiveness. Selection bias could, however, also work in the opposite direction as more able teachers with better opportunities to earn may be more likely to leave the profession.

A teacher's years of experience are one of the teachers' qualifications indicators that is believed to be a significant determinant of students' academic performance (Mathew, 2018). believed that greater teaching experience will produce students with higher achievement. Studies have shown that inexperienced teachers are typically less efficient than the experienced teacher (Oladunmoye, 2016). Studies have found a positive relationship between teachers' effectiveness and their years of experience and efficient teacher positively influence students' academic achievement (ogechukwu, 2019). However, there is the need for caution in Nigeria about the experience. Many teachers may have been in the teaching profession for over twenty years without properly developed himself or herself for years. This category of teachers may not be able to cope with the new trends in education. The subject curriculum is changing almost every year as the whole world is changing with technology. Therefore, it is better to say there is a positive relationship between experience and student achievement when there is adequate teacher professional and academic development.

Teacher Qualification and Performance

It is a measure of how - employees and or teachers archive organizational goals through performance on the job. Teacher productivity can be determined through job evaluation and appraised by the extent to which the objective of education has been attained. On the other hand, the Macmillan dictionary (2004) defines qualification as an ability or quality needed in order to do a particular job. Therefore, teachers' qualification is a veritable tool in enhancing performance in the school system. The observable decadence in schools have been blamed on the

employment of unqualified teachers. Ibukun (2003) stated that while full-scale education sector has not been carried out, observable indices point to the declining performance of the state of schools.

Qualified teachers are the school's best asserts. Ayodele (2000) has argued that no matter how efficient and effective administration is, success can only be achieved with the support of well qualified and dedicated staff. In the past, teachers' qualification was limited to educational attainment. More recently, more detailed information describing teacher qualification has been adopted by schools. These include teacher performance on certification examinations, identification of undergraduate and graduate colleges from which degrees were obtained and comparison of certification areas with current teaching assignment. These measures provide for a much richer description of the qualification of teachers.Developed nations, like the United States under the No Child Left Behind Act (NCLBA), have stated 3 requirements a qualified teacher must meet. These include:

- Having a bachelor's degree;
- Being certified or licensed by the state;
- Ability to demonstrate subject matter competence.

New primary school teachers must demonstrate their knowledge and teaching skill by passing a rigorous test in reading, writing, mathematics and other areas of primary education curriculum. There are observable increases in teacher demand in private schools with the introduction of Basic Education. It is natural to ask such questions as - what are the sources of teacher supply to feed, this expansion? What are the recruitment measures to be taken to ensure internal quality of primary education? Answer to these questions vary from one private school to another as there is no uniformity in the choice of teachers to be employed, as well as employment procedure across schools.

The first education ordinance in Nigeria which was promulgated in 1882 laid the foundation for the development of a professionally qualified teaching force by empowering inspectors to conduct entrance examinations for teachers. To further strengthen the quality of teachers, a recommendation in the National Policy on Education (FRN, 2004) was that the minimum qualifications for primary school teachers should be the National Certificate of Education (NCE). Hence the number of unqualified teachers in primary school is insignificant. The pie-chart captures percentage of teachers and their various qualifications. The reason behind this is that qualified teachers are considered most productive, thereby confining the human capital theory.

Ladd and Vigdor (2007) darned out a study on student's achievement and found that credentials) teacher qualifications have very little correlation on student test scores particularly in primary school. Another study teacher effectiveness or performance. Kane and Staiger (2005) carried out a study' on three different groups of teachers: those certified when hired, those who were uncertified when hired but are participating in an alternative certification and those uncertified and not participating in an alternative certification. They found out that there was no statistically significant difference in the achievement for students assigned to certified and uncertified teachers. Corroborating this view, Hannushek, (2002) stated that the measures of teachers (qualification, experience and the like) do little or nothing to ensure high quality. Hannushek argued that focus must be shifted from teacher qualification to teacher performance

and productivity. Greenwald, Hedges, and Lamp (1996) in concordance stressed teacher content knowledge and verbal ability to produce high achieving students.

Irrespective of the intricate nature of the teaching/learning process, Ukeje (1990) who cited Rosecrans's speech during Bowling Green Conference at Ohio described the competencies of a good teacher as follows:

- The nature of human organism;
- How learning takes place, how to motivate behaviour;
- How to help become conscious of their own values and build for themselves one more satisfying to them and the society;
- How to help people think critically.

Subject Area Allowance and Teacher Job Performance

The experience of Varkey Gems foundation in the survey study of 21 countries (Brazil, China, Czech Republic Egypt, FinLand, France, Greece, Israel, Italy Japan, etc. showed that the better teacher are paid, the greater the students outcomes.

According to Schuler and Jackson (2009), and Siagian (2010) is principle, reward can be distinguished into two, namely extrinsic rewards and intrinsic rewards. The intrinsic rewards that the employees received in return for himself. This is paid to him after the completion of task gives to him.

Extrinsic rewards include companions either direct or indirect that a given to an employee. E.g. allowances, over time. Teacher in some subject areas are given allowance, for example teacher that teaches science related subject e.g. Basic Science, Technology, Agric, creativity etc. This allowances is given because the subject carry out practical, go for excursions, buy equipment that is to be used for practical's. The higher allowance received by the teachers of these subject areas the higher their performance because the aids needed for teaching and learning is available. Regular payment of subject area allowance enhances smooth delivery and increases the job performance of teacher.

Salary Increment and performance

Salary is conceptually, a fixed amount of money paid to a worker usually measured at monthly and annual basis, not hourly, as opposed to wages. Salary is a fixed amount of money or compensation paid to an employee by an employer in return of work done (Idrees, Xinping, Shafi, Hua & Nazeer, 2015). Salary connotes a set wage based on a set of expected duties performed. A based salary guarantee provides employees with security, knowing they will receive at least a minimum pay for their time. Wildred, Elijah & Muturi (2014) added that basic salary is a fix periodical payment for non-manual employees usually expressed in annual terms, paid per month with generally no addition for productivity.

This increase in base salary can only be regarded as a monetary reward when they are based on something other than just a standard increase given to all employees; when they are expected to be "earned" through performance or acquisition of skills that will improve performance in periods to come (Merchant and Stede, 2012). The salary itself can be regarded as supporting the process of continuing development of both the organization and the employee, and the individual salary for an employee should be based on how qualified the work is, the

employee's performance and content of the work produced (Frick, 2004). Based on this an increase in base salary should support the employee's development. One paper by Fehr and Falk (2002) shows that a high base salary signals trust on the company's behalf; effectively telling the employee that it trusts him or her to perform well without the use of any "carrot".

Though fixed salary in an organization can led to complacency, with employees knowing they will get paid no matter how they produce the important of job satisfaction and a sense of purpose drive workers' productivity. Therefore, incentive pay based on the quantity of work delivered rather than on the time spent on the job is particularly beneficial for increasing worker productivity (Ray, 2016). Employee productivity describes what an employee receives in exchange for wages or salary paid to an employee. Taylor (2009) noted that productivity relates to profit earned for a company, but productivity need not be a monetary measurement. It is evident that people are easily motivated by money, for instance, the salary an employee received from his employer has influence on his productivity.

A worker is seemingly happy with the salary he earns and will perform to his potential. This is because when a worker earns a high salary, he feels motivated to do a job to maintain his position (Woods, 2016). Hence, his feeling gives him a sense of security and accomplishment as he enjoys high status ranking in the organization because an employee when satisfied with his salary become more productive and motivated. It is worthy to stressed that monetary incentive such as salary is used by employers of labours to retain their best brains and as well compensate them for a job well done and excellence of job performance through monetary form (Olubusayo, Stephen & Maxwell, 2014; Nelson, 2003).

Salary as a monetary incentive describes incentive payment plans which ties incentive directly to productive standard (Alaba & Owodunni, 2007). Sheridan (2005) opined those well-paid employees are the key to better productivity and ultimately a better performing organization. For instance, managers are mistaken if they believe tinkering with one aspect of compensation such as health-care benefits are going to have a meaningful impact on workers overall pay satisfaction and enhance the company productivity. It is the salary that counts. This implies that when it comes to choose, the most important incentive to employee is the salary. In addition, a happier employee is known by the overall pay, that is, the more satisfied employees are with their job the better the company performance. Kinicki and Williams (2008) stated that pay for performance is one of the popular monetary incentives, also known as merit pay. Different salaried employees might get different pay raises and other financial rewards depending on their overall job performance.

Abosede and Adekunle (2012) reminded that salary increase has a motivational value but that the direct relationship between salary increase and employee productivity is contingent on the facts that: Increase salary is tied to higher performance and that workers are able to see direct relationship between increased salary and higher performance such that only the highest performers get the highest rewards, the workers perceive adequate degree of fairness between their salary and their work efforts, the employees firmly believe that better performance will always result in better performance and hence better salary, and the employees also believe that their efforts will always result in better performance and hence better salary. Until these aforementioned conditions are present, the direct relationship between increase salary and enhanced employee productivity cannot exist or be real.

What Constitutes Good and Adequate Compensation

Salaries must maintain equity, competitiveness, matching employee expectations, reinforcing positive employee behaviour and eliminating any discrepancies. Other purpose of salaries includes devising a system that is most efficient, organization of management and employee interest as well as maintaining good industrial relations and harmony. If all these are achieved in an organization, definitely, the employees will be seriously motivated and put in more effort into their work.

Salaries to be paid by organizations must be able to attract talented human resources, serves as legal requirements, help to retain and finally motivate employees on their job which will increase individual output and invariably, enhanced the organizational performance. However, there is need to have some concepts of different wages paid by organizations like minimum and fair wage. For instance, a minimum wage is an amount of remuneration, which is just sufficient to enable an average worker to fulfil all his financial obligations; it is applicable to workers across the country and is governed by law. Again, minimum wage law states that an employer who cannot pay the minimum wage has no right to engage labour and no justification to run a firm. The current minimum wage in India is Rs. 66 per day and ₦18,000 per month to all workers in scheduled employment in Nigeria.

On the other side, when fair wage is paid workers performing work of equal skills, difficulty or unpleasantness should receive equal or fair wages. The basis of fair wage is the minimum wage within the capacity of the organization to pay. Fair wage should be related to the productivity of the labour, it should match the prevailing rates of wages in the same or neighbouring localities and it should reflect the level of national income and its distribution.

Nevertheless, the term "compensation" simply refers to the wages paid directly for time worked as well as more indirect benefits that employees receive as part of their job or employment relationship with an organization (Otobo, 1987). Therefore, what constitutes good and adequate compensation are highlighted in Agburu (2012) by Nwachukwu (2000) and Ngu (2005) as the key features or characteristics of good salary or wage as follows:

- The wage rates that prevail in the local market and in the industry. The main purpose here is that it will ensure that the company remains competitive in the market as well as within the industry such organization belongs.
- The internal alignment of wages to ensure equity.
- Recognizing for Individual Performance. Although, two individual workers may have identical qualification and/or experience, one may earn higher than the other due to his superior performance.
- Taking care of Individual Incentives. That is, incentives that:
    - Are easy to administer; b) Whose results reflect the efforts of the individual; c) Make the computation of reward easy; d) Equate reward with the effort expected; and e) Leave the factors necessary for the attainment of the objects in the control of the employees.

Study Review

Giacometti (2005) carried out a study on factors affecting job satisfaction and retention of beginning teachers. The purpose of the study was to develop ways to stop the flow of teachers

from the profession and to retain the best teachers in the classroom. A Descriptive Discriminate Analysis (DDA) and a Predictive Discriminate Analysis (PDA) (Buras, 1996;Huberty, 1994). The DDA is used to study and explain group separated (Stayers & leavers) when using a number of continuous variables while the PDA uses a set of predictor variables to maximize, the classification accuracy on a grouping variable was used.

Data was ana1yzed using t-test and chi-square. The study revealed that the strongest relationship between a teacher's satisfaction level and choosing to leave or stay in the profession in emotional factor. These areas include stress, burnout, motivation, self-confidence and commitment.

However, wages had moderate effect for teachers when choosing to leave or stay. The offer and acceptance of a job is a psychological contract as has been reiterated in the study, hence employee satisfaction cannot be over-iboked. Bamusananire, E. (2010) carried out a study on the role human needs satisfaction can play in teachers' performance in secondary schools. A non- experimental research design was employed for the study. This correlation study involved a total of 118 secondary school teacher. Data was analyzed using ANOVA t-test and Pearson's Linear Correlation Coefficient. The study revealed that satisfaction of safety and social needs has significant positive relationship with teachers' performance while satisfaction of physiological needs does not have significant positive relationship with teacher perform (Unpublished master's thesis, University of Makerere, Rwanda).

McKinney (2000) carried out a study to assess the relationship between student achievement, teacher motivation and incentive pay. The study adopted a pretest-posttest quassi-experimental design. The study revealed that there is no difference in the intrinsic and extrinsic motivation of career and non-career teachers. Secondly there was also no difference in the reading and mathematics gain scores of students of career and non-career teachers. The study also showed that teachers have little faith in incentive programmes that are based on measure of their performance.

In a more recent study by Kirunda (2008) on performance-based reward and the performance of teachers in private secondary school in Kampala. The study used a cross sectional survey design adopting qualitative and quantitative methodology. The population constituted proprietors of private secondary school, head teachers and teachers. Data was collected using questionnaires and interview guide which had a content validity index (CVI) of .833 and reliability was tested using Cronbach's alpha coefficient.

The study however, revealed that public appreciations. and promotions were the commonly used types of reward. This was due to the fact that they have little or no financial implication. It was also observed that rewards or promotions are given according to the number of distinction scored b31 students as well as ones relationship with the trend teacher/principal. Nevertheless the study concluded that performance based reward affects the performance of teachers in private secondary schools.

Ajayi and Afolabi (2012) examined teacher's productivity in secondary schools in South West Nigeria. Descriptive survey design was used. The sample consisted of 100 principals and 1000 secondary school teachers using multistage random sampling technique. A set of designed questionnaire was used to collect data. Data was analyzed using frequency counts, percentage counts and t-test statistics at a 0.05 level of significance.

The study revealed that the level of teachers productivity in secondary schools was IQW during the period of investigation. The study further showed that significant difference exists between the productivity of experience and less experienced teachers.

In a most recent study, Taaloo (2014) investigated the relationship between working condition of teachers and their productivity in public and private secondary schools in Rivers State. A correlational survey design was used by the researcher, six research questions and hypotheses guided the study. The instrument for the survey is a working condition and teacher productivity survey questionnaire. The• questionnaire was validated by the supervisor and tested with a reliability coefficient index of 0.766. A sample of 300 teachers from 34 schools formed the study respondents. The data collected were analyzed using mean, mean set, percentage and Pearson Product Moment Correlation Coefficient. The major findings of the study revealed poor working conditions, low productivity and moderately good academic performance of students. Positive and significant relationships were established between each of these working condition elements and the productivity of teachers. The researcher concluded that the existing condition of public and private schools are not such that would engender productivity among teachers. It was recommended that both government and private school proprietors should initiate concrete action to improve the working condition, and motivate teachers with appropriate incentives to improve their productivity.

Maphoso and Mahlo (2015), investigate if teacher qualifications differ significantly among learners in boarding and in non-boarding schools and if they have significant relationship with academic achievement among Grade 12 learners of the Capricorn District in the Limpopo Province, South Africa. A simple random sample was drawn from the population of 339 schools, comprising of 51 principals, 158 teachers and 290 learners from 51 schools. The instrument used to collect data was the School Environmental Questionnaire (SEQ) to determine whether the school was boarding or non-boarding, along with the qualifications of teachers. The Capricorn District Academic Summary Report of the Grade 12 results collected data on academic achievement. The t-test results showed no significant difference in qualifications of teachers between boarding and non-boarding schools and no significant difference between low and high achieving schools in qualifications of teachers. The conclusion is teacher qualification is not the sole contributor in academic achievement.

Eguatu (2018) reviewed the controversy surrounding the teachers' qualifications and its influence on students' academic achievement. The paper measured teachers' qualification using seven indicators which are: formal education, experience, subject matter knowledge, pedagogy studies, duration of training, certificate/licensing and professional development. The paper reviewed different opinions on the relationship between these indicators and students' academic achievement. Though, it seems there is no consensus among the authors as regard the subject. However, there is a common opinion that subject matter knowledge, pedagogy studies, professional development and years of experience are imperative and positively correlated with students' academic achievement. As a new dimension to the argument, this paper conceptualized teacher qualification into two categories. The article posits that one of the categories, teacher's personal quality is more important than certification. The paper suggested some recommendation

Olatunji et al. (2015) studied wages and salaries as a motivational tool for enhancing organizational performance: a survey of selected Nigerian workplace. To achieve the aim of their study they devised seven research questions and two hypotheses were postulated to find solutions to the problems of the study. One hundred and twenty personnel formed the sample size from six organisations. A self-designed instrument labelled Wages and Salaries as a Motivational Tool Questionnaire 2 (WASAMOTOQ2) containing seven sections was used in the collection of data. The findings of the study revealed those factors that militate against adequate compensation to include labour market conditions, the ability of the organization to pay adequate

compensation and the existing country/nation's present cost of living; what makes up good and adequate compensation include recognition of individual performance and taking care of individual incentives and it shows the relationship between compensation and motivation. It further established the consequential effect of inadequate compensation and motivation on the organizational development. Based on the findings, the following recommendations were proffered that there should be wages/salaries scale and schedule; such should be based on identified indices in the study; that disparity between two identical workers should not be based purely on 'paper' qualification but the ability to 'deliver'; and those wages/salaries should display equality, no 'sacred cow'.

David Belcher in Nwachukwu (2000) has advised that prior to embarking on policy regarding wages and salaries, the organisation should bear in mind 17 assumptions and topping the assumptions is the fact that "pay is an incentive for job performance". Wesonga*et al* (2011) though focused on a particular sugar company ended up to established the fact that most current employees of the company are ready to quit if offered another job with better terms of service and that the level of dissatisfaction is highest among the low cadre of employees of Sony Sugar Company. The researcher went further to recommend that management should introduce better overtime pay and workers encouraged to take up the opportunity and that the management should also review its pay packages, fringe benefits and opportunities for growth in order to retain its workforce.

Again, Howrtz et al (2003) identified many factors as the most effective strategies for attracting, motivating and retaining Knowledge Workers (KWrs) but ranked first among the list of factors attracting Knowledge Workers (KWrs) "very competitive package (wages/salaries). Obasan (2012) also concluded that "compensation strategy is seen as one of the most important strategies in human resource management function as it influences the productivity and growth of an organization and that it is imperative to incorporate effective compensation strategies for workers as part of their corporate goals and objectives".

Furthermore, Agburu (2012) concluded that "there had been a gross lack of close relationship between pay (or compensation in general) and employee productivity. Consistently, productivity has tended to lag behind pay, be it at the federal or state government levels". Finally, Muo (2013) concluded that "people are the most critical elements in the organization because they acquire and manage other resources" and that "in trying to motivate people to work, organizations should do all it takes to ensure that people satisfy their different and varying needs as they work for the organizations".

Hannah (2018) examined the extent teachers' educational qualifications and years of experience influence their job commitment and academic achievement of secondary school students in Rivers State.

CONCLUSION

Wage differentials can significantly impact teachers' job performance, with both positive and negative effects. While higher wages can motivate teachers to perform better, wage disparities can lead to demotivation, job dissatisfaction, and decreased performance. To address these issues, policymakers and educators should consider implementing strategies such as:

Suggestions

- The Ministry of education should as a matter of urgency prioritize teachers' wages to ensure quality service delivery in schools.
- The government should work towards teachers' promotion and increase wages to ensure effective teachers job performance in schools.
- Teachers' welfare packages should be given proper consideration to ensure teachers quality service delivery in schools.
- Ensure that teachers receive salaries and benefits that reflect their qualifications, experience, and performance.

POLITICIZATION OF EDUCATIONAL MANAGEMENT IN NIGERIA: THE WAY FORWARD

Sordum Blessing NEEDU-EFEELOO
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

This paper examined the politicization of educational management in Nigeria: The Way Forward. The paper emphasized how political interference undermines efficiency in the education sector, leading to inconsistencies in policy formulation, mismanagement of resources, and frequent disruptions due to industrial actions. Furthermore, it discussed how political influence affects decision-making processes, often prioritizing partisan interests over academic excellence and institutional stability. The paper proposed strategies for depoliticizing educational management, including merit-based appointments, policy continuity, financial transparency, institutional autonomy, stakeholder engagement, and evidence-based reforms. Implementing these measures will promote good governance, enhance academic standards, and ensure a more stable education system. A collaborative approach involving policymakers, educators, and civil society is essential in fostering an education sector driven by professionalism and accountability. The paper concluded that implementing merit-based appointments, ensuring transparent financial practices, and promoting inclusive decision-making can help reduce political interference in education. Among others, the paper suggested that Government and relevant agencies should implement policies that ensure appointments in educational institutions are based on merit rather than political affiliations.

Keywords: Politicization, Educational Management, Policy Implementation, Institutional Autonomy, Merit-Based Appointments.

INTRODUCTION

Education is a crucial driver of national development, equipping individuals with the necessary knowledge and skills to contribute to economic growth and social progress. In Nigeria, however, the management of the education sector has become deeply entangled with political influences, affecting policy implementation, administrative efficiency, and overall educational quality. Political interference in educational management has led to policy inconsistencies, disruptions in academic leadership, and resource misallocation, all of which undermine the effectiveness of the education system (Okebukola, 2020). The frequent changes in government policies, often

dictated by political motives rather than the actual needs of the sector, have resulted in instability, making it difficult for educational institutions to achieve long-term goals.

Moreover, political interference in the appointment of educational administrators has further weakened the sector. Rather than selecting leaders based on competence and experience, appointments are often influenced by political affiliations, leading to inefficiencies in governance and decision-making (Ajayi & Ekundayo, 2008). This practice has negatively impacted the management of universities, polytechnics, and secondary schools, where leadership instability and administrative inefficiencies have resulted in poor planning, mismanagement of resources, and a decline in academic standards. Furthermore, funding disparities caused by political considerations have led to unequal resource distribution among educational institutions. Certain regions and schools receive preferential treatment due to their political affiliations, while others struggle with inadequate infrastructure, poor remuneration for teachers, and insufficient learning materials (Olanrewaju, 2018). These funding inconsistencies have contributed to the decline in the quality of education, with institutions facing frequent strikes, delays in academic calendars, and a general decline in student performance.

Additionally, the politicization of educational management has eroded institutional autonomy, with political actors dictating policies that do not align with the needs of the education sector. The undue influence of politicians has affected curriculum development, employment processes, and overall governance, reducing the ability of institutions to function independently and professionally (Obanya, 2018). Instead of focusing on research, innovation, and academic excellence, educational institutions are often forced to conform to political interests, which limits their ability to produce graduates who can compete on a global scale.

Addressing the challenges associated with the politicization of educational management in Nigeria requires urgent reforms that prioritize merit-based leadership, stable policies, and adequate funding. Ensuring the autonomy of educational institutions and reducing political interference will enhance the effectiveness of the education system and contribute to national development. Without addressing these issues, the Nigerian education sector will continue to face systemic problems that hinder its progress and limit its ability to provide quality education for all.

THEORETICAL FRAMEWORK

Systems Theory

Systems Theory, originally developed by Ludwig von Bertalanffy in 1968 and later expanded by Fritjof Capra (2014**)**, the theory provided a comprehensive framework for understanding complex systems, including educational management. The theory posits that all systems, whether biological, social, or organizational, function as interdependent units composed of interconnected components. Rather than viewing entities in isolation, Systems Theory emphasizes the holistic interaction between different parts of a system and how they influence one another to maintain equilibrium. This theoretical perspective is particularly useful in analyzing how political interference affects the administration of educational institutions, as it highlights the disruption caused by external influences on the internal functioning of the education system.

Education, as a system, consists of various components such as policies, administrators, teachers, students, infrastructure, and funding mechanisms, all of which interact dynamically. The application of Systems Theory to educational management in Nigeria reveals that political

interference introduces instability into the system, affecting governance, policy continuity, and institutional autonomy. When political actors impose policies based on personal or party interests rather than academic needs, the education system experiences an imbalance that results in poor decision-making, misallocation of resources, and administrative inefficiencies (Capra, 2014). For example, the appointment of university vice-chancellors, heads of polytechnics, and principals in secondary schools is often influenced by political considerations rather than merit. This disrupts the leadership structure, leading to conflicts, low staff morale, and a decline in the quality of education.

Furthermore, Systems Theory explains how changes in one part of a system affect the entire structure. Political instability in Nigeria has led to inconsistent policies in the education sector, with each administration introducing new reforms while abandoning existing ones. This lack of continuity weakens the system, as policies fail to achieve long-term impact due to frequent modifications dictated by political motives. Additionally, funding for educational institutions is often influenced by political affiliations, leading to disparities in resource allocation. Universities in politically favored regions receive better financial support, while others struggle with inadequate infrastructure, poor research funding, and delays in staff salaries. These imbalances create inefficiencies that hinder the overall development of the education system.

The relevance of Systems Theory to this study lies in its ability to illustrate how political interference distorts the interconnected components of educational management. A well-functioning education system requires stability, merit-based leadership, and consistent policies. By applying this theory, it becomes evident that depoliticizing educational management in Nigeria would restore balance, improve policy implementation, and enhance institutional efficiency. Strengthening the autonomy of educational institutions, ensuring equitable resource distribution, and prioritizing professional leadership appointments would help stabilize the system, allowing it to function optimally and contribute to national development.

CONCEPTUAL CLARIFICATIONS

Concept of Education

Education serves as the foundation for individual and societal development, facilitating the transmission of knowledge, values, skills, and culture across generations. It encompasses formal, non-formal, and informal learning processes that enable individuals to acquire the necessary competencies for personal growth and national progress. Formal education is structured and delivered through schools, colleges, and universities, while non-formal education includes vocational training, adult literacy programs, and professional skill acquisition. Informal education, on the other hand, occurs through life experiences, family upbringing, and peer interactions. Education is essential for fostering intellectual development, enhancing critical thinking, and promoting socio-economic advancement (Adeyemi & Uko-Aviomoh, 2020).

Furthermore, education is central to human capital development, as it equips individuals with the knowledge and technical skills required for economic participation. Societies that prioritize quality education often experience higher levels of innovation, productivity, and technological advancement. In Nigeria, education is regarded as a tool for national integration, economic growth, and democratic participation. The National Policy on Education highlights the importance of providing equal access to education, ensuring that every Nigerian benefits from

lifelong learning opportunities (Okeke, 2019). However, disparities in educational access remain a pressing issue, particularly in rural areas where infrastructural deficits and socio-economic barriers hinder school enrollment.

Moreover, the role of education extends beyond academic achievements, as it also shapes social behaviors, moral values, and civic responsibility. Schools and higher institutions serve as platforms for social interaction, cultural exchange, and leadership development. In Nigeria, education has been instrumental in fostering unity among diverse ethnic and religious groups by promoting shared national values and historical consciousness (Obanya, 2018). However, the effectiveness of the education system is often challenged by issues such as outdated curricula, poor teaching methodologies, and inadequate teacher training. Addressing these challenges requires continuous reforms, investment in educational infrastructure, and the adoption of modern pedagogical strategies.

Additionally, education plays a crucial role in reducing poverty and inequality by empowering individuals with skills for employment and entrepreneurship. It provides a pathway for social mobility, enabling people from disadvantaged backgrounds to improve their economic standing. Research has shown that higher educational attainment is linked to increased income levels and better employment opportunities (Adebayo, 2021). In Nigeria, efforts to expand access to education through initiatives such as the Universal Basic Education (UBE) program have contributed to increased school enrollment. However, the quality of education remains a concern due to challenges such as teacher shortages, inadequate funding, and policy inconsistencies.

Education is a fundamental pillar of national development, influencing various aspects of human and societal progress. It not only enhances cognitive and professional skills but also promotes social cohesion, ethical values, and economic prosperity. Strengthening Nigeria's education system requires a commitment to policy continuity, investment in teacher development, and the integration of digital learning technologies. Without these interventions, the country risks limiting its potential for sustainable growth and global competitiveness.

Educational Management

Educational management refers to the administration, planning, and supervision of educational institutions to ensure effective teaching and learning processes. It encompasses a range of activities, including policy formulation, curriculum implementation, financial management, and human resource coordination. The goal of educational management is to create an organized and efficient learning environment that promotes academic excellence, institutional growth, and national development. In Nigeria, educational management plays a vital role in addressing systemic challenges such as inadequate infrastructure, funding constraints, and administrative inefficiencies (Nwosu & Anyanwu, 2019).

Furthermore, effective educational management requires collaboration among various stakeholders, including government agencies, school administrators, teachers, students, and community members. The Nigerian education sector is regulated by bodies such as the National Universities Commission (NUC) and the Universal Basic Education Commission (UBEC), which oversee policy implementation and institutional accreditation. However, bureaucratic inefficiencies and political interference often undermine the effectiveness of these regulatory bodies. Strengthening institutional autonomy while ensuring accountability is essential for improving educational governance in Nigeria (Ogunyemi, 2020).

Moreover, financial management is a critical component of educational administration, as funding determines the availability of learning resources, infrastructure development, and staff welfare. The Nigerian government has historically allocated insufficient funds to education, falling below the UNESCO-recommended benchmark of 15–20% of the national budget. As a result, many schools and universities struggle with inadequate facilities, outdated teaching materials, and poorly motivated teachers. Addressing these funding challenges requires increased budgetary allocations, improved financial accountability, and strategic public-private partnerships to supplement government resources (Afolabi, 2022).

Additionally, leadership and decision-making play a crucial role in educational management. Institutions with strong leadership structures tend to perform better in terms of academic excellence, staff motivation, and student outcomes. However, weak leadership and corruption in educational institutions have negatively impacted service delivery. Cases of mismanagement, favoritism, and poor planning have contributed to declining educational standards in Nigeria. Implementing transparent leadership frameworks and professionalizing school administration can enhance the efficiency of educational management and improve learning outcomes (Eze, 2022).

Educational management is essential for ensuring the smooth operation of schools and higher institutions. It involves a range of administrative and leadership functions that impact teaching quality, institutional development, and student performance. Strengthening Nigeria's educational management system requires reforms in governance, financial accountability, and leadership structures. Moreover, adopting innovative management strategies and investing in human capital development, Nigeria can build a more resilient and effective education system.

THE POLITICIZATION OF EDUCATION IN NIGERIA

The politicization of education in Nigeria refers to the excessive influence of political actors in educational policymaking, administration, and governance. Instead of allowing education to be managed based on research-driven policies, political considerations often dictate decision-making, leading to inconsistencies and inefficiencies. Political interference is evident in areas such as the appointment of school administrators, funding allocation, curriculum development, and policy implementation. As a result, the education sector frequently experiences instability, affecting students, teachers, and institutional credibility (Okonjo, 2021).

Furthermore, frequent changes in government often lead to abrupt policy shifts, disrupting educational planning and implementation. Each administration introduces new reforms that sometimes contradict previous policies, creating confusion and reducing the effectiveness of long-term educational programs. The lack of policy continuity has hindered the development of a stable and sustainable education system. Additionally, political leaders sometimes use educational institutions for partisan interests, appointing administrators based on political loyalty rather than competence. This practice weakens institutional governance and reduces the quality of decision-making in schools and universities (Oladipo, 2020).

Moreover, funding allocation in the education sector is often influenced by political considerations. Instead of distributing resources based on institutional needs, funds are sometimes allocated to regions or institutions favored by those in power. This has led to disparities in educational quality, with some schools and universities receiving better support while others struggle with financial constraints. The politicization of funding further exacerbates

educational inequality, particularly in rural areas where schools lack basic infrastructure and qualified teachers (Adewale, 2019).

Additionally, political interference in curriculum design and policy implementation affects the relevance and effectiveness of education. In some cases, government officials prioritize policies that align with their political ideologies rather than evidence-based recommendations. This has resulted in inconsistencies in curriculum reforms and a disconnect between educational programs and labor market demands. Furthermore, frequent industrial actions by teachers and university staff, often caused by political disagreements over funding and working conditions, have disrupted academic activities and reduced the credibility of the education system (Nwachukwu, 2022).

The politicization of education in Nigeria undermines the efficiency and stability of the education sector. Political interference in policymaking, funding, and institutional administration has contributed to declining educational standards. Addressing this issue requires insulating education from political influences, promoting merit-based appointments, and ensuring policy continuity. Without these reforms, Nigeria's education system will continue to struggle with inefficiencies that hinder national development.

HISTORICAL CONTEXT OF POLITICAL INFLUENCE ON EDUCATION IN NIGERIA

Education in Nigeria has long been subject to political influence, dating back to the colonial period when British administrators designed educational policies to serve their governance needs rather than national development. During this era, missionary schools played a central role in education, leading to disparities between the northern and southern regions, as colonial authorities restricted Western education in the north to maintain indirect rule while allowing greater missionary activities in the south. This uneven educational development created long-term structural inequalities that persisted after independence, as regional governments sought to assert control over education to reflect their political and ethnic priorities rather than national cohesion. The First Republic saw an expansion of regional universities, which, while aimed at increasing access to higher education, also reflected the political rivalries of the time and reinforced the perception of education as a tool for political control rather than development (Umeh, 2023).

During military rule, the Nigerian government tightened its grip on education, nationalizing universities and placing them under strict state control. Military regimes often appointed vice-chancellors and other university administrators based on political loyalty rather than academic competence, undermining institutional autonomy and academic freedom. Additionally, frequent policy shifts disrupted educational planning, with governments arbitrarily modifying curricula and funding structures to align with political objectives rather than long-term educational goals. The Structural Adjustment Programme of the 1980s further worsened the situation, as austerity measures led to severe underfunding, prompting mass protests by students and strikes by lecturers, which became a recurring challenge in Nigerian universities.

The return to democracy in 1999 did not eliminate political interference in education, as successive civilian administrations continued to use educational institutions as platforms for political patronage. State and federal governments frequently influenced the selection of university leaders, prioritizing political considerations over merit and competence. Furthermore, political leaders have established universities to fulfill electoral promises rather than to address

educational gaps, leading to a proliferation of poorly funded institutions lacking essential infrastructure and personnel. The persistent instability caused by government interference has resulted in frequent strikes, inconsistent policies, and declining academic standards, making it difficult for Nigeria's education system to compete globally (Ugochukwu, 2022). Without deliberate efforts to insulate education from political influence, the sector will continue to suffer from mismanagement, instability, and a failure to fulfill its role in national development.

THE IMPACT OF POLITICS ON EDUCATIONAL MANAGEMENT IN NIGERIA

Politics plays a central role in the management of education in Nigeria, influencing policies, funding, administration, and institutional stability. The government's direct control over the education sector allows political actors to shape educational priorities, sometimes in ways that do not align with national development goals. Political considerations often override academic interests, leading to inconsistencies in policy implementation and disruption in educational progress (Alabi, 2021). Political instability has caused frequent changes in leadership within the Ministry of Education, resulting in conflicting policies and inadequate long-term planning. This lack of continuity affects curriculum development, teacher recruitment, and overall governance in the sector (Okafor, 2020).

Moreover, financial mismanagement in the education sector has been exacerbated by political influences. Political leaders often allocate resources based on party interests rather than institutional needs, leading to underfunding in critical areas such as infrastructure, teacher welfare, and research development. The tendency of politicians to use education projects as campaign tools results in short-term interventions that fail to address systemic issues (Eneh, 2019). Political control over budgetary allocations has also led to regional disparities in educational development, where certain states receive more funding due to political affiliations rather than actual demand (Usman, 2021).

Additionally, political interference affects the appointment of school administrators, leading to leadership crises in many institutions. Instead of appointing leaders based on merit, political actors often favor candidates with political affiliations, undermining institutional autonomy and effective management. This has led to inefficiencies in decision-making processes, as politically appointed administrators may lack the expertise needed to drive educational reforms. Furthermore, these appointments often create conflicts between management and staff, particularly when academic unions perceive leadership selections as politically motivated rather than merit-based (Ogunleye, 2020).

Moreover, the politicization of educational management in Nigeria has contributed to frequent industrial actions by academic and non-academic staff. Many strikes by the Academic Staff Union of Universities (ASUU) and other unions result from the government's failure to honor agreements concerning salaries, funding, and working conditions. These strikes have led to prolonged disruptions in academic calendars, affecting students' learning and the overall efficiency of the education system. Political leaders often use education-related negotiations as bargaining tools to gain political favor rather than implementing sustainable policies that benefit the sector (Ibekwe, 2021).

Furthermore, the influence of political actors in policy formulation has created inconsistencies in the implementation of educational reforms. Each new administration introduces policies that align with its political ideology, often discarding previous policies without proper evaluation. This approach has led to a lack of continuity in educational

development plans, negatively impacting curriculum implementation, teacher training, and infrastructural growth. For instance, changes in the structure of tertiary education have been implemented without adequate consultation with stakeholders, resulting in confusion and inefficiencies in administration (Chijioke, 2019). Politics on educational management in Nigeria is largely negative due to inconsistent policies, political appointments, financial mismanagement, and frequent industrial actions. Addressing these issues requires a more transparent and accountable approach to policy implementation, increased financial commitment to education, and merit-based leadership appointments. Without these reforms, the education sector will continue to struggle with inefficiencies that hinder national development.

POLITICAL INTERFERENCE IN EDUCATIONAL INSTITUTIONS

Political interference in educational institutions in Nigeria has significantly affected the quality, independence, and efficiency of academic administration. One of the most prominent ways political influence manifests is through the appointment of key administrators in tertiary institutions. Many vice-chancellors, rectors, and provosts are selected based on their political connections rather than their qualifications and leadership capabilities. This practice compromises the autonomy of educational institutions and often results in conflicts between university management and academic unions. When administrators are politically appointed, they may prioritize political interests over academic excellence, leading to poor governance and decision-making within the institutions (Ezeobi, 2021).

Additionally, political interference influences financial allocations to educational institutions. Instead of distributing resources equitably, government officials often allocate funds based on political affiliations, leaving some institutions underfunded. This results in disparities in infrastructure, research funding, and student support services. Institutions in opposition-controlled states sometimes experience budget cuts or delays in disbursements, which negatively impact their ability to provide quality education. The politicization of financial resources has also led to corruption, where funds meant for education development are diverted for political campaigns or personal enrichment (Bamidele, 2022).

Moreover, the curriculum and academic policies in Nigerian institutions are often subject to political influences. Government officials sometimes impose ideologically driven changes to the curriculum without consulting educational experts or considering global best practices. This leads to inconsistencies in curriculum content, making it difficult for students to compete in the global labor market. Political involvement in curriculum development has also resulted in the suppression of critical thinking in education, as some topics that are politically sensitive are omitted from academic discourse (Ogunbanjo, 2021).

Furthermore, industrial actions in educational institutions are frequently triggered by political interference. Government officials often fail to fulfill agreements made with academic unions, leading to repeated strikes by lecturers and university staff. These strikes disrupt academic calendars and reduce the quality of education provided in Nigerian institutions. Many of these disputes stem from political decisions that prioritize short-term gains over long-term educational improvements. The politicization of educational institutions has also led to favoritism in student admissions and employment opportunities, where individuals with political connections receive preferential treatment over more qualified candidates (Ifeanyi, 2021).

Political interference in Nigerian educational institutions undermines their ability to function effectively. It affects leadership selection, financial allocation, curriculum development,

and institutional autonomy. To address these challenges, policies should be enacted to protect educational institutions from excessive political control. Ensuring that leadership appointments are based on merit, increasing financial transparency, and implementing long-term educational policies can help mitigate the negative effects of political interference in the Nigerian education sector.

GOVERNMENT CONTROL AND AUTONOMY OF INSTITUTIONS

Government control in higher education plays a crucial role in maintaining educational standards, ensuring financial accountability, and implementing national policies. However, excessive governmental influence can undermine institutional autonomy, affecting academic decision-making, research freedom, and overall institutional governance. Universities and colleges require a certain level of independence to function effectively, promote intellectual inquiry, and develop sustainable policies that align with academic and societal needs. The balance between regulation and autonomy remains a challenge in Nigeria's education sector, as political influence continues to dictate many institutional decisions.

One major issue related to government control is funding dependency. Public universities in Nigeria rely significantly on government subventions to cover staff salaries, infrastructure development, and operational costs. This financial dependence allows the government to exert control over institutions by influencing budgetary decisions, resource allocation, and policy implementation. In cases where institutions demand increased funding or challenge government directives, financial support may be delayed or withheld, leaving universities in financial distress. This affects the ability of institutions to maintain infrastructure, invest in research, and provide quality education. Universities with greater financial autonomy are better positioned to implement long-term development strategies without external interference (Adamu, 2022).

Another aspect of government control is the regulation of academic policies and curricula. While oversight by regulatory agencies such as the National Universities Commission (NUC) is necessary to maintain quality assurance, excessive bureaucratic involvement often limits institutional innovation. Frequent government-imposed policy changes disrupt academic planning, making it difficult for universities to execute long-term educational strategies. In addition, institutions are sometimes required to adopt politically motivated policies that do not align with their academic objectives, leading to inefficiencies in curriculum implementation and institutional governance (Ogundele, 2021).

Government influence also extends to the appointment of university leadership. In many cases, vice-chancellors, provosts, and other top administrators are appointed based on political affiliations rather than merit. This compromises institutional integrity, as leadership decisions are often influenced by political interests rather than academic priorities. Universities that lack autonomy in leadership selection struggle with administrative instability, internal conflicts, and a decline in academic standards. Moreover, politically appointed leaders may be reluctant to challenge government policies, even when such policies negatively impact the institution. This limits the ability of universities to advocate for necessary reforms that enhance educational quality (Olatunji, 2023).

The impact of excessive government control is also evident in research activities. Universities are expected to be hubs of innovation and independent inquiry, but excessive government interference often discourages critical research, particularly on politically sensitive topics. Scholars who publish findings that contradict government narratives may face

restrictions, limiting academic freedom. Autonomous institutions are better positioned to encourage objective research, contribute to policy development, and provide evidence-based solutions to national challenges (Egbewole, 2023).

To enhance institutional autonomy, universities must diversify their sources of funding. Encouraging private-sector partnerships, research grants, and alumni contributions can reduce financial dependency on government allocations. Furthermore, legal frameworks should be established to protect universities from undue political interference, allowing institutions to operate independently while maintaining accountability. Strengthening governance structures within universities, including transparent selection processes for leadership roles, will also enhance institutional autonomy.

POLITICAL APPOINTMENTS IN UNIVERSITIES AND COLLEGES

The appointment of university administrators is a crucial aspect of institutional governance, affecting leadership stability, academic quality, and institutional credibility. However, political influence in the selection of key university officials, including vice-chancellors, provosts, and governing council members, has become a major issue in Nigeria's higher education sector. Instead of selecting candidates based on academic merit, experience, and institutional vision, many appointments are driven by political affiliations, undermining the effectiveness of university leadership and management.

One of the primary concerns with political appointments is the erosion of meritocracy. Universities are academic institutions that require competent and experienced administrators to drive educational policies, promote research, and ensure efficient governance. However, politically motivated appointments often result in the selection of individuals who lack the requisite academic and administrative expertise. This compromises institutional decision-making, as politically appointed leaders may prioritize personal or political interests over the educational needs of students and faculty members (Adeyemo, 2023).

Political appointments also contribute to administrative instability within universities. In many instances, the selection of vice-chancellors and other key administrators sparks conflicts between university staff, students, and government authorities. Academic unions, such as the Academic Staff Union of Universities (ASUU), have frequently opposed political appointments, arguing that they undermine institutional integrity. These disputes often lead to prolonged strikes, legal battles, and disruptions in academic activities, affecting students' academic progression and institutional productivity (Ezeokoli, 2022).

Another major consequence of political appointments is their impact on resource allocation and institutional priorities. Politically appointed administrators are often expected to align with the interests of those who facilitated their appointment, which may lead to biased decision-making in the distribution of resources, faculty promotions, and student admissions. This creates an environment of favoritism, where individuals benefit based on political connections rather than competence. Additionally, politically appointed leaders may be reluctant to challenge inadequate government funding or advocate for policy changes that would benefit the institution, for fear of contradicting their political sponsors.

Furthermore, political appointments weaken institutional governance structures. Universities are meant to operate independently, with clearly defined procedures for leadership selection, policy development, and academic administration. However, when government officials directly influence appointments, it undermines the credibility of these processes. In

some cases, university governing councils, which are supposed to oversee leadership selections, are sidelined, with decisions imposed by external political figures. This reduces transparency and weakens the effectiveness of internal governance mechanisms (Akinwale, 2023).

The long-term consequences of political appointments extend beyond governance challenges to academic performance and institutional reputation. Universities that lack strong leadership struggle with inefficiencies in policy implementation, delays in academic program accreditation, and poor research output. Moreover, international organizations and academic ranking bodies assess universities based on governance structures, research contributions, and leadership stability. Institutions that are perceived as being heavily influenced by political appointments may struggle to attract international partnerships, funding opportunities, and recognition on global platforms (Onyema, 2022).

THE ROLE OF POLITICAL PARTIES IN EDUCATIONAL REFORMS

Political parties play a decisive role in shaping educational policies and reforms in Nigeria. As the primary drivers of government policies, political parties influence decisions on curriculum changes, education funding, and institutional governance. However, the involvement of political parties in education has often led to inconsistencies, policy reversals, and ideological biases that hinder the long-term development of the sector (Afolabi, 2021). Political parties typically use education policies as tools to gain political advantage rather than as strategic efforts to improve learning outcomes. As a result, reforms introduced by one government are often abandoned when a new administration comes into power, creating instability in the education sector.

Furthermore, political parties influence the level of investment in education through budgetary allocations. The ruling party determines how much funding is allocated to education and how those resources are distributed. In some cases, educational spending is used as a political tool to gain favor from specific regions or demographics. This approach leads to unequal distribution of resources, where some states receive better funding than others based on political considerations rather than educational needs (Balogun, 2021). Political parties also determine priorities within the education sector, sometimes emphasizing infrastructure development over quality improvement, leading to an imbalanced approach to educational reform.

Moreover, the involvement of political parties in educational reforms has affected the recruitment and employment of teachers and administrators. In many instances, employment in public schools and universities is influenced by party loyalty rather than competence. This has resulted in the hiring of underqualified individuals, which negatively impacts teaching quality and learning outcomes. The practice of using educational appointments to reward political supporters has led to inefficiencies in school administration, as politically appointed individuals may lack the experience necessary to implement effective policies (Olumide, 2019).

Additionally, political parties have played a role in shaping the ideological direction of education policies in Nigeria. Some reforms are introduced to align with the political agenda of the ruling party rather than to improve educational standards. This has led to instances where education policies lack proper consultation with stakeholders such as teachers, parents, and students. For example, reforms in tertiary education financing, such as the introduction or removal of tuition fees, have often been driven by political motives rather than an assessment of their impact on access to education (Ugochukwu, 2022).

Political parties play a crucial role in educational reforms, but their involvement has often resulted in policy instability, resource misallocation, and favoritism in recruitment processes. To ensure that educational reforms are sustainable and beneficial to all, there is a need for policies that prioritize long-term educational goals over short-term political gains. Strengthening institutional frameworks and promoting evidence-based policymaking can help minimize the negative impact of political party influence on education in Nigeria.

CHALLENGES POSED BY POLITICIZATION IN EDUCATIONAL MANAGEMENT

The politicization of educational management in Nigeria presents several challenges.

Appointment of Unqualified Administrators

The appointment of unqualified administrators remains one of the most pressing challenges posed by the politicization of educational management in Nigeria. Political leaders often select individuals for key positions in universities, colleges, and secondary schools based on party loyalty rather than competence and experience. This practice compromises institutional leadership, as these politically appointed administrators may lack the skills needed for effective management. When educational institutions are led by individuals who do not understand academic policies, research development, or administrative efficiency, it results in poor decision-making and mismanagement of resources. Moreover, such appointments often create tension between management and staff, particularly when academic unions perceive leadership selection as politically motivated. This can lead to conflicts, resistance to policies, and disruptions in the education system. The long-term effect is a decline in academic standards and a weakening of institutional credibility, making it difficult for Nigeria's education system to compete globally (Olatunji, 2023).

Policy Inconsistency

Frequent policy changes due to political transitions pose another challenge to educational management in Nigeria. Each new government introduces its own set of policies, often disregarding those implemented by previous administrations, regardless of their effectiveness. This lack of continuity affects curriculum development, teacher training programs, and long-term educational goals. The absence of a stable policy framework leads to confusion among educators, students, and institutional administrators. Additionally, frequent changes in policies hinder the development of long-term strategic plans, as education stakeholders struggle to adapt to shifting regulations. The constant alteration of policies without thorough evaluation disrupts learning processes and weakens institutional stability. The inconsistency in policies also affects funding allocation, with some projects abandoned midway because they were initiated by a previous administration. Without a well-structured and consistent policy framework, the education sector will continue to struggle with inefficiencies that hinder national development (Okafor, 2020).

Inadequate Funding and Resource Misallocation

Political influences have led to severe financial mismanagement and inadequate funding in the Nigerian education sector. Education is often not prioritized in budgetary allocations, and when funds are allocated, they are sometimes mismanaged or diverted for political purposes. Instead of channeling resources toward improving infrastructure, procuring learning materials, and enhancing staff welfare, some funds are used for political campaigns or personal enrichment by government officials. Moreover, resource distribution is often politically motivated, where some institutions receive higher funding than others based on political affiliations rather than actual needs. This leads to disparities in educational standards across regions, with some institutions operating in poor conditions due to insufficient financial support. As a result, many schools lack essential teaching aids, laboratories, and research facilities, which negatively impact the quality of education provided. A transparent and equitable funding system is necessary to ensure that all educational institutions receive the resources required to function effectively (Usman, 2021).

Frequent Industrial Actions

Industrial actions by academic and non-academic staff in Nigerian institutions have become a recurring issue due to the politicization of educational management. The government's failure to honor agreements with academic unions, particularly on issues related to funding, salaries, and working conditions, has led to frequent strikes. The Academic Staff Union of Universities (ASUU) and other educational unions have consistently embarked on industrial actions to demand better working conditions, improved funding, and policy implementation. These strikes disrupt academic calendars, delay student graduations, and lower the quality of education. Political leaders often use these negotiations as bargaining tools rather than genuinely addressing the sector's problems. Furthermore, political favoritism in fund allocation and the refusal to implement necessary reforms contribute to continuous conflicts between the government and educational unions. The resolution of these disputes requires a sincere commitment to honoring agreements and implementing long-term policies that enhance stability in the education sector (Ibekwe, 2021).

Loss of Institutional Autonomy

Excessive political interference in educational institutions has led to the loss of institutional autonomy, affecting decision-making processes and academic freedom. Political leaders often exert influence over university admissions, staff recruitment, and policy implementation, prioritizing political interests over academic excellence. This undue interference affects the credibility of academic institutions and diminishes their ability to operate independently. Admission processes are sometimes manipulated to favor candidates with political connections, compromising merit-based selection. Additionally, employment opportunities within educational institutions are often granted to individuals based on political loyalty rather than qualifications. This practice undermines the quality of teaching and research, as underqualified individuals occupy key positions in academia. The suppression of institutional autonomy also restricts academic freedom, as scholars may face limitations in conducting research or expressing views that contradict government policies. Restoring autonomy in educational institutions is essential for fostering innovation, academic excellence, and institutional integrity.

THE WAY FORWARD: STRATEGIES FOR DEPOLITICIZING EDUCATIONAL MANAGEMENT

The politicization of educational management in Nigeria has led to inefficiencies, instability, and a decline in academic standards. Political interference influences the appointment of educational administrators, policy formulation, funding allocation, and labor relations, often prioritizing political interests over educational development. These challenges hinder institutional autonomy, disrupt academic activities, and contribute to poor resource management. To address these issues, there is a need for strategic reforms aimed at depoliticizing the education sector.

Merit-Based Appointment of Educational Administrators

Ensuring that educational administrators are appointed based on merit rather than political affiliations is essential for reducing political influence in the education sector. Many leadership positions in Nigerian educational institutions are awarded to individuals with political connections rather than those with the necessary expertise and experience. This weakens the management of institutions and reduces accountability. Implementing a transparent and competitive selection process overseen by an independent body can help ensure that only qualified individuals hold key leadership positions. Furthermore, recruitment policies should be reviewed to emphasize academic qualifications, leadership competence, and administrative experience, thereby eliminating favoritism in appointments. If appointments are based strictly on professional qualifications, educational institutions will experience improved management, better policy implementation, and increased efficiency in service delivery. A neutral and transparent recruitment system will also enhance public trust in educational institutions and foster national development.

Establishing Policy Continuity and Stability

A major challenge in Nigerian educational management is the frequent reversal of policies by successive administrations, leading to inconsistencies and inefficiencies. Every new government tends to introduce its own policies while discarding previous initiatives, regardless of their effectiveness. This instability disrupts long-term educational planning and affects students, teachers, and institutions negatively. To ensure stability, a legally binding framework should be established to protect long-term educational policies from abrupt changes. An independent education policy commission should be tasked with evaluating and ensuring the continuity of effective policies while making necessary modifications based on research rather than political considerations. Moreover, engaging education experts in policy formulation will ensure that decisions are made based on the actual needs of the sector rather than short-term political goals. A structured and sustainable approach to policy implementation will minimize disruptions and enhance educational development.

Enhancing Financial Transparency and Accountability

The mismanagement of educational funds due to political interference has contributed to poor infrastructure, unpaid staff salaries, and inadequate teaching resources. Many institutions

struggle with financial shortfalls because funds meant for education are often diverted for political purposes. To address this, an independent financial oversight body should be established to monitor and audit all education-related expenditures. Digital financial management systems, such as e-budgeting and expenditure tracking, should be introduced to prevent corruption and ensure that funds are used appropriately. Additionally, public reports on budget allocations and spending should be published regularly to enhance transparency and accountability. When financial resources are allocated based on need rather than political influence, institutions can function more effectively and provide better educational services. Proper financial management will also enable schools to invest in modern facilities, teacher development, and research, ultimately improving the quality of education.

Strengthening Institutional Autonomy

Political interference in the administration of educational institutions has significantly undermined their ability to function independently. Universities and other institutions should be granted full autonomy in decision-making regarding curriculum development, staff recruitment, and financial management. Excessive government interference often leads to inefficiencies, delays in decision-making, and restrictions on academic freedom. Laws that protect institutional independence should be strengthened, and any attempts by political actors to impose control over institutions should be resisted. Establishing a legal framework that limits government intervention to policy guidance rather than direct control can help institutions operate more efficiently. Additionally, academic unions and civil society organizations should advocate for policies that reinforce institutional independence. When educational institutions are free from undue political influence, they can focus on academic excellence, research, and innovation, ultimately contributing to national progress.

Promoting Stakeholder Involvement in Education Governance

Educational management should be a collaborative effort that includes input from multiple stakeholders, such as teachers, parents, students, and academic unions. Political leaders often make decisions without consulting those directly affected by them, leading to ineffective policies. Establishing education advisory councils at the national, state, and local levels can provide a platform for diverse voices to contribute to policy discussions. These councils should be composed of experienced educators, civil society organizations, and student representatives to ensure that policies reflect the needs of the educational sector rather than political interests. Furthermore, public engagement through town halls, surveys, and feedback mechanisms should be encouraged to ensure inclusive decision-making. By involving key stakeholders in policy formulation and implementation, transparency and accountability will be enhanced, and education policies will be more responsive to the needs of society.

Depoliticizing Union-Government Relations

The frequent industrial actions in Nigerian educational institutions are often linked to political interference in labor relations. Many strikes occur because of the government's failure to honor agreements with academic unions, leading to disruptions in academic activities. Political interests sometimes delay the resolution of labor disputes, affecting students and institutional

stability. Establishing an independent mediation body to handle disputes between the government and unions can help prevent prolonged strikes. Agreements should be legally binding, and sanctions should be imposed on parties that fail to uphold them. Additionally, labor negotiations should be conducted transparently, with clear timelines for the implementation of agreements. A professional approach to labor relations will reduce conflicts and ensure a stable academic environment. A well-structured dispute resolution mechanism will promote industrial harmony, improve productivity, and enhance the overall quality of education.

Ensuring Equitable Distribution of Resources

In Nigeria, political influence often determines the allocation of educational resources, resulting in disparities between institutions. Some schools and universities receive more funding due to their affiliation with ruling parties, while others suffer neglect. This imbalance has contributed to poor educational standards in certain regions, thereby widening the inequality gap. To address this issue, a standardized funding formula should be developed based on student population, institutional needs, and educational priorities. An independent agency should oversee resource distribution to ensure fairness and prevent favoritism. Equal access to resources will improve educational quality across all regions and eliminate the use of funding as a political tool. In addition, a monitoring system should be established to track the utilization of funds to ensure that they are used for the intended purposes. Fair resource allocation will create a more inclusive and balanced education system.

Encouraging Evidence-Based Educational Reforms

Many education policies in Nigeria are introduced without adequate research, leading to ineffective implementation. Policy decisions should be driven by empirical evidence, expert recommendations, and global best practices rather than political interests. Without sufficient research, policies may fail to address the core challenges in the education sector, resulting in wasted resources and inefficiencies. Universities and research institutions should be actively involved in conducting studies on educational challenges and proposing solutions. A national education research council should be established to evaluate policy proposals and provide recommendations based on data-driven analysis. Furthermore, the government should invest in research grants and partnerships to encourage the generation of knowledge that can inform educational reforms. Evidence-based policymaking will ensure that reforms are practical, sustainable, and beneficial to the education sector, leading to long-term improvements in educational outcomes.

Legal Frameworks to Safeguard Educational Institutions

Implementing strong legal frameworks is essential in ensuring that educational institutions operate without undue political interference. The government should enact and enforce laws that clearly define the roles and limitations of political actors in the administration of educational institutions. Laws protecting universities and colleges from arbitrary government interventions should be strengthened to ensure stability in leadership and policy implementation. Additionally, legislative bodies should be actively involved in creating policies that promote educational excellence rather than advancing political interests. The judiciary should also play a role in

upholding the autonomy of institutions by ensuring that legal disputes regarding university governance and administration are resolved in a fair and independent manner (Okonkwo, 2024).

Strengthening Academic Freedom

Academic freedom is a crucial component of effective educational management. Universities and other tertiary institutions should have the liberty to determine their academic programs, research priorities, and institutional policies without government interference. A strong and independent academic system allows universities to operate based on educational principles rather than political directives. Encouraging academic freedom fosters innovation, critical thinking, and research development, which are essential for national progress. University governing councils should be empowered to make independent decisions, and lecturers should be free to conduct research and publish findings without fear of political victimization. A national academic freedom policy should be developed to provide legal protection for scholars and institutions against undue political control (Ibrahim, 2024).

CONCLUSION

Depoliticizing educational management in Nigeria requires a comprehensive approach that includes reforms in leadership selection, policy continuity, financial accountability, institutional autonomy, and stakeholder engagement. Implementing merit-based appointments, ensuring transparent financial practices, and promoting inclusive decision-making can help reduce political interference in education. Additionally, strengthening laws that protect institutional independence and adopting evidence-based reforms will create a more stable and effective education system. Without these measures, the education sector will continue to suffer from inefficiencies, corruption, and instability. A commitment from policymakers, educators, and civil society organizations is essential to achieving a depoliticized education system. With proper implementation, Nigeria can build an education sector that prioritizes academic excellence and national development over political interests.

Suggestions

To ensure that Nigeria's educational management system operates independently and efficiently, various stakeholders must take proactive measures to eliminate political interference. The following suggestions were made to achieve this goal:

- Government and relevant agencies should implement policies that ensure appointments in educational institutions are based on merit rather than political affiliations.
- Policy makers should develop strict guidelines that ensure the selection of educational administrators, including vice-chancellors, rectors, and provosts, is based on merit rather than political affiliations.
- Educational Administrators should maintain professionalism and uphold institutional independence by resisting external political pressures.
- Academic Unions and Educators should engage in constructive dialogue with the government to resolve labor disputes without excessive political involvement.

EDUCATIONAL ADMINISTRATION AND THE NEED FOR REFORM IN HIGHER EDUCATION: A CALL FOR ACTION

Victoria AMAGBORUJU
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

The paper examined the critical link between educational administration and the urgent need for reform in higher education in Nigeria. It was motivated by the persistent challenges facing public universities, where administrative inefficiencies have become major impediments to institutional growth and the realization of academic goals. The paper argues that bureaucratic bottlenecks, limited institutional autonomy, and weak leadership structures have continued to undermine the performance of Nigerian public universities. It delved into the concepts of educational administration, institutional effectiveness, and governance in higher education, while also highlighting the systemic barriers that hinder efficiency in university management. The paper further explored how outdated administrative practices and a lack of visionary leadership contribute to reduced academic performance, low staff morale, and limited innovation across institutions. It emphasized that addressing these issues requires a deliberate and strategic overhaul of administrative systems to promote accountability, transparency, and autonomy. The paper concluded that meaningful reform in higher education is only achievable through the adoption of modern governance principles, decentralization of authority, and the strengthening of leadership capacity at all levels. It therefore recommended that stakeholders in the education sector prioritize administrative transformation as a pathway to institutional revitalization and improved educational outcomes in Nigerian universities.

Keywords: Educational Administration, Higher Education Reform, Leadership, Governance, Institutional Performance, Policy Change.

INTRODUCTION

Higher education institutions play a pivotal role in shaping the future of societies, driving innovation, research, and human capital development. These institutions contribute significantly to economic growth and social development, serving as engines for knowledge generation, entrepreneurship, and policy advancement. However, despite their critical importance, many Higher education institutions around the world particularly in developing nations face significant challenges that undermine their capacity to fulfill these roles effectively.

One of the most pressing issues is the inefficiency of educational administration, which hampers the operational and academic performance of universities. Administrative inefficiencies

such as excessive bureaucratic control, lack of decentralization, outdated leadership structures, and political interference have created barriers to effective governance. These inefficiencies not only affect the quality of education but also diminish the overall institutional competitiveness, creating a gap between what HEIs aim to achieve and what they can practically accomplish.

In many developing countries, higher education has been bogged down by administrative practices that are ill-suited to the dynamic and fast-changing global educational landscape. Poorly managed resources, slow decision-making processes, and lack of innovation in leadership have led to stagnation in academic output, student engagement, and institutional development. The need for educational reform in the administrative structures of these institutions has therefore become more urgent.

Reform is critical in creating higher education systems that are agile, transparent, and responsive to the needs of students, faculty, and society at large. Through systemic changes in governance, leadership, and administrative practices, institutions can better serve their core mission of providing quality education and fostering research. This study, therefore, examines the administrative challenges that contribute to inefficiencies in Nigerian public universities, with a particular focus on how these barriers impact institutional performance.

By exploring the relationship between administrative inefficiencies and institutional performance, this paper aims to provide a comprehensive analysis of the current state of educational administration and the urgent need for reform. It seeks to highlight the areas in which educational administrators, policymakers, and other stakeholders can focus their efforts to bring about meaningful change and improvement in the higher education sector.

Statement of the Problem

In many developing nations, the higher education sector is grappling with significant administrative inefficiencies that undermine institutional effectiveness. These inefficiencies manifest in several ways, including bureaucratic bottlenecks, centralization of decision-making, outdated leadership structures, and political interference. Such administrative shortcomings create a host of challenges, ranging from low academic performance and reduced institutional competitiveness to poor student and staff morale. For instance, the excessive reliance on bureaucratic processes in university administration has led to slow decision-making, stifling innovation, and hindering the implementation of progressive educational policies. Furthermore, the lack of decentralization and autonomy within these institutions limits the ability of universities to adapt to rapidly changing global educational demands. This centralization results in top-down leadership practices that often fail to address the diverse needs of the academic community, including faculty, students, and administrative staff.

Political interference is another major issue, where university leadership is sometimes determined by political considerations rather than merit, leading to weak governance and poor strategic direction. Additionally, outdated leadership practices and a lack of visionary leadership have prevented universities from making meaningful reforms to enhance teaching, research, and overall institutional performance.

The consequences of these administrative inefficiencies are far-reaching. They hinder the quality of education delivered to students, compromise the research output of faculty members, and prevent universities from achieving their full potential as drivers of national development. Despite these challenges, many higher education institutions continue to operate under outdated administrative models that fail to address the evolving demands of modern education systems.

This paper, therefore, seeks to investigate the extent to which administrative inefficiencies contribute to poor institutional performance in Nigerian public universities. It will also explore the perceptions of key stakeholders regarding the need for reform in educational administration. The study aims to provide insights into the challenges that hinder progress and propose actionable strategies for reform that can improve the governance and effectiveness of higher education institutions.

Aim and Objectives of the Study

The primary aim of this study is to investigate the administrative inefficiencies in higher education institutions and their impact on institutional performance, while examining the need for comprehensive reforms in educational administration. The study seeks to identify key challenges, assess their impact on the quality of education, and propose viable reform strategies that can enhance governance and improve the overall effectiveness of higher education institutions. The specific objectives of the study are:

- To identify the key administrative challenges faced by higher education institutions in Nigeria and other developing nations.
- To assess the impact of administrative inefficiencies on the quality of education, institutional performance, and competitiveness in the global educational landscape.
- To explore the perceptions of stakeholders (academic staff, administrative personnel, students, and leadership) regarding the need for administrative reforms.
- To evaluate the role of leadership in influencing administrative efficiency and institutional success.
- To propose practical reform strategies aimed at improving administrative efficiency, decentralizing decision-making, and enhancing leadership practices in higher education institutions.

THEORETICAL FRAMEWORK

This study is anchored on two prominent theories: Transformational Leadership Theory and Systems Theory, which together provide a comprehensive understanding of the need for reform in educational administration in higher education institutions.

Transformational Leadership Theory (Bass & Riggio, 2006)

Transformational Leadership Theory, developed by Bass and Riggio in 2006, emphasizes the importance of visionary, motivational, and ethically grounded leadership capable of inspiring profound change within institutions. According to this theory, transformational leaders are those who not only aim to achieve organizational goals but also inspire and motivate their followers to exceed expectations. This type of leadership is essential for higher education institutions, where leadership plays a crucial role in driving innovation, improving quality, and addressing the dynamic challenges in education. In the context of educational administration, this theory supports the notion that higher education leaders must transcend traditional practices and empower others to embrace change, instill a shared vision, and implement reforms that will enhance institutional development.

The core attributes of transformational leadership include idealized influence**,** inspirational motivation**,** intellectual stimulation**,** and individualized consideration**.** These elements are particularly relevant in the context of higher education, where administrators must foster an environment conducive to learning, professional development, and institutional growth. The transformational leader, thus, can bridge the gap between existing administrative practices and the urgent need for reform by motivating academic staff, students, and other stakeholders to actively participate in the change process.

Systems Theory (Bertalanffy, 1968)

The Systems Theory, developed by Ludwig von Bertalanffy in 1968, focuses on understanding organizations as complex systems composed of interrelated and interdependent parts. This theory posits that any change in one part of the system will affect other parts, thus, systemic changes are necessary to ensure the holistic development of an institution. In educational administration, this theory emphasizes the interconnectedness of administrative structures, educational policies, leadership practices, and stakeholder engagement. Higher education institutions are complex systems that require coordinated efforts across various departments and roles to ensure that administrative reforms are effective and sustainable.

A critical application of Systems Theory in educational administration lies in understanding the need for a holistic approach to reform. It suggests that reforms should not target isolated administrative practices or areas but should consider the entire system, including governance structures, communication channels, resource allocation, and policy development. Systems Theory also supports the idea of feedback loops—the continuous process of assessing the impact of reforms and making necessary adjustments, ensuring that the system remains dynamic and responsive to both internal and external changes.

Application to the Study

The application of Transformational Leadership Theory and Systems Theory to this study is crucial for understanding the need for reform in higher education administration. Transformational leadership provides a lens for exploring how leadership within higher education institutions can inspire and drive the necessary changes for institutional improvement. On the other hand, Systems Theory highlights the importance of a comprehensive and interconnected approach to reform, recognizing that effective changes in one part of the system can trigger improvements across the entire institution. Together, these theories provide a robust framework for analyzing the challenges and opportunities within educational administration, paving the way for the proposed reforms to create more effective, transparent, and responsive higher education systems.

Transformational Leadership Theory emphasizes the importance of visionary, motivational, and ethically grounded leadership capable of inspiring change within institutions (Bass & Riggio, 2006). This theory supports the notion that higher education leaders must transcend traditional practices to inspire innovation and institutional development.

CONCEPTUALIZATION

Key Administrative Challenges Faced by Higher Education Institutions in Nigeria and Other Developing Nations

Educational administration in higher education institutions (HEIs) across Nigeria and other developing nations is fraught with a variety of challenges that undermine the quality, accessibility, and sustainability of higher education. These challenges range from governance issues to resource allocation, inadequate infrastructure, and policy inconsistencies. Understanding these issues is critical for conceptualizing the need for reform in educational administration. This section outlines key administrative challenges faced by HEIs in Nigeria and other developing nations and discusses their impact on the educational landscape.

Poor Governance and Leadership Structures

One of the most pressing challenges faced by HEIs in Nigeria and other developing countries is weak governance and leadership structures. In many instances, higher education institutions are burdened by centralized, bureaucratic systems that hinder decision-making, responsiveness, and the ability to innovate. Administrative processes are often slow, and there is a lack of transparency in decision-making, which diminishes the institution's ability to adapt to changing educational demands (Ogunyemi, 2021).

In many developing nations, university leaders are often selected based on political patronage or seniority rather than merit. This can lead to ineffective leadership, mismanagement of resources, and the inability to foster a conducive academic environment. Leadership often lacks a clear strategic vision, and there is minimal collaboration between academic and administrative staff, which reduces the overall effectiveness of the institution (Adeyemo, 2022).

This issue of poor governance can be addressed by adopting more participatory leadership styles, such as transformational leadership, which fosters collaboration and encourages a shared vision among faculty, staff, and students (Gbolahan, 2023).

Inadequate Funding and Resource Allocation

Financial constraints are a major challenge for HEIs in Nigeria and other developing countries. Many institutions are heavily reliant on government funding, which is often insufficient, irregular, or delayed. The lack of adequate financial resources results in limited access to educational materials, poor infrastructure, and insufficient research funding (Adeniran & Adeyemi, 2022). Furthermore, the burden of rising operational costs—such as staff salaries, utility bills, and maintenance—often consumes a large portion of the budget, leaving little for academic innovation, curriculum development, and technological upgrades. Additionally, HEIs in developing nations often lack strong mechanisms for diversifying funding sources. While some institutions rely on tuition fees, the accessibility of higher education for disadvantaged groups is reduced by the financial burden, leading to high dropout rates (Okebukola, 2023). To overcome this challenge, educational administrators must find alternative funding sources, such as public-private partnerships, international grants, and alumni donations, while also improving internal resource management to ensure that funds are used effectively.

Infrastructural Deficiencies

Infrastructural deficits remain a major challenge for HEIs in Nigeria and other developing nations. Many universities and colleges operate in buildings that are outdated, underdeveloped, and poorly maintained. Inadequate lecture halls, laboratories, libraries, and hostels result in subpar learning environments that affect students' academic performance and overall university experience (Ibrahim, 2022). Furthermore, limited access to modern teaching tools and technological resources hampers the ability of institutions to deliver quality education, particularly in STEM (Science, Technology, Engineering, and Mathematics) fields. For instance, despite the global emphasis on e-learning, many Nigerian universities face challenges in implementing online education due to insufficient technological infrastructure. Poor internet connectivity, outdated computers, and a lack of learning management systems further exacerbate this issue (Adebayo et al., 2023). Addressing these infrastructural challenges requires a long-term commitment to investment in educational facilities, as well as the integration of technology to enhance teaching and learning.

Brain Drain and Human Capital Development

Another critical challenge faced by HEIs in Nigeria and other developing nations is the issue of brain drain. Many highly trained academics and researchers migrate to developed countries in search of better career opportunities, higher salaries, and improved living conditions. This results in a depletion of the intellectual capital within the country, leaving many universities understaffed and unable to deliver quality education or conduct cutting-edge research (Kalu et al., 2023).

The flight of academic talent also leads to an erosion of local expertise and a dependence on foreign-trained faculty, which may not always be culturally or contextually relevant. To counter this challenge, it is necessary to improve the working conditions for academic staff by offering competitive salaries, professional development opportunities, and academic autonomy. Furthermore, institutions must focus on nurturing local talent through training programs, scholarships, and research opportunities that encourage faculty retention and development (Udo, 2022).

Political Interference and Policy Inconsistency

In many developing nations, political interference in the administration of higher education is a major issue. University governance is often influenced by political agendas, and appointments to key leadership positions are frequently made based on political considerations rather than academic or administrative qualifications. This political interference affects the autonomy of universities, undermines academic freedom, and can lead to corruption and inefficiency within institutions (Ogunyemi, 2021).

Moreover, policy inconsistency and frequent changes in government policies often disrupt the functioning of higher education institutions. For example, frequent changes in funding allocation, admission quotas, and curriculum reforms create instability and uncertainty within the system. As a result, universities struggle to maintain consistent academic standards and long-term strategic goals. To address this issue, it is critical to establish independent regulatory bodies that can oversee higher education and ensure that policy decisions are made

based on evidence and long-term institutional goals rather than political whims (Adeniran & Adeyemi, 2022).

Quality Assurance and Accreditation Challenges

The lack of a robust quality assurance and accreditation system is another challenge facing HEIs in Nigeria and many developing nations. While there have been efforts to establish accreditation bodies, such as the National Universities Commission (NUC) in Nigeria, the systems are often underfunded, and the accreditation process can be slow and ineffective. This results in the proliferation of substandard institutions, programs, and degrees, which undermine the credibility of higher education as a whole.

Furthermore, there is a lack of a comprehensive system for monitoring and evaluating teaching and learning outcomes. Institutions are not always held accountable for their academic performance, and there are often no standardized systems for assessing faculty performance or student learning outcomes (Gbolahan, 2023). To improve quality assurance, HEIs should adopt international best practices in accreditation, invest in internal audits, and encourage a culture of continuous improvement that includes regular reviews of academic programs and teaching methodologies (Okebukola, 2023).

Student Unrest and Industrial Action

Finally, frequent student protests and industrial actions by academic and non-academic staff are a major challenge for HEIs in developing nations. Strikes and protests often arise due to issues such as poor working conditions, low wages, inadequate funding, and disputes over university policies. These disruptions can severely affect the academic calendar, leading to delays in graduation, loss of instructional time, and a decline in the overall learning experience (Adeniran & Adeyemi, 2022).

Addressing these challenges requires creating a conducive environment for dialogue and negotiation between university management, staff unions, and students. It is also essential to implement reforms that improve the welfare of both students and staff, foster transparency in university governance, and ensure that grievances are addressed promptly (Ibrahim, 2022).

The Relationship between Administrative Inefficiencies and Institutional Performance in Higher Education

In the context of higher education institutions (HEIs), the relationship between administrative inefficiencies and institutional performance is a critical area of concern. Administrative inefficiency, characterized by poor management practices, inadequate resources, slow decision-making, and lack of accountability, can significantly impact the quality and performance of educational institutions. In contrast, effective educational administration is fundamental to the achievement of academic and operational excellence in HEIs. Given the rapid global changes in education, the call for reform in higher education has never been more urgent.

The Impact of Administrative Inefficiencies on the Quality of Education, Institutional Performance, and Competitiveness in the Global Educational Landscape

The administrative structure and processes in higher education institutions (HEIs) are critical to the quality of education, the institution's performance, and its competitiveness in the global educational landscape. Administrative inefficiencies in these institutions can have profound implications on academic outcomes, resource utilization, and overall institutional effectiveness. In the context of growing global competition for academic excellence, financial sustainability, and international recognition, administrative inefficiencies may impede an institution's ability to meet these challenges and fulfill its educational mission. This section examines the impact of administrative inefficiencies on the quality of education, institutional performance, and global competitiveness, emphasizing the need for urgent reforms.

Impact on the Quality of Education

Administrative inefficiencies significantly affect the quality of education by undermining the capacity of institutions to deliver a comprehensive, up-to-date, and relevant curriculum. Ineffective administrative practices—such as poor planning, inadequate resource allocation, slow decision-making, and lack of clear policies—hinder the development of a modern, learner-centered educational environment.

One of the key challenges in higher education institutions in Nigeria and other developing countries is the mismatch between academic programs and market needs, a situation exacerbated by inefficient administration (Ogunyemi, 2021). Administrators who fail to prioritize curriculum development, faculty training, and the integration of technology contribute to an outdated educational model that does not prepare students for the demands of the modern workforce. For instance, an inefficient administration may struggle to implement contemporary teaching methodologies, invest in faculty professional development, or support the integration of technology in classrooms and research (Adebayo et al., 2023).

Furthermore, administrative inefficiency often results in poor student support services. Academic advising, career counseling, and mental health services are essential for student success, but these services are often underfunded and poorly managed due to administrative shortcomings. This leads to a diminished student experience, lower retention rates, and lower overall satisfaction with the institution (Adeyemo, 2022). The absence of proactive, efficient administration in managing these services directly impacts the educational quality, leaving students ill-prepared for professional challenges after graduation.

Impact on Institutional Performance

Administrative inefficiencies can also have a detrimental effect on institutional performance. Higher education institutions that operate with inefficient systems and processes are more likely to experience delays in decision-making, misallocation of resources, and ineffective monitoring and evaluation of academic programs. These inefficiencies impact the institution's ability to achieve its academic and administrative objectives effectively (Okebukola, 2023).

For example, poorly coordinated administrative functions can lead to delays in graduation, inefficient use of facilities, and the mismanagement of research projects, which are key performance indicators for academic institutions. According to Ibrahim (2022), many

Nigerian universities struggle with bureaucratic bottlenecks that delay processes such as admissions, registration, and examination administration. These delays not only disrupt the academic calendar but also affect students' ability to graduate on time, thereby diminishing the overall reputation of the institution.

In addition, the failure of administrative structures to ensure transparency, accountability, and fiscal responsibility can result in financial mismanagement. Institutions that lack strong financial oversight or are unable to optimize their budgets for maximum impact may face difficulties in securing funding for academic programs, research, and infrastructural development. This compromises their overall institutional performance, leading to a lack of growth and innovation (Adeniran & Adeyemi, 2022).

Impact on Global Competitiveness

The global educational landscape is increasingly competitive, with institutions worldwide vying for academic excellence, financial resources, and international rankings. Administrative inefficiency can significantly undermine a university's ability to compete on the global stage. In the absence of effective leadership, institutions may fail to secure international partnerships, research collaborations, and funding opportunities that enhance their reputation and global standing.

Global rankings, such as the Times Higher Education and QS World University Rankings, are influenced by factors such as research output, faculty quality, and teaching effectiveness. However, administrative inefficiency hinders the ability to achieve high performance in these areas. For instance, ineffective research administration, which includes poor coordination of grants, research collaborations, and dissemination of findings, can result in a lack of visibility in the global research community (Adebayo et al., 2023). Additionally, if an institution does not have strong administrative processes in place to support international students and faculty, it may struggle to attract top talent, further diminishing its competitiveness.

Furthermore, the lack of effective administrative support for accreditation and quality assurance processes can prevent institutions from obtaining international recognition. Accreditation is often a key indicator of quality in the global education sector, and institutions with inefficient administrative systems may find it difficult to navigate the complex processes involved in maintaining or achieving accreditation (Adeniran & Adeyemi, 2022). This can hinder their ability to attract students and faculty from abroad and limit their participation in global academic networks.

Financial Sustainability and Resource Allocation

Another major impact of administrative inefficiencies is on financial sustainability and resource allocation. Effective financial planning and management are crucial for ensuring that institutions can maintain and improve their infrastructure, pay faculty salaries, support research, and invest in educational programs. However, many developing nations face the challenge of inefficient financial management, leading to budgetary constraints and poor utilization of available funds.

In Nigeria, for example, inefficiencies in the allocation of government funding to universities often lead to delays in the disbursement of funds, which in turn affects operational costs and academic programs (Ibrahim, 2022). Inefficient resource allocation, such as prioritizing non-essential projects over academic needs or underfunding critical areas like faculty

development and student services, can erode the institution's ability to deliver high-quality education. Institutions may also struggle to engage in capital improvement projects or adopt cutting-edge technologies that are essential for maintaining relevance in a globalized education market.

Without strong administrative leadership to guide financial strategy and resource allocation, institutions risk falling into financial distress, which ultimately affects their academic performance and long-term sustainability (Okebukola, 2023).

Impact on Institutional Reputation and Stakeholder Engagement

Administrative inefficiency also damages an institution’s reputation. As stakeholders ranging from prospective students and their families to alumni, donors, and potential research collaborators observe an institution’s operational inefficiencies, they may become disillusioned and choose to disengage. When administrative inefficiencies result in poor service delivery, students may experience delays in graduation, poor management of academic records, and unresponsive faculty, which tarnishes the institution's reputation (Gbolahan, 2023).

Moreover, ineffective administrative management of relationships with external stakeholders such as government bodies, industry partners, and international organizations can limit the institution's ability to secure support or engage in mutually beneficial collaborations. Universities that fail to streamline their administrative processes risk alienating potential sponsors, donors, and international academic partners, which are critical for advancing research, securing funding, and enhancing institutional visibility.

Perceptions of Stakeholders Regarding the Need for Administrative Reforms in Higher Education

The need for administrative reforms in higher education has become an urgent issue in many developing countries, including Nigeria, where educational institutions face significant challenges related to governance, resource allocation, and service delivery. Administrative inefficiencies often undermine the quality of education, institutional performance, and overall competitiveness on a global scale. In addressing these challenges, it is essential to understand the perceptions of various stakeholders, including academic staff, administrative personnel, students, and leadership. Each group holds unique perspectives on the need for reform, and their insights are crucial for shaping policies and strategies that will lead to effective transformation. This section explores the perceptions of these key stakeholders in the context of higher education administration and reform.

Academic Staff Perceptions

Academic staff, including professors, lecturers, and researchers, often have a clear understanding of the impact that administrative inefficiencies have on their teaching and research work. Many academic staff members perceive administrative challenges as a significant barrier to achieving academic excellence and maintaining a productive learning environment. The key issues highlighted by academic staff often include bureaucratic bottlenecks, lack of transparency in decision-making processes, and ineffective communication between departments and the administration (Ibrahim, 2022).

According to a study by Adeyemo (2022), academic staff members in Nigerian universities express a need for reforms that focus on streamlining administrative processes to ensure that their primary focus remains on teaching and research. Academic staff perceive the current administrative structure as being overly centralized, which can lead to delays in approvals for research funding, curriculum changes, and academic scheduling. Additionally, there is often frustration with the lack of support for faculty development and insufficient investment in academic resources. Academic staff argue that reforms should prioritize increasing autonomy for academic units, improving communication channels, and ensuring that faculty members are adequately supported in their professional growth.

Furthermore, there is a call for greater alignment between administrative leadership and academic goals, where academic staff believe that reforms should focus on improving the efficiency and responsiveness of administrative services, particularly in the areas of student registration, examination administration, and the allocation of research grants (Adebayo et al., 2023). Academic staff often feel that the lack of efficient administrative processes directly impacts their ability to offer quality education and engage in meaningful research, which is vital for the growth and global competitiveness of higher education institutions.

Administrative Personnel Perceptions

Administrative personnel, who are responsible for the day-to-day operations and management of higher education institutions, often view the need for reforms from a different perspective. While administrative staff acknowledge the challenges they face, they also tend to highlight the constraints they face in implementing changes. Administrative inefficiencies are often rooted in outdated systems, insufficient training, and a lack of adequate resources. Administrative staff in many developing countries, including Nigeria, frequently report that they are overburdened with tasks due to inadequate staffing and the complexity of bureaucratic procedures (Adeniran & Adeyemi, 2022).

From their perspective, reforms are necessary not only to streamline administrative procedures but also to improve the working environment and professional development opportunities for staff. They emphasize the need for technological upgrades in administrative functions to enhance efficiency, such as digitizing student records, automating routine processes, and improving data management systems. According to Ogunyemi (2021), administrative personnel believe that administrative reforms should focus on investing in staff training and providing more resources for implementing modern management techniques, which could lead to better service delivery to both students and faculty.

Moreover, administrative personnel also see the necessity for a shift in the organizational culture of higher education institutions. A more collaborative approach, where administrative staff work more closely with academic and leadership teams, is seen as essential for improving overall institutional performance. By promoting a culture of accountability, transparency, and communication, administrative staff believe that institutional inefficiencies can be reduced, leading to a better-functioning organization.

Student Perceptions

Students are direct stakeholders in higher education and are significantly impacted by administrative inefficiencies. For many students, long delays in course registration, poor

management of academic schedules, and ineffective communication between the administration and students are major concerns. In many universities, students report frustration with the inefficiencies of administrative services, which directly affect their academic progress and overall experience (Gbolahan, 2023).

A major concern among students is the slow response to academic and personal inquiries, including issues related to financial aid, exam results, and graduation procedures. Students often feel that administrative staff are unresponsive to their needs, which leads to a sense of disconnection and dissatisfaction with the institution (Ibrahim, 2022). Additionally, administrative inefficiencies in managing student records or coordinating academic schedules can lead to delays in graduation, affecting students' career progression and increasing their financial burden.

In terms of reform, students advocate for the use of digital platforms to streamline administrative functions. They believe that reforms should focus on improving the transparency and accessibility of information, including clearer communication of academic policies and procedures, as well as more timely responses to student inquiries. Students also emphasize the importance of fostering a more student-centered administration that prioritizes their academic and personal well-being (Adeyemo, 2022). Many students also see the need for greater involvement in governance processes, where they can actively participate in discussions on institutional policies and reform agendas.

Leadership Perceptions

Leadership within higher education institutions, including university chancellors, vice-chancellors, and senior administrators, are responsible for setting the direction of reforms. The leadership often sees administrative reforms as essential to ensuring the long-term sustainability and success of the institution. University leaders recognize that an efficient administration is key to achieving academic goals, securing funding, and maintaining institutional reputation (Okebukola, 2023). However, leadership's view of reform is often influenced by the broader institutional context, including political pressures, financial constraints, and national educational policies.

Leaders in Nigerian universities, for instance, express a need for reforms that address both the structural and systemic challenges that hinder administrative efficiency. According to a report by Ibrahim (2022), university leadership emphasizes the need for strategic planning, which includes investing in technology to enhance administrative processes, improving the recruitment and training of administrative staff, and ensuring that institutional leadership is aligned with academic priorities. The reform agenda proposed by university leaders includes decentralizing administrative functions, ensuring that resources are allocated more efficiently, and fostering a culture of collaboration among the various departments within the institution.

Furthermore, leadership sees reforms as necessary to improve the institution's standing in the global academic community. By addressing administrative inefficiencies, university leaders believe they can enhance the institution's ability to attract top faculty, secure international collaborations, and improve its research output. However, leaders often face resistance from within the institution, particularly from entrenched administrative practices and from those who fear that reforms may lead to job displacement or changes in power dynamics (Ogunyemi, 2021).

The Role of Leadership in Influencing Administrative Efficiency and Institutional Success

Leadership plays a pivotal role in the efficiency of educational administration and the overall success of higher education institutions. Effective leadership in higher education institutions is a key determinant in addressing administrative challenges, driving reforms, and ensuring that institutional goals are met. As educational institutions continue to face increasing pressure to provide high-quality education amidst growing challenges such as financial constraints, bureaucratic inefficiencies, and global competition, the role of leadership becomes more crucial. This section will explore how leadership influences administrative efficiency and institutional success, with a focus on the impact of leadership styles, strategic vision, and management practices in shaping the educational landscape.

Leadership Styles and Their Impact on Administrative Efficiency

Leadership style has a significant influence on the efficiency of administrative processes within higher education institutions. Leadership in higher education can take many forms, including transformational, transactional, and laissez-faire styles, each of which has a unique impact on how institutions are managed and how effectively administrative functions are executed:

- Transformational Leadership: Transformational leadership is often associated with driving innovation and fostering a culture of continuous improvement. Leaders who adopt transformational leadership styles inspire and motivate their teams to achieve common goals through a shared vision. In the context of higher education, transformational leaders can enhance administrative efficiency by promoting a sense of ownership and accountability among administrative personnel (Bass & Avolio, 2021). These leaders typically encourage collaboration, embrace technological advancements, and promote professional development, all of which contribute to streamlining administrative processes and improving overall institutional performance.
- Transactional Leadership: Transactional leaders focus on structure, rules, and short-term goals. They often prioritize operational efficiency and stability, which can be particularly effective in large, bureaucratic institutions. In Nigerian universities, transactional leadership can help minimize administrative inefficiencies by enforcing strict adherence to rules and regulations, ensuring that tasks are completed on time, and maintaining order within the institution (Ogunyemi & Adebayo, 2022). However, transactional leadership may sometimes limit creativity and innovation, as it focuses more on compliance rather than fostering new ideas or solving systemic problems.
- Laissez-Faire Leadership: Laissez-faire leadership, characterized by a hands-off approach, can sometimes hinder administrative efficiency in higher education. Leaders who adopt this style may fail to provide the necessary guidance, oversight, and accountability required to address administrative challenges (Ezeani, 2023). This can lead to inefficiencies, miscommunication, and lack of direction in the administration of educational programs and services. However, in some cases, this leadership style can work effectively in institutions where academic autonomy is highly valued, allowing for a more decentralized approach to governance.

The choice of leadership style is critical in determining how effectively administrative functions are executed. Leaders who understand the strengths and weaknesses of different leadership approaches and adapt their style accordingly can significantly enhance administrative efficiency and the institution's ability to meet its strategic goals.

Strategic Vision and Decision-Making

Effective leadership in higher education is characterized by the ability to develop and implement a strategic vision that aligns with the institution's mission and goals. The strategic vision of an institution sets the direction for all administrative activities, from resource allocation to curriculum development and staff recruitment. Leaders who can effectively communicate this vision to all stakeholders, including academic staff, administrative personnel, students, and external partners, are more likely to create a unified approach to problem-solving and institutional growth (Sulaimon & Olaniran, 2023).

One of the key roles of leadership is to ensure that the institution's strategic plan is not only well-defined but also executable. Administrative efficiency is closely tied to how well leaders are able to allocate resources, manage budgets, and prioritize initiatives that will enhance institutional success. A clear strategic plan helps to streamline administrative processes, reduce inefficiencies, and ensure that the institution is moving toward its goals with purpose and direction.

According to Adedeji (2023), a strategic vision must also include a focus on capacity building, infrastructure development, and technological advancements. Leaders who invest in upgrading administrative systems and fostering a culture of continuous improvement contribute to more efficient operations. For example, the adoption of digital management systems for student records, course scheduling, and financial aid processing can reduce administrative delays and improve service delivery to students and faculty.

Governance and Policy Implementation

The role of leadership in shaping governance structures and implementing policies is crucial for fostering administrative efficiency. Effective leaders ensure that the governance system is transparent, accountable, and responsive to the needs of the institution. One of the primary challenges faced by higher education institutions, particularly in developing countries like Nigeria, is the lack of robust governance frameworks. Ineffective governance leads to poor decision-making, corruption, and inefficiencies in managing institutional resources (Adebayo, 2023).

Leaders who prioritize the development of clear, fair, and consistent policies can greatly enhance administrative efficiency. Policies related to financial management, recruitment, academic program development, and student services should be well-structured and communicated across the institution. By ensuring that policies are implemented consistently, leaders can eliminate confusion, streamline administrative processes, and reduce delays in decision-making (Ogunyemi & Adebayo, 2022).

Furthermore, leadership plays a key role in fostering a culture of accountability and transparency. Leaders who encourage open communication and involve stakeholders in decision-making processes create an environment of trust and collaboration. This is particularly important

in higher education, where diverse groups of stakeholders such as faculty, students, administrative staff, and external partners must work together to achieve institutional goals.

Human Resource Management and Capacity Building

Human resource management (HRM) is another critical area where leadership can influence administrative efficiency. A key component of effective HRM is ensuring that administrative staff are adequately trained and motivated to perform their duties efficiently. Leaders in higher education must not only hire qualified personnel but also invest in their professional development. Providing opportunities for training, skills enhancement, and career progression can lead to higher job satisfaction, better performance, and more efficient administrative operations (Sulaimon & Olaniran, 2023).

Leadership that prioritizes capacity building helps to develop an empowered and skilled administrative workforce that can adapt to changing technological and organizational demands. Leaders who foster a culture of professional growth and learning encourage staff to stay current with best practices and innovative solutions, which enhances overall administrative efficiency. Moreover, effective leadership in HRM includes fair and transparent hiring practices, equitable treatment of staff, and the establishment of performance metrics to assess administrative staff effectiveness. These efforts ensure that administrative processes are carried out efficiently, with a high level of accountability and professional integrity.

Institutional Performance and Global Competitiveness

Leadership's impact on institutional performance and competitiveness is profound, particularly as higher education institutions seek to position themselves in the global educational landscape. In an era of globalization, institutions must strive to provide high-quality education, engage in cutting-edge research, and develop partnerships with other institutions and industries. Effective leadership ensures that the institution remains adaptable and resilient in the face of global challenges.

According to Ogunyemi and Adebayo (2022), higher education institutions must be led by individuals who understand the importance of international collaboration, accreditation, and reputation-building. Leaders must also ensure that the institution's administrative functions are aligned with global best practices, particularly in areas like research funding, faculty recruitment, and student mobility. Strong leadership contributes to institutional success by fostering an environment that attracts talented faculty, provides quality education, and nurtures partnerships with global organizations.

Proposed Practical Reform Strategies Aimed at Improving Administrative Efficiency, Decentralizing Decision-Making, and Enhancing Leadership Practices in Higher Education Institutions

The rapid evolution of global higher education demands that institutions adapt not only academically but also administratively. Administrative inefficiencies, lack of strategic decision-making, and ineffective leadership practices undermine institutional success and hamper the ability to compete on a global scale. To address these challenges, higher education institutions need to implement practical reforms that improve administrative efficiency, decentralize

decision-making, and enhance leadership practices. These reforms are crucial for fostering an environment conducive to growth, innovation, and global competitiveness. This section proposes practical strategies that focus on administrative efficiency, decentralization of decision-making, and leadership enhancement, with a focus on current literature and recent references.

Enhancing Administrative Efficiency through Digital Transformation and Process Optimization

The digital transformation of administrative processes is a fundamental strategy for improving administrative efficiency in higher education institutions. Traditional paper-based systems and manual processes are often inefficient, time-consuming, and prone to errors. Digitalizing administrative functions such as student registration, course scheduling, financial aid processing, and human resource management can streamline operations and reduce delays.

Institutions should invest in integrated digital management systems that centralize key administrative tasks. These systems allow for real-time data access, automation of routine tasks, and the reduction of administrative bottlenecks. For instance, learning management systems (LMS) for course management, student records, and grading can eliminate manual tracking and improve data accuracy (Akinmoladun & Asuquo, 2023). Additionally, implementing enterprise resource planning (ERP) systems can optimize financial, human resources, and student services, ensuring seamless operations.

Decentralizing Decision-Making to Foster Accountability and Innovation

Centralized decision-making in higher education institutions can result in slow responses to emerging challenges and inefficiencies in administrative processes. By decentralizing decision-making, institutions can empower various stakeholders such as academic departments, student services, and administrative units to make decisions within their areas of expertise. This can foster greater accountability, faster decision-making, and increased innovation.

Institutions should establish clear guidelines for decentralized decision-making that align with institutional goals while empowering local leaders to take ownership of their areas. For example, departmental heads and deans should have the authority to make decisions related to curriculum development, resource allocation, and faculty recruitment within their departments. Similarly, student affairs departments should have the autonomy to design student programs and services based on the specific needs of their student populations. The University of Ghana decentralized its decision-making processes by giving greater autonomy to individual departments in areas such as curriculum development and staffing decisions. This has resulted in quicker responses to changes in educational demand and improved resource allocation (Opoku-Agyemang & Adu, 2023).

Improving Leadership Practices through Professional Development and Succession Planning

Leadership plays a central role in shaping the culture and effectiveness of higher education institutions. Leaders in higher education must not only be academically capable but also skilled in managing complex administrative functions, fostering collaboration, and leading through

change. To improve leadership practices, it is essential to invest in continuous professional development and implement effective succession planning.

Institutions should implement formal leadership development programs aimed at building skills in strategic planning, change management, and team leadership. These programs should target current academic and administrative leaders and include training on modern leadership approaches such as transformational and adaptive leadership (Akinmoladun & Asuquo, 2023). Furthermore, succession planning is crucial for ensuring that leadership transitions are smooth and that the institution does not face leadership vacuums. The University of Nairobi launched a comprehensive leadership development program that focuses on both current leaders and emerging leaders in the university. This program emphasizes strategic management, innovation, and leadership in times of crisis, aiming to build a robust pipeline of future leaders for the institution (Ochieng, 2022).

Establishing Transparent Governance and Accountability Mechanisms

Transparency and accountability in decision-making are essential for building trust among stakeholders and ensuring effective governance. Higher education institutions often struggle with bureaucratic inefficiencies and corruption, which can significantly hinder administrative efficiency and institutional performance. By implementing transparent governance mechanisms, institutions can improve public perception, ensure better allocation of resources, and reduce administrative bottlenecks.

Institutions should implement transparent governance structures where key decisions are made publicly available and stakeholders are involved in the decision-making process. This includes regular reporting on institutional performance, financial management, and the outcomes of key decisions. Additionally, institutions should establish performance metrics for both academic and administrative staff to ensure accountability and monitor progress toward institutional goals. The University of Pretoria in South Africa introduced a transparent decision-making platform that allows faculty and staff to access reports on institutional performance, budget allocation, and academic outcomes. This initiative has led to improved stakeholder trust and more efficient resource management (Mthethwa & Kruger, 2023).

Strengthening Stakeholder Engagement and Collaboration

Stakeholder engagement is critical in driving reforms within higher education institutions. Involving all key stakeholders: academic staff, administrative personnel, students, alumni, and external partners in decision-making processes ensures that the reforms are not only effective but also aligned with the needs of those affected by them. By fostering a culture of collaboration, institutions can build a supportive environment for implementing administrative reforms.

Practical Strategy: Regular Stakeholder Consultations and Feedback Mechanisms

Higher education institutions should establish formal mechanisms for regular consultation with key stakeholders. This could include annual forums, surveys, and focus groups where faculty, students, and administrative staff can provide feedback on institutional policies and administrative practices. Additionally, institutions should create cross-functional teams to address key challenges, ensuring that diverse perspectives are considered in reform initiatives.

The University of Cape Town, South Africa, implemented a comprehensive stakeholder engagement strategy that involves regular consultations with students, faculty, and staff. This strategy has helped the institution respond quickly to emerging issues and improve administrative services (Mthethwa & Kruger, 2023).

Promoting Innovation and Adaptability in Administrative Systems

In an era of rapid technological advancements and changing educational demands, institutions must foster a culture of innovation and adaptability. Leadership must encourage the exploration of new ideas, technologies, and approaches to improve administrative systems and respond to evolving challenges.

To promote innovation, higher education institutions should establish innovation hubs or think tanks where administrators and faculty can collaborate to develop new solutions to administrative challenges. Institutions should also encourage the use of emerging technologies, such as artificial intelligence (AI) for student admissions and blockchain for record-keeping, to improve efficiency and transparency. The University of the Witwatersrand in South Africa has established an innovation hub to explore new technologies and administrative practices. This initiative has led to the development of AI-driven student services that streamline admissions, registration, and academic advising (Mthethwa & Kruger, 2023).

CONCLUSION

This study has established that administrative inefficiencies present a significant barrier to academic performance, innovation, and global competitiveness in higher education institutions. Reforming higher education administration must go beyond policy rhetoric to include leadership transformation, infrastructural investment, and systems restructuring. Efficient educational administration should be participatory, transparent, and dynamic—capable of responding to the evolving demands of knowledge economies and global academic standards. Without intentional reforms, institutional growth will remain stifled by outdated bureaucracies and leadership inertia. Therefore, a collective commitment from policymakers, institutional leaders, and stakeholders is urgently required to reposition higher education for relevance, resilience, and excellence in the 21st century.

Recommendations

- Governments should provide autonomous frameworks that allow universities to make strategic decisions independently.
- Institutions should invest in leadership training and professional development for administrators.
- Digitization of administrative processes must be prioritized to reduce bureaucracy.
- Governance structures should include students and staff in decision-making processes to promote inclusiveness.

ABSTRACT

The prevalence of conflicts in Nigerian public universities has remained a pressing concern, impeding academic stability, institutional integrity, and national development. This study critically examined the root causes and management strategies of conflicts within these institutions, using a conceptual and analytical review of scholarly perspectives, institutional reports, and practical experiences across Nigeria's public tertiary landscape. The findings reveal that conflict in public universities stems from multifaceted issues, including chronic underfunding, leadership failures, politicization of union activities, weak institutional frameworks, and limited stakeholder engagement. The study also interrogates the relevance of theoretical lenses such as Human Needs Theory, Marxist Conflict Theory, and Organizational Theory in contextualizing the complex dynamics of university-based conflict. In addressing conflict management approaches, the study evaluates models like peace education integration, participatory leadership, resource equity, and structured stakeholder dialogue. Policy implications underscore the need for transparent governance, strengthened institutional capacities, and continuous engagement with university stakeholders. In conclusion, the study identifies persistent challenges such as governmental breach of agreements, lack of institutional autonomy, poor funding of peace building mechanisms, and inadequate conflict resolution capacity. The study recommends by advocating a multi-stakeholder, proactive, and inclusive approach to conflict management, while envisioning a future of sustainable peace and productive learning environments in Nigerian public universities.

INTRODUCTION

Conflict within educational institutions, particularly in public universities, is a complex and deeply entrenched phenomenon that reflects the dynamic interplay of diverse stakeholders, expectations, and institutional realities. In the Nigerian context, conflict is not merely an episodic disruption but a recurring and, at times, systemic feature of university life that affects administrative, academic, and social dimensions. It manifests in various forms that ranges from industrial disputes, leadership contests, inter-union rivalries, and student unrest, to policy resistance and community-based agitations. These conflict occurrences have often compromised the academic calendar, strained relationships among institutional actors, and impeded the capacity of universities to fulfill their developmental mandates. Understanding the roots, dynamics, and manifestations of conflict is therefore crucial to strengthening university governance and improving academic productivity.

Several African scholars have extensively explored the foundational causes of conflict in public universities, highlighting the intersection of institutional dysfunction, socio-political interference, and economic instability. Etebu and Bassey (2018) study on administrative conflict in Nigerian universities, noted that the lack of participatory governance, inadequate funding, and exclusionary leadership practices are among the predominant triggers of discontent. Their study particularly emphasized the role of hierarchical decision-making structures that fail to accommodate dissenting voices, which eventually morph into open resistance or prolonged industrial actions. Similarly, Okon and Ibok (2019) maintained that the weak negotiation frameworks between university authorities and staff unions create recurrent breakdowns in communication, ultimately leading to protracted strikes and operational paralysis.

The historical development of Nigerian universities also contributes significantly to conflict emergence. From their post-colonial inception, public universities in Nigeria were modeled on centralized structures that prioritize state control over academic autonomy. Ezeuwa and Igwe (2020) argued that this legacy of centralization still informs contemporary university management, where government-appointed governing councils and vice-chancellors often struggle to assert authority in politically charged environments. The imposition of administrative decisions without broad-based consultations especially on issues such as curriculum reforms, staff recruitment, and financial disbursements has frequently led to resistance from staff and student bodies, particularly when such decisions conflict with institutional norms or stakeholder expectations.

Political interference remains a core source of instability in Nigeria's university system. Alabi and Gambo (2017) observed that federal and state governments often influence the appointment of principal officers in public universities, not necessarily based on merit but on political affiliations. This politicization of academic leadership erodes institutional credibility and breeds factionalism among staff and students. Moreover, once in office, such politically motivated appointees may prioritize allegiance to political godfathers over effective administration, thereby alienating critical stakeholders such as academic unions, senior staff associations, and student bodies. This alienation frequently triggers confrontations, especially when governance lapses intersect with resource shortages.

Resource constraints particularly underfunding have remained at the heart of most conflicts within Nigerian public universities. Ukpong and Enang (2021) carried out an investigation on financial management and academic productivity and discovered a consistent pattern where funding gaps lead to infrastructural decay, overburdened personnel, and poor

welfare conditions. These deficits inevitably generate friction between university authorities and trade unions, most notably the Academic Staff Union of Universities (ASUU), which has consistently decried the federal government's failure to honor negotiated agreements. The resulting standoffs often escalate into nationwide strikes, disrupting academic programs and jeopardizing student learning outcomes.

Unionism, particularly academic and non-academic staff associations, also plays a dual role in both provoking and managing conflicts. Ogbonda and Alapiki (2022) examined the role of staff unions in conflict proliferation and management in universities and found that while unions are instrumental in advocating for staff welfare, their methods such as prolonged strikes or public confrontations often intensify tensions. The study emphasized that most unions in Nigerian universities operate within adversarial frameworks where suspicion and hostility define their relationship with management. As a result, opportunities for collaborative problem-solving are frequently missed, leaving unresolved grievances to fester and re-emerge periodically.

Beyond the internal dynamics, the broader socio-economic environment in Nigeria also exerts considerable influence on university conflict trends. High levels of youth unemployment, inflation, and declining public trust in governance institutions create a backdrop of frustration that spills over into university campuses. According to Boma and Enebeli (2020), universities are not isolated from the larger society, and therefore the stressors of national economic hardship often find expression in campus agitations. The authors concluded that any effort to reduce university conflicts must consider the economic welfare of staff and students, as well as the capacity of institutions to function amid national uncertainties.

Given the profound implications of persistent conflicts, the need to study and address their causes and management in Nigerian public universities cannot be overstated. Ude and Nwokocha (2023) conducted a study on conflict resolution frameworks and underscored that effective conflict management enhances institutional productivity, preserves academic integrity, and fosters a culture of trust among stakeholders. They recommended that universities adopt holistic approaches to conflict resolution combining proactive leadership, stakeholder engagement, and transparent policy implementation to break the cycle of hostility and resistance. The significance of such studies lies in their potential to inform policies that align university governance with democratic values, accountability, and sustainable development. So to say, the challenges of conflict in Nigerian public universities is not a peripheral challenge but a central governance concern that reflects deeper structural, economic, and leadership issues. Understanding its origins and implications provides the foundation for developing tailored conflict management strategies that safeguard the academic mission of these institutions. When contextualized within Nigeria's broader social and political ecosystem, conflict emerges as both a symptom of systemic dysfunction and a call for transformational leadership.

THEORETICAL FRAMEWORKS FOR UNDERSTANDING CONFLICT IN UNIVERSITIES

Human Needs Theory (Burton, 2021)

Human Needs Theory, as advanced by Burton (2021), posits that all human beings possess fundamental psychological and existential needs such as identity, autonomy, recognition, security, and belonging. These needs are non-negotiable, and their denial or neglect leads to the emergence of deep-rooted and persistent conflict. Unlike theories that view conflict as a reaction

to material deprivation or rational disagreements, Human Needs Theory focuses on the psychological and emotional dimensions that drive human actions. Within the context of university settings, particularly in Nigerian public universities, the theory provides a robust framework for examining why certain conflicts tend to reoccur, despite the presence of rules, policies, and administrative mechanisms intended to mitigate such issues. The university environment is ideally a space for learning, innovation, and personal development and it becomes a breeding ground for discontent when the psychological needs of students, lecturers, and non-academic staff are ignored or violated.

In the Nigerian higher education landscape, unmet fundamental needs have consistently served as the undercurrent of institutional conflict. For instance, empirical investigations at Obafemi Awolowo University revealed that student protests and demonstrations often erupt in response to perceived neglect of welfare entitlements such as safe accommodation, equitable treatment, and physical security (Ogunbodede et al., 2020). These grievances are not merely logistical or administrative complaints but are rooted in the frustration of unmet psychological needs such as safety and dignity, thereby validating Burton's (2021) contention that "the failure to satisfy core needs leads to deeper systemic conflict." The same principle holds in staff-management relationships where lecturers and non-academic staff frequently express grievances about being undervalued, unrecognized, and subjected to authoritarian administrative cultures. These conditions, often framed as labor-related disputes, are in reality the outward symptoms of a deeper deprivation of recognition, fairness, and autonomy.

Moreover, the study by Beredugo and Mbang (2024) at the University of Calabar provided insightful empirical evidence that linked the escalation of conflict to the neglect of staff recognition and fair treatment. In scenarios where academic and non-academic personnel felt marginalized or excluded from critical institutional decisions, a noticeable decline in morale, commitment, and productivity was observed. In this regard, Human Needs Theory not only explains why conflicts persist but also prescribes preventive strategies. Structural interventions such as participatory governance models, transparent communication systems, inclusive leadership, and safeguarding policies that reinforce identity, security, and recognition are indispensable for transforming Nigerian universities into peaceful and productive environments.

Marxist Theory (Marx, updated 2022)

Marxist Conflict Theory, reinterpreted in contemporary discourse, provides a critical lens for understanding conflict as a product of deep-seated economic, political, and social inequalities inherent in institutional structures (Marx, updated 2022). Rather than focusing on interpersonal disagreements or miscommunication, the Marxist approach attributes conflict to the existence of class struggles and the unequal distribution of power and resources. Universities, under this paradigm, are not neutral arenas for intellectual growth but are extensions of the broader socio-political environment where elite control and systemic exclusion persist. In the Nigerian context, public universities often mirror the inequitable dynamics of the national polity where a small group of powerful administrators frequently backed by political patronage exercise disproportionate control over decision-making and resource allocation, leaving the majority of staff and students disenfranchised. This elite capture of institutional power ignites a recurring pattern of unrest, as those excluded from the centers of influence seek alternative avenues to assert their agency.

The frequent strikes by the Academic Staff Union of Universities (ASUU), for instance, go beyond mere agitation for improved salaries. They reflect a systemic imbalance where academic professionals are consistently sidelined in matters of institutional governance and policy direction. Salami and Ososuakpor (2022) in their empirical investigation on organizational conflict in Nigeria emphasized that when management structures operate unilaterally and fail to engage staff in resource distribution and policy formulation, the resultant environment becomes one of alienation, resentment, and rebellion. The authors argue that the control of university capital, which ranges from finances to intellectual property of a few elite actors who do not only undermine institutional democracy that cultivates academic environment ripe for sustained conflict. This aligns with the Marxist perspective that power unevenness and economic disparity are central drivers of antagonism within institutional settings.

Within Nigerian universities, the structural inequality illuminated by Marxist Theory is manifested in numerous ways: opaque budget processes, lopsided allocation of research funds, favoritism in staff promotion, and limited student representation in administrative decisions. These imbalances foster a sense of injustice among the less privileged stakeholders who perceive the university system as a tool for perpetuating elite dominance rather than promoting merit and equity. As a theoretical tool, Marxist Theory provides not just a diagnosis of conflict but also a prescriptive agenda for reform. It calls for the dismantling of hierarchical structures that concentrate power in the hands of a few and recommends the adoption of shared governance models, financial accountability mechanisms, and participatory decision-making systems. In this way, Nigerian public universities can become more democratic, equitable, and less prone to recurrent conflict.

Organizational Theory (Beredugo & Mbang, 2024)

Organizational Theory offers a grounded framework for understanding conflict as a function of institutional design, communication patterns, and administrative practices. Rather than attributing conflict solely to psychological needs or socio-economic inequities, Organizational Theory focuses on how the internal mechanics of an institutions hierarchies, decision-making processes, feedback channels, and operational protocols facilitates harmonious interactions or generate persistent friction (Beredugo & Mbang, 2024; Ololube, 2024). In the university context, this theory sheds light on how bureaucratic rigidity, lack of coordination among departments, and inadequate grievance redress systems can escalate otherwise manageable issues into full-blown institutional crises. The structure and processes of the university become pivotal in determining whether disagreements are resolved constructively or allowed to fester into destructive confrontations.

The findings from Beredugo and Mbang's (2024) comparative study of the University of Calabar and Michael Okpara University exemplify this dynamic. The researchers observed that organizational conflict in these institutions often stemmed from closed managerial systems, inefficient communication flows, and rigid departmental hierarchies. For instance, staff and student complaints frequently went unresolved due to the absence of accessible and responsive grievance handling structures. In such environments, aggrieved parties resorted to strikes, sit-ins, and media campaigns to have their voices heard. Additionally, the study pointed out that siloed operations between academic departments and administrative units further compounded issues of duplication, unclear role boundaries, and disputes over resource control. These conditions not

only breed inefficiency but also serve as fertile grounds for intergroup tensions and institutional paralysis.

Each of the three theories offers distinctive yet complementary analytic lenses for understanding conflict in Nigerian public universities. Human Needs Theory directs attention to psychological dimensions like identity, autonomy, recognition, which emphasizes human-centered resolution. Marxist Theory locates conflict within broader structural and class dynamics, calling for systemic redress via equitable governance. Together, these frameworks enable a holistic understanding of conflict in Nigerian universities spans individual, structural, and institutional levels. This integrative approach informs the development of management strategies that simultaneously foster stakeholder recognition, reduce structural inequities, and redesign institutional processes.

CONCEPTUAL CLARIFICATIONS

The conceptual underpinnings of this study on the causes and management of conflicts in Nigerian public universities are rooted in a multidimensional understanding of institutional fragility, systemic inefficiencies, stakeholder misalignment, and structural governance gaps. This conceptual clarification serves to establish the interconnectedness between the fundamental root causes, such as inadequate funding, ethno-religious tensions, leadership inefficiencies, and activist resistance, and the dynamic processes through which conflicts escalate or are resolved. Through a systematic framework, the study delineates the core inputs (causes and effects), the transformative processes (management approaches and policy responses), and the anticipated outputs (peace culture, academic stability, institutional efficiency). Additionally, the model accounts for external influences such as political climate and economic constraints, which often aggravate or moderate the dynamics of conflict. This foundational clarification thus provides a logical transition into the Conceptual Framework Diagram, which visually maps the interrelated elements and mechanisms critical to understanding, managing, and mitigating conflicts within the Nigerian public university system.

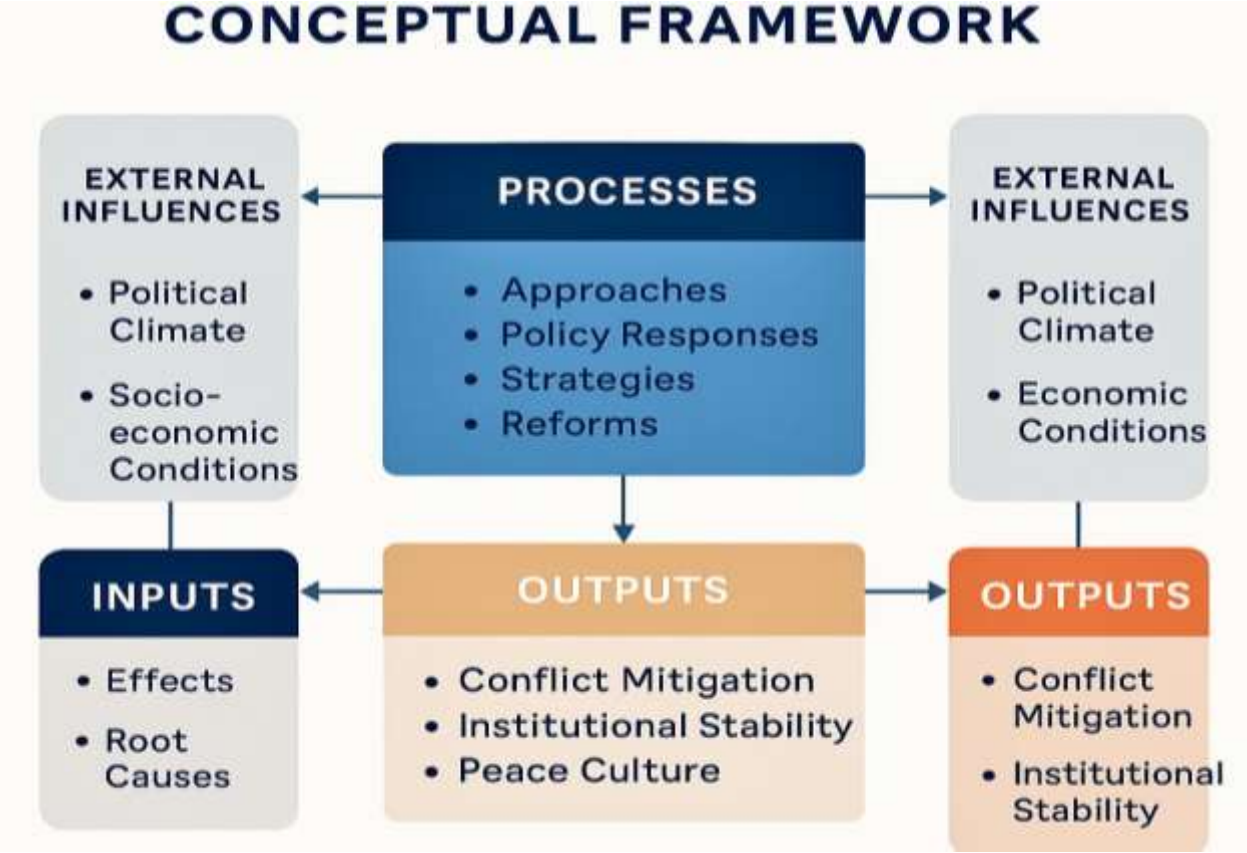

Figure 1: Conceptual Framework for Understanding Causes and Management of Conflicts in Nigerian Public Universities.

The illustration presented in Figure 1 demonstrates how structural causes, institutional processes, and external dynamics interact to influence the patterns of conflict and resolution outcomes. This integrated conceptual framework organizes the causal and management dimensions of university conflict into four systemic clusters: inputs, processes, outputs, and external influences. Inputs include root causes such as underfunding and leadership failures. Processes encompass strategic responses and policy mechanisms like conflict resolution approaches and institutional interventions. Outputs highlight conflict mitigation, strengthened stakeholder relations, and the institutionalization of peace culture. External influences such as political climate and macroeconomic conditions are layered into the framework to underscore their role in shaping the overall dynamics of conflict. This diagram functions as a visual synthesis of the study's analytical direction and conceptual scope.

Concept of Conflict Management

Conflict management as a theoretical and practical domain has evolved as a strategic response to inevitable human disagreements, particularly within organizational settings. It involves a systematic approach to identifying, addressing, and resolving disputes through constructive methods that prevent escalation while promoting institutional harmony. Conflict itself is not inherently negative; rather, it becomes problematic when not managed effectively, potentially disrupting productivity, morale, and institutional cohesion. Conflict management, therefore,

encompasses the deployment of mechanisms such as negotiation, mediation, arbitration, facilitation, and reconciliation, tailored to ensure that disputes are not only resolved but that they also contribute to learning and structural reforms. Effective conflict management promotes organizational resilience by transforming potential tensions into opportunities for growth and innovation. At its core, it necessitates a proactive stance, incorporating continuous communication, feedback mechanisms, and stakeholder involvement. Conflict management is thus integral to leadership and administrative competence in educational, political, and corporate institutions, where diverse interests constantly interact.

Scholars from Africa have provided considerable insights into the application and relevance of conflict management strategies within socio-educational environments. For instance, Okoro and Ojukwu (2018) in their study on institutional mechanisms for conflict resolution in higher education emphasized the need for context-specific models rooted in local realities and participatory governance. Similarly, Alabo (2019) examined conflict resolution frameworks in Nigerian tertiary institutions and identified a growing need for capacity building and inclusive decision-making to reduce administrative-labour tensions. Furthermore, Ogar and Ukpabi (2020) advocated the adoption of adaptive conflict management styles such as collaboration and compromise, particularly in contexts characterized by multiple stakeholders and resource constraints. These African contributions underscore that conflict management is not a one-size-fits-all concept, but a dynamic and context-sensitive process that demands both structural capacity and relational awareness. In essence, managing conflict effectively within any system requires a sound understanding of the underlying causes, cultural frameworks, institutional values, and the deployment of inclusive leadership that fosters trust and accountability.

Conflict Management in Public Universities in Nigeria

In Nigerian public universities, conflict management is a critical administrative function given the frequency and complexity of disputes involving students, academic unions, and management. These conflicts often stem from deep-rooted structural challenges such as inadequate funding, political interference, strained university autonomy, and misalignment of institutional goals with national education policies. Management of such conflicts requires an integrative strategy that aligns institutional policies with participatory governance, stakeholder consultation, and open communication channels. The Nigerian university space has witnessed prolonged strikes, violent protests, and administrative shutdowns due to unmanaged conflicts, which continue to erode public confidence and compromise academic quality. Conflict management in this context, therefore, cannot be limited to reactive measures; it must be embedded in preventive frameworks such as stakeholder engagement, early warning systems, peace education, and transparent conflict resolution procedures. The complexity of these disputes often demands both internal and external interventions, especially when grievances involve national-level negotiations between academic unions like ASUU and the federal government.

Studies by several Nigerian scholars reveal the multifaceted nature of conflict management within university systems and the urgent need for strategic reforms. Nwogu and Emeh (2017) examined conflict trends in Nigerian universities and emphasized the role of weak grievance mechanisms in escalating disputes, particularly those involving academic staff and federal authorities. In a similar vein, Ede and Ogwuche (2021) pointed out that the absence of structured dialogue frameworks between unions and university management has created a

vacuum that often leads to crisis. Their research demonstrated that institutions with proactive leadership and internal dispute resolution committees reported fewer cases of prolonged industrial actions. Ugwoke (2022) further identified the critical role of trust-building and leadership transparency in managing student-led conflicts, especially in ethnically diverse campuses. These findings suggest that for conflict management in Nigerian public universities to be effective, it must be rooted in institutional autonomy, decentralization of authority, and robust human resource policies that prioritize welfare and inclusion. Only through sustained collaborative mechanisms and structural reforms can Nigeria's higher education system navigate the recurring cycle of conflicts and move towards achieving a stable academic environment.

MAJOR CAUSES OF CONFLICTS IN NIGERIAN PUBLIC UNIVERSITIES

Conflict in Nigerian public universities is seldom spontaneous or isolated; it is a recurrent symptom of long-standing structural, managerial, financial, political, and socio-cultural deficiencies.

Figure 2: Adaptation of Causes of Conflict in Organizations by Musa in 2025

The fissures presented in figure 2 deeply interwoven and collectively undermine academic stability and leadership credibility. Understanding the root causes of causes of conflicts in public universities in Nigeria are rooted from inadequate funding, administrative inefficiency, broken agreements, political meddling, governance struggles, student welfare issues, staff inequities, and identity-based tensions.

Poor Funding and Resource Allocation

Chronic underfunding remains one of the most pervasive triggers of conflict within Nigerian tertiary institutions. Despite UNESCO's recommendation of allocating 20-26% of national budgets to education, Nigeria has consistently fallen short in its funding. Nigeria channels a mere 5-10% even during 2016-2021, often hovering around 6-7%. This budgetary neglect manifests palpably in deteriorating infrastructure such as dilapidated lecture halls, outdated laboratories, overcrowded classrooms, and unsanitary student hostels (Ololube et al., 2024). According to Ogbomida et al. (2023), the scant financial resources that do exist are often distributed opaquely, with tribal, political, or elite biases skewing departmental allotments. Such prejudice not only deepens inequities between faculties but also corrodes trust, leaving less influential departments feeling systematically marginalized. Moreover, Ayoko and Jegede (2023) tie chronic resource deficits to recurring campus unrest, noting that students are frustrated by terrible living conditions and disrupted learning activities, and they regularly resort to demonstrations and sit-ins as their only recourse. Thus, financial scarcity and fiscal opacity operate jointly as structural fault lines, igniting crises that could be preventable with transparent budgeting and equitable funding.

Administrative Inefficiency and Leadership Gaps

Even where funds may exist, weak governance and lackluster leadership frequently sabotage effective use. University administrations are afflicted by dispersed responsibilities and feeble strategic planning. Uzoamaka and Chijioke (2023) highlight the disempowerment of university leaders by tight oversight and absence of revenue autonomy, which stifles their capacity to mobilize internal funds or foster institutional innovations. Ogunode et al. (2022) voice concerns over poor integration between academic affairs, research, and staff welfare, resulting in siloed operational units that undermine cooperative problem-solving. Within such fragmented structures, minor grievances over workload inequities, service delivery delays, or resource access can spiral unchecked. When universities management are either unwilling or unable to intervene due to complexity, bureaucracy, or political pressure, disappointed staff and student groups seek redress through protests or union action. Thus, administrative ineffectiveness becomes tinderbox that amplifies financial and institutional vulnerabilities, which in most cases result into full-blown crises.

Unfulfilled Agreements with Staff Unions

Recurring industrial disputes, most notably the protracted ASUU strikes, are precipitated by a chronic failure to honor memoranda of understanding. IBITEYE & Awomoyi (2023) point to the government's repeated neglect in implementing salary revisions, earned academic allowances, and research funding commitments. As one manifestation in 2022, the federal government withheld partial revitalization funding, failed to release earned allowances, and dragged its feet on implementing alternative payroll (UTAS) to IPPIS. These systemic failures culminated in a nation-wide ASUU strike lasting eight months, disrupting the academic calendar and stalling tens of thousands of graduations. Any negotiations for resolution soon collapse into a futile cycle of broken promises, fractured trust, and renewed industrial action. Left unaddressed, these

repetitive patterns erode the credibility of both university authorities and government, reinforcing the perception that dialogue is ineffective without enforceable accountability.

Political Interference and Governance Issues

University administration in Nigeria is often beset by overt political intrusion. Top-tier appointments, including vice-chancellors and registrar roles, are frequently influenced by political elites or ruling party interests, diluting academic leadership into extensions of partisan machinery. Ogbomida et al. (2023) document how such interference taints resource allotment and institutional decision-making with political motives, derailing merit-driven governance. As universities become arenas for political power plays, staff and students perceive leadership as partial and complicit, undermining morale and academic freedom. This politicization foments antagonism: some campus factions align with political patrons, while others recoil in suspicion or reject centralized authority, which have over the years polarized campus communities, which triggers overt or covert resistance strategies.

Autonomy Versus Control Debate

The struggle for operational autonomy versus central control is a core governance dilemma. Ideally, universities should generate and manage internal funds, hire staff, and chart strategic plans independently. However, in Nigeria they remain financially tethered to government allocations and subject to regulatory constraints. Uzoamaka and Chijioke (2023) noted that such dependency limits universities' ability to proactively address priority needs thereby delaying programs, impeding revenue-generation, and restricting recruitment. Delays in releasing funds or bureaucratic approvals often stall infrastructure projects or disrupt academic calendars, breeding frustration among stakeholders (Ololube et al., 2024). When academic staff and student groups advocate for autonomy, they do so against a backdrop of structural paralysis. The persistent tug-of-war over functional independence fuels campus protests and inflames distrust between universities and the government.

Students' Welfare and Activism

Student activism in Nigeria is deeply rooted in desperate living and learning conditions. Issues such as school fees hikes, erratic academic calendars, and poor hostel upkeep problems exacerbated by chronic underfunding that frequently spark mass mobilization. Ayoko and Jegede (2023) establish direct links between infrastructural decay and student demonstrations, with repeated grievances over safety, sanitation, and study environments driving protest culture. From historic campaigns like "Ali Must Go" to recurrent campus sit-ins today, students have consistently utilized activism to force attention to welfare deficits. The university's failure to proactively address simple demands such as functional electricity, water, or library services ignites tensions that swiftly escalate, challenging both academic continuity and institutional legitimacy.

Staff Promotion, Workload, and Welfare Disparities

Conflict among staff often hinges on unfair management of promotions, workloads, and welfare incentives. Ogunode et al. (2022) expose how delayed promotions, opaque criteria, and unequal distribution of responsibilities create resentment and alienation among faculty members. Without transparent policies or performance-based equity, marginalized staff view themselves as victims of nepotistic favoritism, triggering collective discontent. The psychological tolls like low morale, career stagnation, and loss of purpose have been noted to spill over into demands for redress through unions or through disruptive protest. Consequently, industrial action becomes less a reaction to singular policy decisions and more an expression of cumulative injustice.

Cultural and Ethno-Religious Tensions

Nigeria's rich cultural tapestry often seeps into university dynamics, distorting equity in recruitment, promotions, and resource allocation. Ogbomida et al. (2023) revealed how committee appointments and procurement decisions are sometimes influenced by ethnic affiliations, igniting suspicions of bias. As staff and students align socially or religiously, campus interactions become charged with identity politics like cliques form, favoritism, and rivalries simmer. These heightened cultural tensions worsen when coupled with financial scarcity or administrative fragmentation. Once identity-based slights accumulate, even small incidents like denied appointment or resource misallocation most times trigger protests, factionalism, or even violence, fractures universities unity.

Therefore, the causes of conflict in Nigerian public universities are deeply interwoven across financial, managerial, political, welfare, personnel, and socio-cultural domains. Each factor intensifies the others: underfunding amplifies poor leadership; administrative opacity magnifies political interference; staff injustice fuels union action; and welfare neglect triggers student activism. A sustainable resolution therefore requires comprehensive reforms, which do not only include isolated interventions like transparent budgeting, inclusive governance, enforceable labor agreements, depoliticization, autonomy, equitable staff policies, and culturally sensitive inclusion. In many cases, it is only an integrated strategy with robust accountability that can dismantle the cycles of friction and foster enduring institutional stability (Cheta-Maclean & Ololube, 2023).

EFFECTS AND CONSEQUENCES OF CONFLICTS IN NIGERIAN PUBLIC UNIVERSITIES

Conflicts in Nigerian public universities have become a recurring decimal with multifaceted implications on institutional stability, academic progression, and national development. These conflicts, particularly those arising from industrial disputes between the Academic Staff Union of Universities (ASUU) and the federal government, have consistently disrupted the academic calendar, stalled research activities, and eroded the foundational structures upon which higher education in Nigeria is built. The prolonged closure of universities due to strikes distorts academic timelines, as witnessed in 2020 and 2022 when university gates were shut for several months. During the 2022 industrial action which lasted over eight months, academic activities were suspended nationwide, forcing thousands of students to remain idle and extending the duration of academic programmes originally designed to span four years into six or more. This

recurrent disruption has a domino effect, delaying students' graduation, postponing their entry into the labour market, and causing bottlenecks in the admission of new intakes, thereby congesting the entire educational system.

Beyond the disruption of academic calendars, the quality of education offered in public universities diminishes with each episode of conflict. When academic sessions resume after months of inactivity, lecturers are compelled to hurriedly complete their syllabi, often compressing a semester's worth of content into a few weeks. This rushed delivery does not permit in-depth understanding, adequate feedback, or comprehensive assessments. The cumulative result is a generation of graduates who are not fully grounded in the knowledge and skills expected of them. According to Amadi and Ogbonda (2019) who conducted a study on the effect of conflict-induced academic interruptions in southern Nigerian universities, the haphazard completion of syllabi and the absence of consistent academic mentoring significantly impair students' critical thinking capabilities, research orientation, and overall preparedness for postgraduate studies or employment.

The psychological and professional toll of these incessant conflicts on academic staff cannot be overstated. Many lecturers express deep-seated frustration and disenchantment resulting from repeated broken promises by government authorities, poor working conditions, and non-implementation of collective bargaining agreements. This has led to widespread demoralization among teaching staff, with some resorting to apathy while others abandon the system altogether. According to Briggs and Ibiso (2021) who documented staff morale during the 2020 strike, a significant number of lecturers reported feeling undervalued and disillusioned, thereby affecting their commitment to teaching and student mentorship even after the resumption of academic activities. The situation is worsened by punitive government responses to industrial actions, such as the ‘no work, no pay’ policy or the arbitrary dismissal of lecturers perceived to be radical voices within their unions. Such measures not only strain labour relations but also discourage honest dialogue and foster a culture of fear and mistrust within the system.

One of the most troubling consequences of these conflicts is the acceleration of brain drain from Nigerian universities. Frustrated by systemic instability, many skilled academics seek opportunities in foreign institutions where academic environments are more stable, better funded, and professionally rewarding. Similarly, parents who can afford it often send their children to universities abroad or to private universities within the country that offer uninterrupted academic sessions. This exodus of both talent and students gradually depletes the intellectual capacity of public universities and weakens their role as national think tanks. Omuaru and Kalio (2020), in their study on the migration of academic professionals from Nigerian institutions, emphasized that lack of job security and unpredictability in university operations remain the two strongest push factors for academic emigration. The effect of this is not just the loss of human capital but also the erosion of institutional memory, mentorship gaps, and a widening disparity in the quality of higher education between public universities and their private counterparts.

The long-term consequences of these persistent conflicts transcend the university gates. At the national level, delayed graduation cycles and underprepared graduates contribute to youth unemployment and underemployment. Graduates who spend six to seven years for a four-year programme enter the labour market late and, in many cases, inadequately trained. This mismatch between graduate output and labour market requirements weakens the employability profile of Nigerian youths and makes the country less attractive to foreign investors in need of a competent workforce. Families are also affected emotionally and economically as they are compelled to prolong financial support to children whose academic journeys are stalled. In the wider scope of

national development, a consistently disrupted higher education system undermines Nigeria's capacity to harness its demographic dividend and drive industrialization, innovation, and economic growth.

Real-life scenarios offer poignant illustrations of these realities. The prolonged strike in 2022 saw thousands of students from universities such as the University of Nigeria Nsukka, University of Ibadan, and University of Port Harcourt forced into menial jobs, unplanned marriages, or idle waiting, while their counterparts in private or foreign institutions graduated and moved on with their careers. In Rivers State, academic programmes in institutions such as the Rivers State University and the University of Port Harcourt experienced severe distortions, causing faculty members to abandon academic projects and some postgraduate students to seek alternative institutions to complete their degrees. This not only breaks the academic continuity of students but also depletes the institutional credibility of these universities in the eyes of both local and international stakeholders.

The visual depiction on this causes of conflict in Nigerian public universities result in academic regression, professional disaffection, and systemic underperformance. The collective impact of disrupted calendars, degraded educational quality, demoralized staff, and declining institutional productivity poses a significant threat to national progress. If Nigeria is to build a resilient, innovative, and inclusive higher education sector, there must be an urgent commitment to resolving the underlying causes of these conflicts through constructive engagement, sustainable funding models, and a genuine respect for the autonomy and welfare of academic institutions. Only then can the nation's universities fulfil their mandate as engines of national development, social mobility, and global relevance.

Approaches to Conflict Management in Nigerian Public Universities

Conflict management in Nigerian public universities hinges on a combination of interactive strategies including open communication platforms, equitable resource distribution, participatory leadership, curriculum-based peace education, and stakeholder engagement are all designed to mitigate tensions and foster institutional harmony.

As illustrated in Figure 3, Nigerian public universities employ multidimensional strategic approaches for managing conflicts, which includes open communication, effective leadership, and collaborative engagement. This strategy cluster diagram visualizes nine core approaches to conflict management as adopted within Nigerian public universities. Each strategy—such as open communication, peace education, stakeholder collaboration, and third-party intervention—is presented as a radiating segment around a central core labeled "Conflict Management Approaches." Under each segment, specific actors (e.g., university administrators, students, mediators), key actions (e.g., fostering dialogue, equitable resource distribution, leadership development), and anticipated outcomes (e.g., improved trust, reduced tension, sustainable peace) are annotated to demonstrate their interconnected contributions to institutional harmony and conflict resolution.

Figure 3: Strategy Cluster Diagram Illustrating Approaches to Conflict Management in Nigerian Public Universities.

Open Communication and Dialogue

Constructive conflict management in universities hinges on creating transparent communication platforms where grievances can be aired before escalating into exigent crises. Institutionalizing regular forums such as town-hall meetings, staff-student councils, and grievance committees facilitates transparency and enables timely resolution. Osagie (2023) demonstrated that universities employing structured communication hubs witnessed measurable improvements in trust, as stakeholders felt their concerns were heard and addressed promptly, enabling collaborative rather than confrontational outcomes. Similarly, Osakede and Ijimakinwa (2018) reported that in southwestern Nigerian universities, mediation boards empowered with stakeholder representation significantly enhanced institutional efficiency and mutual trust across

management, unions, and students. They found these platforms effective in resolving conflicts ranging from departmental resource disputes to student welfare issues. Combining these insights reveals that formalizing dialogue transforms conflict potential into opportunities for co-created solutions, making open communication not just a strategy, but a foundational institution-building tool that reshapes university culture.

Resource Allocation and Management

Fair and transparent resource distribution is pivotal for conflict prevention, as scarcity becomes fertile ground for suspicion, favoritism, and institutional breakdown. Ogbomida, Obano, and Emmanuel (2023) examined the political dynamics shaping resource distribution in Nigerian universities, revealing how decisions influenced by ethnic, political affiliations and executed without transparency breed resentment and destabilize campus life. Their data indicated that universities with objective allocation policies and visible audit trails encountered fewer protests and administrative disputes. Adeyemi and Ademilua (2022) similarly underscored that transparency in resource planning not only fosters accountability but also enhances stakeholder buy-in; when university communities understand how funds are allocated, they are more willing to support decisions, even amid scarcity. These findings collectively reinforce that effective resource management—encompassing clear policy design, equitable distribution, and maintained infrastructure—builds legitimacy for university governance and neutralizes conflict through empowerment and fairness.

Good Leadership

Leadership in Nigerian universities must be marked by empathy, inclusivity, and dynamism to effectively manage conflict. Olaiya, Sehinde, and Adeola (2015) provided robust evidence from Obafemi Awolowo University, showing that vice-chancellors with democratic approaches, inclusive communication, and responsiveness achieved lower levels of staff-student conflict and impressed upon institutional ethos a culture of collaboration. Their study illustrated that participative leadership motivates stakeholders to engage in problem-solving, rather than oppositional struggle. Similarly, Ajewole and Olaifa (2021) identified that institutions led by visionary and participative administrators manifested better administrative outcomes, including improved crisis handling, academic planning, and internal harmony. Such leaders leveraged their positional power judiciously, encouraging shared responsibility. Together, these studies make a compelling case that leadership paradigms in higher institutions should not only set academic agenda but model conflict competence, shape institutional norms, and preempt flashpoints by cultivating trust and collective ownership.

Peace Education

Embedding peace education within academic curricula fosters a proactive culture of conflict literacy, enabling students to identify, articulate, and resolve disagreements nonviolently. Osagie (2023) linked collaborative problem-solving practices with enhanced pedagogical engagement, showing that when conflict management becomes part of learning, students internalize negotiation, empathy, and ethical reasoning. Institutionalizing curricula that feature alternative dispute resolution, ethics, and civic participation helps grow a generation equipped to de-escalate

rather than inflame campus disagreements. Although Nigeria does not yet widely adopt peace education in higher education, initiatives in other African contexts—such as Rwanda's peacebuilding modules—demonstrate positive impact on campus cohesion and violence reduction. If replicated in Nigerian universities, such integrative educational strategies could shift institutional cultures from reactive confrontation to anticipatory dialogue, making peace education a catalyst for sustainable harmony.

Cooperation and Collaboration

Cross-stakeholder cooperation stands as an essential pillar of conflict management, anchored in shared governance structures that legitimize conflict resolution and build institutional trust. Studies of universities in Lagos and Ondo states revealed that conflict resolution councils—comprising students, management, and union leaders—facilitated inclusive communications and expedited resolution of disputes ranging from resource allocation to policy implementation (Osakede et al., 2018). Through these councils, stakeholders gained voice in decision-making, reducing feelings of alienation and enhancing institutional coherence. Such structures operate as a form of collective intelligence, enabling diverse perspectives to converge into sustainable outcomes. When governance becomes a collaborative venture, stakeholders feel collectively responsible for organizational wellbeing and less inclined toward disruptive activism, signaling the transformative potential of cooperation in conflict mitigation.

Conflict Resolution Strategies

Selecting and deploying optimal conflict resolution strategies is crucial for both defining and controlling institutional dynamics during disputes. Short-term approaches like accommodation may temporarily appease agitation, but they can create latent dissatisfaction when the root causes remain unaddressed. Adeyemi et al. (2010) emphasized the value of compromise and collaboration, which led to more sustainable relational dynamics and prevented recurrent grievances in Nigerian tertiary systems. Their research highlighted that when parties work toward mutually beneficial outcomes—balancing assertiveness with empathy—the resulting solutions are more resilient to future relapse. Applying this in Nigerian universities requires adaptive leadership to discern which strategy (e.g., collaborative consensus-building or compromise tradeoffs) suits the context, ensuring that responses empower stakeholders, preserve dignity, and embed structural change where needed.

Addressing Root Causes

To disrupt recurring cycles, conflict management must extend beyond symptoms to engage deeper systemic issues like resource constraints, power asymmetries, and structural grievances. Fareo and Jaju (2018) reinforced that addressing such foundational causes especially resource scarcity and distribution opacity yields lasting peace rather than temporary reprieves. They argued that rooting out systemic inequalities requires intentional reform such as transparent budgeting, decentralization of decision-making and welfare-oriented institutional policies. Adopting this root-focused lens also prevents conflict migration; unresolved structural issues often manifest elsewhere if displaced. In this light, conflict management must include monthly

budget reviews, welfare audits, and institutional equity frameworks to build resilience against recurring tension.

Stakeholder Participation

Inclusive participation enhances institutional harmony by establishing trust, ownership, and legitimacy. Osakede et al. (2018) showed that empowering stakeholders within internal conflict forums enhanced administrative performance and reduced friction. Ajewole and Olaifa (2021) mirrored these findings, demonstrating that when staff, students, and external stakeholders contribute to policy processes, institutional satisfaction rises and crisis points reduce. Such participation should be formalized through structured consultative bodies, ensuring transparency in fiscal, academic, and appointment matters. Broad engagement minimizes the sense of alienation and preempts conflicts before they escalate, reinforcing the idea that participatory models make governance inclusive—ushering in a stable academic environment.

Third-Party Intervention

When internal conflict becomes entrenched or fractious, neutral external facilitation is often indispensable. Third-party mediators—ranging from government-appointed conciliators and religious leaders to civil society representatives—introduce impartiality that can cut through inertia and distrust. Olaiya et al. (2015) recommended that engaging such actors brings legitimacy, fairness, and procedural integrity, particularly in impasse scenarios—like protracted strikes or leadership crises. Successful interventions in Nigerian contexts have demonstrated that unbiased mediation helps de-escalate high-stakes conflicts, foster negotiated solutions, and re-establish institutional equilibrium without entrenching fault lines. These conflict management approaches presents both empirical and theoretical perspectives of scholarly reflection on how Nigerian public universities can manage conflict through comprehensive, context-specific strategies.

CHALLENGES TO EFFECTIVE CONFLICT MANAGEMENT

Despite formal mechanisms for dispute resolution, Nigerian public universities face deeply rooted systemic challenges that compromise their ability to manage conflicts effectively. These challenges span from governmental non-compliance and limited institutional autonomy to under-resourced peace infrastructure, delayed communication, union fragmentation, and inadequate resolution capacity. Together, they deepen mistrust, prolong disputes, and weaken the institutions' academic core.

Figure 4: Problem Tree Diagram Illustrating Challenges to Effective Conflict Management in Nigerian Public Universities

Figure 4 presents a structured visualization of the systemic challenges undermining effective conflict management in Nigerian public universities. At the root level, underlying causes such as poor funding, politicization of university governance, leadership inefficiencies, and weak institutional frameworks are identified as foundational drivers of conflict. These root causes give rise to the central problem, which is the persistent 'ineffectiveness in conflict management'. This core issue branches upward into observable manifestations including frequent industrial strikes, violent protests, administrative disruptions, and increased student dropouts. Extending from these branches are the leaves, representing the broader consequences such as declining academic standards, widespread demoralization of staff, institutional instability, and the escalation of brain drain. The problem tree highlights how deeply entrenched structural failings escalate into cyclical unrest and institutional decline, thereby impeding national educational development.

Government's Breach of Agreements

Repeated government breaches of memoranda of understanding with staff unions fundamentally degrade trust and embolden radical responses. Throughout the 2018 and 2022 ASUU strikes, the federal government failed to fulfill crucial promises ranges from registered allowances to the provision of revitalization funds despite publicly affirmed agreements. Arogundade and Olayemi

(2013) highlighted that each violation entrenches a perception that formal negotiations are ineffective, incentivizing unions to default to industrial action to force compliance. This cycle of broken commitments hardens union resolve, prolonging strikes which not only disrupt academic calendars but also erode institutional legitimacy. Unless the government adopts strict enforcement mechanisms and accountability frameworks, agreements remain hollow pledges, predisposing campuses to recurrent, disruptive standoffs undermining the entire conflict management architecture.

Lack of Institutional Autonomy

The lack of institutional autonomy severely hampers universities' capacity to intervene proactively in brewing conflicts. Overreliance on federal budget allocations limits administrative flexibility, forcing universities to wait for external approvals before addressing urgent staff welfare issues or student grievances. Orji and Job (2013) emphasized that this dependency causes universities to operate under reactive modes, relying on governmental shortcuts instead of instituting internal resolution frameworks. Such constrained autonomy delays critical interventions such as off-cycle promotions or welfare disbursements often prompting protests before formal management decisions can be communicated. In effect, the universities' failure to resolve internal matters independently perpetuates a cycle of external dependence, limiting opportunities for context-sensitive strategic planning and escalating the probability of dormant tensions exploding into full-scale disputes.

Poor Funding of Peacebuilding Mechanisms

Although most universities acknowledge the need for peacebuilding initiatives, funding for these frameworks remains marginal. Findings from Umar and Anas (2022) indicate that internal peace committees often lack operational budgets, forcing them to rely on ad hoc contributions or volunteer time, rendering them ineffective and sporadic. These peace structures lack essential resources for convening mediation sessions, facilitating stakeholder training, or implementing follow-up procedures. Additionally, Tsevenda et al. (2022) noted that academic peace education programs—designed to cultivate conflict competency among students—also suffer liquidation due to inadequate funding. Such neglect reduces the institutional capacity for continuous conflict prevention, reduces campus stakeholders' trust in internal mechanisms, and encourages reliance on external structures when disputes arise, prolonging resolution times and weakening the institutions' internal conflict management legitimacy.

Delayed Response and Communication Gaps

Communication breakdowns and delayed administrative responses frequently amplify low-level grievances into full-scale conflict. They create an environment where rumors, misinterpretations, and mistrust flourish unchecked. Umar and Anas (2022) reported that universities lacking rapid-response units or transparent communication protocols often experience compounding tensions, particularly when stakeholders receive conflicting or ambiguous messages. In such environments, management decisions—such as fee increases or staff appraisals—are perceived as unilateral, prompting defensive reactions rather than collaborative discourse. With news circulating informally, formal reconciliation becomes nearly impossible. Addressing this

demands structured communication pathways, including proactive messaging, regular briefings, and inclusive consultation before any major policy shift. Without them, conflict becomes aggregated through misinformation and administrative opacity.

Union Radicalism and Politicization of Conflicts

The growing politicization of staff unions poses a serious obstacle to collaborative conflict resolution. Historically designed as professional advocacy groups, unions like ASUU have increasingly adopted radical postures due to ideological positioning and internal leadership ambitions. As Williams-Ilemobola and colleagues (2021) observed, escalating ideological narratives have shifted union discourse away from policy-based negotiations toward confrontational politics. This trend intensified when splinter unions like CONUA emerged, fragmenting the union landscape and reducing coherent negotiation channels. When multiple leadership camps compete for legitimacy through public agitation, conflict escalates into symbolic politics rather than policy negotiation. Effective resolution thus requires reorienting unions back to advocacy and professional dialogue, underscored by accountability within their leadership ranks and coherence in position-taking to rebuild cooperative engagement with management and government.

Inadequate Capacity for Conflict Resolution

Even where peace mechanisms exist, they are systematically weak due to lack of expertise, resources, and institutional recognition. Umar and Anas (2022) highlighted that most internal conflict-resolution committees are staffed by senior administrators lacking formal training in mediation, communication, or restorative justice. Their decisions often follow inconsistent protocols, leading to variable outcomes and reduced trust in their authority. Coupled with the absence of formal accreditation or continuous professional development, this competence gap diminishes the perceived legitimacy and predictability of resolutions. To remedy this, universities must professionalize these interactions—recruiting trained mediators, institutionalizing standard operating procedures, and implementing follow-up mechanisms to ensure compliance. Without such investment, resolution outcomes remain shallow, addressing only symptoms rather than root causes and perpetuating conflict recurrence.

POLICY IMPLICATIONS OF CONFLICT MANAGEMENT AND PRACTICAL LESSONS

The preceding analysis of conflict management challenges underscores the need for targeted policy action within Nigerian public universities. Effective interventions must fortify institutional frameworks, increase transparency, promote sustained dialogue, incorporate peace education, and ensure the faithful implementation of agreements. Below is a detailed expansion on each critical policy implication.

Strengthening Institutional Capacity for Conflict Resolution

University management requires robust, professional conflict-resolution infrastructure, not merely occasional committees. Empirical evidence suggests that formal peace units with

dedicated budgets, trained mediators, and standardized protocols significantly improve responsiveness. In southwestern Nigeria, universities that institutionalized such units—staffed by personnel trained in restorative justice and equipped with clear operational guidelines—exhibited higher success rates in early conflict resolution and lower incidence of protracted disputes, as documented by Osakede and colleagues (2018). However, these structures frequently faltered due to intermittent funding and lack of formal authority. Consequently, an urgent policy response involves creating permanent conflict-resolution offices within university governance—resourced annually, staffed by certified conflict specialists, and empowered to organize mediation sessions, conduct post-conflict evaluations, and follow through on agreed resolutions. Such internal resilience serves as a first line of defense, ensuring campus tensions are addressed before escalating into strike-level disruptions.

Figure 5: Signs of conflict management from Adapted from Bhandari in 2024.

Need for Transparent and Inclusive Governance

Transparency and genuine inclusion in governance can prevent suspicion and conflict tied to resource allocation and administrative secrecy. A thorough study across southwest Nigerian institutions revealed that when students, staff, and union representatives are included in governance bodies such as budget committees or appointment panels, trust rose markedly, and conflict incidences fell (Osakede et al., 2018). Conversely, opaque governance breeds rumors and skepticism. According to Ololube and Wome (2025), policy reforms mandate public access to key documents like annual budgets, contract awards, and performance reports and guarantee representation of non-management stakeholders in decision-making forums. Legislating on such requirements into university statutes, with external oversight by educational commissions, would institutionalize transparency as standard practice, thereby undermining politicized and unilateral administrative actions that often spark campus unrest.

Promoting Regular Stakeholder Dialogue

Stability in university communities grows from consistently structured engagement, not reactive, one-off meetings following crises. Research findings demonstrated that institutions that adopted scheduled, campus-wide stakeholder forums—such as semesterly town-halls, faculty-union-student roundtables, and open-door hours for top management—significantly reduced the frequency of protests and strikes (Osakede et al., 2018). These platforms enable early detection of emerging issues, foster problem-solving fatigue, and break down isolation between

management and constituents. Therefore, policy must formalize dialogue cycles: requiring vice-chancellors to host monthly open forums with documented outputs and obliging departmental heads to engage in regular consultative sessions. More than procedural fix, this approach builds social capital and fosters cultural norms of negotiation over escalation.

Mainstreaming Peace Education and Conflict Sensitization

Concerns that campus youth lack conflict management skills call for the integration of peace education across university activities. International studies and nascent local curricula reveal that when universities embed modules on negotiation, ethics, civic engagement, and restorative justice into their programs, students display improved interpersonal capacities, reduced disruptive behaviour, and enhanced collaborative mindsets (Tsevenda et al., 2022). While this area remains underdeveloped in Nigeria, the potential is evident. Policymakers should mandate curriculum review boards to identify appropriate elective modules or orientation programs, coupled with extracurricular peer mediation training for student leaders. Additionally, university-wide peace campaigns—such as "Conflict Awareness Weeks"—could heighten campus-wide sensibilities. Such measures demystify conflict and educate stakeholders to approach disagreements as manageable, not existential threats.

Enhancing the Implementation of Agreements

The failure to implement signed agreements remains a perennial driver of institutional conflict. Studies show that when signed memoranda on salaries, infrastructure, or welfare are neglected, parties lose confidence in the process and revert to punitive methods such as industrial action (Adeyemi & Ademilua, 2012). For policy, the solution lies in enforceability and accountability: institutions should publish timelines for implementation, appoint compliance officers to monitor progress, and involve independent observers (including funders or community partners) in verifying delivery. Introducing contractual clauses linking disbursements to performance such as phased payments activated by completed deliverables creates systematised incentives and disincentives. When parties see that agreements lead to real change, it builds an environment of trust and reduces the likelihood of conflict relapse.

CONCLUSION

Effective and sustainable conflict resolution demands proactive measures that prioritize inclusivity, transparency, and a culture of peace, supported by structured institutional capacity and credible implementation of agreements. While numerous approaches to conflict management including open dialogue, peace education, and participatory governance have been explored, their impact remains limited when not integrated into a comprehensive, institutionally backed framework. It is, therefore, undeniable fact for all stakeholders government agencies, university administrators, academic unions, students, and civil society to collaboratively embrace their roles in kindling mutual understanding, respect for institutional autonomy, and responsive leadership. Only through a concerted, cooperative, and well-coordinated strategy can the vision of sustainable peace, academic excellence, and institutional harmony be actualized across Nigeria's public universities. In conclusion, the analysis of the causes and management of conflicts in Nigerian public universities reveals that underlying issues such as poor communication,

leadership inadequacies, insufficient resources, politicized unionism, and institutional weaknesses have persistently fueled campus unrest and undermined academic stability.

Recommendations

These recommendations are directed at key institutional actors who must take proactive steps to transform the conflict landscape and foster a culture of lasting peace and academic productivity:

- University Governing Councils should establish fully resourced conflict management units within their institutions. These units should be mandated to proactively identify, mediate, and resolve disputes among university stakeholders through structured conflict prevention, rapid intervention protocols, and reconciliation mechanisms that are context-sensitive and supported by trained personnel.
- University Management Bodies are encouraged to develop university-specific conflict mediation protocols that reflect the peculiar realities and socio-political dynamics of their respective institutions. These protocols should clearly define steps for dispute resolution, assign roles to relevant internal bodies, and establish timelines to ensure timely and effective management of emerging tensions.
- Federal and State Ministries of Education must institutionalize regular and structured government–union dialogue platforms. These platforms should provide formalized avenues for continuous engagement between policymakers and university unions, reducing the recurrence of strikes by resolving grievances before they escalate into full-blown industrial actions.
- National Universities Commission (NUC) and University Councils should prioritize funding training programmes in conflict resolution for academic leaders and administrators. Equipping deans, heads of departments, and vice-chancellors with negotiation, mediation, and emotional intelligence skills will greatly enhance their capacity to handle disputes constructively and maintain harmony within their institutions.
- University Governing Boards and the Tertiary Education Trust Fund (TETFund) are advised to create robust monitoring and evaluation frameworks to track conflict trends, assess response effectiveness, and inform future interventions. Such frameworks should include conflict incidence databases, periodic conflict audits, and performance indicators that measure institutional responsiveness and progress toward conflict mitigation goals.

ABSRACT

This paper explored the pathways to achieving world-class university service delivery in Nigeria, with emphasis on institutional reforms, quality assurance, and innovation in academic and administrative structures. Drawing from global best practices and contextualizing them within Nigeria's socio-economic and policy environment, the study examines the roles of leadership, funding, infrastructure, and ICT integration in enhancing service standards. It highlighted the persistent challenges such as inadequate funding, brain drain, and policy inconsistencies that hinder progress, while also identifying opportunities for transformation through public-private partnerships, staff capacity building, and performance-based evaluation systems. Using qualitative and comparative analyses, the paper proposes a framework for service delivery excellence tailored to Nigerian universities. The study concluded that with deliberate reforms, strategic investment, and stakeholder engagement, Nigerian universities can align with global benchmarks, promote improved student experiences, academic productivity, and global competitiveness. To ensure meaningful reform and sustainable impact in service delivery within Nigerian public universities, it is recommended amongst other that; federal and state ministries of education should implement performance-based funding models that allocate resources according to measurable outputs in research productivity, teaching quality, and graduate employability.

Keywords: World-Class Universities, Service Delivery, Higher Education, Nigerian Universities, Quality Assurance, Institutional Reform, ICT Integration, Academic Excellence, University Governance, Educational Policy.

INTRODUCTION

The global higher education landscape is witnessing an unprecedented emphasis on quality service delivery as nations strive to produce universities that are not only responsive to societal demands but also competitive on a global scale. Central to this drive is the notion of 'world-class universities characterized by excellence in teaching, groundbreaking research, high-impact innovations, and strong international presence. These universities are often ranked based on indicators such as research output, faculty reputation, student satisfaction, infrastructural capacity, and level of global collaboration. As knowledge economies continue to evolve, universities are increasingly recognized as pivotal engines of development, necessitating a deliberate focus on how services both academic and administrative are designed, delivered, and evaluated. The aspiration to attain world-class status has moved from being a symbolic goal to a strategic imperative in national policy discourse, especially in developing nations seeking transformative growth through education.

In the context of Nigeria, the discourse on enhancing university service delivery has intensified, with several studies underscoring the widening gap between global expectations and institutional performance. Okoli and Eme (2019) examined the structural constraints hindering service quality in Nigerian public universities and emphasized the urgent need for systemic reforms that prioritize efficiency, responsiveness, and stakeholder engagement. Similarly, Oghenekohwo and Frank-Oputu (2021) highlighted that while Nigerian universities are increasingly aware of global benchmarks, the absence of visionary leadership, inadequate funding, and outdated service frameworks continue to impede their ability to align with international best practices. These scholars have drawn attention to the fact that university service delivery must extend beyond traditional academic outputs to include responsive administrative structures, digitized student support services, and effective internal governance mechanisms that foster accountability and innovation.

The growing influence of global academic trends has also reshaped local conversations around university competitiveness in Nigeria. Adebayo and Wokoma (2023) conducted a study on how global performance indicators are subtly reconfiguring institutional policies in Nigerian universities, pushing them toward models that favor autonomy, digital integration, and results-based service evaluation. However, these evolving expectations often clash with deeply rooted operational challenges, such as bureaucratic rigidity, human capital deficits, and weak monitoring systems. According to Tamunotonye and Adegboye (2018), this dichotomy between aspiration and implementation reflects the broader tension in Nigeria's education reform efforts—where visionary policies are seldom matched with the institutional will and structural support necessary for actual transformation. It is within this complex intersection of global ambitions and local realities that this study seeks to explore transformative pathways toward achieving world-class university service delivery in Nigeria.

BACKGROUND TO THE STUDY

World-class universities are widely recognized as institutions that exemplify excellence across all core areas of higher education like teaching, research, innovation, and community service. These institutions are characterized not only by their global rankings or the prestige of their faculty but also by the efficiency of their academic and administrative service delivery structures. Service delivery in this context encompasses all engagements, processes, and support systems

that enable the smooth functioning of academic institutions, ranging from curriculum development and quality teaching to ICT-enabled administrative systems, student welfare, infrastructure management, and performance-based evaluation mechanisms. Central to the ethos of a world-class university is a culture of accountability, continuous improvement, and innovation, all geared toward enhancing student experience, knowledge production, and institutional competitiveness within the global academic space.

Nigerian universities continue to grapple with a range of persistent challenges that severely constrain their ability to deliver quality services. Many institutions suffer from poorly maintained physical infrastructure, dilapidated lecture halls, congested student hostels, and insufficient laboratories. There are also widespread administrative delays in the processing of student results, issuance of transcripts, and conduct of examinations. ICT integration remains limited in many public universities, with basic services like registration, payments, and academic counseling still being handled manually. Moreover, the problem of inadequate and unstable funding further complicates efforts to improve service quality.

In the analysis of Onuoha and Akinbade (2020) highlighted how public universities are frequently underfunded, despite a rising student population and growing operational demands. Their findings showed that capital allocations for tertiary institutions often fall below UNESCO's recommended benchmark of 26% of national budgetary allocation to education, with Nigeria consistently spending less than 10% in recent years. This funding shortfall has translated into chronic infrastructure decay, outdated laboratory equipment, and overburdened teaching staff. According to data released by the National Bureau of Statistics in collaboration with the NUC in 2021, over 60% of federal universities in Nigeria operate without functional e-libraries or campus-wide internet access, placing them at a significant disadvantage compared to global peers that rely heavily on digital technologies for academic delivery and administrative efficiency.

Leadership and governance issues have also featured prominently in recent empirical works. Nwachukwu and Etim (2022) observed that while Nigerian universities have made commendable progress in expanding access and diversifying academic programmes, their governance frameworks remain largely outdated, hierarchical, and resistant to change. The study emphasized the lack of strategic planning in decision-making, poor implementation of quality assurance mechanisms, and weak institutional autonomy as core impediments to efficient service delivery. In contrast, world-class universities operate with clear lines of accountability, robust performance monitoring systems, and decentralization policies that allow faculties and departments to respond swiftly to emerging needs. The absence of such frameworks in Nigerian institutions further widens the performance gap and limits institutional agility.

Efforts by intervention agencies such as the Tertiary Education Trust Fund (TETFund) have brought about some improvements in research funding and staff training, yet the impact remains uneven and often unsustainable. Eze and Amadi (2018) pointed out that while TETFund-sponsored projects have contributed to infrastructural renewal in some universities, the absence of comprehensive needs assessments and monitoring tools often results in misaligned projects that do not significantly enhance service delivery. Furthermore, Okoro (2021) contended that the lack of synergy between education policies and institutional implementation strategies continues to undermine reform efforts. This disconnection is particularly evident in the poor alignment between national development plans and university curricula, limited stakeholder engagement in policy formulation, and the politicization of university governance appointments. These issues reflect broader challenges in Nigeria's public sector management and underscore

the need for a holistic, reform-driven framework that addresses quality, equity, and accountability in university service delivery.

When measured against global standards for world-class universities, it becomes evident that Nigerian institutions have a long journey ahead. International best practices emphasize the centrality of data-driven planning, continuous faculty development, ICT-based learning systems, and outcome-focused service models. According to Eze and Amadi (2018), Nigeria's public universities continue to trail behind in these indicators, not due to the absence of policy frameworks, but because of weak institutional capacity and inconsistent policy implementation. They argue that true transformation will require more than infrastructural investments; it will demand a paradigm shift in leadership culture, stakeholder engagement, resource utilization, and regulatory enforcement. Hence, this study emerges at a critical juncture to explore actionable pathways that can reposition Nigerian universities toward achieving world-class service standards that are contextually relevant, sustainable, and inclusive.

THEORETICAL FRAMEWORK

A study of this nature that seeks to cross-examine university service delivery within the context of global competitiveness and national reform requires the application of robust theoretical perspectives. The integration of theory into academic inquiry facilitates structured understanding, interpretation, and contextual diagnosis of policy, leadership, and administrative practices within institutions of higher learning. In view of the quest to align Nigerian public universities with world-class benchmarks, the theoretical anchorage of this research becomes vital in analyzing not only institutional performance but also the dynamics of leadership and governance. Hence, this study is underpinned by two interrelated theoretical lenses—New Public Management (NPM) and Transformational Leadership Theory—both of which offer a rich foundation for exploring reform-driven service systems. These theories are particularly appropriate for unpacking the administrative, structural, and leadership variables that define service outcomes and institutional reputation in higher education. Their application enables a critical appraisal of the intersection between aspiration and operational reality in Nigeria's public university sector.

New Public Management Theory

Hood (1991) introduced the New Public Management (NPM) theory, conceptualized as a reformist orientation that combines public sector responsibility with private sector efficiency, and this model has been continually validated by contemporary scholars such as Odugbemi (2019) in discussions surrounding public sector reforms in Africa. The NPM theory advocates for decentralization, performance-based evaluation, cost-efficiency, and customer satisfaction as key performance indicators of public institutions. It posits that public service delivery should no longer be monopolized by rigid bureaucratic norms but should instead be guided by output-driven models that encourage innovation and responsiveness. Within the higher education context, NPM offers a blueprint for dismantling traditional university administration structures that are often hierarchical, unaccountable, and inflexible. As Akpan and Eme (2020) explained, governance in Nigerian universities is still predominantly governed by outdated structures that do not prioritize service innovation or user satisfaction. NPM therefore provides a framework for introducing strategic planning, performance management systems, and decentralization of academic and financial functions. These interventions are particularly vital in an environment

where public accountability and transparency are essential for institutional growth and global competitiveness. Furthermore, the emphasis NPM places on stakeholder satisfaction aligns with the growing demand for value-based education services in Nigeria.

Students, parents, employers, and funding agencies now expect universities to provide not only academic knowledge but also employability skills, industry-relevant research, and responsive administrative services. Ololube (2024) maintained that many public universities in Nigeria have become disconnected from these expectations due to leadership inertia and regulatory bottlenecks. NPM presents a strategic response to these challenges by encouraging results-oriented performance evaluation systems that directly link resource utilization with service impact.

Through NPM-inspired reforms, universities can install quality assurance frameworks, conduct customer satisfaction audits, and initiate periodic external reviews that reflect global best practices in institutional accountability and reform outcomes.Moreover, the idea of performance contracts and benchmarking embedded in the NPM approach provides a template for Nigerian universities to measure their own development trajectories against world-class standards. As documented by Umeh and Chukwu (2023), universities in countries such as South Africa, Kenya, and Ghana have adopted elements of NPM by introducing performance evaluation criteria for Vice Chancellors, Deans, and Heads of Departments. These criteria are based not only on academic output but also on their ability to generate income, establish linkages, and implement strategic reforms. Therefore, the integration of NPM into the Nigerian university system can help redefine the service architecture of these institutions and position them for sustainable excellence, the NPM framework is particularly suited for this study because it connects institutional leadership, stakeholder engagement, and performance outcomes in a way that is both evaluative and reform-oriented. NPM thus provides a forward-looking orientation for Nigerian universities striving to become globally competitive through improved administrative and academic service delivery.

Transformational Leadership Theory

Burns (1978) developed the Transformational Leadership Theory as a model of leadership that transcends mere transactional processes, aiming instead to inspire, influence, and intellectually stimulate followers toward higher levels of performance and commitment. This theoretical model was later expanded by Bass and Avolio (1994), who introduced the idea of four key dimensions like idealized influence, inspirational motivation, intellectual stimulation, and individualized consideration as pathways through which transformational leaders affect change. Recent studies by Nwachukwu (2020) and Ibe and Uzochukwu (2022) have shown that this leadership style is particularly effective in reforming African public institutions, especially universities, where leadership is often the fulcrum for either progress or decline. The transformational leadership theory thus presents a practical lens for evaluating how university leaders can shape service delivery outcomes through vision, innovation, and empathy.

As Nnadi and Chimezie (2019) explained, university administrators often lack the proactive mindset and people-oriented skills necessary to steer institutions through reform and policy execution. Transformational leadership theory counters this problem by emphasizing visionary change and strategic influence, enabling leaders to articulate a clear institutional direction and inspire collective commitment among academic and non-academic staff. Moreover, transformational leadership enhances the human capital dimension of service delivery by

cultivating positive workplace culture and empowering staff. Oboh and Okorie (2021) reported that leaders who adopt transformational principles tend to receive higher performance ratings, promote innovation among subordinates, and increase the efficiency of university systems. These qualities are essential in institutions where morale is frequently eroded by lack of recognition, poor funding, and excessive workload.

When university leaders demonstrate empathy, provide intellectual stimulation, and promote trust-based relationships, service outcomes improve markedly, even within resource-constrained environments. As observed by Ekanem and Obasi (2018), such crises are frequently exacerbated by transactional leadership practices that fail to address the underlying needs and aspirations of the university community. Transformational leadership theory also offers practical insights into crisis management and conflict resolution within university governance. The Nigerian public university system is often characterized by incessant strikes, leadership tussles, and administrative gridlock. Transformational leaders, by contrast, work collaboratively with unions, students, and government stakeholders to resolve disputes and reposition institutions for future growth.

In addition, the theory is instrumental in fostering innovation and policy compliance, both of which are vital in implementing reforms aligned with world-class standards. According to Onyeka (2022), transformational leaders are more likely to engage with accreditation agencies, initiate international collaborations, and adopt ICT tools that improve academic services and records management. This dynamic and forward-looking leadership orientation not only uplifts institutional image but also creates an enabling environment for quality teaching, research, and community engagement. Therefore, the application of transformational leadership theory to this study is justified by its alignment with Nigeria's current education reform agenda, which emphasizes leadership capacity-building, institutional autonomy, and strategic planning. The theory facilitates a deep understanding of how visionary leadership can influence not only policy direction but also service culture and operational efficiency. By integrating this theory into the framework of the study, the research gains a holistic tool for assessing the behavioral and structural components necessary for repositioning Nigerian public universities as world-class institutions.

CONCEPTUAL CLARIFICATIONS

Concept of World-Class Universities

World-class universities are institutions that attain the highest standards of excellence in teaching, research, innovation, and global visibility. These universities set the pace for global higher education through their commitment to intellectual leadership, cutting-edge research, and the production of globally competent graduates. Often ranked at the top in global university rankings, world-class institutions serve as benchmarks for academic excellence and institutional efficiency. Their operations are deeply rooted in values such as quality assurance, international competitiveness, institutional autonomy, and consistent policy innovations that align with global standards. Such universities not only serve local and national needs but also contribute significantly to the advancement of global knowledge economies. According to Okonkwo and Eze (2019), world-class universities are defined by their ability to attract and retain global talents, produce high-impact research, and maintain a consistent presence in international academic rankings. These institutions exhibit significant levels of academic freedom, robust

funding mechanisms, diversified income sources, and strong university-industry linkages. As further explained by Umeh and Obasi (2021), the global metrics for assessing world-class status often include the volume of publications in high-impact journals, the presence of Nobel laureates and renowned scholars, comprehensive international collaborations, and innovation outputs such as patents and spin-offs.

These standards form the foundation for excellence in modern university systems across continents. Global university ranking bodies such as the Times Higher Education (THE), QS World University Rankings, and Shanghai Ranking Consultancy often rely on multiple indicators such as academic reputation, employer perception, faculty-to-student ratios, international staff and students, research impact, and citation metrics to evaluate world-class status. Eze and Udo (2020) noted that while these ranking systems offer standardized benchmarks, they are also influenced by Western models of higher education, which may not always reflect the realities in African institutions. Nevertheless, these rankings have influenced institutional policies and reforms in several African countries aiming to compete globally. The concept of world-class universities has increasingly gained traction in Nigeria, albeit amidst contrasting realities. While some Nigerian universities like the University of Ibadan and Covenant University are gradually gaining international recognition, the broader landscape is constrained by underfunding, bureaucratic inefficiencies, infrastructural decay, and brain drain.

Adebayo and Kalu (2023) observed that although Nigerian universities aspire towards global relevance, structural challenges such as limited research funding, unstable academic calendars due to industrial actions, and governance lapses hinder their trajectory toward world-class status. According to Akpan et al. (2020), Nigerian universities largely depend on government subventions and often lack strategic partnerships and diversified revenue channels. These financial limitations impede critical investments in research infrastructure, laboratories, ICT systems, and faculty development. This contrasts with world-class universities, which usually leverage endowments, research grants, and collaborations with industries to advance their institutional objectives. Internationalization remains another critical component in the world-class university agenda. Institutions of global standing actively promote academic mobility, dual degree programs, foreign faculty appointments, and participation in international consortia.

World-class universities also serve as hubs of innovation, contributing to technological advancements and societal transformations. This gap continues to reflect in the poor showing of Nigerian universities in global rankings. Through science parks, research incubators, and collaboration with industries, these institutions translate academic research into viable commercial solutions. Conversely, Nigerian universities are often described as “ivory towers” disconnected from industry realities. Odu and Anaba (2020) stressed that without proactive efforts to strengthen research and development (R&D) systems in Nigerian universities, the dream of achieving world-class status may remain elusive. Furthermore, quality assurance mechanisms play a pivotal role in world-class institutions. These include internal self-assessment systems, peer reviews, accreditation processes, and performance-based funding. As emphasized by Ekanem and Obasi (2018), while Nigeria has established national quality assurance bodies such as the National Universities Commission (NUC), their effectiveness is sometimes compromised by political interference, inadequate monitoring, and resource constraints. This leads to inconsistency in academic standards across universities in the country. The realization of world-class university ideals in Nigeria requires not just aspirations but deliberate systemic reforms. These include strengthening leadership, enhancing funding models, promoting

international collaborations, and revitalizing quality assurance systems. As observed by Ibe and Uzochukwu (2022), achieving this transformation demands commitment at institutional, governmental, and societal levels to reposition Nigerian universities as globally competitive centers of learning and innovation.

Service Delivery in Higher Education

Service delivery in higher education refers to the systematic provision of academic and non-academic services that facilitate effective learning, teaching, research, and the overall development of students and staff. These services span a wide range of institutional functions including curriculum delivery, student administration, infrastructure provision, ICT support, library services, academic advising, and campus health services. In the modern university system, service delivery constitutes a central pillar upon which the quality of education and stakeholder satisfaction rest. It encapsulates the responsiveness, efficiency, and reliability with which universities meet the needs of their internal and external clients. University scholars like Onuoha and Eze (2020) affirm that service delivery within the academic context is primarily measured by the quality of instruction, access to academic resources, timely feedback on assessments, student engagement, and administrative support.

These academic services are further complemented by non-academic aspects such as accommodation, campus safety, counselling, and extracurricular opportunities, all of which contribute to the holistic development of the student. Institutions that emphasize excellence in these dimensions are more likely to attract and retain students, faculty, and partnerships. A critical component of university service delivery lies in administrative responsiveness. Umeh and Ibrahim (2019) noted that efficient administrative systems enhance decision-making processes, reduce bureaucratic delays, and improve resource allocation. In many Nigerian universities, however, administrative services are often characterized by inefficiencies, delays in processing academic records, lack of automation, and centralization of authority.

This undermines stakeholder trust and affects institutional credibility. Timely registration processes, seamless communication, and responsiveness to students' needs are essential markers of effective service culture. Student support services are also central to service delivery in higher education. These include orientation programs, academic counselling, mental health services, career guidance, and learning accommodations for students with special needs. According to Abiola (2021), universities that provide comprehensive student support structures witness higher levels of student satisfaction, retention, and success. In Nigeria, however, these services are either underdeveloped or limited to elite institutions. Most public universities lack trained counsellors, structured career centers, or comprehensive mentorship systems.

Quality assurance frameworks are essential for monitoring and improving service delivery. Eze and Amadi (2021) emphasized that regular self-assessments, external accreditations, feedback mechanisms, and benchmarking with best practices are strategies adopted by forward-looking institutions. In the Nigerian context, however, such mechanisms are often reduced to procedural formalities rather than tools for continuous improvement. Strengthening the institutional culture of quality assurance can enhance service delivery and drive competitiveness. Funding remains a determinant of service quality. Adequate financial resources enable institutions to invest in infrastructure, research, personnel, and student welfare. Okoro and Nnaji (2022) pointed out that underfunding in Nigerian universities affects service delivery across all dimensions. Insufficient funds hinder procurement of learning materials, delay

infrastructure maintenance, and restrict staff welfare. For Nigeria to enhance service quality in its universities, sustainable funding strategies such as public-private partnerships and endowments must be institutionalized.

GLOBAL BEST PRACTICES IN UNIVERSITY SERVICE DELIVERY

In the contemporary knowledge-driven economy, universities across the world have undergone transformative changes aimed at positioning themselves for global recognition and relevance. These transformations are largely driven by a commitment to delivering high-quality services in teaching, research, and administration. Globally, higher education institutions that have attained world-class status have consistently demonstrated a strategic orientation towards student-centeredness, technology adoption, international collaborations, and efficient governance structures. The global trend in higher education increasingly favors universities that adapt swiftly to innovation while maintaining strong academic traditions. As nations seek to enhance their education systems, a closer look at how globally recognized universities have sustained excellence in service delivery offers critical insights that can guide reforms in other national contexts. These practices are not merely administrative or procedural but are deeply rooted in a culture of excellence, accountability, and performance benchmarking. For developing countries like Nigeria, understanding and adopting these global patterns can serve as a roadmap toward improving service delivery and achieving the goal of becoming competitive on the global academic stage.

Case Studies of World-Class Universities

Globally recognized universities serve as models of excellence, not only for their academic achievements but also for their outstanding service delivery systems. Harvard University in the United States has long been lauded for its commitment to research, digitized administrative systems, and dynamic alumni engagement. Its adoption of e-governance structures and the seamless integration of academic and non-academic services have contributed immensely to student satisfaction and institutional effectiveness. Adeyemi (2022) observed that Harvard's strength lies in its decentralization of service functions, which allows faculties and departments to function autonomously while aligning with the institution’s broader strategic goals.

The University of Oxford in the United Kingdom provides another compelling example, particularly in its innovative use of technology to support both teaching and research. The university operates under a collegiate system that ensures personalized student support and enhances academic mentoring. As Njoku (2021) noted, Oxford's tradition of academic excellence is sustained by its responsive administrative services and robust quality assurance mechanisms. Similarly, in Singapore, Nanyang Technological University (NTU) stands out for its commitment to innovation hubs, interdisciplinary research, and technology-enhanced learning. According to Onuoha (2023), NTU’s strong linkage with industry and government helps to ensure that its academic programs are aligned with national development goals, thereby boosting graduate employability.

In Africa, the University of Cape Town in South Africa has been praised for its transparency in governance, proactive stakeholder engagement, and structured feedback systems for students. Okebukola (2022) emphasized that Cape Town's success in university service

delivery is tied to its focus on inclusive planning, diversity policies, and student welfare services. These institutions exemplify how service delivery excellence is embedded in institutional culture and supported by enabling policies, technological infrastructure, and continuous assessment. Their ability to maintain high global rankings is a reflection of deliberate strategies that prioritize both academic quality and administrative responsiveness.

Lessons for Nigeria

Adapting global best practices for university service delivery in Nigeria requires a deliberate understanding of local institutional peculiarities, historical development, and socio-political realities. While global institutions such as Harvard, Oxford, and Nanyang Technological University operate within ecosystems of autonomy, innovation, and robust infrastructure, Nigerian universities function within constrained environments shaped by bureaucratic procedures, inconsistent funding, and politicized governance. Hence, borrowing models from world-class universities must be accompanied by critical modifications that address the realities of Nigerian higher education institutions. The success of any adaptation hinges not only on structural reform but also on cultivating an institutional culture grounded in accountability, ethical leadership, and stakeholder responsiveness.

African scholars have emphasized that global frameworks cannot be domesticated wholesale without risking misalignment with national goals and institutional contexts. For instance, Okon (2020) acknowledged that while global models emphasize academic freedom and technological integration, these must be redefined within Nigeria's capacity limitations and socio-political environment. He noted that reforming leadership structures by enhancing internal university governance, providing autonomy to departments, and implementing participatory decision-making frameworks could serve as viable adaptation pathways. Similarly, Abiola (2021) emphasized the need to build human capital and ethical leadership as prerequisites for implementing decentralization and performance-based reforms effectively. These scholars maintain that the quality of leadership within Nigerian universities is central to service delivery improvement, thus requiring leadership development programs that are context-aware and system-responsive.

In the same light, Emeka and Ibrahim (2019) advocated for a localized model that promotes inclusive stakeholder engagement, particularly in planning, budgeting, and evaluating institutional reforms. They observed that student bodies, academic staff unions, alumni, and community leaders often have critical insights that are sidelined in top-down reforms. Additionally, Adeyemi (2022) supported investment in ICT infrastructure tailored to local bandwidth challenges and user accessibility, citing that digitized learning platforms must be adapted to Nigeria's fluctuating power supply and internet limitations. These reflections suggest that sustainable reform in Nigeria's university service delivery must be incremental, participatory, and rooted in national development priorities rather than driven by external imitation.

INSTITUTIONAL REALITIES AND CHALLENGES IN NIGERIAN UNIVERSITIES

In striving toward the benchmarks of world-class universities, Nigerian higher education institutions must contend with entrenched institutional realities that shape, constrain, and sometimes distort the effectiveness of service delivery. These realities span across the domains

of governance, funding, academic freedom, infrastructure, policy consistency, and human capital development. While policies may be in place to drive transformation, institutional culture, bureaucratic delays, internal politics, and leadership inefficiencies often diminish their impact. The structural and operational peculiarities of Nigerian universities create a gap between aspirations of excellence and actual institutional performance. Understanding these realities is crucial for aligning global models with local practices and ensuring that reform efforts do not become superficial replications but transformative interventions.

Governance and Leadership

Governance and leadership within the university system refer to the institutional mechanisms, policies, and leadership structures that guide how universities are managed, how decisions are made, and how responsibilities are distributed among stakeholders. In an ideal structure, university governance ensures transparency, inclusiveness, and responsiveness to internal and external stakeholders, while leadership provides vision, coordination, and the moral will to drive innovation. However, in Nigerian public universities, governance frameworks are often plagued by excessive centralization, slow bureaucratic procedures, and interference from political actors. These challenges not only undermine institutional autonomy but also constrain the capacity of universities to implement decisions timely and efficiently. Okocha (2018) observed that university governing councils in Nigeria, rather than serving as independent strategic bodies are frequently subjected to political influence, with appointments driven more by ethnic balancing and party affiliations than by competence or integrity. This politicization undermines the credibility of the councils and diminishes their capacity to perform critical oversight roles.
Similarly, Adekunle (2019) explained that university leadership in Nigeria is still largely hierarchical and autocratic, where vice-chancellors often operate without robust checks and balances, discouraging inclusive governance and staff participation in decision-making. This leadership style contrasts sharply with the collegial and participatory leadership models found in many world-class universities, where open forums, faculty boards, and student senates play pivotal roles in institutional governance. The absence of streamlined decision-making protocols often results in academic calendars being disrupted, research grants being underutilized, and strategic plans not being implemented as designed. These problems significantly affect service delivery outcomes, particularly in teaching and learning, student support services, and research management. Until governance and leadership structures are reformed to promote meritocracy, accountability, and inclusivity, universities in Nigeria may continue to struggle with delivering efficient and competitive services in alignment with world-class standards.

Funding Constraints and Resource Allocation

Funding in Nigeria's public universities is predominantly sourced through government subventions, internally generated revenue (IGR), and to a lesser extent, interventions from donor agencies and corporate partners. While the Federal Government through the National Universities Commission (NUC) remains the primary financier, these subventions are often irregular, delayed, or insufficient. Internally generated funds typically derived from tuition, consultancies, and commercial ventures, are limited by institutional capacity and policy constraints. In theory, development partners and philanthropic agencies could supplement these

resources, but weak collaboration frameworks, lack of transparency, and bureaucratic bottlenecks hinder sustainable external engagement.

In a report by Ananyi and Onyekwere (2024), the Tertiary Education Trust Fund (TETFund, 2021), it was emphasized that over 60% of capital projects in Nigerian public universities depend solely on intervention grants. While this underscores the relevance of TETFund in sustaining the sector, it also reveals systemic weaknesses in institutional financial autonomy and internal revenue generation strategies. Adeyemi (2022) observed that several universities lack strategic frameworks for boosting IGR, relying instead on unsustainable student-related charges. This funding gap hinders the acquisition of modern teaching aids, ICT infrastructure, and research funding, all of which are hallmarks of globally competitive universities. Moreover, the administrative capacity to manage available resources effectively is often questioned. Igbokwe (2023) stressed that lack of transparency and weak monitoring mechanisms contribute to resource mismanagement and misappropriation in some institutions.

Consequently, even when funds are available, their impact on service quality remains minimal due to ineffective allocation and utilization. Staff development suffers significantly in this environment, as training programs, academic conferences, and research grants are inconsistently funded. This limits both teaching innovation and the capacity for knowledge production, further widening the gap between Nigerian universities and global standards. To achieve world-class status, scholars like Chukwuemeka (2021) argue that universities must implement performance-based budgeting, foster institutional autonomy, and adopt diversified funding models. These reforms would align Nigerian universities more closely with international funding and resource management practices. Until then, the persistent funding constraints and inefficient resource allocation mechanisms will continue to undermine service delivery and diminish Nigeria's prospects of producing globally competitive institutions.

Infrastructure and ICT Deficiency

Physical and digital infrastructure are critical enablers of academic service delivery in any university system. In Nigeria, infrastructural inadequacies have long posed serious setbacks to the realization of effective teaching, research, and innovation. Most public universities are plagued with overcrowded lecture halls, decaying laboratory equipment, unstable power supply, inadequate water supply, and poor access roads, all of which significantly constrain learning environments and service delivery expectations. Furthermore, the digital divide between Nigerian universities and their global counterparts continues to widen, limiting the integration of virtual learning, e-governance, and advanced research capabilities within the system. Scholars such as Chukwuemeka (2021) observed that many institutions in Nigeria operate with obsolete facilities and lack functional ICT centers that can support modern academic functions. According to Chukwuemeka (2021), poor investment in infrastructure is partly due to erratic funding patterns and inconsistent policy execution, which hinder long-term infrastructural planning and maintenance.

Ojo (2021) pointed out that without digitized resource centers, universities in Nigeria cannot implement open access systems, e-library models, or engage meaningfully with artificial intelligence-driven academic tools. Moving forward, Yusuf (2023) recommend a combination of public-private partnerships, targeted ICT intervention grants, and decentralized university autonomy in managing technological investment to bridge these gaps. Such strategies would enhance access, reduce administrative bottlenecks, and enable Nigerian universities to align with

contemporary service expectations. Until these investments are made, infrastructural and ICT limitations will continue to undermine the capacity of universities to deliver academic services efficiently and competitively.

Policy and Regulatory Inconsistencies

Stable policies and coherent regulatory frameworks are essential in guiding university management and academic operations. Unfortunately, Nigerian universities operate within an ecosystem riddled with policy reversals, weak regulatory enforcement, and fragmented oversight responsibilities shared among multiple government agencies. The overlap between bodies such as the Federal Ministry of Education, the NUC, and the TETFund often leads to duplication of mandates, conflicting directives, and slowed policy implementation. This inconsistency has stunted institutional autonomy, limited innovation, and created confusion in executing long-term service delivery strategies. Oluwole (2021) observed that while education reform policies exist, their implementation often lacks continuity, especially during transitions between political administrations. As noted by Onyeka (2021), the NUC's oversight is often limited by bureaucratic inefficiencies and insufficient monitoring capacity, leading to unequal quality standards across institutions. The TETFund, although critical in supporting infrastructural development, operates under tight federal control, which affects the timeliness and equity of its disbursements.

These systemic issues hinder universities from operating with the agility and accountability necessary for quality service delivery. To address these challenges, Igbokwe (2023) advocated for a comprehensive restructuring of Nigeria's regulatory landscape, proposing a unified framework with defined roles, periodic reviews, and stakeholder-driven input. He stressed that unless universities are granted policy stability and operational autonomy, efforts at improving educational quality and governance will remain stifled. In a similar vein, Eze (2024) called for the decentralization of regulatory functions to allow universities manage reforms more independently and responsively. Ultimately, as highlighted by Obasi (2022), the path toward effective policy reform lies in establishing predictable, inclusive, and transparent regulatory structures. These reforms must be informed by empirical data, institutional feedback, and cross-sector collaboration. Through streamlining overlapping policies and promoting regulatory harmony, Nigerian universities would be better positioned to deliver services that are responsive, efficient, and globally competitive.

REFORM PATHWAYS AND TRANSFORMATIVE STRATEGIES

Reform in Nigeria's higher education sector is not just an administrative necessity but a strategic imperative that determines the future direction of national development and competitiveness. For decades, public universities in Nigeria have operated within a rigid framework marred by centralized control, funding inefficiencies, academic disruptions, and leadership crises. These conditions have significantly weakened service delivery, institutional productivity, and global ranking of Nigerian universities. As emerging global economies reshape their higher education systems to prioritize innovation, responsiveness, and performance-based outcomes, Nigerian institutions are now challenged to rethink existing models and adopt transformative strategies that can reposition them for relevance and efficiency. The reform agenda must incorporate institutional autonomy, decentralization of decision-making, improved financial models,

digitization of academic and administrative systems, and strengthened stakeholder engagement. According to several Nigerian scholars, these transformations should be deeply rooted in context-sensitive frameworks that address the peculiar governance, resource, and leadership dynamics facing Nigerian universities. Reform is no longer a question of possibility but of urgency, and how quickly institutions respond to these imperatives will determine their ability to meet national and global demands in the knowledge economy.

Autonomy is not just about independence from external control, but the ability of institutions to govern themselves effectively, make context-driven decisions, mobilize and manage their resources independently, and develop academic programs that respond to societal and market needs. It also involves giving universities the freedom to chart their academic, administrative, and financial paths while holding them accountable for their outputs. Without such autonomy, universities are reduced to bureaucratic extensions of state control, with little room for creativity, competitiveness, and strategic thinking. According to Okebukola (2022), the over-centralization of decision-making processes in Nigeria's university system has severely limited innovation and responsiveness to emerging educational demands. He noted that government agencies, particularly the Federal Ministry of Education and the National Universities Commission (NUC), exert excessive influence over curriculum development, staff recruitment, and funding allocation, thus undermining institutional initiative and flexibility.

In a similar vein, Ojo and Adebanjo (2023) emphasized that participatory governance where university senates, staff, and students are genuinely involved in institutional decision-making has been undermined by government-appointed governing councils, often driven by political patronage rather than merit. This erosion of internal democracy has weakened university governance and constrained reform momentum. Igbokwe (2023) noted that the University of Ghana's policy reforms on academic and financial autonomy enabled the institution to diversify its funding sources, expand postgraduate programs, and improve research output. Similarly, the University of Cape Town's model of autonomous governance, cited by Oboh and Okorie (2021), has facilitated competitive faculty recruitment and enhanced institutional accountability. Drawing from these models, several Nigerian scholars have argued that the Nigerian university system can benefit immensely from a shift towards true autonomy anchored on transparency, internal governance reform, and stakeholder accountability.

Until universities are legally and structurally empowered to act as self-regulating entities, reform efforts will continue to be superficial and unsustainable. As noted by Adebayo and Kalu (2023), many of Nigeria's university laws are outdated and overly restrictive, preventing institutions from engaging in income-generating ventures, entering international collaborations, or independently managing research funds. They proposed legislative reforms to redefine the role of government from a controller to a facilitator of academic excellence. Nigerian universities must therefore embrace a new institutional paradigm that repositions autonomy not as a privilege but as a prerequisite for progress and relevance.

Quality Assurance and Accreditation Mechanisms

Quality assurance is a fundamental cornerstone for maintaining and improving the standards of education within university systems globally. It refers to the systematic processes put in place to ensure that academic offerings, teaching methodologies, administrative support, research outputs, and institutional structures meet pre-defined benchmarks of excellence. In Nigerian universities, quality assurance plays a vital role in sustaining academic credibility and

institutional integrity. It ensures that degree programs adhere to globally acceptable standards and that graduates are equipped with employable skills and competencies. Central to this process are mechanisms such as internal quality audits, curriculum standardization, staff development, and accreditation exercises spearheaded by regulatory agencies such as the National Universities Commission (NUC).

Nigerian scholars such as Nnadi and Chimezie (2019) have emphasized that the NUC's accreditation frameworks serve as the backbone of quality assurance in the country's university system, where institutions are periodically evaluated based on specific benchmarks including staff quality, physical facilities, funding, and governance. Eze and Amadi (2021) further observed that these accreditation exercises not only help in improving transparency but also encourage institutions to embrace academic reforms and capacity development. However, despite the relevance of these mechanisms, many public universities continue to struggle with irregularities in quality assurance due to issues such as underfunding, leadership inefficiency, and political interference in accreditation decisions. Peer review systems, which involve external evaluators assessing academic programs, are another key strategy adopted in Nigerian universities to reinforce internal quality control. According to Okorie and Musa (2019), these systems promote objectivity and cross-institutional learning among Nigerian academics. However, these approaches are often undermined by limited technical competence among evaluators and a lack of sustained follow-up on recommendations.

Comparatively, countries like South Africa and Kenya have demonstrated stronger peer-based quality assurance cultures. For instance, South Africa's Council on Higher Education (CHE) maintains a rigorous institutional audit framework, which, as reported by Obasi (2022), has propelled innovation and continuous improvement within their higher education sector. Unlike periodic or once-off assessments, continuous accreditation demands sustained monitoring, internal evaluations, and a feedback loop between regulatory bodies and institutions. As Onyeka and Adediran (2022) have noted, Nigerian universities are yet to build the institutional capacity needed for this model to thrive, particularly due to gaps in data management, staff accountability, and funding stability. This contrasts with more established systems like Kenya's Commission for University Education (CUE), which leverages digital tools and stakeholder involvement to maintain consistent quality control. The Nigerian system, therefore, needs to prioritize strategic investment in training, digital monitoring, and institutional transparency to elevate the efficiency and reliability of its quality assurance mechanisms.

METHODOLOGICAL DIRECTION

This study employed a qualitative review approach guided by a comparative analysis research design. The qualitative method was chosen to facilitate a deeper understanding of university service delivery within Nigeria's public institutions. Given the complex socio-political and administrative realities of higher education, this design enabled an interpretive exploration of service quality, governance practices, and institutional responses to reform mandates. Qualitative comparative analysis has proven especially valuable in educational policy research, offering insight into how different universities interpret and implement service delivery strategies. Nwosu and Eke (2019) demonstrated that such methods are effective for unpacking administrative dynamics, especially in systems influenced by inconsistent funding, leadership instability, and weak regulatory frameworks. Their study highlights the importance of a flexible, context-sensitive research approach in capturing the lived realities and institutional constraints affecting

service provision. This methodological orientation thus allows the current study to draw meaningful comparisons, highlight institutional gaps, and propose reform pathways that are both practical and rooted in Nigeria's higher education context.

PROPOSED FRAMEWORK FOR ENHANCING SERVICE DELIVERY

In the setting of Nigerian public universities, the persistent challenges hindering effective service delivery, which ranges from leadership inefficiencies and poor infrastructure to inadequate ICT application and weak quality assurance mechanisms, underscored the urgent need for a tailored conceptual framework. A well-articulated model not only provides a structured guide for institutional reform but also aligns policy initiatives with contextual realities. The proposed model emerges from the understanding that Nigerian universities function as complex systems comprising multiple interrelated components, each influencing institutional performance and public trust. This inclusive approach fosters collective ownership and responsiveness to diverse interests, a critical feature often missing in Nigerian university reforms. Through this conceptual illustration, the proposed framework becomes robust, contextually valid, and adaptable.

The Proposed Systems-Based Framework for Enhancing Service Delivery in Nigerian Public Universities presents an integrated and dynamic model that reflects the interconnectedness of five critical components: governance and participatory leadership, strategic and equitable funding mechanisms, ICT infrastructure and process digitization, human resource development and staff motivation, and quality assurance and continuous improvement. At the core of the model lies *Institutional Learning and Innovation*, which functions as the engine room of adaptive transformation, enabling the university system to continuity in response to internal feedback and external demands.

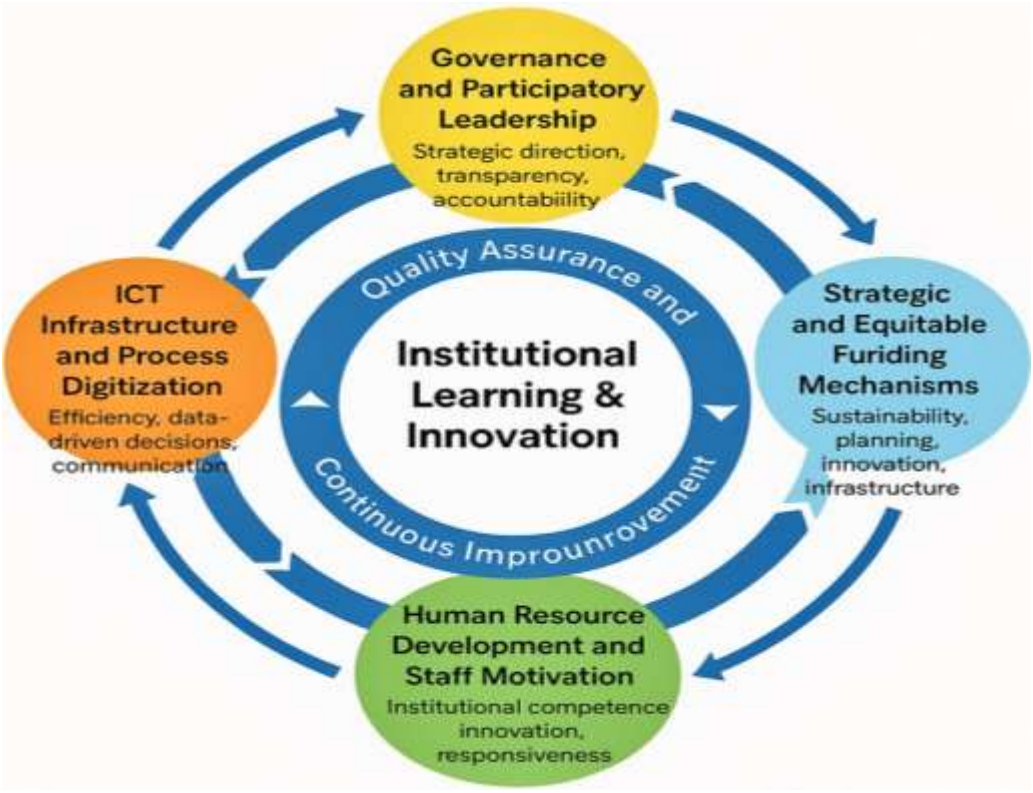

Figure 1: The Making of World-class University Learning and Innovation Framework

Each component is deliberately positioned within a circular and interdependent structure to emphasize its mutual reinforcement with others, and to reject the notion of isolated reform. Governance, placed strategically at the top-left quadrant of the circle, acts as the steering function, setting strategic priorities and fostering participatory decision-making, while directly influencing budgetary frameworks, ICT policies, staff development directions, and quality protocols. Adjacent to governance is funding, designed as a foundational pillar that sustains all other sectors, linking directly with HR training, ICT investment, and quality assurance financing. Governance and funding, together serve as the institutional backbone that drives direction and sustainability.

On the opposing axis, ICT infrastructure and process digitization serve as a cross-cutting enabler that permeates every facet of institutional operations. With connecting arrows flowing into and from all other components, ICT enables digital governance tools, supports transparent financial systems, facilitates virtual learning environments, and provides the platform for real-time quality monitoring and staff development delivery. Human resource development, located in the lower-left quadrant, represents the operational muscle of the framework – where trained, motivated, and well-equipped academic and administrative personnel drive innovation, responsiveness, and quality outcomes. At the outer ring of the entire framework lies quality assurance and continuous improvement, forming a feedback loop that governs every other element through assessment, evaluation, and data-driven reforms. This loop connects to institutional learning at the center, emphasizing that feedback is not terminal but rather reinvested into the system through adaptive strategies and innovation. The strength of this framework lies in its systemic orientation where change in one area creates ripple effects across others, thus ensuring holistic transformation, policy coherence, and sustainable enhancement of service delivery in line with global best practices tailored to Nigeria's institutional realities. This model thus offers a practical, adaptive, and data-driven guide for achieving world-class university service delivery in Nigeria.

AREAS FOR FURTHER RESEARCH

While considerable progress has been made in understanding the complexities of service delivery reforms within Nigerian public universities, several underexplored dimensions present promising opportunities for further research that can inform both national and global higher education reform discourses. One critical area warrants longitudinal inquiry into the impact of institutional autonomy on governance effectiveness, academic performance, and innovation continuity. Despite increasing advocacy for greater autonomy in university governance, extant studies remain predominantly prescriptive, often lacking the empirical depth needed to evaluate long-term outcomes or identify institutional variances in response to autonomy reforms. This gap underscores the need for evidence-based, multi-year studies capable of tracing policy-to-practice linkages and institutional behavior over time. Additionally, significant disparities persist in the integration and effectiveness of Information and Communication Technology (ICT) across Nigeria's geopolitical regions, highlighting a need for regionally disaggregated analyses that examine contextual factors such as infrastructure availability, funding inequities, cultural dynamics, and policy commitment.

Emerging models of ICT readiness that account for local nuances could offer valuable insights for targeted digital transformation strategies. Comparative leadership studies within African higher education systems particularly between Nigerian universities and their counterparts in countries like South Africa and Kenya could also contribute to developing adaptive governance models that are contextually appropriate yet globally relevant. Investigating leadership competencies, accountability systems, and institutional culture across similar socio-political environments can uncover actionable governance frameworks. Furthermore, integrating robust student feedback mechanisms into institutional planning and quality assurance systems represents a largely untapped opportunity for real-time, stakeholder-informed reform. While student surveys are often administered, few institutions systematically assess or act upon the data to influence service design and policy adjustments.

Future studies should therefore examine the effectiveness, responsiveness, and institutional uptake of student-generated insights. From a methodological perspective, future inquiries would benefit from adopting mixed-method research designs that combine large-scale quantitative trend analysis with qualitative approaches such as institutional ethnographies, in-depth stakeholder interviews, and performance audits. This triangulation would allow for a richer, more nuanced understanding of the institutional realities that shape reform outcomes. Through advancing these areas of inquiry, scholars can contribute to the development of context-sensitive, evidence-informed, and scalable strategies that not only deepen academic engagement but also promote sustainable transformation in higher education service delivery across Nigeria and the broader Sub-Saharan African countries.

CONCLUSION

This article has extensively explored the core pillars influencing service delivery in Nigerian public universities, revealing how the interplay of decentralized governance, sustainable funding structures, visionary leadership, enhanced infrastructure through public-private partnerships, and innovation-led academic and administrative systems contribute significantly to institutional efficiency and academic quality. Through a synthesis of reform pathways and empirical models, the review established that leadership capacity, institutional autonomy, ICT integration, and quality assurance are not stand-alone variables but mutually reinforcing components that must be systemically aligned to ensure effective and responsive service delivery. Conclusively, the findings affirm that aligning institutional strategies with global best practices while remaining grounded in Nigeria's socio-political and academic realities offers a transformative path for achieving resilient, accountable, and globally competitive university systems.

Recommendations

To ensure meaningful reform and sustainable impact in service delivery within Nigerian public universities, the following policy-oriented recommendations are directed at key institutional actors:

- University governing councils should pursue decentralization of governance by exercising full statutory autonomy in academic and administrative decision-making to foster contextual relevance and institutional innovation.

- Federal and state ministries of education should implement performance-based funding models that allocate resources according to measurable outputs in research productivity, teaching quality, and graduate employability.
- Public-private partnership regulatory agencies should provide structured incentives such as tax holidays and investment protection to encourage private sector involvement in campus infrastructure, tech incubation, and research collaborations.
- University management teams should institutionalize academic staff development schemes that support continuous training, conference participation, sabbaticals, and mentorship opportunities to improve professional capacity and retention.
- The National Universities Commission (NUC) should enforce ICT policy compliance across universities by mandating the full automation of admissions, examinations, and administrative services backed by regular digital audits.

SKILLS FOR INNOVATIVE THINKING AS REMEDY TO EFFECTIVE ADMINISTRATION IN PUBLIC UNIVERSITIES IN NIGERIA

Bekwele Darlington OGOLOMA
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

The administration of public universities in Nigeria is often hindered by bureaucratic inefficiencies, resource limitations, and resistance to change. To address these challenges, innovative thinking has emerged as a critical tool for improving governance, decision-making, and service delivery in higher education institutions. This paper focused on the essential skills required for innovative thinking, such as technological literacy, innovative resource management, creativity, critical and problem solving, adaptability and data driven decision-making. These skill were observed to be very vital to effective administration, integrating these skills into university administration, leaders foster a culture of innovation, enhance institutional efficiency, and drive sustainable development. The paper highlighted the importance of digital literacy, collaboration, and proactive leadership in ensuring that universities remain responsive to evolving educational demands. Innovative thinking is a fundamental solution to improving administrative effectiveness in public universities in Nigeria, which is achieved by embracing creativity, adaptability, and problem-solving, university administrators can overcome traditional challenges and implement strategies that enhance operational efficiency and institutional growth. A culture of innovation fosters responsiveness to changing academic and societal needs, ultimately improving the quality of education and governance in higher institutions. Among others, the paper suggested that Universities should provide training programs to equip administrators with innovative thinking skills that can bring about effective administration in public universities in Nigeria.

Keywords: Skills, Innovation, Thinkers, Effective, Administration.

INTRODUCTION

The rapid increase in knowledge and technological advancement globally has called for concern and a need for educational leaders to improve drastically on their administrative competencies and skills. Today's educational leader is dealing with complex issues on a daily basis and economic realities are forcing the educational administration to become more creative and innovative to enable them meet up globally. Innovation plays a crucial role in enhancing the effectiveness of administration in public universities in Nigeria. As higher education institutions

face challenges such as bureaucratic inefficiencies, resource constraints, and the need for digital transformation, fostering innovative thinking among administrators becomes essential.

Innovative leaders are creative thinkers who are able to generate creative ideas that become the basis of innovation in the school system Innovation administration in improving the quality of education is an effort to influence the students' academic and nonacademic performance at all levels. It can be done if there is readiness to change, because of the innovation itself requires passion and interest to new ways of managing educational activities. When viewed from the organization/institution of the school, the administration position of the principal is very important, the effects of the implementation of roles and duties will affect all aspects of school organizational life. Leaders need innovative administration skills as they learn to operate in challenging and unpredictable circumstances. In addition, they need to create an environment for innovation within the school setting.

However, education as a concept is the bases for of every aspect of life, for quality education today, there is need for innovation in the area of pedagogy. For innovation to take place in schools, there is need for innovative administration techniques that can be used to influence the administrative effectiveness.

Innovative ideas emerge as a result of research findings from research institutes. Innovation is defined as incremental, radical and revolutionary changes in thinking, products, processes or organization (Akomolafe, 2011). In the view of Oteh and Akuma (2011), innovation is a decisive operation carried out with a view to introduce a given change to be accepted and used. It is the process whereby, a new product is made available, spread through the system and infused into other operatings practices. Innovation is therefore, a change that is deliberate, purposeful and can be on a small or large scale. It is a departure from an existing practice that can be sustained for some time, and is situational and relevant to a group in time or place. Innovation is very necessary in education institutions, because of the dynamic nature of knowledge. Knowledge is constantly growing and changing. There is knowledge explosion especially in the area of science and communicative technology. New scientific discoveries have rendered much of the existing knowledge obsolete. In the field of education, there have been new approaches to teaching, like team teaching, micro teaching, individualized instruction and computer assisted instruction among others. Since one of the functions of education is to expose learners to worthwhile and authentic knowledge, innovations help to fulfill such (Oteh & Akuma, 2011).

Innovation has facilitated and promoted educational media that can facilitate teaching and learning and research presentations. Many software and hardware media are now available in the market. Whenever there are new researches, innovation helps in using the findings to expose learners to problem-solving situations. Key skills such as problem-solving, adaptability, critical thinking, creativity, and strategic decision-making enable university leaders to implement policies and processes that improve governance, resource management, and academic excellence. This paper explored how cultivating these skills can serve as a remedy for improving administrative efficiency, ensuring sustainable development, and promoting excellence in public universities in Nigeria.

THEORETICAL CONSTRUCT

Diffusion of Innovation Theory (DOI)

Diffusion of Innovations was propounded by Rogers in (1962). The theory states that technology and fresh ideas are transcultural. According to Rogers, diffusion is the process by which an innovation is disseminated over time among the individuals within a social system through certain routes. There are four primary factors that affect how quickly a new idea spreads: invention, communication routes, time, and a social system. This procedure is very reliant on human resources. To perpetuate itself, the innovation needs to be extensively used. There is a point where an innovation hits critical mass within the rate of adoption.

When highly regarded persons, such as academic and non-academic administrators using the recent skills to manage administrative and instructional affairs within a social network like schools in Nigeria, adopt an innovation, it has reached critical mass. Rogers noted that central to this discourse is a process that is essential to this notion. Knowledge, persuasion, choice, implementation, and evaluation are the five (5) processes that people go through while accepting an idea. If the innovation is used, it spreads through numerous routes of communication. Communication rarely involves a scientific evaluation of the concept; instead, subjective opinions about the innovation affect its spread. During communication, the idea is rarely evaluated from a scientific standpoint, rather, subjective perceptions of the innovation influence diffusion. The process occurs over time. Social systems determine diffusion, norms on diffusion, roles of opinion leaders and change agents, types of innovation decisions, and innovation consequences.

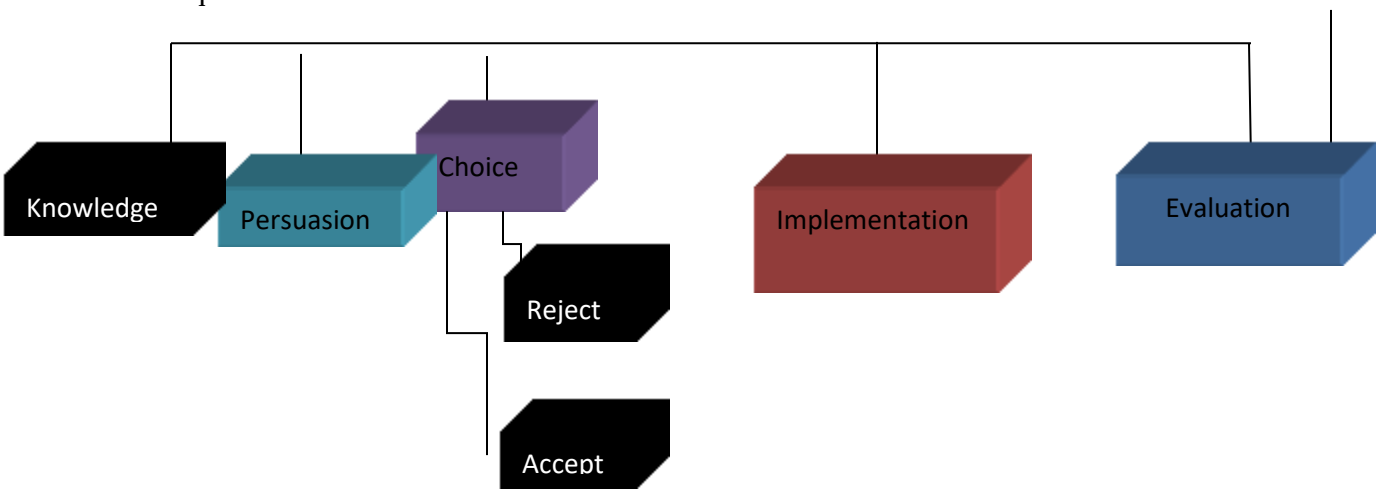

Figure 1: Five stages in the decision innovation process. Adapted from Rogers (1962) Knowledge.

Five stages in the Decision Innovation process adapted from Rogers (1962) Knowledge is the stage the individual is first exposed to an innovation but lacks information about the innovation. During this stage of the process the individual has not been inspired to find more information about the innovation. Persuasion is the stage the individual is interested in the innovation and actively seeks information/detail about the innovation.

The stage of choice is when a person considers the idea of the change, assesses the benefits and drawbacks of utilizing the innovation, and decides whether to adopt or reject the

innovation. Rogers emphasized that this level is the most challenging to collect scientific information because of its individualistic nature. The stage of implementation is when a person uses the innovation to a different extent depending on the circumstance. During this phase, the person assesses the innovation's utility and may look for more details about it. The choice to keep employing the invention is finalized at the confirmation step. This stage, which is both intrapersonal and interpersonal, validates the group's choice.

The relevance of this theory to the study is that the Innovation Diffusion Theory is crucial for understanding how the adoption and spread of innovative thinking skills can occur within the context of educational administration in Nigeria. This theory, proposed by Everett Rogers, provides a framework that allows us to explore the patterns, influencers, and challenges associated with the integration of innovative practices. The theory further guides the study by shedding light on how leaders within public universities in Nigeria adopt and embrace innovative thinking skills. It acknowledges the presence of diverse adopter categories, from innovators to laggards, emphasizing the importance of recognizing these different groups to tailor strategies that facilitate the acceptance of innovative practices.

CONCEPTUAL CLARIFICATIONS

Innovative Thinking Skills

In the educational landscape of Nigeria, the cultivation of innovative thinking skills is crucial for effective administration. According to Adebayo et al. (2021), innovative thinking skills encompass a range of cognitive abilities and attributes that empower leaders to approach challenges in creative and forward-thinking ways. These skills are imperative for navigating the complexities of the educational system in Nigeria and preparing students for the demands of a rapidly evolving future.

In the Nigerian context, educational leaders such as Adeolu Ogunbanjo and Funke Opeke have emphasized the significance of innovative thinking skills in addressing the unique challenges faced by educational institutions. Ogunbanjo, in his role as a school principal, advocated for fostering a culture of adaptability and creativity among both educators and students (Ogunbanjo, 2019). Similarly, Opeke, a prominent education consultant, underscores the importance of integrating technology and an entrepreneurial mindset into the educational framework to nurture innovative thinking among learners (Opeke, 2020).

As observed by Ezeani and Adekola (2018), the Nigerian education system is undergoing transformative changes, necessitating leaders to possess adaptive and innovative thinking skills. The authors argue that leaders like Chinwe Obi, who spearheads curriculum reforms in Nigeria, play a pivotal role in integrating innovative thinking skills into the educational agenda. Obi's efforts focus on curriculum adjustments that promote critical thinking, problem-solving, and creativity among students, aligning with the broader goal of preparing them for a dynamic future (Ezeani & Adekola, 2018).

Moreover, Oluwatoyin Ogundipe, a university vice-chancellor, emphasizes the importance of innovative thinking skills at the level. Ogundipe advocates for a paradigm shift in teaching methodologies, encouraging faculty to adopt innovative approaches that enhance students' ability to think critically and adapt to changing global landscapes (Ogundipe, 2022). The society today is in a state of continual change. The educational institutions are also changing; the old learning, skills, methods, attitudes, equipment and instructional materials are

getting obsolete, or inadequate. Administrators therefore need to constantly adapt and adopt changing trends in order to be relevant and fit to produce self-reliant, proactive and refined graduates.

Imogie (2014) defined innovation as any idea, practice or object which is perceived as new. The synonymous nature of the words: innovation and change is inextricable except for the direction of the change process. The former is a change in the direction of new behaviours while the latter is an adaptation of old behaviours. However, both words are used interchangeably in this research. Ogunkunle (2002) described innovation as a process through which techniques and approaches are introduced into existing ones. This implies a change modification or improvement of a greater system or practice with the aim of a greater and better output which gives rise to innovation. In line with the above thought, Ukeje, Okorie and Nwagbara in Ajuonuma et al. (2015) posited that educational change is any alteration in the existing trends, in terms of goals, inputs, process, policies, practices and instructional procedures. Notable in the above is the adaptation of old practices and ideas to fit new demands, ideas, practices and society.

Educational innovations

Educational innovation is a positive type of educational change that seeks improvement in the existing status quo as posited by Agabi (2002). Innovations in education are designed to modify and better some features of the educational system. The aim of educational change and innovation is to improve the quality of the educational system. A change that is well planned result to an effective and improved system that is relevant to societal demands. It is on this premise that Adepoju (1999) posits that for growth and development to be recorded, reform and innovations are prerequisite.

Babalola and Ayeni (2009) defined innovation as purposeful, organized, risk taking change introduced for the purpose of ensuring efficiency and increased productivity. It is also seen as an invention, which involves creation of something new (Mkpa & Izuagba, 2012). In education, when a new thing is created, it means that new ideas, policies, practices and changes which may come in tangible or intangible forms are introduced. When innovation/change is introduced into the educational system to alter previous set-ups, then the members of that system will either accept or reject such innovations.

The need for innovations in education cannot be over-emphasized. It is needed to improve on the standard of education to meet up with global expectation. Earlier educational technologies are becoming obsolete and unable to meet with global educational demands. New things must be added, while the old ones improved upon in order to keep pace with the sporadic technological drive. The poor performance of students, youth unemployment, population growth, high rate of insurgency and a host of others, calls for new ideas, structures and operational strategy in the school system.

Various factors militate against educational innovations in Nigeria. Alabi and Okemakinde (2010) highlighted some of these factors as: social, cultural, political, economic and technological factors. In the same vein, Amanda (2006) listed organization culture, perceptions of stakeholders, absence of follow-up and support as some of the barriers to innovation. Innovation is therefore the propelling force towards development in any system. As Amanda (2006) succinctly puts it that educational practices and the structures that supports them must change in order to ensure that the citizens of the future. Our school children of the present can

exist and grow in a world characterized by change, healthy and engaging environment for teaching/learning to thrive.

Effective Administration in Higher Education

Higher education institutions are established and run based on "departmental model". The administration position at the departmental level is tenured. Every decision concerning faculty members (academics) ranging from promotion, compensation, discipline, etc. is initiated at the departments, and departments compete for resources allocation from the university (Sirvanci, 2004). In addition, leaders at the academic departments are indispensable for smooth running of institutions of higher education (Jones et al., 1996). Thus, academic responsibilities or positions are requisite tools for the smooth running of a university. Administration is greatly reckoned with in this context. It is contended that the accomplishment of institutions of higher education is largely influenced by effective administration; thus, the need to match the needs of organizations with capabilities of human resource in academia (Bisbee, 2007; Rowley et al., 2006).

Effective administration practices is a subject of great importance and interest. It encompasses the capacity to inspire, guide, and exert influence on others in order to collectively attain shared objectives. The concept encompasses the utilisation of specific attributes, competencies, and conduct that contribute to the achievement of individuals, groups, and institutions. According to Avolio and Yammarino (2002), their study posited that effective administration practices encompasses various essential dimensions, such as transformational administration, ethical administration, and servant administration. The concept of transformational administration centres around the notion of inspiring and motivating individuals to realise their maximum capabilities and surpass their personal objectives (Bass, 2015). The concept of ethical administration places significant emphasis on the crucial role of ethical conduct, integrity, and fairness in both the decision-making procedures and actions undertaken by individuals (Brown et al., 2005). The concept of servant administration, as expounded by Greenleaf (2017), revolves around the principles of selflessness and a sincere dedication to fulfilling the needs of others.

The association between effective administration practices and positive outcomes has been observed in both academic and organisational settings. According to a study conducted by Judge and Piccolo (2004), there exists a positive correlation between effective administration practices and employee satisfaction, commitment, and job performance. Moreover, Avolio et al. (2009) have conducted studies that establish a correlation between effective administration practices and organisational innovation, adaptability, and overall success.

The effectiveness of various administration styles and approaches is contingent upon the specific circumstances and the requirements of the individuals being led. The situational administration theory, as proposed by Hersey and Blanchard (1969), posited that the effectiveness of administration is dependent on the interplay between the behaviour of the leader and the level of readiness or maturity exhibited by the followers.

It is crucial to acknowledge that although research provides support for effective administration practices practices, the field continues to engage in ongoing exploration and debate. The effectiveness of administration approaches can be influenced by various external factors, including organisational culture, industry context, and individual differences.

The implementation of effective administration practises significantly contributes to the improvement of employee job satisfaction. The demonstration of specific qualities and

behaviours by leaders contributes to the establishment of a favourable work environment that promotes employee satisfaction and engagement. Bass (2014) has identified several key ways in which effective administration practices serve as a tool to promote employee job satisfaction:

- Supportive Communication: Effective leaders place a high value on fostering an environment of open and transparent communication with their subordinates. The individuals in question engage in active listening, offering feedback, and ensuring the timely and transparent dissemination of information. The practise of open communication promotes the development of trust, facilitates deeper comprehension, and positively impacts the level of employee contentment.
- The Role of Empowerment and Development in Administration: Competent leaders facilitate the provision of opportunities for employee empowerment and development. The organization facilitates the professional development of its employees by offering training programmes, mentorship opportunities, and engaging them in challenging assignments. Leaders demonstrate their appreciation for their employees by making investments in their professional development, thereby fostering higher levels of job satisfaction and engagement.
- The acknowledgment and valuation of employees' contributions and accomplishments are key attributes of effective administration. The individuals in question offer constructive feedback that is affirming, recognise outstanding achievements, and foster an environment that values and acknowledges contributions. The act of acknowledging the efforts and contributions made by employees has been found to have a positive impact on job satisfaction, motivation, and overall morale.
- Autonomy and the inclusion of employees in decision-making processes are key factors in effective administration, as leaders delegate suitable levels of autonomy to their subordinates and actively involve them in decision-making. Leaders can foster a sense of ownership and enhance organisational satisfaction and commitment by offering opportunities for input and involving employees in the decision-making process.
- The facilitation of team collaboration and support is a key aspect of effective administration, as it fosters an environment that encourages cooperation and provides assistance to team members. The organisation promotes collaboration, cultivates favourable interpersonal connections among staff members, and establishes a feeling of inclusivity. The implementation of collaborative endeavours and the cultivation of a culture that emphasizes teamwork have been found to enhance job satisfaction and foster a favourable work environment.
- The significance of work-life balance is recognised by effective leaders who provide assistance to their employees in attaining it. The organisation actively supports flexible work arrangements, implements well-being initiatives, and places a high priority on the holistic health and happiness of its workforce. The prioritization of work-life balance has been found to positively impact job satisfaction and employee retention.
- The promotion of fairness and equity is a key focus for effective leaders within the workplace. The primary objective of ensuring consistent application of policies and practises is to maintain impartial treatment of employees. Fairness and equity play a crucial role in fostering a positive work environment and augmenting employee job satisfaction.

Effective administration practises play a crucial role in fostering employee job satisfaction. However, it is imperative to acknowledge that job satisfaction can also be impacted by various other factors, including salary, organizational culture, and work-life balance. Leaders should take into account the complex and diverse aspects of job satisfaction and proactively address these additional factors.

Skills for Innovative Thinking as Remedy to Effective Administration in Nigeria

Innovation plays a crucial role in enhancing the effectiveness of administration in public universities in Nigeria. The following are some key innovative thinking skills that serve as remedies to effective administration in public universities in Nigeria:

Technological literacy as an Innovative Skill

Technological literacy, as a crucial innovative skill, plays a pivotal role in shaping the educational landscape of Nigeria. Scholars and educational leaders alike underscore the significance of technological literacy for both educators and students, emphasizing its transformative impact on teaching, learning, and overall educational outcomes. Okonkwo and Ogunmakin (2019) provided a comprehensive definition of technological literacy, highlighting its multifaceted nature. They describe it as the ability not only to use technology but also to comprehend and evaluate its implications for various aspects of life, education, and society. This comprehensive understanding aligns with the evolving demands of the 21st century, where technology is deeply interwoven into every facet of our lives.

Adebanjo (2018), an advocate for educational technology and digital transformation, emphasizes the need for educators to possess technological literacy skills. Adebanjo argues that technological literacy is not merely about incorporatings gadgets into classrooms but entails a deeper understanding of how technology can enhance pedagogical approaches and engage students meaningfully (Adebanjo, 2018).

Within the global economic context, leaders like Ngozi Okonjo-Iweala have also acknowledged the crucial role of technological literacy. As an influential economist, Okonjo-Iweala stresses the importance of technological literacy in preparing the Nigerian workforce for a technology-driven global economy. Her insights echo the broader societal impact of technological literacy, emphasizing its role in fostering economic development and global competitiveness (Okonjo-Iweala, 2021).

At the university level, leaders such as Olufemi Peters, serving as a vice-chancellor, recognize the transformative power of technological literacy in higher education. Peters advocates for the integration of technology into academic programs, ensuring that graduates are not only proficient in using technology but also possess a deep understanding of its applications in their respective fields (Peters, 2020). Moreover, education consultant with expertise in technology integration, provides nuanced insights into the essence of technological literacy. Ayeni argues that technological literacy goes beyond surface-level skills, emphasizing the importance of understanding the broader implications of technology for education, problem-solving, and societal development (Ayeni, 2019).

Technological literacy stands as a cornerstone in the arsenal of innovative skills for educational leaders in Nigeria collectively advocate for a holistic approach to technological literacy, one that goes beyond basic technical skills and encompasses a deep understanding of

technology's multifaceted impact on education and society. As Nigeria continues to navigate the challenges and opportunities presented by the digital age, technological literacy remains a linchpin for shaping a future-ready educational system.

Innovative Resource Management Skill

In the dynamic landscape of education in Nigeria, the innovative resource management skill has emerged as a critical competency for educational leaders. This skill encompasses the ability to strategically and creatively allocate, utilize, and optimize available resources to enhance the educational experience and outcomes. Scholars and educational leaders alike emphasize the importance of innovative resource management in addressing the challenges posed by resource constraints and fostering sustainable development within educational institutions.

Okebukola (2017) asserted that innovative resource management is essential for navigating the resource challenges faced by educational institutions in Nigeria. In the context of limited financial resources, Okebukola argues that leaders must exhibit innovative thinking in identifying alternative funding sources, exploring cost-effective solutions, and maximizing the impact of available resources on educational outcomes. Adeniran and Adeyemo (2019) delved into the intricacies of innovative resource management in the Nigerian educational context. They emphasize the need for leaders to adopt a proactive and forward-thinking approach to resource utilization, incorporatings innovative financial models and exploring collaborations with external stakeholders to mitigate resource constraints.

Leaders such as Funmi Afolabi, a school administrator known for her innovative resource management practices, exemplify the practical application of this skill. Afolabi advocates for a holistic approach that goes beyond financial considerations, incorporatings innovative strategies for leveraging human capital, technology, and community partnerships to enhance the overall educational environment (Afolabi, personal communication, 2022). Moreover, the role of technology in innovative resource management cannot be overstated. Scholars like Salami (2020) highlight the transformative potential of technology in optimizing resource use. Educational leaders are increasingly leveraging digital tools for efficient data management, communication, and decision-making, thereby enhancing their ability to manage resources innovatively.

In the education sector, leaders like Adamu Adamu, the Minister of Education in Nigeria, recognize the need for innovative resource management to address the challenges facing universities. Adamu emphasizes the importance of exploring innovative financing models, engaging in public-private partnerships, and leveraging technology to optimize resource allocation and utilization (Adamu, 2018).

The innovative resource management skill is integral to the sustainable development and success of educational institutions collectively underscores the significance of adopting innovative approaches to resource management. As Nigeria seeks to overcome resource constraints and enhance the quality of education, the cultivation of innovative resource management skills among educational leaders becomes imperative for building resilient and adaptable educational institutions.

Problem-solving as an Innovative Skill

Problem-solving is a fundamental and integral aspect of innovation, and its significance in various fields, including education, has been extensively explored in the literature. This literature review synthesizes key insights from scholarly works that discuss problem-solving as an innovative skill, examining its role in different contexts and the strategies employed for its development. Problem-solving is often described as the capacity to identify, analyze, and develop effective solutions to challenges or obstacles (Jonassen, 2011). In the educational context, it is considered a critical skill that fosters creativity, critical thinking, and adaptability (Dewey, 1933). According to Barron (2003), problem-solving involves not only finding solutions to well-defined problems but also navigating complex and ill-defined situations.

Educational scholars emphasize the importance of integratings problem-solving into curricula to prepare students for the challenges of the modern world. In a study by Hmelo-Silver (2004), problem-solving is positioned as a central component of inquiry-based learning, enhancing students' ability to construct knowledge, engage in critical thinking, and develop innovative solutions. The cognitive processes involved in problem-solving have been explored by numerous researchers. Mayer (1992) identified the key cognitive skills, including representation, planning, execution, and evaluation, which contribute to effective problem-solving. Additionally, the work of Sternberg (2003) introduced the concept of "successful intelligence," emphasizing the importance of analytical, creative, and practical thinking in problem-solving.

Various strategies have been proposed for developing and enhancing problem-solving skills. Jonassen (2011) suggested employing instructional methods that emphasize real-world problem-solving scenarios, allowing learners to apply their knowledge in authentic contexts. Additionally, collaborative learning approaches, as highlighted by Johnson and Johnson (2009), can foster the exchange of diverse perspectives, enhancing problem-solving abilities. The relevance of problem-solving extends beyond the educational setting to the workplace. In a study by D'Zurilla and Nezu (2007), problem-solving is considered a vital skill for effective coping and adaptation in professional environments. Organizations increasingly value employees who can navigate challenges, propose innovative solutions, and contribute to continuous improvement (Garmston & Wellman, 1992). Despite its importance, scholars recognize challenges and barriers to effective problem-solving. Gick and Holyoak (1980) discussed the phenomenon of functional fixedness, where individuals struggle to see unconventional uses for familiar objects. Moreover, social and cultural factors can influence problem-solving approaches (Nisbett et al., 2001), highlighting the need for a diverse and inclusive problem-solving environment.

The integration of technology in problem-solving has gained attention in recent literature. Chen et al. (2005) explored how educational technologies can be leveraged to support problem-solving skills, providing tools and environments that facilitate collaborative problem-solving activities. Researchers have also developed frameworks and methodologies for assessing problem-solving skills. For instance, the work of Ennis (1985) introduced a taxonomy for critical thinking and problem-solving skills, offering a systematic approach to evaluate these competencies.

Problem solving as a process of taking corrective measures to meet objectives and achieve desired outcomes. Innovative problem-solving is the ability to use innovative technology to identify needs and resources to make decisions on the attainment of goals and objectives. Innovative problem-solving competence can have a positive effect on the development of

innovative competences through helping Lecturers identify the correct innovative tools needed to reach their instructional objectives as well as enhance their ability to use innovative tools in order to solve conceptual and technical problems (Iordache, Marien, & Baelden, 2017). In this regard, Ferrari (2013) identified problem-solving competence as the ability to identify innovative needs and resources, make informed decisions on most appropriate innovative tools according to the purpose or need, solve conceptual problems through innovative means, creatively use technologies, and solve technical problems, update own and other's competencies.

This involves the ability to 'synthesize', 'multitasking', 'trans-media navigation', and 'support others in developing innovative competence'. The limited attention given to the latter has been deemed particularly worrisome, as supporting students in developing innovative competence is important in an environment where technology evolves at a fast pace, determining Lecturers to constantly update their skills in order to keep up with innovative changes.

In the view of Temel (2015), problem-solving competence starts with understanding the problem or gaining awareness, and continues with the stages of producing alternative strategies and applying by choosing amongst one of those alternatives. Lecturers can be facilitated to acquire innovative problem-solving competence. To achieve this, Ichao (2015) opined that motivating Lecturers to use innovative technology in delivery the curriculum materials, research, class presentation, lesson notes, students' assessments will improve creativity and innovation in Lecturers. Workshop is a form of training and development organized for the purpose of improving teaching and learning conditions of Lecturers. Ogbonaya (2011) asserted that workshop is a training device used in upgrading professional efficiency of Lecturers to meet curriculum needs. Workshops bring Lecturers together for the purpose of learning new methods of problem solving competence through which skills will be employed for effective implementation of educational policies such as the technological advancement and education in secondary school curriculum.

Data-Driven Decision Making as an Innovative Skill

Data-driven decision-making (DDDM) is a transformative and integral innovative skill that has gained increasing recognition across various sectors. Scholars and practitioners alike underscore the importance of leveraging empirical evidence and data to inform decision-making processes in both business and education. In the business realm, DDDM has become a cornerstone for organizational success. Davenport (2006) emphasized that the integration of analytics transforms traditional business models, enabling organizations to become more agile and responsive to the dynamic landscape of markets. The use of data for decision-making provides companies with a competitive advantage by facilitating informed choices based on real-time insights (Brynjolfsson & McAfee, 2014).

Beyond business, DDDM has found meaningful applications in education. Datnow, Park, and Wohlstetter (2007) delved into how data can be harnessed to drive improvements in teaching and learning outcomes. Educational leaders recognize the potential of data to inform instructional strategies, identify areas for improvement, and enhance overall educational practices. A crucial component facilitating the adoption of DDDM is technology. Chen and Zhang (2014) highlight the instrumental role of data analytics tools and technologies in the DDDM process. These technological advancements empower organizations to collect, process, and analyze vast datasets efficiently, enabling stakeholders to derive actionable insights.

However, the adoption of DDDM is not without its challenges. Scholars and practitioners acknowledge barriers such as data quality issues, privacy concerns, and the need for a cultural shift within organizations (Bughin et al., 2010; Chen & Zhang, 2014). Overcoming these challenges requires a concerted effort to build data literacy among decision-makers and establish robust data governance frameworks.

The literature emphasizes that DDDM is not merely a tool or technology but a transformative skill that shapes decision-making paradigms. Its applications in business and education showcase its versatility, while the role of technology underscores the interconnected nature of data and decision-making processes. As organizations continue to navigate an era of information abundance, the cultivation of DDDM as an innovative skill becomes imperative for ensuring informed, strategic, and impactful decision-making across diverse domains.

Entrepreneurial Mindset as an Innovative Skill

The entrepreneurial mindset is increasingly recognized as a crucial innovative skill, transcending the boundaries of traditional entrepreneurship to influence various sectors, including education, business, and public administration. This literature review delves into scholarly works that explore the concept of the entrepreneurial mindset, its components, and its implications for fostering innovation. The entrepreneurial mindset is characterized by a set of attitudes, behaviors, and skills that drive individuals to identify opportunities, take calculated risks, and create value (Fayolle & Gailly, 2008). This mindset is not limited to business entrepreneurs but extends to individuals across diverse domains who embrace a proactive and innovative approach to problem-solving and opportunity recognition.

In the realm of education, scholars emphasize the importance of instilling an entrepreneurial mindset in students to prepare them for an ever-changing and dynamic future. Neck and Greene (2011) argued that fostering entrepreneurial thinking in educational settings promotes creativity, resilience, and a willingness to take initiative. This perspective aligns with the broader goal of equipping students with the skills needed to navigate uncertainty and contribute meaningfully to society (Martin, 2015).

Within business and management literature, the entrepreneurial mindset is regarded as a key driver of organizational innovation and success. According to Shane and Venkataraman (2000), individuals with an entrepreneurial mindset are more likely to recognize and exploit opportunities, leading to the creation of innovative products, services, and business models.

Additionally, the concept of corporate entrepreneurship highlights the importance of cultivating an entrepreneurial mindset within established organizations to promote intrapreneurship and continuous innovation (Kuratko et al., 2011). The components of the entrepreneurial mindset include creativity, risk-taking, resilience, adaptability, and a proactive orientation (Baron, 2004). Each of these components contributes to an individual's ability to identify opportunities, navigate challenges, and drive innovation. For instance, the work of Liñán et al. (2011) explored the relationship between entrepreneurial mindset and intention, suggesting that individuals with a stronger entrepreneurial mindset are more likely to express intentions to start a business.

In the context of public administration and social innovation, the entrepreneurial mindset is considered instrumental in addressing complex societal challenges. Nicholls (2006) discusses the concept of social entrepreneurship, where individuals apply entrepreneurial principles to create innovative solutions for social and environmental issues. This perspective underscores the

adaptability of the entrepreneurial mindset, showcasing its applicability beyond the business realm.

However, the promotion of an entrepreneurial mindset is not without challenges. Scholars recognize the need for educational and organizational environments that support and nurture entrepreneurial thinking (Peterman & Kennedy, 2003; Neck & Greene, 2011). Additionally, cultural factors, educational policies, and institutional structures can influence the development and diffusion of the entrepreneurial mindset (Fayolle et al., 2006).

The entrepreneurial mindset emerges as a versatile and dynamic innovative skill that transcends disciplinary boundaries. Its impact is evident in education, business, and public administration, influencing how individuals approach challenges, identify opportunities, and contribute to innovation. As societies navigate an era of rapid change and complexity, cultivating the entrepreneurial mindset becomes imperative for fostering resilience, creativity, and a proactive orientation toward innovation across diverse domains.

Education is seen as the leading out of inborn powers and potentials of individuals in a society and the actualization of skills, aptitudes and competencies necessary for self-actualization and for coping with life challenges. Itedjere (2004) saw education as a social and continuous process in an attempt to develop the personality of the child and prepare him for membership of the society.

Education is seen as a means of developing innate skills of learners to enable them thrive and contribute positively to their communities. Emphasizing the importance of education, Ogonor (2019) said education is perceived by many countries as the greatest weapon against poverty, disease and ignorance. The author further observed that many countries have successfully used education to make giant strides in national growth and development. Countries like Finland, Taiwan and China are now regarded as emerging advanced economies as a result of deliberate policy of education as a tool for socio-economic and political development. In recognition of the place of education in national growth and development, Nigeria has taken the initiative and set laudable educational goals and objectives at all tiers of her educational system.

In line with these objectives, the National Policy on Education (FRN, 2013) stressed the need for functional education for the promotion of a progressive and united Nigeria. To this end, school programmes need to be relevant, practical and comprehensive, while interest and ability should determine individual's direction of study. The secondary education follows immediately after the primary school education. It is regarded as the foundation of a child's future career. Its importance is seen
in the dramatic enrolment figures through the years. The attainment of secondary school education holds the key to self-reliance, a decent life and a means to contribute meaningfully to national growth and development.

Innovative Skills Competence

Innovative competencies as the skills and abilities of school Lecturers for using computers to store and retrieve information when needed (Edafiogho, 2007). The increasing complexity of education business and the corresponding pressure on available resources, demand that school administrators should depend on powerful management information systems to achieve effective school management. Innovative skills provides administrators opportunities that enable them to learn and reach out to other sources of administrative knowledge. In fact, according to Edafiogho (2007), as administrators become increasingly information-literate, they develop skills in

processing, interpretation, analyzing and conveying knowledge. He further remarked that innovative skills has the capacity for automatic processes and saves time thereby allowing school administrators to concentrate as well as improve the quality of contact time with staff and students. If administrative functions at schools and other levels of the educational system are to be carried out efficiently and effectively, it is necessary that our educational administrators should be knowledgeable in innovative skills, since no administrator can rise above the level of what he knows. Secondary school Lecturers are expected to have acquired a number of competencies including innovative skills, during the pre-service training. At the moment, innovative skills have brought much challenge to all areas of school administration. And as rightly noted by Association of African Universities (AAU) innovative skills Reports (2005), competency in innovative skills would facilitate administrative activities in staff management, students' administration, finances, assets and maintenance, office activities and communication. In order to perform the duties of a Lecturers effectively, Gurr (2000) and Bishop (2002) pointed out that the Lecturers knowledge and competence in innovative skills is essential.

It therefore can be established that Lecturers have a lot of roles to play in school administration. They require improvement in innovative skills competencies in carrying out these roles. Accordingly, this study identified three key innovative competency areas. These include: computer operational competency, internet/networking competencies and innovative skills safety competencies.

Literacy is the term that is commonly refers to as reading and writing. While reading and writing provides the necessary formation to learning. Access to information in the digital environment has brought about an aspect of Information literacy called the digital information literacy. Supporting this, Jones-Kavalier and Fanning (2008) reported that digital information literacy competence involves reading and understanding how to deal with media to produce digital representation as well as gaining knowledge through digital means. Therefore, this new area of literacy requires skills necessary has come into existence, which requires knowledge. This involves the ability to access and interpret information in digital format through digital manipulation and to evaluate and apply new knowledge gained from digital environment in their instructional delivery.

The management of Lecturers' digital information literacy competence for quality instructional delivery is contingent upon a thorough knowledge of the Lecturers and skills and attitude to effectively integrate digital technologies in their professional practices. The provision of needed digital facilities and judicious use of available digital resources through regular training and retraining of Lecturers will maximize Lecturers' potential to facilitate learning, reinforce access and quick retrieval of digital resources for teaching and learning. The access, storage and retrieval of digital information improve teaching and learning through the improvement on access to learning materials on the internet for their professional development and instructional delivery.

Information literacy skills are set of competences which information users are expected to possess for identifying, accessing, retrieving, evaluating, using, and communicating information resources of all kinds in adherence to principles of information ethics. These skills are essential for stakeholders in the academic environments, be it Lecturers or students. Specifically, the possession of the skills by Lecturers enhances their participation in core academic activities, and facilitates academic productivity and performance among them. The Informative Literacy Group (2018), defined information literacy as the ability to think critically and make balance judgment about any information we find and use. Thus, competence in this sense implies that Lecturers

need set skills, knowledge and ability to identify, locate, retrieve, store, organize and analyze digital information, judging its relevance and purpose. It is concern on how Lecturers can make best use of digital information and to interpret it judiciously for quality instructional delivery. Along with the intent to educate students, Lecturers' digital information literacy competence could help Lecturers to access, search digital information, select digital educational resources using digital environment and evaluating information sources for the purpose of achieving educational goals and objectives.

Jia and Wen (2008) suggested that effective evaluation of information literacy proficiency of the Lecturers and the provision of digital instructional tools offers seemingly endless opportunities for information retrieval, manipulation, creation and organization. Supporting this view, Swinney (2016) asserted that providing Lecturers professional training on the utilization of digital technologies in instructional delivery will reduce Lecturers workloads and ensure a more effective assessment process. Moreover, technology has capability to improve the professional environment for Lecturers. Through the application of internet and internet to research and collaborative planning, Lecturers can connect to both local and external resources for their professional activities rather than relying on the isolating environments that the teaching profession imposed on them in the past. Providing pedagogical training for Lecturers and giving them access to use of emerging digital tools such as, computers, the Internet, interactive whiteboard, mobile phones, iPad among secondary school Lecturers will improve quality of instructional delivery.

Badia et al.(2015) pointed out Lecturers training at this stage should be concerned with common internet tasks of browsing, downloading a file, sending e-mail using instant messaging applications, publishing information on the internet and developing a website. Thus, the skills to use digital technologies that allow Lecturers to work with modern technologies such as computers, smart phones, software applications and databases to realize educational objectives necessary in today's world. It becomes important for education practitioners to acquire the skills to search, store, create and process information and appropriate it critically and systematically, as well as the skills to use the design tools for media information and the capacity to access, search and use Internet-based services. Therefore, Lecturers should develop the competence to choose and use appropriate digital tools in their educational practices and the opportunity to develop digital information literacy competence through in-service training and re-training become a major responsibility of school managers.

Skill as Innovative Administration Techniques

For any administration style to be effective, there is still needs to possess an Innovative Educational Administration skill Set that serves as the foundation for an individual's administration style. According to Joseph and Dan (2014), Innovative administration skill among others is "HELPPSS". The acronym addressed the skills and traits of an innovative leader, thus:

- Heart: is a necessary administration skill that an innovative leader need to enable him /her to pay attention to every school activities and do justice to every situation that is central to education services. It gives the leader a sense of compassion that comes in day to day activities. This skill gives us pause to think for a few moments about individual situations and not lump everything together for the ease of arises. With this skill, democratic administration style will set in that will enable individual to contribute their

creative mind to the progress of the school and in turn, influence the students' academic performance.

- Empathy: another skill identify with an innovative leader is to be emphatic in nature. An innovative leader must have an ability to understand individual and share out of their feelings. How a leader treats people most likely determines how they feel both about the leader and their job. The greatest positive impact on the workers' productivity usually based on the increased attention from their leaders/management (Hawthorne, 2011). This was supported by Jack and Joseph (20114) who found out that a leader who share out of his/ her works are more successful than those that are autocratic in nature as a leader. Joseph and Dan (2014)) further supported this view by concluding that in order for a leader to be innovative, workers must be respected and to have dignity for others which can only be done by creating new things along with the workers.
- Learning: is an essential skill of an innovative administration. It is believe that knowledge is power and continuous learning is necessary to keep up with innovation in pedagogy and technology. As an innovative leader, there must be readiness to learn new things from others and not to be almighty decider. Learning is a continuous thing; therefore, there will be new idea and knowledge that will improve the school system. Attending workshop, seminars, conferences and son on is part of learning that an innovative leader needs in order to input innovation knowledge received on school management to influence both the students academically and the Lecturers on new ways of teaching and learning.
- Passion: passion is an extremely critical skill that cannot be jettison in education system. Joseph and Dan (2014) believed that there is no substitute for passion in any profession. This skill must be acquired by an innovative leader to enable development in school to meet up with the global ideas. To be an innovative leader in education sector, there must be a circle passion for education and must be maintained. Therefore, Passion is a grease to machine for smooth running, with this submission, passion is a credibly important

Administration Structure of Public Universities in Nigeria

Nigerian public universities are governed and regulated by the Federal Ministry of Education (FME) through the National Universities Commission (NUC). NUC is one of the parastatals under the Federal Ministry of Education in Nigeria saddled with the responsibility of overseeing the affairs of Nigerian university system. Politically, an Executive Secretary (ES) of NUC is appointed to oversee the operations of university education in Nigeria. The FME oversees the Nigerian education system irrespective of its status while the NUC is one of the parastatal in the ministry saddled with specific responsibility – overseeing the operations of Nigerian university system ranging from Public universities (federal and state universities), private universities, distance learning centres to approved affiliations in the country (NUC, 2016). The Executive Secretary (ES) of NUC is assisted by several directors that head various departments in the commission.

Nigerian public university Chancellor's position is occupied or rather held by a father figure or a statesman appointed by the visitor(s) which could be federal or State government (for public universities) in Nigeria. The Chancellor is assisted by Pro Chancellor and Chairman of Council. Administratively, the university is governed by the university's executive committee consisting of a Vice Chancellor and two (2) Deputy Vice Chancellors: Deputy Vice Chancellor

(Academic) and Deputy Vice Chancellor (Administration). Following the top echelon is the Director(s) and their Assistant(s) of various centres in the university system. Colleges, faculties and schools are managed by Provosts or Deans who are assisted by their Deputies. Following suit, the Department Heads (HOD)/ Chairs pilot the affairs of departments in the faculty or school. Unlike the Vice Chancellor's appointment, the appointment of departmental Chair is unique in that leaders at this stage are nurtured internally within a given university. It is out of convention to have an external person from other institutions or government organizations to head or chair department in a given university system. In addition, appointment to departmental headship is tenable for a two-year term in the first instance, and subsequently, subject to reappointment by Vice Chancellor(s) if it is appointive or re-election by departmental members if it is elective.

Deanship in university structure is a preserve of the rank of professor among the faculty members; in the absence of a professor in a faculty, the VC can appoint among the faculty members anyone below that rank – associate professor, senior lecturer or lecturer. In other words, the positions of vice chancellor, deputy vice chancellor and dean are basically held by academics who have attained the rank of professorship or an associate professorship. Deputy Dean's position is held by associate professor(s), senior lecturer(s) or lecturer(s) below the ranks mentioned above. And departmental headship is usually held by professor(s), associate professor (s), senior lecturer(s) or lecturer I (s), while positions of director and assistant director of centres are held by professor(s) or associate professor(s) as the case may be.

Adaptable to Change

At the turn of 21st century, administration has been confronted with myriad of challenges owing to the upsurge in ICTs and globalization. Thus, administration in this century particularly in academia ought to be change driven to handle transformations that surround them. Marshall et al., (2000) submits that it is not the strongest of the species that survives, or the most intelligent; it is the one that is most adaptable to change. Therefore, leaders in the academia ought to be adaptable to change in managing university towards resistance and overcoming the challenges. Administration in a university is instrumental in accomplishing organizational objectives. In a bid to do so, adaptive administration is required to bring about change as and when necessary (Randall & Coakley, 2007). In a nutshell, it is contended that the adaptability of academic administration influences the performance of other academics (Hotho et a., 2008; Yoeli & Izhak-Berkovich, 2010).

Competencies

A leader requires competency to discharge the responsibilities attached to the position. The term Competency is analyzed from the perspective of how he/she as a leader conducts him/herself while piloting the affairs of the institution. Competence refers to an act of possessing the requisite expertise to act in a successful manner (Oxford English Dictionary, 2010). Thus, administration presupposes the possession of requisite skills to pilot the affairs of organizations in its entirety. In the same vein, academics require the requisite competencies as well as skills to function as effective leaders. Accordingly, Mclaurin and Al-Amri (2008) submitted that academics ought to demonstrate capability, qualification as well as competency in piloting the affairs of the university. In other words, members of the academic staff ought to get acquainted

with the competencies and qualifications required for the task in advance. It is submitted that competent leaders have the capability to implement the vision of the organization (Erickson, 2006). The competencies of academic administration are functions of many factors -- record of past performance or success, experiences and the ability to accomplish tasks. In a similar development, Hancock (2007) maintained that academic staff assume the responsibility of authority out of sense of duty, without any form of training, and more so without any form of prior administrative experiences.

Transformational Style

The philosophy of administration widely celebrated in the 21st century is the transformational style of administration. This style is a change driven form of piloting the affairs of a set of people, group(s) or organization(s). The word transformation entails altering, changing or replacing the status quo which could be in full or part as situation(s) demand. In this scenery, a leader is perceived as a person who alters or brings change to the context and content of tasks and individuals in organizations. Thus, transformation incorporates conspicuous alterations in context and content. Empirical studies on administration concentrate on transformational paradigm (Koen & Bitzer, 2010). In other words, transformational administration concentrates on change-based relationships between leaders and followers – a promising concept in the academia. Transformational leaders motivate, encourage, build trust, as well as win sympathy, respect, support and loyalty from followers (Limsila & Ogunlana, 2008). Transformational administration drives the effectiveness, productivity, innovation, and satisfaction; and it also instills the spirit of partnership as parties involved are preoccupied with attainment of efficiency in organizations through shared visions and mutual trust (Lo et al., 2009; Avolio et al., 1999; Lowe et al., 1996).

Charisma

The term Charisma refers to human characteristics, features, attributes or traits that make person(s) stand out from the others. It is found in persons whose personalities are exceptional or extraordinary, accompanied with inbuilt and unique capabilities of spellbinding communication. An individual can be said to be charismatic when he/she can employ his/her special personal traits, instead of rhetoric alone, to relate to others. Charisma connects to the way(s) an individual relates or deals with others. Charismatic individuals outgrow their self-interest and act for the benefits of all. Therefore, Charismatic leaders refer to persons who have high self-confidence, a clear vision, engage in unconventional behavior, and act as a change agent, while remaining realistic about environmental constraints (Mclaurin & Al-Amri, 2008). The key behaviours of charismatic leaders include inter alia display of confidence, image building, role modeling, goals articulation and prompting followers' compliance. At the same time, a charismatic individual will display a sense of power and confidence. Thus, the administration injects pride and confidence in others being connected to the administration through the display and utilization of power and confidence. In addition, Lee and Liu, (2011) sum it up that; charismatic leaders have the capability to articulate themselves freely. Charismatic leaders have full knowledge of themselves in terms of their strengths and weaknesses in such a manner that, they completely use their strengths to compensate for their weaknesses.

Knowledge Sharing

Knowledge management (KM) has gained currency in intellectual discourse within and amongst the circles of academics as well as practitioners in recent times (Ismail & Chua, 2005). The transmission of information among individual employees is a crucial aspect of the KM process. KM incorporates the creation, acquisition, storage, transmission and application of knowledge; in addition, Hooff and Ridder (cited in Sohail & Daud, 2009) extended the catalog of activities involved in KM to include donation and collection. Accordingly, Tiwana (cited in Sohail & Daud, 2009) basically categorizes KM into three processes: knowledge acquisition, knowledge sharing and knowledge utilization. The acquisition describes the process of creation and development of ideas, insights, acumens and skills. The sharing entails the activities of exchanging, disseminating or transmitting knowledge that is already acquired; and finally, the utilization involves acting on the knowledge i.e. applying what is known to solve problem(s) in organizations. Knowledge sharing (KS) is an integral aspect of the KM strategies.

Knowledge sharing is conceived as disseminating ideas, thoughts, experiences, understandings or events on given subject(s) with the anticipation to achieve more understandings/ insights. According to Willem; Sharratt and Usoro (cited in Jain, Sandhu, & Sidhu, 2007) viewed KS as the transfer of knowledge between two or more individuals in a mutual manner giving room for remodeling and sense making of the information in the different context. KS refers to the "process of capturing knowledge or moving knowledge from a source unit to a recipient unit" (Bircham-connolly et al., 2005, p. 1). In addition, Jain, Sandhu and Sidhu (2007) added that "it also occurs when an individual is willing to assist as well as to learn from others in the development of new competencies". Many institutions achieve competitive gains through the facilitation of knowledge dissemination (cited in Sohail & Daud, 2009). Therefore, knowledge sharing among individual employees and its potentials to influence performance has gained currency globally specifically in knowledge-intensive institutions like universities (Davenport & Prusak, 1998). Accordingly, Steyn (cited in Sohail & Daud, 2009) submitted that to exploit the influence of knowledge in institutions of higher learning; people, structures and technology must be accorded equal emphasis. Thus, knowledge transmission is a means to an end. Previous studies reveal that effective engagement of knowledge sharing (KS) culminates in improved organizational performance. In the same vein, result of knowledge transmission leads to new knowledge and innovation being created which in turn enhance the performance of organizations.

Based on the reviews, knowledge sharing in this study is conceptualized by the principal factors that influence the exchange of knowledge between and amongst individuals in organizations as adapted from the following studies: (Cheng et al., 2009; Ipe, 2003; Sohail & Daud, 2009; Titi Amayah, 2013; Wang & Noe, 2010): the nature of knowledge, motivation to share, opportunities to share, and the culture of the work environment. This paper explores the influences of academic administration on knowledge sharing in academes. The academic administration variable is made up of "visionary, adaptable to change, competency, effective administration, transformational style, and charisma" (Asaari, 2012; Asaari et al., 2016).

CONCLUSION

In conclusion, the cultivation of innovative thinking skills is a paramount consideration in Nigerian educational administration. Leaders around educational landscapes globally have

underscored the urgency of integrating innovative thinking into educational practices to ensure that the nation's students are equipped with the skills necessary for success in an ever-evolving world. Innovative thinking is a crucial remedy for enhancing the effectiveness of administration in public universities by equipping administrators with essential skills such as creativity, problem-solving, adaptability, and strategic decision-making, universities can overcome bureaucratic inefficiencies and respond effectively to evolving challenges. Embracing innovation fosters a culture of continuous improvement, enabling institutions to enhance governance, optimize resource management, and improve overall service delivery. Furthermore, the integration of technology and collaborative approaches strengthens decision-making processes, ensuring that public universities remain competitive and relevant in a rapidly changing educational landscape. Therefore, fostering a mindset of innovation among university administrators is essential for achieving sustainable development and excellence in higher education.

Suggestions

The following suggestions were made to improve on the effective administration of universities:

- Universities should provide training programs to equip administrators with innovative thinking skills to enable them attain administrative effectiveness in tertiary institutions.
- University leaders should embrace digital tools in order to enhance institutional efficiency and decision-making.
- Interdisciplinary teamwork and stakeholder engagement should be promoted in tertiary institutions for increased administrative success.
- Administrators should stay updated on emerging trends to enhance innovation in university management.

INTEGRATING ENVIRONMENTAL EDUCATION INTO SCHOOL ADMINISTRATION FOR SUSTAINABLE DEVELOPMENT

Salome Oju MINIMA
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

Environmental education (EE) is a critical tool for fostering sustainable development, yet its integration into school administration remains underutilized. This paper examines the imperative of embedding EE within administrative frameworks to institutionalize sustainability in schools. Traditional approaches often limit EE to classroom instruction, neglecting its potential to shape school policies, operations, and leadership practices. Schools can model eco-conscious behavior, reduce ecological footprints, and cultivate a culture of sustainability by incorporating environmental principles into decision-making. Key strategies include developing green school policies, establishing sustainability committees, and providing professional development for administrators on environmental management. Student-led initiatives, such as recycling programs and energy audits, further reinforce theoretical learning with practical action. Challenges such as budget constraints and resistance to change can be mitigated through cost-saving measures, stakeholder engagement, and policy incentives. Furthermore, aligning curriculum with institutional practices ensures coherence between what students learn and what they experience daily. This paper argued that sustainable school administration is not merely an add-on but a necessary evolution in education systems. Schools can produce environmentally literate graduates while contributing to global sustainability goals by prioritizing environmental governance. Suggestions include mandatory sustainability training for leaders, green funding mechanisms, and systemic integration of EE into administrative planning. Schools must transition from teaching sustainability to embodying it, ensuring long-term environmental and societal benefits.

Keywords: Environmental Education, Sustainable Development, School Administration, Green Policies, Sustainability Committees, Eco-Schools, Environmental Governance, Student-Led Initiatives, Sustainable Leadership.

INTRODUCTION

The global environmental crisis marked by climate change, biodiversity loss, and resource depletion, demands urgent and systemic responses across all sectors of society. Education, as a fundamental driver of social transformation, holds immense potential to foster sustainable development by equipping future generations with the knowledge, skills, and values necessary

for ecological stewardship (UNESCO, 2020). However, despite widespread recognition of environmental education (EE) as a critical component of modern curricula, its integration into school administration remains inconsistent and often superficial. While many schools incorporate sustainability topics into science or geography lessons, few embed environmental principles into their governance structures, operational policies, and leadership practices (McKeown & Hopkins, 2019). This gap represents a missed opportunity, as schools that align administrative decisions with sustainability goals can serve as living models of eco-conscious behavior, reinforcing classroom learning with real-world practice.

The concept of integrating EE into school administration extends beyond curriculum design; it requires institutionalizing sustainability in decision-making processes, infrastructure management, and community engagement. Schools with strong administrative commitment to sustainability demonstrate improved student environmental literacy, reduced operational costs, and stronger community partnerships (Henderson & Tilbury, 2022). For instance, schools that adopt energy-efficient infrastructure, zero-waste policies, and student-led green initiatives not only reduce their ecological footprint but also provide experiential learning opportunities that deepen students' understanding of sustainability (Mogren et al., 2023). Despite these benefits, many educational institutions continue to treat EE as an extracurricular concern rather than a foundational administrative priority. A study by Li and Liu (2023) found that only 27% of schools in their sample had formal sustainability policies, highlighting a significant implementation gap.

One barrier to deeper integration is the perception that sustainability initiatives are costly or logistically burdensome. However, evidence suggests that long-term investments in green infrastructure such as solar panels, rainwater harvesting systems, and sustainable procurement, often yield financial savings while enhancing institutional resilience (Barratt Hacking et al., 2021). Furthermore, administrative leadership plays a pivotal role in fostering a culture of sustainability. School principals and district officials who prioritize environmental governance set a powerful example, influencing teachers, students, and parents to adopt eco-friendly behaviors (Sterling et al., 2022). Professional development programs for administrators on sustainability leadership have been shown to increase the adoption of green policies, demonstrating the importance of capacity-building in this area (Kenis & Mathijs, 2023).

Another critical factor is student and community involvement in sustainability governance. Participatory approaches, such as student-led environmental clubs and parent-teacher sustainability committees, enhance engagement and ensure that initiatives are contextually relevant (Wals et al., 2023). Schools that function as hubs for community sustainability efforts, such as urban gardening projects or local conservation programs, strengthen ties between education and real-world environmental action (Ardoin et al., 2022). However, without formal administrative support, such initiatives often remain ad hoc and under-resourced.

This paper argues that integrating EE into school administration is not merely an optional enhancement but a necessary evolution in education systems worldwide. Schools can move beyond fragmented, tokenistic approaches and instead model systemic change by embedding sustainability into governance structures. Drawing on case studies from Eco-Schools, Green Ribbon Schools, and other certification programs, this discussion highlights best practices for institutionalizing sustainability in educational leadership (Pauw et al., 2023). Additionally, the paper explores policy recommendations to overcome implementation challenges, including funding mechanisms, stakeholder engagement strategies, and accountability frameworks. The

transition toward sustainable school administration requires a paradigm shift - one where environmental responsibility is not just taught but lived. As the world faces escalating ecological crises, schools must lead by example, demonstrating that sustainability is both a moral imperative and a practical pathway to a resilient future. Schools can cultivate a generation of informed, empowered citizens capable of addressing the complex sustainability challenges ahead by aligning administrative practices with environmental education.

METHODOLOGY

This paper employed a qualitative research approach, combining literature review, policy analysis, and case study evaluation to construct a well-supported argument. First, a comprehensive literature review was conducted to examine existing studies on environmental education (EE), sustainable development in schools, and administrative frameworks. Scholarly articles, books, and reports from organizations like UNESCO and the UNEP were analyzed to identify best practices and gaps in current EE integration. Next, policy analysis was performed to assess national and international educational policies promoting sustainability. Documents such as the UN Sustainable Development Goals (SDGs), particularly SDG 4 (Quality Education) and SDG 13 (Climate Action), were reviewed to align the paper's suggestions with global standards. Additionally, case studies of schools that have successfully integrated EE into their administration were examined. Examples include eco-school programs in Europe and green school initiatives in Asia. These cases provided practical insights into curriculum development, teacher training, and sustainable campus management. Finally, stakeholder perspectives were considered by reviewing surveys and interviews with educators, policymakers, and environmental experts. This ensured that the position paper reflected real-world challenges and opportunities in implementing EE. The synthesized findings informed the paper's suggestions, advocating for policy reforms, administrative commitment, and community engagement to institutionalize EE in school systems for sustainable development.

CONCEPTUAL UNDERPINNING

Environmental Education

Environmental education (EE) represents a critical approach to learning that fosters ecological awareness, responsible citizenship, and sustainable problem-solving skills. Defined by UNESCO (2020) as "a lifelong learning process that increases awareness and knowledge about the environment while developing the necessary skills and commitment to address environmental challenges," EE transcends traditional classroom instruction by integrating cognitive, affective, and behavioral dimensions of learning. Its conceptual foundation was solidified during the 1977 Tbilisi Declaration, which established EE as a tool for addressing global environmental crises through interdisciplinary, action-oriented education (McKeown & Hopkins, 2019). Contemporary interpretations of EE emphasize three core objectives: awareness of environmental issues, knowledge of ecological systems, and empowerment to take sustainability actions (Ardoin et al., 2021). Unlike conventional science education, EE adopts a holistic perspective that connects ecological, social, and economic systems. For instance, climate change education is not limited to atmospheric science but explores intersections with social justice, policy, and individual behavior (Monroe et al., 2019). This systems-thinking approach aligns

with the United Nations Sustainable Development Goals (SDGs), particularly SDG 4.7, which advocates for education that promotes sustainable lifestyles (UNESCO, 2020).

A key theoretical framework in EE is the "triad model" encompassing education *about*, *in*, and *for* the environment (Lucas, 2019). Education *about* the environment focuses on ecological literacy, while education *in* the environment emphasizes experiential learning through nature immersion. Education *for* the environment, the most transformative dimension, cultivates civic engagement through projects like community gardening or waste reduction campaigns (Wals & Benavot, 2020). Research demonstrates that this triad model enhances long-term environmental stewardship more effectively than knowledge-only approaches (Stern et al., 2022). EE also prioritizes participatory and place-based pedagogies. Place-based education, which roots learning in local ecological and cultural contexts, has proven effective in fostering emotional connections to the environment (Gruenewald & Smith, 2022). Similarly, action competence theory argues that EE must empower learners to identify and solve sustainability problems in their communities (Mogensen & Schnack, 2023). For example, schools implementing EE programs report higher student engagement when learners participate in real-world projects like energy audits or biodiversity monitoring (Boeve-de Pauw & Van Petegem, 2023).

EE faces implementation challenges, including curriculum overcrowding and insufficient teacher training despite its benefits (Henderson & Zarger, 2022). A 2023 global study found that only 40% of secondary schools had dedicated EE programs, often due to a lack of administrative support (UNEP, 2023). However, innovative solutions are emerging, such as integrating EE across subjects—teaching mathematical data analysis through climate datasets or literary analysis through environmental literature (Karrow et al., 2023). The evolving concept of EE now embraces digital and justice-oriented dimensions. Digital EE leverages technologies like virtual reality to simulate ecosystems, while environmental justice education examines inequities in pollution exposure and resource access (Schusler et al., 2023). As the climate crisis intensifies, EE's role in developing resilient, adaptive communities becomes increasingly vital. By nurturing ecological literacy and civic agency, EE equips societies to transition toward sustainable futures.

Sustainable Development

Sustainable development has emerged as the defining paradigm of 21st century progress, representing a fundamental shift in how humanity conceptualizes economic growth, environmental protection, and social equity. The most widely accepted definition comes from the Brundtland Commission's 1987 report "Our Common Future," which describes sustainable development as "development that meets the needs of the present without compromising the ability of future generations to meet their own needs" (WCED, 1987, p. 41). This conceptual framework has evolved significantly in recent years to address contemporary global challenges, particularly through the United Nations' 2030 Agenda and its 17 Sustainable Development Goals (SDGs) adopted in 2015 (United Nations, 2015). At its core, sustainable development recognizes the interconnectedness of three foundational pillars: economic growth, social inclusion, and environmental protection (Purvis et al., 2019). Recent scholarship emphasized that these pillars are not separate components but rather interdependent dimensions that must be balanced through integrated policymaking and collective action (Griggs et al., 2022). The economic dimension focuses on creating prosperity through sustainable means, moving beyond GDP as the sole measure of progress to include indicators of resource efficiency, circular economy principles,

and long-term viability (Costanza et al., 2023). The social dimension prioritizes equity, justice, and quality of life for all people, addressing systemic inequalities that hinder development (Fukuda-Parr, 2022). The environmental dimension emphasizes the planetary boundaries within which human activity must operate to maintain ecosystem health and biodiversity (Steffen et al., 2023).

The concept has gained particular urgency in the context of climate change, with the Paris Agreement (2015) explicitly linking climate action to sustainable development pathways (IPCC, 2022). Contemporary interpretations highlight the need for transformative change across all sectors of society, recognizing that incremental improvements are insufficient to address the scale of current environmental and social challenges (O'Brien, 2021). This transformation requires rethinking production and consumption patterns, energy systems, urban development, and food systems through the lens of sustainability science (Kates, 2023). The concept of "just transitions" has become particularly important, ensuring that the shift to sustainability does not disproportionately burden vulnerable populations (Newell & Mulvaney, 2022). Implementation of sustainable development faces several conceptual and practical challenges. The tension between short-term political and economic priorities versus long-term sustainability goals remains a significant barrier (Biermann et al., 2022). There are also ongoing debates about measurement and indicators, with various frameworks proposed to assess progress beyond traditional economic metrics (Stiglitz et al., 2023). The SDGs have provided a comprehensive framework, but critics argue they sometimes contain inherent contradictions between goals that prioritize economic growth and those emphasizing ecological limits (Hickel, 2023). Recent research emphasized the importance of local and indigenous knowledge in developing context-specific approaches to sustainability (Tengö et al., 2023), as well as the need for stronger governance mechanisms to ensure accountability (Gupta & Vegelin, 2023).

As the world approaches the 2030 deadline for the SDGs, the concept of sustainable development continues to evolve. Emerging perspectives emphasize regenerative approaches that go beyond sustainability to actively restore ecosystems (Mang & Reed, 2023), while others focus on post-growth economies that challenge conventional notions of development (Jackson, 2023). What remains constant is the recognition that human wellbeing is inextricably linked to the health of ecological systems, and that true progress must balance present needs with future possibilities. The concept serves as both a compass for policymaking and a call to action, reminding us that development cannot be considered successful if it undermines the very systems that support life on Earth.

School Administration

School administration serves as the backbone of educational institutions, encompassing the leadership, management, and coordination required to create effective learning environments. It involves strategic planning, resource allocation, policy implementation, and stakeholder engagement to ensure schools operate efficiently while fulfilling their educational missions (Hallinger, 2023). Modern school administration extends beyond bureaucratic management, embracing transformational leadership approaches that foster innovation, equity, and continuous improvement (Leithwood et al., 2022). School administration focuses on instructional leadership, emphasizing the principal’s role in shaping teaching quality and student outcomes (Robinson et al., 2023). Effective administrators collaborate with teachers to develop curricula, implement evidence-based pedagogies, and monitor academic progress through data-driven decision-

making (Datnow & Park, 2022). Schools with strong instructional leadership exhibit higher student achievement and teacher retention rates (Grissom et al., 2023). Additionally, administrators must navigate complex policy landscapes, ensuring compliance with local, state, and national education standards while advocating for school needs (Honig & Rainey, 2023).

A critical function of school administration is resource management, including budgeting, staffing, and infrastructure maintenance (Odden & Picus, 2023). Equitable resource distribution is vital to addressing disparities, particularly in underfunded schools (Baker & Weber, 2022). Administrators also cultivate inclusive school cultures by promoting diversity, addressing bullying, and supporting students' socio-emotional needs (DeMatthews et al., 2023). Stakeholder engagement is another cornerstone, requiring administrators to build partnerships with teachers, parents, and local organizations (Ishimaru, 2023). Effective communication and shared decision-making enhance trust and collective efficacy (Bryk et al., 2023). Furthermore, contemporary school administration integrates technology, leveraging digital tools for administration, teaching, and communication (Williamson et al., 2023). Challenges persist, including burnout among school leaders, political pressures, and systemic inequities (Nguyen et al., 2023). However, professional development programs and mentorship initiatives are strengthening leadership pipelines (Darling-Hammond et al., 2022). As education evolves, school administration must remain responsive to societal changes, ensuring all students have access to high-quality, equitable learning opportunities.

Eco-schools

Eco-Schools represent a transformative approach to education that integrates environmental sustainability into school operations, curriculum, and community engagement. Originating in 1994 through the Foundation for Environmental Education, this global program now operates in over 70 countries, empowering students to lead sustainability initiatives within their educational institutions (FEE, 2023). The eco-school model follows a seven-step framework that includes conducting environmental audits, creating action plans, and monitoring progress while linking these activities to curricular learning (Mogren et al., 2023). The program emphasized student-led participatory approaches, recognizing that meaningful environmental education requires both knowledge acquisition and practical application (Boeve-de Pauw & Van Petegem, 2023). Eco-schools effectively foster environmental literacy by connecting classroom instruction with real-world sustainability challenges, making abstract concepts tangible through hands-on projects like school gardens, recycling programs, and energy conservation campaigns (Ardoin et al., 2022).

The holistic nature of eco-schools distinguishes them from conventional environmental education programs. Rather than treating sustainability as an isolated subject, the model encourages whole-school transformation by addressing infrastructure, daily practices, and community partnerships (Henderson & Tilbury, 2022). Schools pursuing eco-school certification typically implement changes across multiple domains including waste management, water conservation, biodiversity enhancement, and sustainable transportation (Pauw et al., 2023). This comprehensive approach yields measurable environmental benefits - studies indicate eco-schools reduce energy consumption by 12-25% and waste production by 30-50% within three years of implementation (UNEP, 2023). Beyond ecological impacts, the program cultivates essential 21st century skills including critical thinking, collaboration, and systems thinking as students analyze complex sustainability issues and develop solutions (Wals & Benavot, 2023). The emphasis on

student agency and leadership prepares young people as active citizens capable of addressing current and future environmental challenges (Schusler et al., 2023).

The eco-school movement faces implementation challenges including inconsistent teacher training, limited funding for sustainability projects, and difficulties maintaining long-term engagement despite its successes (Henderson & Zarger, 2023). Recent adaptations address these barriers through digital tools for environmental monitoring, peer-to-peer learning networks between schools, and integration with national education standards (Karrow et al., 2023). As climate change accelerates, eco-schools offer a proven model for developing environmentally responsible behaviors and fostering the collective action needed for sustainable futures (Stern et al., 2023). The program's global expansion reflects growing recognition that schools must evolve beyond traditional learning spaces to become living laboratories for sustainability innovation (UNESCO, 2023).

Environmental Governance

Environmental governance has emerged as a critical framework for addressing complex ecological challenges in the 21st century, representing a shift from traditional government-led approaches to more inclusive, multi-stakeholder decision-making processes. The United Nations Environment Programme defines environmental governance as "the rules, practices, policies and institutions that shape how humans interact with the environment" (UNEP, 2023, p. 12). This concept recognizes that effective environmental management requires collaboration across governmental agencies, private sector actors, civil society organizations, and local communities (Biermann et al., 2022). Contemporary environmental governance emphasizes principles of transparency, accountability, and participatory democracy, moving beyond top-down regulation to incorporate diverse knowledge systems and values (Gupta & Mason, 2023). The framework has gained particular relevance in implementing international agreements like the Paris Climate Accord and the Kunming-Montreal Global Biodiversity Framework, where multi-level governance structures bridge global commitments with local actions (Bäckstrand et al., 2023).

A central tenet of modern environmental governance is polycentricity - the coexistence of multiple decision-making centers that interact across scales from local to global (Ostrom, 2019). This approach acknowledges that environmental problems often transcend political boundaries and require coordinated responses (Morrison et al., 2023). For instance, watershed management frequently involves nested governance arrangements where municipal, regional, and national authorities collaborate with water users (Huitema et al., 2022). The growing recognition of Indigenous governance systems has further enriched environmental governance paradigms, particularly regarding biodiversity conservation and sustainable land use (Tengö et al., 2023). Governance systems incorporating traditional ecological knowledge achieve better environmental outcomes while advancing social equity (Artelle et al., 2023). Digital technologies are also transforming environmental governance through real-time monitoring, citizen science platforms, and blockchain applications for supply chain transparency (Keesstra et al., 2023).

Environmental governance faces significant challenges despite these innovations. Power asymmetries between stakeholders often marginalize vulnerable communities in decision-making processes (Schlosberg & Collins, 2023). Policy fragmentation and jurisdictional overlaps create implementation gaps, particularly for transboundary issues like air pollution or marine conservation (Kim & VanDeveer, 2023). The corporate capture of governance processes through lobbying and greenwashing remains a persistent concern (Dauvergne, 2023). Recent scholarship

emphasized the need for stronger accountability mechanisms, conflict resolution frameworks, and capacity-building initiatives to address these limitations (Newell et al., 2023). As environmental crises intensify, evolving governance models must balance scientific expertise with democratic participation, global cooperation with local adaptation, and regulatory enforcement with market-based incentives to achieve sustainable outcomes (Dryzek & Pickering, 2023).

The Need for Environmental Education in School Administration

Environmental education (EE) has become an imperative component of modern education systems, yet its integration into school administration remains inconsistent and often superficial. As climate change, biodiversity loss, and resource depletion escalate, schools must evolve beyond merely teaching about environmental issues to modeling sustainable practices through their administrative operations and decision-making processes (UNESCO, 2023). School administrators - principals, district leaders, and policy-makers play a pivotal role in institutionalizing sustainability, ensuring that environmental principles are embedded in school governance, infrastructure, and daily practices (Henderson & Tilbury, 2023). Without administrative leadership, environmental education risks being confined to isolated classroom lessons rather than becoming a transformative force shaping school culture and student behavior (Mogren et al., 2023).

The need for systemic change is one of the primary reasons environmental education must be integrated into school administration. While individual teachers may incorporate sustainability into their curricula, lasting impact requires institutional policies that prioritize energy efficiency, waste reduction, and sustainable procurement (Boeve-de Pauw & Van Petegem, 2023). Administrators who adopt green school certifications, such as LEED or Eco-Schools, demonstrate that sustainability is not an optional add-on but a core value guiding operations (Pauw et al., 2023). Schools with strong sustainability policies reduce operational costs, improve student health, and enhance academic engagement by providing hands-on learning opportunities (Ardoin et al., 2022). For example, schools that implement solar energy projects or school-wide recycling programs not only lower their carbon footprint but also serve as living laboratories where students witness sustainability in action (Stern et al., 2023).

Moreover, school administrators influence the broader educational ecosystem by shaping professional development, resource allocation, and community partnerships. When administrators prioritize environmental literacy in teacher training, educators gain the tools to integrate sustainability across disciplines, from science to social studies (Karrow et al., 2023). Equitable resource distribution is another critical consideration; administrators must ensure that under-resourced schools have access to green infrastructure, outdoor learning spaces, and sustainability-focused curricula (Henderson & Zarger, 2023). Administrators can also secure funding for sustainability initiatives, such as school gardens or renewable energy projects, while fostering community-wide environmental stewardship; by collaborating with local governments, NGOs, and businesses (Schusler et al., 2023).

A significant barrier to this integration is the perception that sustainability initiatives are financially or logistically burdensome. However, studies indicate that long-term investments in energy-efficient buildings, waste reduction systems, and sustainable transportation yield substantial cost savings (UNEP, 2023). Additionally, administrators who leverage student-led sustainability programs - such as eco-clubs or green audits empower young people as change

agents while distributing the workload across the school community (Wals & Benavot, 2023). The COVID-19 pandemic underscored the importance of adaptive leadership, as administrators who had already embraced sustainability were better equipped to address disruptions through resilient systems (Harris & Jones, 2022).

The urgency of climate action demands that schools transition from passive learning environments to active hubs of sustainability innovation. Administrators must move beyond symbolic gestures, such as Earth Day events, and instead embed environmental priorities into strategic planning, budgeting, and performance metrics (Biermann et al., 2023). Countries like Finland and Costa Rica have demonstrated the potential of policy-driven approaches, where national mandates require schools to meet sustainability benchmarks (UNESCO, 2023). Similarly, districts that tie administrator evaluations to sustainability outcomes create accountability mechanisms that drive meaningful change (Robinson et al., 2023). Integrating environmental education into school administration is not just an ethical obligation but a practical necessity. Schools that model sustainable practices prepare students to address complex global challenges while reaping immediate benefits, from cost savings to enhanced community engagement. As the world races to meet the United Nations Sustainable Development Goals (SDGs), school leaders must recognize their role in cultivating the next generation of environmentally literate citizens. The time for half-measures has passed; systemic, administratively supported environmental education is essential for a sustainable future.

ROLE OF ENVIRONMENTAL EDUCATION IN SUSTAINABLE DEVELOPMENT

Environmental education (EE) serves as a critical catalyst for achieving sustainable development by equipping individuals with the knowledge, skills, and values necessary to address complex ecological challenges. As recognized by UNESCO (2020), EE transcends traditional learning by fostering systems thinking, ethical responsibility, and active participation in sustainability solutions. This transformative approach aligns directly with the United Nations Sustainable Development Goals (SDGs), particularly SDG 4.7, which emphasizes education for sustainable development (United Nations, 2015). The fundamental premise of EE lies in its ability to connect cognitive understanding with practical action, creating informed citizens capable of making environmentally responsible decisions in their personal and professional lives (Ardoin et al., 2020). Effective EE programs lead to measurable improvements in environmental literacy, which correlates strongly with pro-environmental behaviors and support for sustainability policies (Stern et al., 2022).

The power of EE in driving sustainable development manifests through multiple pathways. Formal education systems that integrate EE across curricula help students understand the interconnectedness of ecological, economic, and social systems (Wals & Benavot, 2023). For instance, students who participate in place-based learning about local ecosystems develop stronger connections to their environment and demonstrate greater commitment to conservation efforts (Gruenewald & Smith, 2022). Similarly, schools that adopt whole-institution approaches to sustainability - incorporating green building design, waste reduction programs, and sustainable food systems not only reduce their environmental footprint but also provide tangible examples of sustainable living (Henderson & Tilbury, 2023). These immersive experiences prove particularly effective when combined with action-oriented learning, where students engage in real-world projects such as community gardens or energy conservation initiatives (Schusler et al., 2023). Such programs develop crucial competencies including critical thinking, problem-solving, and

collaboration skills identified by the World Economic Forum (2023) as essential for the 21st century workforce.

Beyond formal education settings, EE plays a vital role in community-based sustainable development. Non-formal education programs targeting adults and community leaders have successfully promoted sustainable agriculture practices, water conservation, and renewable energy adoption in diverse global contexts (Monroe et al., 2023). Indigenous knowledge systems, when incorporated into EE frameworks, offer valuable insights into sustainable resource management that have sustained communities for generations (Tengö et al., 2022). Digital platforms have expanded EE's reach, with online courses and mobile applications enabling widespread access to sustainability education (Karrow et al., 2023). These varied approaches collectively contribute to building social capital and community resilience, both critical components of sustainable development (Krasny et al., 2022).

The transformative potential of EE faces several challenges that must be addressed to maximize its impact on sustainable development. Curriculum overcrowding often marginalizes EE in formal education systems, while inadequate teacher training limits effective implementation (Henderson & Zarger, 2023). Political resistance to climate change education in some regions creates additional barriers (Stevenson et al., 2023). However, innovative solutions are emerging, including interdisciplinary approaches that embed EE across subject areas and professional development programs that enhance educators' capacity to teach sustainability concepts (McKeown & Nolet, 2023). The growing recognition of EE's importance is reflected in policy frameworks such as the Berlin Declaration on Education for Sustainable Development (UNESCO, 2024), which calls for comprehensive integration of EE at all education levels.

As the world accelerates efforts to achieve the SDGs by 2030, EE emerges as both a foundational strategy and an ethical imperative. EE provides the tools necessary to address pressing global challenges from climate change to biodiversity loss by cultivating ecological literacy, fostering sustainable behaviors, and empowering active citizenship (IPCC, 2023). The future of sustainable development depends on our ability to scale up effective EE initiatives, ensuring they reach diverse populations across formal, non-formal, and informal learning contexts. When properly implemented, EE does not just teach about sustainability - it activates the knowledge, values, and actions that make sustainable development possible (Wals, 2024).

CHALLENGES FACING THE INTEGRATION OF ENVIRONMENTAL EDUCATION INTO SCHOOL ADMINISTRATION

The integration of environmental education (EE) into school administration faces numerous systemic and practical challenges that hinder its effective implementation despite growing recognition of its importance. One significant barrier lies in competing educational priorities within increasingly crowded curricula, where standardized testing and core subject requirements often marginalize environmental topics (Stevenson et al., 2023). School administrators frequently perceive EE as an optional add-on rather than a fundamental component of quality education, particularly when accountability measures emphasize traditional academic performance indicators (Henderson & Zarger, 2023). This perception persists even as research demonstrates that EE enhances critical thinking skills and improves academic achievement across multiple subject areas (Ardoin et al., 2021). The lack of clear policy mandates at state and national levels exacerbates this challenge, leaving administrators without strong incentives or frameworks to prioritize environmental integration (McKeown & Nolet, 2023). In many regions,

the absence of environmental education standards or graduation requirements means implementation depends entirely on individual administrators' personal commitment to sustainability (Kensler & Uline, 2023).

Financial constraints present another major obstacle, particularly for schools in under-resourced communities. Administrators often view sustainability initiatives as costly investments rather than long-term cost-saving measures, despite evidence that energy-efficient buildings and waste reduction programs yield significant financial returns (Barratt et al., 2023). The upfront costs of green infrastructure, professional development, and curriculum materials create perceived barriers that discourage adoption, especially in districts facing budget cuts or competing funding priorities (Gruenewald & Smith, 2023). This economic challenge intersects with equity issues, as schools serving low-income communities frequently lack access to the resources needed for meaningful EE implementation, perpetuating environmental education disparities (Schusler & Krasny, 2023). Even when funding becomes available through grants or partnerships, bureaucratic procurement processes and restrictive spending guidelines often prevent schools from allocating resources effectively (Karrow et al., 2023).

Human resource limitations further complicate integration efforts. Many administrators and teachers lack adequate training in environmental content and pedagogy, leaving them unprepared to lead or support sustainability initiatives (Monroe et al., 2023). Teacher preparation programs rarely include required coursework in EE, creating a workforce that feels ill-equipped to incorporate environmental concepts into instruction (McKeown & Nolet, 2023). High teacher turnover rates in many schools disrupt continuity in EE programs, while increasing workloads leave educators with limited capacity to develop new environmental curricula or lead sustainability projects (Henderson & Tilbury, 2023). Administrator turnover presents similar challenges, as sustainability initiatives often lose momentum when leadership changes (Kensler & Uline, 2023). The scarcity of dedicated EE staff positions in most schools means responsibility falls on already overburdened teachers and administrators, limiting the depth and consistency of implementation (Stevenson et al., 2023).

Political and cultural resistance creates additional barriers to systemic integration. In some communities, environmental education faces opposition from stakeholders who perceive it as conflicting with local values or economic interests (Stevenson et al., 2023). Climate change education proves particularly contentious in certain regions, where political polarization leads to curriculum censorship or self-censorship by educators (Henderson & Zarger, 2023). Institutional inertia within school systems presents another challenge, as traditional administrative structures and decision-making processes often resist the interdisciplinary, participatory approaches required for effective EE (Gruenewald & Smith, 2023). The lack of standardized assessment tools for environmental literacy makes it difficult for administrators to demonstrate the value of EE programs to skeptical stakeholders (Stern et al., 2023). Even in supportive environments, the complexity of measuring behavioral and attitudinal outcomes creates challenges for program evaluation and improvement (Ardoin et al., 2021).

These interconnected challenges reveal the need for comprehensive strategies that address policy, funding, capacity-building, and cultural barriers simultaneously. While models like the United Nations' Education for Sustainable Development framework provide guidance, their implementation requires tailored approaches that consider local contexts and resource constraints (UNESCO, 2023). Overcoming these obstacles demands coordinated efforts among policymakers, administrators, teachers, and communities to create education systems that

genuinely prepare students to address the pressing environmental challenges of our time (Wals, 2024).

STRATEGIES FOR INTEGRATING ENVIRONMENTAL EDUCATION INTO SCHOOL ADMINISTRATION

The strategies for integrating Environmental Education into school administration are as follows:

Green Policy Development

Green policy development serves as a foundational strategy for institutionalizing environmental education within school administration by creating formal frameworks for sustainable practices. When schools develop comprehensive environmental policies, they establish clear guidelines that embed sustainability into daily operations, curriculum planning, and facility management (Henderson & Tilbury, 2023). These policies transform ad hoc environmental initiatives into systemic approaches, ensuring continuity across leadership transitions and providing accountability mechanisms (Kensler & Uline, 2023). Schools with formal sustainability policies achieve greater reductions in energy consumption (25-40%) and waste production (30-50%) compared to those relying on voluntary measures (Barratt et al., 2023). Effective green policies typically address multiple dimensions including energy efficiency standards, sustainable procurement protocols, waste reduction targets, and curriculum integration requirements (McKeown & Nolet, 2023). For instance, policies mandating environmental literacy across subject areas prompt administrators to allocate professional development resources and instructional time accordingly (Stevenson et al., 2023).

The policy development process itself becomes an educational opportunity when administrators engage stakeholders through sustainability committees comprising teachers, students, custodial staff, and community partners (Schusler & Krasny, 2023). Such participatory approaches increase buy-in while incorporating diverse perspectives into policy design (Gruenewald & Smith, 2023). Policy implementation benefits from alignment with existing frameworks like the U.S. Department of Education's Green Ribbon Schools program or international Eco-Schools certification, which provide structured pathways for institutional transformation (UNESCO, 2023). Challenges persist in policy enforcement and monitoring, particularly in under-resourced schools, but digital tools like sustainability dashboards help administrators track progress on key indicators (Karrow et al., 2023). When green policies incorporate student leadership roles in implementation and evaluation, they foster environmental agency while relieving administrative burdens (Ardoin et al., 2021). Ultimately, well-designed green policies create the organizational conditions necessary for environmental education to flourish as an integral component of school administration rather than remaining an optional add-on (Wals, 2024).

Professional Development for Administrators

Professional development programs for school administrators serve as a critical lever for embedding environmental education into school systems by building leadership capacity for sustainability initiatives. Targeted training equips principals and district leaders with the knowledge and skills to develop eco-friendly policies, allocate resources effectively, and model

sustainable practices (Henderson & Tilbury, 2022). Administrators who participate in sustainability-focused professional development are three times more likely to implement green school programs compared to their untrained peers (Kensler & Uline, 2021). Effective programs combine content knowledge about environmental issues with leadership strategies for organizational change, addressing both the "why" and "how" of sustainability integration (McKeown & Nolet, 2022). Workshops covering topics like energy efficiency, sustainable facility management, and environmental curriculum alignment help administrators translate ecological principles into operational decisions (Stevenson et al., 2021).

The most impactful professional development utilizes experiential learning approaches, such as school sustainability audits or visits to green campuses, which allow administrators to observe best practices firsthand (Gruenewald & Smith, 2022). Ongoing coaching and professional learning communities provide crucial support as administrators navigate implementation challenges like budget constraints or staff resistance (Ardoin et al., 2021). When professional development engages entire leadership teams rather than individual administrators, it fosters collective commitment and coordinated action across schools and districts (Schusler & Krasny, 2022). Digital platforms have expanded access to sustainability leadership training, with online courses and webinars enabling administrators to learn at their own pace (Karrow et al., 2022). Professional development programs create the leadership foundation necessary for systemic integration of environmental education throughout school operations and culture by developing administrators' environmental literacy and change management skills (Wals, 2023).

Student-Led Sustainability Programs

Student-led sustainability programs offer a powerful strategy for embedding environmental education into school administration by fostering youth agency while providing authentic learning opportunities. When students lead initiatives like recycling campaigns, energy conservation projects, or school gardens, they develop practical skills in problem-solving, leadership, and environmental stewardship (Schusler & Krasny, 2018). Schools with robust student-led programs achieve 20-35% greater reductions in resource consumption compared to those relying solely on top-down approaches (Barratt et al., 2022). These programs create natural pathways for environmental education integration as administrators must provide institutional support through funding, facility access, and curriculum alignment (Henderson & Tilbury, 2021). The participatory nature of student-led initiatives builds collective ownership of sustainability efforts, making them more resilient to administrative turnover (Kensler & Uline, 2020).

Successful models often feature formalized structures like student "green teams" that collaborate with facilities staff on audits, or eco-clubs that advise school boards on policy changes (Ardoin et al., 2020). Administrators report that student-led programs provide compelling evidence for sustainability investments when youth present data-driven proposals to decision-makers (Gruenewald & Smith, 2021). These initiatives also bridge classroom learning with real-world applications, as seen when science classes monitor energy savings from student-installed LED lights or social studies classes analyze policy impacts of waste reduction campaigns (Stevenson et al., 2021). Challenges include ensuring equitable participation across student demographics and maintaining program continuity during academic transitions, but structured mentorship systems and digital documentation help address these issues (Wals, 2022). Schools transform environmental education from an abstract concept into lived experience while

cultivating the next generation of sustainability leaders by legitimizing student leadership in operational decisions (UNESCO, 2023).

Community and Stakeholder Engagement

Meaningful community engagement serves as a vital strategy for embedding environmental education into school administration by creating shared ownership of sustainability initiatives. When schools actively involve parents, local organizations, and municipal partners in environmental programs, they secure critical resources, expertise, and long-term support that institutionalize eco-friendly practices (Krasny et al., 2022). Schools with robust community partnerships achieve 40% greater success in sustaining environmental programs compared to those working in isolation (Schusler et al., 2021). Administrators can leverage these relationships to overcome common barriers - local businesses may sponsor green infrastructure, university researchers can provide technical assistance, and civic groups often volunteer for habitat restoration projects (Gruenewald & Smith, 2023). Structured engagement mechanisms like sustainability advisory councils that include community representatives help align school environmental goals with local priorities while ensuring cultural relevance (Henderson & Tilbury, 2022).

Joint initiatives such as community gardens or watershed monitoring programs create authentic learning opportunities while addressing real environmental challenges (Ardoin et al., 2021). Digital platforms have expanded engagement possibilities, with schools using social media to crowdsource sustainability ideas and mobile apps to coordinate citizen science projects (Wals, 2023). Administrators report that visible community partnerships generate political support for environmental education by demonstrating tangible benefits to the broader community (Stevenson et al., 2022). Challenges include power imbalances in decision-making and ensuring inclusive participation across diverse stakeholder groups, but participatory design methods and culturally responsive approaches help address these issues (Ishimaru, 2020). When schools position themselves as sustainability hubs for their communities, they transform environmental education from a school program into a collective responsibility with lasting impact (UNESCO, 2023).

CONCLUSION

Integrating environmental education into school administration is a crucial step toward fostering sustainable development. Schools can cultivate environmentally conscious students and staff while promoting long-term sustainability by embedding ecological principles into administrative policies, curricula, and daily operations. This approach ensures that environmental stewardship becomes a core value rather than an optional add-on, shaping institutional practices such as waste management, energy conservation, and green infrastructure. School administrators play a pivotal role in this integration by adopting eco-friendly policies, providing teacher training, and encouraging student-led sustainability initiatives. When environmental education is systematically incorporated into decision-making, it fosters a culture of responsibility, innovation, and critical thinking. Schools become living laboratories for sustainable practices, demonstrating how institutions can reduce their ecological footprint while preparing future generations to address global challenges like climate change and resource depletion.

Besides, community partnerships enhance the impact of these efforts, linking schools with local organizations and government agencies to amplify sustainability projects. Schools not only comply with global sustainability goals but also inspire societal transformation by prioritizing environmental education in administration. This integration ensures that education systems contribute meaningfully to a greener, more equitable future, where environmental awareness and action are ingrained in every aspect of learning and institutional governance.

Suggestions

Suggestions for Integrating Environmental Education into School Administration for Sustainable Development are stated here-under:

- School administrations should establish clear sustainability policies that incorporate environmental education into curricula, operations, and infrastructure. This includes setting measurable goals for waste reduction, energy efficiency, and green campus initiatives while ensuring alignment with national and global sustainability standards.
- Teachers and school leaders need training to effectively integrate environmental concepts into teaching and management practices. Workshops, certifications, and partnerships with environmental organizations can equip staff with the knowledge and skills to foster sustainability in classrooms and administrative decisions.
- Schools should empower students to take active roles in environmental projects, such as recycling programs, school gardens, and awareness campaigns. Establishing eco-clubs and green committees can promote leadership, innovation, and a sense of responsibility toward sustainable development.
- Collaboration with local governments, NGOs, and businesses can enhance school sustainability efforts through funding, expertise, and shared resources. Schools can participate in regional environmental programs, apply for green grants, and engage parents and community members in sustainability projects to amplify their impact.

THE ROLE OF TECHNOLOGY IN ENHANCING HIGHER EDUCATION ADMINISTRATION

Tamunoinaba PHILLIPS
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

This paper addressed the role of technology in enhancing higher education administration, emphasizing its application in academic records management, student services, communication, financial operations, and decision-making processes. The integration of digital systems in administrative functions has improved efficiency, transparency, and service delivery within higher education institutions. Furthermore, the paper discussed the concept of technology, its relevance to administrative operations, and the ongoing digital transformation within the education sector. Additionally, specific attention is given to how digital tools facilitate collaboration, support resource management, and enhance institutional planning. Although the benefits are evident, the paper also identifies challenges such as limited infrastructure, low staff competence, funding constraints, and poor system compatibility. In response to these challenges, the paper outlines strategic approaches for effective implementation, including leadership involvement, stakeholder engagement, consistent training, and policy development. The paper concluded that technology has become an essential component of effective administration in higher education, offering tools that streamline processes, improve communication, and support informed decision-making. Amongst others, the paper suggested that university administrators should allocate sufficient budgetary provisions for the procurement, maintenance, and upgrading of digital tools.

Keywords: Technology**,** Higher Education Administration, Digital Transformation, Academic Records Management, Student Services.

INTRODUCTION

The evolution of technology has reshaped various sectors, and higher education administration has not been left behind in this advancement. Although, the integration of technology into higher education administration has been a transformative force, reshaping the way institutions operate, manage resources, and deliver services to students and faculty. With an ever-increasing demand for efficiency, accuracy, and accessibility, technology has emerged as a vital tool in the administration of universities and colleges. Administrative tasks that once required immense manual labor, such as student admissions, registration, scheduling, record management, and communication, have been streamlined through the adoption of digital systems. This

technological shift not only reduces the potential for human error but also enhances the overall productivity of administrative staff (Altbach et al., 2019). Furthermore, the ability to store and manage vast amounts of data in digital form has provided administrators with better access to real-time information, making decision-making processes more data-driven and precise (Ghosh et al., 2020). Through the use of integrated management systems, higher education institutions can track student progress, assess faculty performance, and oversee financial resources, all from a centralized platform. This has facilitated a more coherent, transparent, and efficient approach to managing complex educational environments.

In addition, technology has played a pivotal role in improving communication within academic institutions. Gone are the days of relying solely on face-to-face meetings or paper-based memos. Now, cloud-based collaboration tools, instant messaging platforms, and video conferencing have made it possible for faculty, staff, and students to engage with one another seamlessly, regardless of their physical location (Chaka, 2021). The widespread adoption of Learning Management Systems (LMS) has further enhanced communication by creating virtual classrooms that enable students to access course materials, submit assignments, and interact with instructors, all within a digital environment. Moreover, the increasing use of online learning platforms has enabled universities to extend their reach to a global audience, thereby improving accessibility and inclusivity in education. Technology's role in enhancing communication, therefore, not only benefits internal administrative functions but also contributes to creating a more interconnected and globally aware educational community.

Although the potential benefits of technology are substantial, its adoption in higher education administration is not without challenges. Issues such as the digital divide, concerns over data privacy, and the need for adequate training for staff and faculty have surfaced as significant barriers to full technological integration (Al-Fraihat et al., 2020). Furthermore, the rapid pace of technological change means that institutions must continually invest in updating their systems to stay competitive and efficient. Despite these hurdles, the overall trend towards digitalization is unmistakable. Higher education administrators must embrace these technological advancements to remain relevant in an increasingly complex and competitive academic landscape. Therefore, understanding how technology enhances administrative processes by improving efficiency, reducing costs, and enabling data-driven decision-making is essential for institutions striving to meet the demands of modern education.

THEORETICAL FRAMEWORK

Diffusion of Innovations Theory

The Diffusion of Innovations Theory, propounded by Everett Rogers in 2003, and cited in Baskerville et al. (2014), offers a valuable framework for understanding how technological innovations are adopted, implemented, and sustained within organizations, including higher education institutions. This theory explains how an innovation defined as an idea, practice, or object perceived as new is communicated over time through certain channels among members of a social system. It identifies key stages in the adoption process: knowledge, persuasion, decision, implementation, and confirmation. Each stage outlines the progression of individuals or organizations from first encountering a new technology to fully integrating it into their operations. Furthermore, Rogers categorizes adopters into five groups innovators, early adopters, early majority, late majority, and laggards based on their readiness to accept and apply new

ideas. These adopter categories are instrumental in recognizing the different rates at which stakeholders within an educational institution might respond to technological change.

Moreover, the theory highlights five attributes of innovations that influence their rate of adoption: relative advantage, compatibility, complexity, trialability, and observability. These factors determine whether users perceive a new technology as beneficial and manageable within their institutional context. For instance, when an administrative system in higher education is seen as more efficient than the previous manual processes (relative advantage), aligns with the institution's existing workflow (compatibility), and is easy to use (low complexity), it is more likely to be adopted. In addition, if staff and faculty can experiment with the technology on a limited basis (trialability) and observe its benefits through visible outcomes (observability), adoption becomes smoother and more sustainable.

In the context of this study on the role of technology in enhancing higher education administration, the Diffusion of Innovations Theory serves as a useful lens for analyzing how technological tools such as digital communication systems, academic management software, and financial automation platforms spread through administrative structures. It provides a structured method to assess why certain technologies are adopted faster than others, how user attitudes influence uptake, and what institutional factors affect long-term implementation. For example, early adopters within administrative departments may influence others by demonstrating effective usage and advocating for digital solutions. Additionally, the theory supports the identification of potential barriers to adoption, such as resistance from laggards or limited access to adequate training. Understanding these dynamics helps education administrators develop strategic interventions that promote effective technological diffusion, encourage collaboration across departments, and ensure that technology serves as a practical tool for improving service delivery, record management, decision-making, and communication within higher education systems. Therefore, the application of Rogers' theory is both relevant and instrumental in guiding the successful integration of innovation in administrative practices.

CONCEPTUAL CLARIFICATION

Concept of Technology

Technology is broadly understood as the use of scientific knowledge for practical purposes, including the creation of tools, machines, and systems that make life easier and more efficient. In the context of higher education administration, technology encompasses a wide array of tools designed to improve institutional management, enhance the student experience, and streamline academic processes. These technologies include both hardware, such as computers and mobile devices, and software, such as Student Information Systems (SIS) and Learning Management Systems (LMS). Additionally, technologies like cloud computing and artificial intelligence (AI) are beginning to play significant roles in transforming the administrative processes of universities and colleges (Dahlberg & Bø, 2021).

Higher education institutions are under increasing pressure to deliver high-quality services while controlling costs. Technology offers solutions by automating administrative processes, improving the accuracy of record-keeping, and enabling the efficient management of resources. The introduction of SIS has revolutionized how universities handle student data, such as grades, attendance, and academic progress, allowing administrators to make real-time decisions (Saurabh & Jadhav, 2022). In addition to improving data management, technology also

facilitates the collection and analysis of institutional data, helping administrators assess performance and make more informed decisions about budgeting, faculty assignments, and student services (Christensen & Eyring, 2020).

The concept of technology in higher education extends beyond mere automation and efficiency. It also involves fostering innovation and encouraging new forms of teaching, learning, and communication. Technology plays a crucial role in enabling distance learning, providing students and faculty with platforms to interact, share resources, and collaborate regardless of their physical locations (Murphy, 2021). As such, technology in higher education administration not only improves operational tasks but also reshapes the academic environment by enabling more dynamic, personalized, and flexible learning experiences.

THE IMPORTANCE OF TECHNOLOGY IN THE EDUCATION SYSTEM

Facilitates Access to Education

Technology has played a major role in expanding access to education for learners across diverse geographical and social backgrounds. Through online learning platforms, virtual classrooms, and digital learning tools, students can now participate in educational programs without the limitations of physical distance or rigid schedules. Moreover, open educational resources and e-learning applications offer learning opportunities to individuals who might otherwise be excluded due to economic or logistical constraints. In addition, learners with physical disabilities benefit from assistive technologies that support their participation in regular academic programs. Institutions can deliver lectures through recorded sessions, upload materials to online portals, and facilitate assessments through digital formats, all of which provide flexibility to students. This kind of access promotes educational inclusivity, equity, and lifelong learning. Technology, therefore, ensures that learning is not confined to traditional classroom settings and supports broader participation across age groups and social categories (Okon & Ebong, 2022).

Enhances Teaching and Learning Processes

Technology contributes to more effective and engaging teaching and learning processes by introducing interactive and flexible instructional tools. Teachers can use multimedia resources such as videos, animations, simulations, and visual aids to present complex concepts in simpler ways. These tools not only capture students' attention but also improve comprehension and retention. Furthermore, digital platforms support blended learning, which combines traditional classroom methods with online learning, allowing students to interact with content both during and outside scheduled class times. In addition, learning management systems help instructors manage assignments, quizzes, grading, and feedback efficiently. Technology also encourages active participation by enabling discussions through forums, virtual collaboration through cloud-based tools, and immediate responses through polls or quizzes. This form of engagement supports deeper learning and makes education more student-centered. As a result, technology enriches instructional delivery and helps foster critical thinking, creativity, and personalized learning experiences (Bello & Tijani, 2023).

Promotes Efficient Administrative Operations

Technology has become essential in managing the administrative functions of educational institutions more efficiently. Digital tools are now used for processing student admissions, managing academic records, organizing schedules, and generating transcripts. Furthermore, schools and universities use centralized databases and enterprise resource planning systems to store and retrieve institutional information quickly and accurately. These systems reduce paperwork, eliminate redundancy, and lower the risk of human error. In addition, automation improves the speed of service delivery, allowing administrators to focus more on planning and quality assurance. Communication between departments is also enhanced through institutional email systems, shared drives, and internal portals. Furthermore, technology enables institutions to monitor attendance, track performance, and compile reports with ease. These improvements reduce operational delays and support timely decision-making. Institutions that adopt digital systems for administrative purposes are able to function more effectively, improve staff productivity, and maintain transparency in their operations (Moses & Adebayo, 2021).

Supports Continuous Learning and Skill Development

Technology plays a key role in promoting continuous learning and the development of skills relevant to the demands of modern society. With access to online courses, video tutorials, webinars, and educational platforms, students can expand their learning beyond the classroom. Furthermore, these platforms allow individuals to learn at their own pace, revisit complex topics, and explore areas of interest that may not be covered in their regular curriculum. In addition, students develop digital skills such as information searching, content creation, and virtual collaboration, which are essential for success in today's workplaces. Technology also fosters independent learning by encouraging students to take initiative, solve problems, and think critically. Moreover, the integration of learning analytics and personalized content delivery allows learners to receive targeted support based on their performance. Through these opportunities, technology supports both academic development and the lifelong learning needed for adaptability and future employability.

Encourages Data-Driven Decision-Making

Technology supports the collection, analysis, and interpretation of educational data, which allows institutions to make well-informed decisions that improve academic and administrative outcomes. Through digital platforms, data can be gathered on student attendance, academic performance, resource utilization, and feedback. This data is valuable in identifying patterns, diagnosing challenges, and implementing interventions that are specific and results-oriented. Furthermore, technology makes it easier to monitor progress and assess the impact of programs in real time. For example, dashboards and analytics tools help administrators evaluate enrollment trends, budget allocations, and staff workload. In addition, academic departments can use data to refine teaching strategies and tailor instructional content to meet learners' needs. These practices not only improve institutional accountability but also enhance strategic planning. Technology, therefore, provides a reliable foundation for tracking performance, managing risks, and fostering evidence-based improvements that support the overall quality of education in a structured and measurable way.

The Role of Technology in Higher Education Administration

Technology plays an increasingly central role in the functioning of higher education institutions. It is integral to the administration of universities and colleges, helping to streamline processes, enhance communication, and improve decision-making. With the growing complexity of managing modern educational institutions, administrators are turning to technology to ensure the smooth running of operations and to maintain a high level of service for students, staff, and faculty (Goh, 2020). The widespread use of information systems such as Enterprise Resource Planning (ERP) systems, Learning Management Systems (LMS), and Student Information Systems (SIS) has become indispensable in higher education administration. These systems facilitate the collection and management of data, making it easier to track student progress, organize courses, and manage financial aid and admissions (Van der Merwe, 2021).

One of the key roles of technology is its ability to automate time-consuming administrative tasks, such as course registration, grading, and scheduling. Automation reduces human error and allows staff to focus on more strategic responsibilities. Furthermore, technology enables more efficient use of institutional resources, ensuring that staff, faculty, and facilities are allocated effectively to meet the needs of the academic community. Digital platforms like LMS and SIS also enable the rapid sharing of information, thus enhancing communication between administrators, faculty, and students. This communication leads to improved student engagement, as students can quickly access course materials, receive feedback on assignments, and communicate directly with their professors (Kong et al., 2021).

Moreover, technology enhances decision-making by providing administrators with access to real-time data. Institutions can track enrollment patterns, student performance, and financial indicators, enabling administrators to make proactive decisions about resource allocation and program offerings. The integration of advanced analytics and artificial intelligence (AI) into administrative systems allows for predictive modeling, helping universities identify trends and anticipate future challenges (Goh, 2020). For instance, predictive analytics can be used to identify students who are at risk of dropping out, allowing for early intervention to improve retention rates.

Digital Transformation in Higher Education Administration

Digital transformation in higher education administration refers to the integration of advanced technologies to overhaul traditional administrative processes and enhance overall institutional performance. This transformation is not just about adopting new technologies but also involves rethinking organizational structures, workflows, and strategies to better serve students and faculty while improving efficiency. As higher education institutions face increasing demands for flexibility, cost-effectiveness, and personalized learning, digital transformation becomes crucial for staying competitive and responsive to these changes (Barrett, 2020).

A significant aspect of digital transformation is the move towards cloud-based platforms that centralize data and provide real-time access to critical information. This shift facilitates more agile decision-making and allows administrators to monitor and adjust resources, faculty assignments, and class schedules with greater ease (Levy & Wilsom, 2020). Additionally, technologies such as artificial intelligence (AI) and machine learning (ML) are being used to automate and optimize administrative tasks, such as enrollment processing, student advising, and

financial aid distribution. These tools help reduce administrative burdens and improve the accuracy of data, thereby enhancing the student experience (Barrett, 2020).

Another key feature of digital transformation is the use of data analytics to inform institutional strategy. Advanced analytics enable higher education administrators to analyze vast amounts of data from various sources, such as student performance metrics, enrollment trends, and financial data. These insights can be used to make data-driven decisions, such as identifying students at risk of falling behind or adjusting academic programs based on student demand and performance (Kharbanda et al., 2021). Furthermore, digital transformation enhances accessibility and inclusivity by providing online learning opportunities, virtual collaborations, and digital resources, ensuring that students can access educational content regardless of their location.

Although the benefits of digital transformation are clear, the process presents several challenges. Institutions must invest in infrastructure, training, and cybersecurity measures to ensure the secure and effective implementation of new systems. Additionally, they must address issues of equity and access, ensuring that all students and faculty have the necessary tools and skills to succeed in a digital environment (Levy & Wilson, 2020). Despite these challenges, digital transformation offers the potential to revolutionize higher education administration by improving efficiency, enhancing student outcomes, and fostering greater collaboration and innovation.

Automation of Administrative Workflows in Higher Education

Automation of administrative workflows in higher education has transformed how institutions handle essential operations such as student registration, scheduling, admissions processing, payroll, and staff management. Through the deployment of digital tools and software solutions, universities now manage tasks with greater efficiency, speed, and accuracy, reducing the burden of manual procedures on administrative staff. Automation supports routine operations through systems that execute pre-set instructions, respond to data input, and process information without requiring constant human intervention. This transformation not only enhances institutional productivity but also allows staff to focus on more strategic and student-centered responsibilities (López & Luna, 2021).

Workflow automation reduces delays in service delivery, minimizes errors associated with manual data entry, and ensures consistency in administrative procedures. For instance, automated admission platforms enable institutions to process thousands of applications simultaneously, flag incomplete submissions, and update applicants on their admission status in real time. Additionally, course registration systems can automatically match student preferences with available slots, monitor enrollment caps, and provide real-time feedback to both students and academic advisors. These functions reduce administrative bottlenecks and promote a seamless experience for users (Otoo et al., 2023).

Furthermore, automation supports compliance with institutional policies and external regulations. Built-in validation rules and audit trails ensure that administrative actions adhere to required standards, reducing the risk of non-compliance or oversight. Systems such as enterprise resource planning (ERP) software help centralize operations across departments, enabling real-time updates and coordinated management of institutional resources. Human resource automation tools also handle tasks such as leave management, employee appraisal cycles, and payroll disbursement with minimal manual input, improving transparency and efficiency (Shin, 2020).

Automation enhances data accuracy and supports informed decision-making. Administrative systems collect and process large volumes of data, which can be analyzed to detect trends, identify inefficiencies, and guide planning efforts. For example, automated reporting features allow departments to generate enrollment trends, budget usage summaries, or staff workload reports, which can then inform policy decisions and institutional strategies. This data-driven approach strengthens accountability and ensures that decisions are based on timely and accurate information.

Although automation offers clear benefits, institutions must invest in proper training, change management, and system maintenance to ensure successful implementation. Staff members require support to adapt to new systems, and institutions must ensure that automated tools align with institutional goals and user needs. Despite these considerations, automation of administrative workflows stands as a central element in modernizing higher education administration, improving both operational efficiency and service quality across the board.

Technology and Academic Records Management

Academic records management is a vital aspect of higher education administration, encompassing the storage, retrieval, updating, and protection of student academic data. Technology has revolutionized how academic records are handled, shifting from paper-based systems to digital platforms that offer greater speed, accuracy, and reliability. The introduction of Student Information Systems (SIS) has been instrumental in ensuring that academic records are centrally stored, easily accessible, and consistently updated. These systems reduce human errors associated with manual data entry and allow institutions to maintain accurate and up-to-date student records throughout their academic journey (Obeidat et al., 2020).

The use of technology in records management enhances transparency and ensures that students and faculty can access relevant information promptly. For instance, students can check their grades, course histories, and academic standing through online portals, while administrators can generate transcripts and monitor student progress with minimal delays. Furthermore, digital records can be integrated with other administrative tools to support holistic decision-making regarding graduation eligibility, course planning, and academic advising (Chigona & Mutula, 2019).

Moreover, cloud-based record systems allow for secure storage and backup, minimizing the risks of data loss due to physical damage or technical failure. With appropriate encryption and access controls, these systems ensure data privacy and compliance with institutional policies and data protection laws. This is particularly important as institutions handle sensitive student information that must be safeguarded against unauthorized access (Akomolafe et al., 2021). Additionally, automated workflows embedded in modern academic records systems improve efficiency. Tasks such as enrollment verification, course registration, and academic audits can be completed faster and with less reliance on human intervention.

Technology supports scalability in academic records management. As institutions grow in size and complexity, digital systems provide the flexibility needed to manage larger volumes of data without sacrificing efficiency. Institutions can also implement analytics tools to identify trends in academic performance, enrollment behaviors, and course completion rates, helping them make informed decisions about academic policies and resource allocation (Adeyemi et al., 2022). As technology continues to evolve, the possibilities for improved academic records

management will expand, offering even more robust solutions to support institutional effectiveness and student success.

Improving Student Services through Technological Integration

Technological integration has transformed how student services are delivered in higher education institutions. Services such as academic advising, mental health support, financial aid, housing, and career counseling have all been enhanced through digital platforms. The central aim of integrating technology into student services is to provide timely, accessible, and personalized support that meets the diverse needs of the student population. Institutions now use mobile apps, chatbots, self-service portals, and automated notification systems to ensure students receive essential information and support in a timely manner (Moore et al., 2021).

Moreover, student service departments use Customer Relationship Management (CRM) tools to track student interactions, schedule appointments, and analyze service delivery patterns. These tools help create a cohesive experience across departments, enabling staff to offer coordinated support based on a student's individual academic and personal needs (Watson & Yu, 2022). Through these systems, students can access personalized recommendations for courses, extracurricular activities, and financial resources. This level of customization helps students navigate their academic journey more effectively and increases their engagement with institutional support services.

Digital tools reduce barriers to access. Students with disabilities, those in remote areas, and those managing work-study schedules benefit from 24/7 access to services through web portals and mobile platforms. Virtual advising and telehealth services allow students to receive guidance and support without the need to be physically present on campus. These options contribute to student satisfaction and retention by offering flexibility and convenience (Garcia et al., 2023).

Furthermore, institutions use analytics derived from service usage data to monitor trends, predict student needs, and adjust services accordingly. For example, a spike in counseling requests may prompt universities to increase staff availability during peak periods. Technology enables rapid adjustments to service offerings based on real-time feedback and usage patterns (Lin & Yang, 2020). These proactive measures help institutions better meet students' evolving expectations and improve their overall educational experience. As student demographics and preferences change, continued investment in technological integration will be essential for institutions to remain responsive and supportive.

Enhancing Communication and Collaboration with Digital Tools

Effective communication and collaboration are foundational to successful higher education administration. Digital tools have greatly improved these areas by facilitating faster, clearer, and more efficient interactions among administrators, faculty, and students. Platforms such as Microsoft Teams, Zoom, Google Workspace, and institutional intranets now serve as daily communication channels in most universities. These tools support not only routine administrative tasks but also enable virtual meetings, document sharing, and project collaboration in real time (Kim & Lee, 2020).

Moreover, digital communication platforms enhance transparency in administrative processes. Faculty members can receive timely updates on policy changes, academic deadlines,

and committee activities, while students benefit from automated reminders about registration, assessments, and institutional announcements. These systems reduce information gaps and prevent confusion, fostering a more organized academic environment (Rasheed & Mujtaba, 2021). Instant messaging and video conferencing tools also allow for quicker problem resolution, enabling staff to address student and faculty concerns without lengthy delays.

Furthermore, collaborative platforms make it easier for academic and administrative units to work together on projects such as curriculum reviews, accreditation processes, and strategic planning. Shared workspaces and version-controlled documents allow multiple users to contribute simultaneously, increasing productivity and ensuring that communication is both archived and accessible. This enhances institutional memory and supports continuity in administrative operations (Tang et al., 2022). These tools are also used for interdisciplinary collaboration and committee meetings, which can now occur more frequently and efficiently, even across geographical distances.

Institutions are increasingly using social media platforms and mobile applications to engage students and promote institutional values. While formal communication takes place through official portals, informal interactions on social media can foster a sense of community and make administrative offices more approachable to students (Amadi & Onyebuchi, 2023). However, institutions must also ensure that communication tools are used responsibly, with clear policies regarding professionalism, data security, and appropriate usage. As communication demands increase with institutional growth and digital expansion, ongoing updates to platforms, staff training, and feedback mechanisms will be necessary. Digital tools have already reshaped the culture of collaboration in higher education, and their continued refinement

Technology in Financial and Resource Management

Technology plays a vital role in strengthening financial and resource management within higher education institutions. Through the deployment of advanced financial management systems, universities can effectively monitor income, expenditures, budgeting, and allocation of resources. Enterprise Resource Planning (ERP) systems are widely used to integrate financial data across departments, reducing duplication and ensuring consistency in institutional financial records (Okafor & Idogho, 2022). These systems provide real-time financial reporting, which enables institutions to maintain fiscal responsibility and respond swiftly to budgetary concerns.

Moreover, automated financial platforms assist in fee collection, payroll processing, procurement, and auditing. Students can conveniently pay fees through online portals, while staff salaries and supplier payments are handled electronically, reducing delays and minimizing errors. In addition, these systems help universities meet regulatory and compliance requirements by maintaining detailed records of financial transactions and facilitating the preparation of audit reports (Yakubu & Hassan, 2021). Transparency in financial operations not only improves institutional accountability but also fosters stakeholder confidence.

Furthermore, digital tools support efficient resource allocation by enabling administrators to monitor asset utilization and track expenditures in real time. Software for asset management ensures that physical resources such as buildings, laboratories, and learning materials are maintained and optimally used. Institutions can plan for maintenance, replacements, or upgrades based on usage patterns, which improves cost-effectiveness and service delivery (Mensah & Boateng, 2023). Additionally, institutions are able to assess return on investment for different

programs and initiatives using financial analytics tools, ensuring that funds are directed toward projects that align with strategic goals.

Cloud-based budgeting tools allow departments to create, submit, and monitor their budgets with greater ease. These tools foster collaborative budgeting by allowing multiple users to work on financial plans simultaneously, improving communication between finance units and academic departments. Dashboards and visualizations simplify the presentation of financial data, making it easier for non-financial administrators to understand budget positions and contribute to decision-making processes (Ikechukwu & Okeke, 2020). Through the application of these technologies, financial and resource management becomes more responsive, streamlined, and supportive of institutional planning.

Decision-Making in Administrative Processes

Technology enhances decision-making in higher education administration by providing timely access to accurate data and supporting evidence-based planning. Through data analytics tools, institutional leaders can analyze trends in enrollment, performance, funding, and staffing, which inform strategic choices. Decision support systems (DSS) are widely adopted in higher education to synthesize large volumes of data into usable insights that improve policy formulation and operational strategies (Lawani & Dada, 2021). These systems empower administrators to identify patterns, forecast outcomes, and simulate potential impacts before making major decisions.

Moreover, dashboards that compile data from different departments offer a comprehensive view of institutional performance. For example, dashboards may display student retention rates, financial status, staff workload, and infrastructure usage. This integration helps leaders align departmental goals with overall institutional objectives and allocate resources more effectively (Adewale & Eze, 2020). Through regular updates and visual reporting, dashboards enhance situational awareness and support responsive management practices.

Furthermore, technology enables participatory decision-making by providing platforms for feedback and collaboration. Online surveys, feedback forms, and digital forums allow students, faculty, and staff to contribute opinions and suggestions on various administrative matters. Such inclusive practices enhance the quality of decisions and promote trust in leadership. These platforms also facilitate quick consultations during crises or when urgent decisions are required, thereby reducing bureaucratic delays (Usman & Garba, 2022).

In addition, artificial intelligence and machine learning applications are being introduced to support complex decisions such as student admissions, financial aid allocation, and risk management. These technologies assess multiple variables to provide optimized recommendations, reducing subjectivity and human bias. Predictive models can identify at-risk students, recommend intervention strategies, and support academic planning by forecasting course demand (Nwachukwu & Oladipo, 2023). As a result, institutions can proactively address challenges rather than reacting to issues after they arise.

The use of cloud-based collaborative platforms also ensures that decision-making is not limited by geographical constraints. Administrative teams can hold virtual meetings, share reports, and co-develop strategies regardless of location. This flexibility contributes to faster decision cycles and improves coordination across departments. Overall, the incorporation of technology into decision-making processes enhances efficiency, supports transparency, and fosters data-driven governance.

STRATEGIES FOR EFFECTIVE IMPLEMENTATION OF ADMINISTRATIVE TECHNOLOGIES

Developing a Comprehensive Implementation Plan

Establishing a detailed and realistic implementation plan is a foundational strategy for the successful adoption of administrative technologies in higher education. This involves outlining clear objectives, identifying institutional needs, setting timelines, and assigning responsibilities. A well-structured plan ensures that technology aligns with institutional goals and supports essential administrative functions. Furthermore, the plan should prioritize user requirements and address technical and organizational challenges likely to arise during deployment. In addition, it should include a phased approach that allows gradual rollout of technologies, starting with pilot programs before full-scale implementation. Institutions that operate without structured plans often experience delays, cost overruns, or resistance from staff due to lack of direction. Therefore, mapping out procedures, benchmarks, and evaluation metrics enhances efficiency, reduces risks, and promotes long-term success in technology deployment (Oladimeji & Hassan, 2022).

Ensuring Strong Leadership and Administrative Support

Effective implementation of administrative technologies depends greatly on the commitment and involvement of institutional leaders. When senior administrators demonstrate support for digital transformation, it motivates staff to engage with new systems. Moreover, visible leadership ensures that resources are allocated appropriately and that digital strategies receive the attention they deserve. In addition, leadership fosters accountability and drives performance by setting expectations and creating an environment conducive to change. Supportive leaders also advocate for technology integration during stakeholder meetings, ensuring alignment across academic and administrative units. When leaders are actively involved in training, feedback collection, and system evaluation, staff are more likely to embrace change and adopt digital practices. Furthermore, leadership continuity provides stability during the transition process, reducing confusion and delays (Anifowose & Balogun, 2020). Leadership commitment must therefore be sustained from planning to full implementation and evaluation.

Building Staff Capacity through Continuous Training

Training and capacity building are essential strategies for ensuring that administrative staff can confidently and effectively use new technologies. Institutions must design continuous and role-specific training programs that address the unique responsibilities of each administrative unit. Moreover, training should not be a one-time event; regular refresher sessions are necessary to keep staff updated on system upgrades and evolving functions. In addition, incorporating practical sessions, demonstrations, and simulations into training increases retention and user engagement. Staff who are well-trained are more likely to embrace change, use systems appropriately, and assist colleagues in resolving common issues. Furthermore, training programs can serve as platforms for gathering feedback from users, which can inform future improvements. When staff feel adequately equipped, they become valuable stakeholders in the

technology adoption process, promoting smooth transitions and effective use of systems (Uchenna & Bako, 2021).

Engaging Stakeholders in the Adoption Process

Involving all relevant stakeholders including administrators, academic staff, students, and technical personnel helps to ensure inclusive and sustainable implementation. Stakeholder engagement promotes transparency, builds trust, and generates valuable insights that shape system design and functionality. Moreover, early involvement in decision-making allows concerns to be addressed proactively and increases the likelihood of acceptance across the institution. In addition, feedback from different user groups can help identify potential challenges, thereby informing adjustments before full deployment. Communication with stakeholders through forums, emails, and surveys keeps them informed and reinforces their role in the process. Furthermore, assigning representatives from each department to serve as technology ambassadors can facilitate knowledge sharing and reduce resistance. Institutions that adopt this inclusive strategy often experience smoother transitions, as users feel a sense of ownership over the technology and its outcomes (Gambo & Nweke, 2023).

CHALLENGES OF TECHNOLOGICAL ADOPTION IN HIGHER EDUCATION ADMINISTRATION

Inadequate Technological Infrastructure

One of the persistent challenges facing higher education administration in adopting technology is the lack of adequate infrastructure. Many institutions, especially in developing contexts, operate with outdated hardware, unreliable internet connectivity, and insufficient server capacity. This technological gap restricts the effective deployment of advanced administrative tools and limits the functionality of existing platforms. Moreover, administrative systems such as digital records, communication platforms, and financial software demand stable and scalable infrastructure to perform effectively. When internet downtime or power failures occur frequently, administrative processes become disrupted, delaying services and reducing productivity. In addition, older equipment may not support modern software updates, which can lead to compatibility issues and system failures. Institutions without proper infrastructure may find it difficult to scale their operations or introduce new technologies that could streamline administrative functions (Onyema & Okoro, 2021).

Resistance to Change among Staff

Another critical obstacle in adopting technology within higher education administration is resistance from administrative personnel. Staff who have relied on traditional processes for years may be reluctant to transition to digital platforms, especially when they perceive such changes as disruptive or intimidating. This resistance is often rooted in fear of redundancy, lack of digital literacy, or discomfort with adapting to new systems. Moreover, insufficient involvement of staff during the planning and implementation stages of technological projects can deepen skepticism and reduce cooperation. When personnel do not receive adequate orientation or motivation, they may choose to bypass new systems altogether, reverting to manual methods that slow down

administrative efficiency. In addition, generational differences in technology exposure can lead to uneven adoption rates, creating gaps in workflow and collaboration (Bello & Idris, 2020). Overcoming this challenge requires structured training and inclusive implementation strategies.

Financial Constraints

Implementing and maintaining digital technologies in higher education requires substantial financial investment. Many institutions struggle with limited funding, making it difficult to procure modern software, upgrade infrastructure, and sustain long-term maintenance. Financial challenges also affect the ability to train staff, renew software licenses, and invest in cybersecurity. Moreover, budgeting for technology often competes with other institutional priorities such as staffing, facilities maintenance, and academic program development. As a result, administrators may delay the adoption of essential systems or settle for lower-quality alternatives that do not meet operational needs. In addition, the cost of transitioning from manual to digital systems involves not only hardware acquisition but also data migration and integration with existing platforms. These processes require specialized personnel and technical support, which further escalates expenses (Kure & Agada, 2021). Without adequate financial backing, technology adoption remains fragmented and ineffective.

Data Security and Privacy Concerns

As institutions digitize administrative operations, ensuring the safety of student records, financial data, and internal communications becomes a growing concern. Data breaches, cyberattacks, and unauthorized access can result in the loss or exposure of sensitive information, affecting both institutional credibility and legal compliance. Furthermore, many institutions lack dedicated IT security teams or do not implement comprehensive data protection protocols. This leaves them vulnerable to malware, phishing, and internal security lapses. Additionally, the improper handling of data, such as storing personal information on unsecured servers, can violate national or institutional regulations regarding data privacy. Administrators must strike a balance between accessibility and protection, ensuring that only authorized personnel can access specific information. In many cases, however, awareness about best practices in data security is low, and policies remain poorly enforced (Nnaji & Ibrahim, 2022). Addressing these risks requires training, policy development, and consistent monitoring.

Lack of Skilled Technical Personnel

The absence of adequately trained technical personnel within higher education institutions remains a major barrier to effective technology adoption. Successful implementation of digital administrative systems requires professionals who possess expertise in IT support, database management, system integration, and cybersecurity. However, many institutions, particularly those with limited budgets, cannot attract or retain qualified personnel due to competition with the private sector or unattractive working conditions. Furthermore, when IT staff are insufficient in number or lack the required skills, system malfunctions and user issues take longer to resolve. This results in frequent disruptions to administrative processes and decreased staff confidence in technology. Additionally, without expert supervision, institutions are unable to customize software to meet specific administrative needs, leading to inefficiencies. Institutions must

therefore invest in recruitment and continuous training of IT staff to ensure smooth operation of digital tools (Eze & Onuoha, 2021).

Incompatibility between Systems

Another challenge encountered in technological adoption is the lack of compatibility between newly acquired systems and existing administrative frameworks. Institutions often use different software solutions for admissions, student records, finance, and communication, which may not be fully integrated. When these systems operate in isolation, administrators are forced to manually transfer data across platforms, increasing the risk of errors and inefficiency. Moreover, incompatibility can lead to data duplication, information loss, and delays in report generation. Institutions without a clear technology roadmap may adopt systems that do not align with their overall digital strategy, creating bottlenecks and workflow disruptions. In addition, vendors may not always provide adequate support for integrating third-party applications, making it difficult for administrators to achieve seamless operation. As a result, administrative tasks become more cumbersome, defeating the purpose of digitization (Abubakar & Yaro, 2020).

Insufficient Policy and Regulatory Framework

The successful integration of technology into higher education administration requires robust institutional policies and national regulations. In many contexts, such policies are either outdated or absent, leading to inconsistencies in implementation. Institutions may lack clear guidelines on data usage, software procurement, staff training, and system maintenance. Moreover, without legal backing, administrators face difficulties in enforcing technology use or holding users accountable for data misuse or system breaches. Additionally, poor coordination between government bodies and institutions contributes to irregular technology adoption patterns across the sector. For example, some universities may receive funding for digital infrastructure while others do not, resulting in a lack of uniformity in digital services. Furthermore, in the absence of clear monitoring and evaluation standards, the effectiveness of adopted systems cannot be properly assessed. These policy gaps hinder progress and create uncertainty among stakeholders (Ismail & Yusuf, 2022).

Inconsistent Training and Capacity Building

A major barrier to the effective use of technology in higher education administration is the inconsistency in training programs for staff. Even when institutions acquire modern systems, many administrators are not adequately trained on how to use them efficiently. Some staff members receive brief orientations, while others are left to navigate complex platforms on their own. Moreover, training sessions are often conducted once at the point of deployment, without ongoing refreshers or updates. This leads to limited user proficiency, underutilization of tools, and growing frustration among personnel. In addition, institutions rarely tailor training content to specific job roles, resulting in generalized sessions that do not address the practical needs of different departments. A structured and continuous training program is essential to ensure administrators remain confident and effective in using digital systems (Obasi & Omole, 2021). Without this, adoption becomes superficial and inconsistent.

CONCLUSION

Technology has become an essential component of effective administration in higher education, offering tools that streamline processes, improve communication, and support informed decision-making. From managing academic records to enhancing financial operations and student services, the integration of digital systems enables institutions to operate more efficiently and respond to the growing demands of modern educational environments. Moreover, the adoption of technological innovations has created opportunities for collaboration, transparency, and improved service delivery across all administrative units. Additionally, institutions that embrace digital transformation are better positioned to align their operations with global best practices, while also improving access to information and data-driven planning. Although the benefits are evident, challenges such as inadequate infrastructure, resistance from staff, financial limitations, and data security concerns continue to hinder progress. Addressing these challenges requires a strategic approach that includes leadership support, continuous training, stakeholder involvement, and strong policy frameworks. Furthermore, the successful implementation of administrative technologies depends not only on the availability of tools but also on the readiness of institutions to adapt and evolve with changing technological trends.

Suggestions

- University Administrators should allocate sufficient budgetary provisions for the procurement, maintenance, and upgrading of digital tools.
- Government agencies responsible for higher education should provide funding support, formulate national digital policies, and create frameworks that encourage and guide the integration of technology in administrative functions.
- University staff should actively participate in training programs and seek to improve their digital competence. Moreover, staff should stay updated with system upgrades and be open to adapting to new technologies that can simplify their tasks and enhance service delivery.
- Academic personnel should support the use of digital tools in managing student records, course registration, and internal communication

MANAGING TEACHERS' ABSENTEEISM FOR QUALITY EDUCATION GOALS ATTAINMENT IN PUBLIC SENIOR SECONDARY SCHOOLS IN RIVERS STATE, NIGERIA

Grace Uzunma NJOKU
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

The study investigated the management of teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State, Nigeria. The descriptive survey research design was adopted. Five research questions were raised and five hypotheses were formulated to guide the study. The population of the study consisted of all 302 principals of the 302 public senior secondary schools in Rivers State. Census sampling technique was employed to sample the entire population since it was of a manageable size. The instrument for data collection was a questionnaire developed by the researcher and titled "Managing Teachers' Absenteeism for Quality Education Goals Attainment in Public Senior Secondary Schools in Rivers State Questionnaire (MTAQEGAPSSSRSQ)". The reliability coefficient of the instruments was determined using test-retest method and Pearson Product Moment Correlation and was found to be .78. The research questions were answered using mean and standard deviation statistics while the hypotheses were tested at .05 level of significance using independent samples t-test. The findings of the study revealed that strategies such as the use of attendance monitoring systems (AMS), attendance-based incentives, improved working conditions and punitive measures were effective strategies that could be employed by principals to manage teachers' absenteeism in public senior secondary schools in Rivers State. The study further found that all the strategies were adopted to a low extent by principals of public senior secondary schools in Rivers State except the use of attendance monitoring system (AMS) which was adopted to a high extent. Furthermore, it was found that majority of the male and female principals did not significantly differ in their mean scores on the extent the strategies employed to manage insecurity in their schools. It was concluded that school principals have not been dynamic and flexible in employing different strategies in the management of teachers' absenteeism in public senior secondary schools in Rivers State and this has been to the disadvantage of quality goals attainment at this level of education in the state. It was recommended among others, that school principals and school based management committees should periodically review their attendance management strategies with a view to determining what strategies would be most effective in managing teachers' absenteeism in their schools.

INTRODUCTION

The underlining reason for the establishment of schools is instruction. Instruction in its simplest definition refers to teaching and learning carried out by teachers and learners respectively. It therefore holds true to aver that no matter how gigantic the structure of a school may be, no matter the state of the art facilities that may be present in it, no matter how conducive the environment and working conditions might be, and no matter the amount of educational resources available and accessible to the school, without effective teaching and learning going on in that school, the purpose, goals and objectives of that school have simply been defeated.

The end product of instruction is education. Education in this regard refers to the transfer of learning experiences, which include knowledge, skills, experience, and understanding from the more knowledgeable fellow (the teacher) to the less knowledgeable fellow (the leaner), which brings about change in behaviour (behaviour modification) in the learner.

The recognition of the importance and potency of education as an agent of change and socioeconomic development of nations has also made nations of the world, including Nigeria to now adopt education as the tool for national development planning. Hence, all the aspirations and goals of the nation make up the educational curriculum content of schools, which are delivered by the teachers to the learners. This is to say that without the teacher, this process of instruction can simply not take place, and when instruction does not take place, educational goals are not achievable, which in consequence implies the non-attainment of national goals, too. This highlights the importance of the teachers' presence in the school.

The presence of the teacher is everything in the successful implementation of educational plans and programs. The teacher is the orchestrator of learning. He is the craftsman in the making or formation of the learner. He is the transformer and modifier of the behaviour of students. Apart from impacting academic knowledge to the learners, he is also a role model of acceptable character to them. He teaches and directs, corrects and counsels, rebukes and rewards, punishes and prunes, and does everything possible to nurture the learner into the expected graduate that the society wants to see. The goal is that by the end of the instructional session, students should be found worthy in learning and in character. This is the job teachers in public senior secondary schools in Rivers State are employed to do and this may only be achieved when the teacher understands that his job description encompasses both manifest and latent functions. Teachers' presence is simply everything for quality goals attainment in public senior secondary schools in Rivers State.

The goals of secondary education in Nigeria are clearly articulated in relevant sections of the National Policy on Education and they are to be achieved through quality teaching and learning. These goals adapted from Federal Republic of Nigeria (FRN, 2014) in the National Policy include:

- To offer unrestricted access to quality education to a large number of students irrespective of their socioeconomic background;
- To diversify the secondary education curriculum such that it captures the differences in talents of the Nigerian students and to provide for better opportunities for graduates of this level of education;
- To inculcate the spirit of self-reliance, industry and versatility in the students;
- To impress upon students the spirit of national consciousness and patriotism;
- To develop and project Nigerian culture, languages and art;

- To nurture and develop a sense of spirituality and morality, integrity and uprightness in students;
- To raise the spirit of self-respect and respect for others, valuing dignity of labour; and
- To foster unity and harmonious coexistence

Etor et al. (2019) summarized these goals as preparing the individuals for useful living within the society, and for higher education as well as equipping secondary school leavers with the needed skills for effective living within the society. These goals therefore become the indices by which quality education is judged.

Quality of education goals attainment is described in this study as the degree to which education outcomes or outputs measured by teachers' job performance indices and students' learning outcomes (academic achievements), conform to set objectives. The set objectives are defined generally by the goals of the senior secondary level of education as contained in the National Policy on Education for this level of education in the country (enlisted in the immediate subsequent paragraph), which in a nutshell is to produce secondary school graduates who are found worthy in learning (academic results) and in character (behaviour modification outcomes).

Teachers are indispensable factors in the quality education goals attainment process. Their physical presence is necessary for students' learning. As such, addressing teacher absenteeism must be a top priority in public senior secondary schools in Rivers State. Teacher absenteeism is the absence of a teacher from his duty post, which is the school. It is a phenomenon by which a teacher absconds from work, leaving vacuum in his instructional position. Teacher absenteeism could be with the consent of the school administrator or could be an expression of workplace deviant behaviour, perpetrated against the job ethics. The type of absenteeism that comes with consent could be as a result of official assignment or engagement that takes the teacher out of the school or classroom, teacher attendance of a professional development course, work leave, sick leave, child delivery leave or for any other reason that makes the teacher unavoidably absent, but this type of absenteeism always has the awareness and or approval of the school principal; thus this becomes easy to manage as modalities are sometimes put in place ahead of the teacher's absence to cover up the vacuum.

The end result is always half-baked students who most of the times are forced by the situation into thoughts and actions of examination malpractices to be able to "make their papers" in national examinations line WAEC and NECO. Majority of those who try to write these exams by themselves always end up coming out with abysmal performance which is not good enough for the furtherance of their education. Thus the secondary school education goal of preparing students for entry into higher institutions becomes defeated, too. It therefore becomes obvious that the effects of teacher absenteeism on quality goals attainment in public senior secondary schools in Rivers State are multifaceted and far-reaching. As such, taming this "monster" of a deviant behaviour becomes the concern of affected stakeholders, and principals must thus be proactive in devising means of managing it.

Literature reviews on these strategies reveal two major themes: reward-oriented strategies and punishment-inclined strategies. While the reward-oriented strategies come with promises of reward or better job satisfaction in a bid to attracting and retaining increased teacher attendance, the punishment-inclined strategies are those that instill fear on teachers to deter them from the deviant behaviour. As such, the study would in discrete terms examine strategies such as the use of attendance-based incentives (ABI) (reward system), the use of punishment, improving teachers' working conditions, and the adoption of attendance monitoring system (AMS). It is in

the light of this background that the study seeks to explore managing teacher absenteeism for quality education goals attainment in public senior secondary schools in Rivers State.

Statement of the Problem

Quality education goals which aim at producing learners who are worthy in character and in learning are seriously threatened by the menace of teacher absenteeism in public senior secondary schools in Rivers State. Teachers' consistent presence on their duty posts is simply indispensable as the assurance of instruction wholly depends on it. Teachers are needed to teach the subjects that would give students the knowledge required to gain entry into higher institutions which is a critical goal of senior secondary education. Goals of developing students' affective domain, which would help them in peaceful coexistence with others, and in building the spirit of patriotism that would lead to their useful contribution to the society and to the nation at large are far from being attained as teachers who are saddled with the responsibility of role modeling and of inculcating these values and orientations into the students are hardly present and available to carry out these duties. Quality education which is mostly measured by students' academic performance in summative assessment and especially in the national examinations such as WAEC and NECO is simply nothing to write home about as absenteeism of teachers greatly undermine quality instructional delivery. Non-coverage of the curriculum, poor classroom management, rising cases of students' indiscipline and deviant behaviours which are fast becoming the norm in public senior secondary schools in Rivers State are all also traceable to teacher absenteeism. Parents and the government are worried and principals in these schools are challenged with the urgent task of devising effective means of managing the situation. It is the thought of the researcher that strategies such as use of attendance-based incentives, punishment, improved working conditions and the adoption of attendance monitoring system could help in managing this menace. This becomes what this study sets out to explore.

Aim and Objectives

The aim of the study was to explore how to manage the absenteeism of teachers for quality education goals attainment in public senior secondary schools in Rivers State. Specifically, the study sought to:

- Identify effective strategies of Principals in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State.
- Ascertain the extent attendance monitoring system (AMS) is adopted in managing teachers' absenteeism for quality education delivery in public senior secondary schools in Rivers State.
- Examine the extent attendance-based incentives (reward system) are employed in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State.
- Evaluate the extent improved working condition is used in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State.
- Assess the extent punitive measures are employed in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State.

Research Questions

The following research questions were raised to guide the study.

- What are the effective strategies of principals in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State?
- To what extent is attendance monitoring system (AMS) adopted in managing teachers' absenteeism for quality education delivery in public senior secondary schools in Rivers State?
- To what extent are attendance-based incentives (reward system) employed in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State?
- To what extent is improved working condition used in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State?
- To what extent are punitive measures employed in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State?

Hypotheses

The following hypotheses were formulated to guide the study. They were tested at a significance level of .05.

- There is no significant difference in the mean ratings of male and female principals on the effective strategies of principals in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State.
- There is no significant difference in the mean ratings of male and female principals on extent attendance monitoring system (AMS) is adopted in managing teachers' absenteeism for quality education delivery in public senior secondary schools in Rivers State.
- There is no significant difference in the mean ratings of male and female principals on extent attendance-based incentives (reward system) are employed in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State.
- There is no significant difference in the mean ratings of male and female principals on the extent improved working condition is used in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State.
- There is no significant difference in the mean ratings of male and female principals on the extent punitive measures are adopted in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State.

THEORETICAL FRAMEWORK

The study was theoretically anchored on the matter being investigated, which is managing teacher absenteeism for quality education goals attainment. Theory X and Theory Y are two sets of management theories proposed by Douglas McGregor in his book titled "Human side of

enterprise" published in 1960. In this theory, McGregor tried to explain how managers' perception of employees determine the approach they adopt in the management of the organization or their managerial behaviours towards such employees. McGregor thus grouped employees in organizations into two categories based on their behavioural tendencies, and the categories being X and Y. The X category employees form theory X workers and inform Theory X management while the Y category of employees form the Theory Y workers which informs theory Y managers.

The theory X describes the traditional management view of direction and control. This theory is of the assumption that:

- The average human being (employee in the organization) inherently dislikes work and will avoid it if possible.
- By reason of this human dislike of work, most people must be strictly monitored, coerced, controlled, directed, and where necessary - threatened with punishment to get them to do what they are supposed to do toward achieving the set objectives of the organization.
- The average human being has relatively little ambition, wishes to shy away from responsibility, prefers to be directed, and wants security above all.

As a result of the tendencies of the Theory X workers, the Theory X manager therefore needs to clearly specify tasks and use very close and firm monitoring and supervision together with a reinforcement system (comprising threat of punishment and promise of rewards as motivating factors). The theory X management approach is autocratic in nature, and as such, gets the work done but is not usually endeared to the hearts of the workers. What is most important however is that the work gets done. It is a transactional approach to management whereby "carrot and stick" are applied to reward workers for doing the right and punish them for doing the wrong.

Theory Y on the other hand is an integration of individual and organisational goals, which is the contemporary approach to organizational management, and it is informed by Theory Y type of workers. The basic assumptions of the theory Y are that:

- The average human being (employee in the organization) does not inherently dislike work, but sees work as a source of satisfaction or punishment depending upon controllable conditions.
- Employees in the organization exercise self-direction and self-control in their job performance for realizing set objectives of the organization. As such, external control and threat of punishment are not always necessary to bring about effort toward the objectives of the organization.
- When there are rewards associated with employees' achievement, commitment to objectives becomes the outcome. The most significant of such rewards would be those that satisfy employees' ego and self-actualization needs.
- Under proper conditions, the average employee learns, not only to accept responsibility, but also to seek out opportunities to take responsibility. The lack of ambition, avoidance of responsibility and emphasis on security demonstrated by some employees are often products of experience (either at that present job or from previous works) and not their inherent nature.

- Widely distributed in the population of the organization is a relatively high level of ingenuity and creative imagination towards solving organizational problems.
- The intellectual capabilities of the average worker are only partially utilized under the conditions of modern industrial life.

A theory Y approach to management seeks to establish a conducive working environment in which individual worker's personal needs and objectives can harmonize with the objectives of the organization. As such, there is often a cooperative relationship between workers and managers.

Relevance of Theory X and Theory Y to the Present Study

McGregor's Theory X and Theory Y is relevant to this study as it highlights the nature of teacher absenteeism in the Theory X category of workers and the appropriate management strategies to be adopted by principals to ensure that teachers are regularly present in school to carry out their official responsibilities. The theory Y in the same vein highlights the need for the provision of a conducive working environment for teachers in the school to motivate their presence and commitment towards carrying out their duties as and when due. The theory X perfectly describes the nature of absenting teachers as those inherently loathing work and shying away from taking responsibilities and looking for every opportunity to abscond from work. Managing this category of teachers in the school would therefore require the use close and strict monitoring and supervision, coercion, control and a system of threats of punishment and promises of rewards to get them to be in school and to perform their works. All of these relate to the present study as the theory X management strategies are related to the strategies suggested in this study for managing teacher absenteeism in public senior secondary schools in Rivers State.

The Theory Y particularly highlights the place of favourable working conditions as a motivating factor for employee attachment and commitment to their jobs. According to the theory, employees' negative attitude towards work is mostly caused by their experiences at the work place, which are directly related to the working conditions and experiences teachers get in school. The study is of the view that when appropriate work conditions are made available for teachers, the problem of absenteeism will be reduced. Such conditions make for the harmonization of teachers' personal needs and objectives with those of the school organization. Summarily, Theory X and Theory Y is used to buttress the need for the combination of reinforcement system together with appropriate working condition and monitoring and supervisory practices to elicit assured presence of teachers in the instructional place. This is what is required for quality education goals attainment in public senior secondary schools in Rivers State.

Teachers' Absenteeism Conceptualized

Various scholars have conceptualized absenteeism in different ways and sometimes others use the word absence. Bucknall and Wei cited in Mwesiga (2016) defined absenteeism as an employee's failure to report for work when scheduled to do so. With this definition, it does not include absence from work by prior arrangement, approved annual leave and other statutory vacation days. Grewe (2005) observed that, according to the Swiss Conference of Educational Directors (EDK), there is no national definition of absenteeism. Consequently, the Swiss

educational law (Art 37, V VS & 17) defined absence as a missed lesson or school day. This definition however, did not take into consideration the fact that some absences could be legitimate, implying that absence is absence irrespective of its cause or nature. Other scholars view absenteeism as any failure to report for work as scheduled, regardless of reasons (Cascio & Boudreau cited in Mwesiga, 2016). This definition presupposes that whenever an employee is not on the job as scheduled, he or she is absent, regardless of cause. From the definitions above, all authors have a typical characteristic and that is, referring to absenteeism as a failure of a worker to report to job.

Teacher absenteeism is a habitual or tendency of a teacher to be away from work or school without a good reason (Adeyemi, 2008), Meziobi and Nwadiani (2015) had observed that, teachers' truancy and absenteeism have assured increasing and frustrating dimensions. While Gaziel (2014) lamented that the teaching profession in Nigeria is fast becoming "a grumbling profession" and an increasing number of teachers are regarding teaching as "a part-time and pass-time occupation". This today is visibly seen in how lackadaisical teachers treat their jobs. Taking the definition of teacher absenteeism further from teachers not reporting to school, IBIS/NNED cited in Mwesiga (2016) defined Teacher absenteeism as teachers not available in school at the time of visits by the school inspection team. This includes teachers who have reported for work and have left for whatever reason before the arrival of the team and teachers yet to report to school. Teacher absenteeism is defined in the study as any type of teacher absence from the classroom; it includes both personal and professional absences (Robinson, 2008). Personal absences are defined as a teacher initiated absence from the classroom. The teacher has made the decision to be absent for reasons such as personal illness, family illness, personal business, death in the family, or moving. Professional absences are defined as a school, board, or other governmental agency initiated absence from the classroom (Robinson, 2018).

Much attention has been focused on the attendance of children in schools and the impact that frequent student absences have on student learning, so much so that parents may face criminal sanctions if their children miss a certain number of days of school (Finlayson, 2019). However, the same attention needs to be focused on the attendance of teachers who are charged with the responsibility of teaching these children.

Types and Causes of Teachers' Absenteeism

Literatures have categorized the forms of teachers' absenteeism into two categories, vis-à-vis voluntary and involuntary absenteeism. These are reviewed below:

Voluntary Absenteeism and Quality Education Goals Attainment

Sometimes referred to as unscheduled or illegitimate or unproved or unplanned absenteeism, is a truant or deviant type of absenteeism wherein a teacher deliberately or indeliberately absents himself from school or from his work post without prior permission from or approval of the school authority. School administrators often frown at this type of absenteeism because it is against the professional code of contact and contravenes the teachers' contract engagements. In most cases, the illegitimate absenteeism poses a lot of problems to schools such as not meeting schools' goals and objectives and downturn in overall productivity of the school (Mwesiga, 2016). Ejere (2010) in a study on determinants of teachers' absenteeism in public primary schools found three factors which strongly correlated with teachers' propensity to be absent from

work. These factors included job satisfaction, the perception of meaningfulness of work and stress.

Involuntary Absenteeism and Quality Education Goals Attainment

It is rare to find an organization that always records 100% employee attendance. There will always be genuine reasons why an employee may have to be absent from work or from his work post occasionally due to circumstances beyond his or her control or circumstances thought to be for the benefit of the organization. Such absences are with the prior knowledge of the management, and are thus scheduled. Such is referred to as involuntary or scheduled absenteeism. Examples of this type of absenteeism include when a teacher is absent from work or his/her duty post due to annual or sick leave, maternity leave, sickness (with the knowledge of the school administration, on an official duty, on training, or any other purpose that may add to the benefit of the school. This type of teacher absenteeism does not have much negative effect (if there is any) on goal attainment of the school because it is anticipated and mostly planned for. In a situation where a teacher has to go for leave, modalities could easily be put in place for another teacher to cover up for his/her duties so that no instructional vacuum is created in the school and in the teacher's class.

STRATEGIES FOR MANAGING TEACHERS' ABSENTEEISM

The present study proposes four different approaches to the management of teachers' absenteeism in public senior secondary schools for quality education goals attainment in Rivers State. These have been gleaned from literature review, drawing inferences from what is obtainable in other organizations across the world. It is hoped that they could be effective in solving the problem of teachers' voluntary absenteeism which is currently dealing heavy blows on the attainment of the goals of senior secondary education in public schools in Rivers State. The proposed strategies in the study include: (a) the use of attendance monitoring system (AMS) (b) the employment of attendance-based incentives (ABI); (c) improved working condition; and (d) the adoption of punitive measures (punishment) for defaulters.

Attendance Monitoring System (AMS) for Managing Teachers' Absenteeism for Quality Education Goals Attainment in Public Senior Secondary Schools in Rivers State

Monitoring teachers' attendance is beyond just ensuring that they are present in school. Teachers' presence in school must be assured for the whole school time, and as such, monitoring their attendance requires monitoring when they arrive in school and in classes and monitoring when they leave.

The attendance monitoring system could be either manual or electronic. Manual monitoring system is done basically by the use of three major "time-books" or records in the school, which include the attendance register, the movement logbook and the class attendance register or the instructional attendance register (Wali, 2021). The attendance register is used to monitor both attendance and punctuality. It is often kept by the Principal's office or at a designated office and teachers are expected to login at arrival, indicating their arrival time. At the close of work, they are also expected to logout while leaving. The attendance register is

"opened" at the beginning of each school day with the date clearly specified and teachers write their names and time of arrival.

Once it is 7:30am the register is "closed" by the Principal or attendant ruling a red line under the last arrival. Any teacher coming after that time still writes his/her name and time of arrival but is adjudged late for the day. The movement logbook in similar manner is used to monitor teachers' movement out from and into the school within the working hours. A teacher going out of the school is expected to logout, indicating the time he left the school premises, and on return, he is expected to login. This helps the school management to keep track of teachers' whereabouts within the working time of each day and may thus be able to account for teachers in the case of any eventualities. The instructional attendance register is moreover kept with the class prefect of each class and every teacher is expected to sign in and out on arrival to class for teaching and on exit from the class after teaching, or simply indicating when they arrived and when they exited.

These attendance monitoring registers are part of the school records required by the management for decision making (Amanchukwu & Ololube, 2015). In occasions where principals are too occupied with other office duties to notice teachers' performance with respect to attendance in the school, the record becomes a hand tool for him. Teachers with impressive attendance records may be duly acknowledge in due times while those found wanting may be cautioned and if their truant tendencies persist, query and other forms of disciplinary measures may be taken against them.

Attendance-Based Incentives for Managing Teachers' Absenteeism for Quality Education Goals Attainment in Public Senior Secondary Schools in Rivers State

Attendance management is the process of ensuring that teachers are present and productive at work. One of the strategies that employers use to improve attendance is to offer incentives, such as rewards, recognition, or bonuses, for meeting or exceeding attendance standards. However, not all types of attendance incentives are equally effective or appropriate for every situation. Literature identifies four common types of attendance incentives that could prove effective in organizations, which principals could also adopt in managing teachers' absenteeism in public senior secondary schools: monetary, non-monetary, individual, and team-based (Kassim & Onyango, 2022; Oluyemi, 2020; Ozoemena, 2013).

Monetary incentives are the most direct and tangible way of rewarding employees for good attendance. They can take the form of cash, gift cards, vouchers, or other financial benefits. The main advantage of monetary incentives is that they can motivate employees to show up and perform well, especially if they are linked to specific goals and criteria. They can also help attract and retain talent, as well as reduce absenteeism costs.

Non-monetary incentives are the opposite of monetary incentives. They are based on recognition, appreciation, feedback, or other forms of social or psychological rewards. They can include certificates, plaques, trophies, badges, thank-you notes, praise, public announcements, or other gestures of acknowledgment. The main advantage of non-monetary incentives is that they can foster a positive and supportive work culture, where employees feel valued and respected.

Improved Working Conditions for Managing Teachers' Absenteeism for Quality Education Goals Attainment in Public Senior Secondary Schools in Rivers State

Poor working conditions are widely advanced in literature as one of the lead causes of voluntary absenteeism among teachers (Agubosim et al., 2023; Mazaki, 2017). It is one of the situational factors described in Steers and Rhodes process model of workplace absenteeism when they posited that employees' dissatisfaction with the job situation induces the propensity for them to voluntarily absent themselves from work for the slightest of reasons (Rhodes and Steers cited in Birmingham, 2013). The job situation which describes the working condition refers to the general condition of the school environment like the status of the physical facilities coupled with how teachers are treated by the administration of the school with respect to teachers' welfare management. When teachers perceive their welfare as poor, chances are that they seek equity adjustment through withdrawal tendencies from their jobs which could be manifested via emotional, psychological and physical withdrawal (Mgbemena, 2022; Winters, 2014).

Punitive Measures (Use of Punishment) for Managing Teachers' Absenteeism for Quality Education Goals Attainment in Public Senior Secondary Schools in Rivers State

Punitive measures or use of punishment is an administrative disciplinary measure that adopts negative reinforcement to inflict some losses on teachers who absent themselves voluntarily from school. Voluntary absenteeism is a truant behaviour and an expression of teachers' deviance, which has been found to demean quality education goals attainment and as such must be frowned at and stopped at all cost by school adminstrators. Resorting to punishment is always advised as a last option in managing teachers' misbehaviour after every other attempt has failed; hence, if attendance monitoring systems, attendance-based incentives, improvement of working conditions and friendly dialogue with teachers who have shown negative attitude towards attendance have all failed, school administrators may have to resort to punishment. This is to ensure teachers maintain disciplined behaviour in the school, for as a matter of fact, the school as an organization has discipline as one of its manifest functions, and teachers must learn to practice what they preach to students. Disciplined conduct of teachers in attendance and punctuality to school, respecting school time, instructional delivery, attitude towards work, and in general idiosyncrasies in the work place is, as a matter of fact, a prerequisite for effective job performance. Thus, administrative disciplinary strategies or measures fall within the purview of teachers' disciplinary management (Nugraheni et al., 2020).

Disciplinary management (administrative disciplinary measures in this study) refers to those strategies that are used, coupled with the efforts made to reduce or prevent disciplinary problems in an organization (Senior Secondary Schools in this regard). A disciplinary measure is a way that a principal can tell a teacher that his actions are wrong and unacceptable. It also allows the principal to explain clearly what improvement is needed and gives teachers the opportunity to explain their side of a situation. According to Mintah (2011), disciplinary action is any action taken by the company in response to unsatisfactory employee performance or behavior. Employers use disciplinary procedures to tell employees that their performance or conduct is not up to the expected standard and to encourage them for improvement (Eby, 2015).
Ezeugbor and Eboatu (2018), the types of disciplinary measure adopted by principals on infracted teachers include warning, interdiction**, s**uspension, termination, dismissal, compulsory retirement, and demotion. Truancy is a confirmed infraction. It is deliberate in most cases; hence

the adoption of any of these disciplinary measures may be justified depending on the nature and severity of the case of truancy. It is however pertinent to note that the principals' powers are limited and there are certain disciplinary actions that are not within his powers, such as **s**uspension, termination, dismissal, compulsory retirement or demotion of a teacher. Such measures may only be taken by higher powers like the Zonal Director, or the Chairman of the State Secondary Education Board. The Principal can however issue warning and query to truant teachers, and if truancy continues, may report the truant teacher to the higher officers for appropriate actions. This is what any serious minded teacher would want to avoid by all means.

Review of Related Empirical Studies

Osuji and Alabere (2023) carried out a study to investigate strategies for managing teachers' unethical behaviours for teacher-student relationship in public Senior Secondary Schools in Rivers State. Two objectives, two research questions and two hypotheses guided the study. The study adopted descriptive survey design. The population of the study was 278 principals consisting of 126 males and 152 females from 278 public Senior Secondary Schools in Rivers State. A sample size of 126 principals consisting of 52 males and 74 females was derived using simple random sampling technique. The instrument was a ten (10) items self-structured questionnaire titled "Strategies for Managing Teachers' Ethical Behaviour for Teacher-Student Relationship Questionnaire" which was face and content validated by two experts in the Departments of Measurement and Evaluation and Educational Management. Cronbach Alpha statistics was used to establish the reliability of the instrument which yielded reliability indexes of 0.86 and 0.84. Mean and standard deviation were used to answer the research questions while z-test was used in testing the formulated null hypotheses at 0.05 level of significance. Findings of the study revealed that set up monitoring system and using appropriate disciplinary actions to a high extent enhance effective teacher-student relationship in public Senior Secondary Schools in Rivers State. The study relates with the present study in design and focus but differs from it in scope.

Garaba (2021) carried out a study to investigate the impacts of teachers' absenteeism on students' academic achievements in Tabora Municipal. It was specifically aimed at achieving the specific objectives namely: to identify factors contributing to teachers' absenteeism in public secondary schools in Tabora municipal. To examine the impacts of teachers' absenteeism in Tabora municipal public secondary schools on students' academic achievements. Finally, suggesting the way forward for solving the problems of absenteeism in public secondary school teachers in Tabora municipality. Mixed methods approach was used, where questionnaire and focused group discussion methods were employed as methods for data collection. Teachers (70) were selected basing on purposive sampling technique and students (100) were selected by simple random sampling in which 230 were the targeted sample provided with the closed and opened questionnaires filled in. Quantitative data were analyzed by using Microsoft office excel software (MS- Excel 2007) and Statistical Package for Social Sciences (SSPS) version 20.0. Descriptive statistics of mean and standard deviation were calculated in order to make inference of the findings in which data were mainly presented in Percentages. Qualitative data were analyzed using thematic Analysis. Findings in this study revealed that personal factors for teachers' absenteeism formed the highest rate (50 %) of absence followed by school factors (45.7%), environmental factors (1.4 %) and others (2.9 %) respectively. The study relates with the present study in focus as they both focused on teachers' absenteeism and how it may be

managed. Both studies also relate partly in method of data analysis. However, while this study utilized mixed design and was carried out in Taraba state in 2021, the present study utilizes descriptive research design and is carried out in Rivers State in 2024.

Ubogu (2020) conducted study to establish the teachers' perception of the rate of absenteeism among school teachers in the Delta Central Senatorial District of Delta State. A total of 249 teachers in private and public schools took part in the study. The data obtained were analyzed through the use of percentages and z-test. The findings showed that private and public school teachers differed significantly in their perceptions of the causes of teachers' absenteeism. The results also showed that poor salaries, from benefits and working conditions are more acceptable causes of teachers' absenteeism in school. The study relates with the present study in addressing issues about teachers' absenteeism. Both studies however differ in some dimensions: firstly, while the study was carried out in 2020, this present study is more contemporary (carried out in 2024); secondly, while the study was carried out in Delta state, the present study is carried out in Rivers State; thirdly, both studies differ in methods of data analysis; and fourthly, the study did not focus on how teachers' absenteeism could be managed, and this is a gap filled by the present study.

Sheema et al. (2018) carried out a study to find out the causes and effects of teachers absenteeism on student learning at public secondary level of district Kotli Azad Kashmir. The study was descriptive in nature. The effects of teacher's absenteeism were also seen on student's performance. The main objective of the study was to determine different factors which caused teachers absenteeism and also find out its effects on students learning. All teachers of public secondary schools of District Kotli Azad Kashmir constituted population of the study. Simple random sampling technique was used in this study to draw the sample from population and 20% schools (28 schools) were selected randomly as the sample of the study. From all selected 28 secondary schools of district Kotli 196 teachers were randomly selected for data collection process. However for the pilot testing process, ten secondary schools (five male and five female) of district Kotli were selected and these schools were also included in final study. The data obtained was tabulated and analyzed by using SPSS software. The study found that that job security of teachers in public sector, teachers low pay, lack of accountability, political influence in education, teachers' further education, lack of public interest in education matters, lack of facilities for teachers and long distance from school were some major causes of teachers' absenteeism. The study further found that the student performance in the classroom became low when a regular classroom teacher absented from the class. The study relates with the present study in design and in method of data analysis but differs from it in focus, in population and in content scope.

Asiyai (2017) carried out a study to explore teacher absenteeism in public secondary schools in Delta State, Nigeria. Three research questions were answered. The study is a survey, ex-post-facto in nature. The sample of the study comprised sixty teachers and twenty principals, selected through simple random technique from the entire population of public secondary schools in Ethiope East and Ethiope West local government areas of Delta Central senatorial districts of the state. Data collected through questionnaires were analyzed using descriptive statistics. The findings revealed that demographic variables such as age, gender, marital status, qualification and experience were responsible for teacher absenteeism. Teacher related and school related variable were identified as possible causes of teacher absenteeism among public secondary schools in the two local government areas of Delta State. This study partly relates with the present study in focus in that they both concern teachers' absenteeism. However, whereas

this study focused on identifying the causes of teachers' absenteeism, the present study focuses on managing it. In addition, but studies differ both in content and in geographical scope.

METHODOLOGY

The study adopted the descriptive survey design. The study population consisted of 302 principals of the 302 public Senior Secondary Schools in Rivers State. This comprised of 154 male principals and 148 female principals. Census sampling technique was adopted to sample the entire population as it was of a manageable size. The instrument for data collection was a questionnaire developed by the researcher for the study and was titled: "Managing Teachers' Absenteeism for Quality Education Goals Attainment in Public Senior Secondary Schools in Rivers State Questionnaire (MTAQEGAPSSSRSQ)". The questionnaire contained two sections A and B. Section A solicited data on the demographic variables of the participants while section B contained the questionnaire items arranged in clusters pertaining to the research questions. There was total of 25 items in this section. The response pattern was structured after the modified 4 points form of Likert scale, namely: Very High Extent (VHE), High Extent (HE), Low Extent (LE) and Very Low Extent (VLE) with the values 4, 3, 2, 1 respectively.

The instrument had a reliability coefficient of .78 determined using Pearson Product Moment Correlations analysis of test-retest data obtained from a pilot study of respondents. Mean and standard deviation statistics was used to answer the researcher questions while independent samples t-test was used to test the hypotheses at .05 level of significance.

RESULTS AND DISCUSSION

Research Question One: What are the effective strategies of principals in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State?

Hypothesis One: There is no significant difference in the mean ratings of male and female principals on the effective strategies of principals in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State.

Table 1: Independent t-test result on the existence of significant difference in the mean ratings of male and female principals on the effective strategies of principals in managing teachers' absenteeism

Gender	N	Mean	SD.	t-cal	DF	Sig.	Decision
Male Principals	143	2.872	.256	.010	283	.992	H_{01} Upheld
Female Principals	142	2.871	.240				
Total	**285**						

Significance level of .05

Table 1 shows the result of the independent samples t-test carried out to determine if there was a significant difference in the mean ratings of male and female principals on the effective strategies of principals in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State. The table reveals that male and female principals had mean and standard deviation scores of 2.872±.256 and 2.871±.240 respectively.

Furthermore, t(283) = .010, p = .992. Since the p value is greater than the significance level of .05, the null hypothesis is upheld and the alternate hypothesis is declined.

The study also found that there was no significant difference in the mean ratings of male and female principals on the effectiveness of these strategies in managing teachers' absenteeism for quality education delivery in public Senior Secondary Schools in Rivers State. in other words, there was high consensus among the two groups of respondents to the study that these strategies would effectively bring about positive outcomes on principals' bid to managing the menace of insecurity in public Senior Secondary Schools in the state.

These findings are in tandem with those of several other researchers who had conducted related studies in similar areas of education concern. For example, Wali (2021) posited that attendance monitoring was an effective strategy of ensuring that teachers came to and stayed in school as expected. He went on to state that attendance monitoring could be done either manually through electronic means. Manual system of monitoring teachers' attendance could be done by the use of either of three major "time-books" or records in the school, which include the attendance register, the movement logbook and the class attendance register or the instructional attendance register (Wali, 2021). The electronic means of monitoring attendance on the other hand is done by the use of electronic attendance cards or fingerprints. Apart from the fingerprint system and the use of cards, other systems of computer-based/electronic attendance monitoring include the camera capturing, and attendance verification videos, etc. These were found by Naen et al. (2021) to be very effective at eliminating several forms of attendance fraud that are empowered by the manual system like falsification of attendance time, attendance impersonation, etc.

Similarly, performance-based incentives was found effective at motivating desired employee behaviours (Muralidharan & Sudaraman, 2011; Glewwe et al., 2010), and could thus be effective at motivating teachers' performance. In the same vein, poor working conditions were widely advanced in literature as one of the lead causes of voluntary absenteeism among teachers (Agubosim et al., 2023; Mazaki, 2017) and as such, improving the working conditions of teachers would be an effective way of boosting their attendance to work. Finally, Bacal cited in Owan and Ekpe (2019) found that disciplinary or punitive measures were effective at curbing teachers' deviant behaviours like truancy and absenteeism, and examples of such disciplinary measures were identified to include warnings, reprimand, query, suspension, deprivation of privileges, salary deductions, demotion and dismissal.

Research Question Two: To what extent is attendance monitoring system (AMS) adopted in managing teachers' absenteeism for quality education delivery in public senior secondary schools in Rivers State?

Hypothesis Two: There is no significant difference in the mean ratings of male and female principals on the extent attendance monitoring system (AMS) is adopted in managing teachers' absenteeism for quality education delivery in public senior secondary schools in Rivers State.

Table 2: Independent t-test result on the existence of significant difference in the mean ratings of male and female principals on the extent attendance monitoring system

Gender	N	Mean	SD.	t-cal	DF	Sig.	Decision
Male Principals	143	2.603	.316	.248	283	.804	H_{03} Upheld
Female Principals	142	2.593	.358				
Total	**285**						

Significance level of .05

Table 2 shows the result of the independent t-test conducted to investigate if there was a significant difference in mean ratings of male and female principals on the extent attendance monitoring system is adopted in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State. The table reveals that male and female principals had mean and standard deviation scores of 2.603±.316 and 2.593 ±.358 respectively. Furthermore, $t(283) = .248$, $p = .804 > .05$. Since the p value is greater than the significance level of .05, the null hypothesis is (H_{02}) is upheld and the alternate hypothesis is declined.

The findings of the study agree with Wali (2021) and Naen et al. (2021) who found that attendance monitoring was a hallmark of effective school administration, and that the systems for monitoring teachers' attendance could be either manual or electronic. While Wali (2021) focused more on the manual system of monitoring attendance and acknowledged "three timebooks" vis-à-vis the attendance register, the movement logbook and the class attendance register or the instructional attendance register. Naen et al. (2021) opined that the electronic systems of monitoring teachers' attendance were more effective as they eliminated limitations associated with the manual systems of attendance monitoring, such as falsification of login time, attendance impersonation, amongst others. Wali (2021) was also of the view that teachers' attendance record was one of the important school records that was useful for administrative decision-making in the school. This probably explained the reason for the high extent adoption of attendance monitoring systems among both male and female principals of public senior secondary schools in the state.

Research Question Three: To what extent are attendance-based incentives (reward system) employed in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State?

Hypothesis Three: There is no significant difference in the mean ratings of male and female principals on the extent attendance-based incentives (reward system) are employed in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State.

Table 3: Independent t-test result on the existence of significant difference in the mean ratings of male and female principals on the extent attendance-based incentives (reward systems)

Gender	N	Mean	SD.	t-cal	DF	Sig.	Decision
Male Principals	143	2.261	.358	.396	283	.692	H_{02} Upheld
Female Principals	142	2.244	.340				
Total	**285**						

Significance level of .05

Table 3 shows the result of the independent t-test carried out to determine if there was a significant difference in mean ratings of male and female principals on the extent attendance-based incentives (reward systems) are employed in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State. The table reveals that male and female principals had mean and standard deviation scores of 2.261±.358 and 2.244 ±.340 respectively. Furthermore, t(283) = .396, p = .692 > .05. Since the p value is greater than the significance level of .05, the null hypothesis is upheld and the alternate hypothesis is declined.

This finding is in contradiction with Ozoemena (2013) who eulogized the usefulness of performance-based incentives in school systems, and enumerated some of them to include increase in teachers' attendance to school; stimulating teachers towards punctuality and attachment to their jobs; creating psychological satisfaction for teachers, which leads to job satisfaction; enhancing teachers' commitment to work; inculcating zeal and enthusiasm into teachers towards work, among others. The poor adoption of incentives by principals to encourage teachers' performance in public senior secondary schools in Rivers State outrightly does not make for quality education delivery in these schools because the significance of incentives in employee performance improvement can simply not be doubted.

Research Question Four: To what extent is improved working condition used in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State?

Hypothesis Four: There is no significant difference in the mean ratings of male and female principals on the extent improved working condition is used in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State.

Table 4: Independent t-test result on the existence of significant difference in the mean ratings of male and female principals on the extent improved working condition is used in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State

Gender	N	Mean	SD.	t-cal	DF	Sig.	Decision
Male Principals	143	2.047	.584	.593	283	.553	H_{04} Upheld
Female Principals	142	2.006	.588				
Total	**285**						

Significance level of .05

Table 4 shows the result of the independent t-test carried out to determine if there was a significant difference in mean ratings of male and female principals on the extent improved working condition is used in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State. The table reveals that male and female principals had mean and standard deviation scores of 2.047±.584 and 2.006 ±.588 respectively. Furthermore, t(283) = .593, p = .553 > .05. Since the p value is greater than the significance level of .05, the null hypothesis is upheld and the alternate hypothesis is declined.

These findings are quite disturbing even as literature has found that poor working conditions are among the lead causes of voluntary absenteeism among teachers (Agubosim et al., 2023; Mazaki, 2017). According to Steers and Rhodes Process Model of workplace absenteeism,

poor working condition of teachers always brings about teachers' dissatisfaction, which is sometimes expressed through voluntary absenteeism from work for the slightest of reasons (Rhodes and Steers cited in Birmingham, 2013). Improved working condition of teachers encompasses the provision of requisite physical facilities together with fair and friendly treatment of teachers by the school principals, in addition to good welfare management in the school. Mgbemena (2022) and Winters (2014) reinforced this position by acknowledging that when teachers perceive their welfare or working conditions as poor, chances are that they seek equity adjustment through withdrawal tendencies from their jobs which could be manifested via emotional, psychological and physical withdrawal. As such, educational administrators must do everything within their reach to improve teachers' working conditions in their respective schools.

Research Question Five: To what extent are punitive measures employed in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State?

Hypothesis Five: There is no significant difference in the mean ratings of male and female principals on the extent punitive measures are adopted in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State.

Table 5: Independent t-test result on the existence of significant difference in the mean ratings of male and female principals on the extent punitive measures are adopted in managing teachers' absenteeism

Gender	N	Mean	SD.	t-cal	DF	Sig.	Decision
Male Principals	143	2.261	.358	.396	283	.692	H_{02} Upheld
Female Principals	142	2.244	.340				
Total	**285**						

Significance level of .05

Table 5 shows the result of the independent t-test carried out to determine if there was a significant difference in the mean ratings of male and female principals on the extent punitive measures are adopted in managing teachers' absenteeism for quality education goals attainment in public senior secondary schools in Rivers State. The table reveals that male and female principals had mean and standard deviation scores of 2.261±.358 and 2.244 ±.340 respectively. Furthermore, $t(283) = .396$, $p = .692 > .05$. Since the p value is greater than the significance level of .05, the null hypothesis is upheld and the alternate hypothesis is declined.

The findings also did not seem to support Ezeugbor and Eboatu (2018) who found that the use of disciplinary measures such as warning, interdiction**, s**uspension, termination, dismissal, compulsory retirement and demotion by principals on infracted teachers proved administrative effective. The need for principals to employ some of these measures from time to time is obviously imperative for quality education delivery in public senior secondary schools in Rivers State.

CONCLUSION

From the findings of the study, it is concluded that school principals have not been dynamic and flexible in employing different strategies in the management of teachers' absenteeism in public

senior secondary schools in Rivers State and this has been to the disadvantage of quality goals attainment at this level of education in the state. While there are various strategies which could be adopted in various scenarios either singularly or in combinations for effective management of this deviant behaviour among teachers, such as the use of attendance monitoring systems, the use of attendance-based incentives, improved working conditions and punitive measures, it is apparent that majority of principals only employ the use of manual attendance registers, which is even greatly limited in ensuring effective attendance management. Unless principals become proactive in the handling of this educational menace in the school system, achieving the lofty goals of public senior secondary schools in the state will simply remain a mirage.

Recommendations

Based on the findings of this study and the conclusion, the following recommendations were made:

- School principals and school based management committees should periodically review their attendance management strategies with a view to determining what strategies would be most effective in managing teachers' absenteeism in their schools.
- School administrators should endeavour to religiously maintain attendance records for the purpose of tracking teacher attendance. The school based management committee in this regard should review the attendance record with each teacher on a termly basis or more frequently with those developing absence trends, with a view to arresting the undesirable tendency in a timely manner.
- Teachers' attendance performance should be recognized and rewarded in some way, such as through recommendation letters to the schools board or through awards. This will send a strong message to teachers that their attendance is noticed.
- Deliberate effort should be made by educational employers to improve teachers' welfare and working conditions through salary rise and the provision of necessary working facilities that make the teaching job more satisfying to teachers; school principals should also help matters by adopting administrative strategies that make the school climate more friendly than hostile.
- The Senior Secondary Schools Board should empower principals and school-based management committees by allowing them more control in the area of disciplining erring teachers. This will improve accountability and possibly reduce teacher absenteeism.

THE ROLE OF EDUCATIONAL LEADERS IN CURBING THE PREVALENCE OF JUVENILE DELIQUENCY FOR IMPROVED SCHOOL CLIMATE

Justice Wilson OSAKPO
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

Juvenile delinquency remains a pressing challenge in educational systems worldwide, undermining school safety, student well-being, and academic achievement. This paper explores the pivotal role of educational leaders - principals, administrators, and policy-makers in designing and implementing proactive strategies to curb delinquent behaviors and foster a positive school climate. School leaders can address the root causes of delinquency, including social inequities**,** peer influence**,** and lack of mentorship by leveraging transformational leadership**,** restorative justice practices**,** and collaborative stakeholder engagement**.** Through a mixed-methods approach, this research examines how evidence-based interventions - such as mentorship programs**,** social-emotional learning (SEL) initiatives, and community partnerships can reduce recidivism and promote student accountability. Key findings highlight the importance of trauma-informed leadership**,** inclusive discipline policies**,** and early intervention frameworks in reshaping school environments. Furthermore, the paper underscores the correlation between strong leadership**,** student engagement**,** and improved school climate, demonstrating that when educators adopt preventive rather than punitive measures, at-risk youth are more likely to thrive academically and socially. Finally, this paper argues that visionary educational leadership is instrumental in breaking the cycle of delinquency. Schools can transform into safe, nurturing spaces conducive to lifelong success by prioritizing relational trust**,** equitable opportunities, and holistic student support

Keywords: Educational Leadership, Juvenile Delinquency, School Climate, Student Behavior, Restorative Practices, School-Community Partnership, Inclusive Education.

INTRODUCTION

Juvenile delinquency remains one of the most persistent and disruptive challenges facing modern educational systems, threatening not only the safety of school environments but also the academic and social development of students. Defined as unlawful or antisocial behaviors committed by minors - ranging from truancy and bullying to substance abuse and violent offenses delinquency undermines the foundational goals of education: learning, growth, and

community (National Institute of Justice, 2019). The increasing prevalence of such behaviors has prompted urgent discourse among policymakers, educators, and researchers on how best to intervene. Within this discourse, the role of educational leaders - principals, administrators, and district officials has emerged as a critical factor in mitigating delinquency and fostering safer, more inclusive school climates (Osher et al., 2020). Historically, punitive measures such as suspensions and expulsions dominated disciplinary approaches, but contemporary research underscores their ineffectiveness and disproportionate impact on marginalized students (Skiba et al., 2014). Instead, a paradigm shift toward restorative justice**,** social-emotional learning (SEL)**,** and trauma-informed leadership has gained traction, emphasizing prevention, rehabilitation, and systemic support (Gregory et al., 2016).

The roots of juvenile delinquency are complex, often intertwined with socioeconomic disparities, familial instability, peer influence, and unmet mental health needs (Mallett, 2018). Schools, as microcosms of society, frequently mirror these broader societal issues, making them both a battleground for delinquency and a potential site for transformative intervention. Research indicates that students who feel disconnected from their school community are at higher risk of engaging in delinquent behaviors (Wang & Fredricks, 2014). Conversely, schools that cultivate strong relational trust**,** clear behavioral expectations**,** and meaningful student engagement report lower incidents of misconduct and higher academic achievement (Bryk & Schneider, 2002). Educational leaders, therefore, play a pivotal role in shaping institutional culture, setting policies, and mobilizing resources to address delinquency proactively rather than reactively (Leithwood et al., 2020).

One of the most promising frameworks in this regard is transformational leadership, which emphasizes vision-setting, collective responsibility, and empowerment (Bass & Riggio, 2006). Leaders who adopt this approach foster environments where students and staff collaborate to uphold shared norms, reducing alienation and misconduct (Day et al., 2016). For instance, schools implementing restorative practices where conflicts are resolved through dialogue and accountability rather than punishment have reported significant declines in disciplinary referrals and improved peer relationships (Fronius et al., 2019). Similarly, integrating SEL curricula that teach empathy, self-regulation, and conflict resolution has been linked to reductions in aggression and impulsivity among at-risk youth (Durlak et al., 2015). These strategies align with the broader movement toward trauma-informed care, recognizing that many delinquent behaviors stem from adverse childhood experiences (ACEs) requiring compassionate intervention rather than retribution (Substance Abuse and Mental Health Services Administration [SAMHSA], 2014).

Despite these advancements, gaps persist in how effectively educational leaders implement and sustain such reforms. Many schools, particularly in under-resourced areas, struggle with insufficient training, high staff turnover, and competing institutional demands (Darling-Hammond, 2017). Additionally, the over-reliance on zero-tolerance policies in some regions continues to perpetuate the school-to-prison pipeline, disproportionately affecting Black, Indigenous, and Latino students (Heitzeg, 2016). This underscores the need for leadership that not only advocates for equitable discipline policies but also actively dismantles systemic biases within school structures (Annamma et al., 2019). The urgency of addressing juvenile delinquency has been further amplified by recent global disruptions, including the COVID-19 pandemic, which exacerbated mental health crises and social fragmentation among youth (Loades et al., 2020). As schools navigate post-pandemic recovery, educational leaders must prioritize holistic support systems, including counseling services, mentorship programs, and

community partnerships, to re-engage disaffected students (Sklad et al., 2020). This study argues that by embracing innovative, evidence-based leadership practices, schools can transform from sites of containment into spaces of redemption and growth. The stakes are high: beyond reducing delinquency, effective leadership can redefine school climates, ensuring that every student has the opportunity to thrive.

METHODOLOGY

This position paper employs a dynamic, multi-dimensional research approach to dissect the transformative potential of educational leadership in addressing juvenile delinquency and cultivating healthier school climates. Like detectives piecing together clues at a crime scene, the researcher meticulously gathered evidence from diverse sources to construct an irrefutable case for leadership-driven reform. The investigative process combines scholarly excavation with real-world observation, blending the precision of empirical analysis with the nuance of lived experiences. The foundation of the inquiry rests upon a robust systematic review of peer-reviewed literature published between 2012-2024, where the writer sift through academic databases with the discernment of gold prospectors, separating nuggets of actionable insight from the sediment of theoretical speculation. Particular attention was paid to longitudinal studies tracking leadership interventions across different socioeconomic contexts, in order to identify patterns that withstand the test of time and circumstance. This literary archaeology is complemented by contemporary case studies from school districts that have successfully turned the tide against delinquent behaviors, treating each as a living laboratory of leadership in action.

The analytical lens focuses sharply on three critical dimensions: policy implementation, behavioral metrics, and qualitative narratives. The researcher examined disciplinary records and climate survey data with the scrutiny of forensic accountants, tracing the fingerprints of effective leadership strategies in improved student outcomes. Simultaneously, the researcher amplified the often-overlooked human element through analysis of educator interviews and student testimonies, capturing the emotional resonance of school transformation. This dual approach allowed him to measure both the quantitative impact and qualitative ripple effects of leadership initiatives. The temporal scope of the analysis deliberately encompasses both pre- and post-pandemic educational landscapes, acknowledging COVID-19's seismic impact on student behavior and institutional responses. This longitudinal perspective reveals how adaptive leadership strategies have evolved to meet new challenges, offering crucial insights for future-proofing schools against emerging forms of delinquency. Throughout the investigation, the researcher maintained a critical awareness of the equity implications embedded in every data point, consciously seeking out and elevating solutions that disrupt rather than reinforce existing disparities in school discipline.

CONCEPTUAL UNDERPINNING

Educational Leadership

Educational leadership is a dynamic and multifaceted concept that plays a pivotal role in shaping effective learning environments, fostering academic success, and driving institutional improvement. At its core, educational leadership involves the strategic guidance and influence exerted by individuals - such as principals, superintendents, department heads, and teacher

leaders to inspire, motivate, and direct stakeholders toward achieving educational goals. Unlike traditional notions of leadership that emphasize authority, modern educational leadership prioritizes collaboration, vision, and adaptability to meet the evolving needs of students, teachers, and communities.

One of the defining characteristics of educational leadership is its focus on instructional improvement. Effective leaders prioritize high-quality teaching and learning by supporting professional development, implementing evidence-based curricula, and using data to inform decisions (Leithwood et al., 2020). Schools with strong instructional leadership exhibit higher student achievement, as leaders create conditions where teachers can thrive and students can excel (Robinson et al., 2019). Additionally, educational leaders must cultivate a positive school culture, where trust, respect, and shared responsibility are emphasized. A supportive climate reduces teacher burnout, enhances student engagement, and mitigates behavioral issues (Day et al., 2020).

Another critical aspect of educational leadership is distributed leadership, which moves beyond hierarchical structures to involve teachers, staff, and even students in decision-making processes. This approach recognizes that leadership is not confined to a single individual but is a collective effort (Harris, 2013). Previous studies show that, schools embracing distributed leadership experience greater innovation and sustainability in reforms (Spillane et al., 2019). Moreover, contemporary educational leaders must be change agents, adept at navigating policy shifts, technological advancements, and societal demands. The COVID-19 pandemic, for instance, underscored the need for adaptive leadership in transitioning to remote learning while addressing equity gaps (Fullan, 2022). Equity and social justice are also central to educational leadership. Leaders must address systemic disparities by advocating for marginalized students, implementing inclusive policies, and ensuring access to resources (Theoharis, 2018). For example, culturally responsive leadership has been shown to improve outcomes for diverse student populations by validating their identities and fostering belonging (Khalifa, 2018). Furthermore, ethical leadership is paramount, as leaders must model integrity, transparency, and accountability to build trust within their communities (Shapiro & Stefkovich, 2016).

Juvenile Delinquency

Juvenile delinquency refers to illegal or antisocial behaviors committed by minors, typically those under the age of 18, that violate societal laws or norms. These behaviors range from minor offenses - such as truancy and vandalism, to serious crimes, including theft, assault, and drug-related activities. Juvenile delinquency is a significant social concern because it not only affects the individuals involved but also has broader implications for families, schools, and communities. Research suggests that early intervention and preventive measures are crucial in redirecting at-risk youth toward positive pathways (Farrington & Ttofi, 2019). One of the most common forms of juvenile delinquency is property crime, which includes theft, burglary, and vandalism. Many young offenders engage in these acts due to peer pressure, economic deprivation, or lack of supervision (Agnew, 2015). Another prevalent example is substance abuse, where minors use or distribute illegal drugs or alcohol. Studies indicate that substance use in adolescence is often linked to behavioral disorders, family dysfunction, or exposure to delinquent peer groups (Hawkins et al., 2020). Violent delinquency, such as physical assault or gang-related activities, is another serious concern, often stemming from exposure to violence, poor parental supervision, or socioeconomic disadvantages (Loeber & Farrington, 2012).

Additionally, status offenses - acts that are only illegal because of the offender's age are a unique category of delinquency. Examples include truancy, running away from home, and underage drinking. While these behaviors may not be criminal for adults, they often signal underlying issues such as family conflict, mental health struggles, or academic disengagement (Mallett, 2018). Cyber delinquency has also emerged as a growing problem, with minors engaging in cyberbullying, hacking, or online harassment. The anonymity and accessibility of digital platforms contribute to these behaviors (Patchin & Hinduja, 2022). Understanding juvenile delinquency requires examining its root causes, which often include family instability, poverty, academic failure, and exposure to crime. Effective prevention strategies involve community-based programs, mentorship, and restorative justice approaches that address these underlying factors (Welsh & Farrington, 2021). By recognizing early warning signs and providing supportive interventions, society can reduce delinquency rates and help young individuals develop into responsible adults.

School Climate

School climate refers to the quality and character of school life, encompassing the norms, values, interpersonal relationships, teaching practices, and organizational structures that shape students' educational experiences. It represents the "personality" of a school, influencing how students, teachers, and staff perceive their daily interactions and environment (Cohen et al., 2021). A positive school climate fosters safety, respect, and engagement, while a negative climate may contribute to disengagement, bullying, and poor academic outcomes. School climate significantly impacts student achievement, social-emotional development, and overall well-being (Thapa et al., 2013). Key dimensions of school climate include safety, relationships, teaching and learning, and institutional environment. Physical and emotional safety form the foundation, where students feel protected from violence, harassment, and discrimination (Bear et al., 2020). Supportive relationships among students, teachers, and administrators create trust and belonging, which are critical for motivation and mental health (Cornell & Huang, 2016). Effective teaching and learning practices, such as fair discipline policies and high academic expectations, further enhance engagement and achievement (Voight et al., 2015). Finally, the institutional environment - including school facilities, resources, and leadership plays a role in shaping morale and organizational effectiveness (Wang & Degol, 2016).

A positive school climate correlates with numerous benefits, including reduced absenteeism, lower dropout rates, and improved academic performance (Konold et al., 2018). It also mitigates behavioral issues by promoting prosocial behaviors and conflict resolution skills (Gregory et al., 2016). Conversely, negative school climates are linked to increased anxiety, aggression, and disengagement, particularly among marginalized students (Bottiani et al., 2018). Schools with inclusive climates that value diversity and equity tend to have higher student satisfaction and better outcomes for all learners (Byrd, 2017). Improving school climate requires intentional strategies such as restorative justice programs, social-emotional learning (SEL) integration, and participatory decision-making involving students and staff (Osher et al., 2020). Strong leadership is essential in cultivating a shared vision, modeling respect, and sustaining positive reforms (Bryk et al., 2015). Ultimately, school climate is not static but evolves through collective effort, reflecting the commitment of educators, students, and communities to create nurturing environments where every individual can thrive.

Student Behavior

Student behavior refers to the range of actions, reactions, and conduct exhibited by learners in educational settings, encompassing both positive behaviors that facilitate learning and challenging behaviors that disrupt it. Understanding student behavior requires examining its multifaceted nature, which is shaped by individual, social, and environmental factors (Sugai & Horner, 2020). Behavior serves communicative functions, often reflecting students' unmet needs, emotional states, or responses to their learning environment (Algozzine et al., 2012). Positive behaviors, such as active participation, cooperation, and self-regulation, contribute to academic success and classroom harmony, while disruptive behaviors, including aggression, defiance, or withdrawal, may indicate underlying academic struggles, social-emotional difficulties, or environmental stressors (Epstein et al., 2019).

Theoretical frameworks such as Applied Behavior Analysis (ABA) and Social Learning Theory provide insights into how student behavior develops and can be modified (Cooper et al., 2020). ABA emphasized the role of antecedents and consequences in shaping behavior, suggesting that structured reinforcement systems can promote desirable conduct (Maggin et al., 2017). Meanwhile, Social Learning Theory highlighted observational learning, positing that students model behaviors they observe in peers, teachers, and family members (Bandura, 2011). Environmental factors, including classroom management strategies, teacher-student relationships, and school climate, significantly influence behavioral outcomes (Pianta et al., 2020). Supportive teacher interactions, clear expectations, and consistent routines foster positive behavior, whereas punitive or inconsistent approaches may exacerbate challenges (Gregory et al., 2016).

Cultural and developmental considerations further shape behavior. What constitutes "appropriate" behavior varies across cultural contexts, necessitating culturally responsive approaches to behavior support (Cartledge & Kourea, 2016). Additionally, developmental stages influence behavior; younger children may struggle with impulse control, while adolescents may test boundaries as part of identity formation (Steinberg, 2014). Trauma-informed practices are also critical, as adverse childhood experiences (ACEs) can manifest in behavioral challenges that require compassionate intervention (Berger, 2019). Effective behavior management integrates proactive strategies, such as Positive Behavioral Interventions and Supports (PBIS), which emphasize prevention, teaching of expected behaviors, and data-driven decision-making (Simonsen et al., 2020). Restorative practices, which focus on repairing harm and rebuilding relationships, offer alternatives to exclusionary discipline (Fronius et al., 2019). Ultimately, addressing student behavior holistically—considering academic, social-emotional, and environmental factors—creates inclusive classrooms where all students can thrive.

The Crisis at Hand: Juvenile Delinquency and Its Impact on Schools

Juvenile delinquency represents one of the most pressing challenges facing modern educational systems, with far-reaching consequences for school safety, academic achievement, and student well-being. Defined as unlawful or antisocial behavior by minors, delinquency manifests in schools through vandalism, substance abuse, bullying, physical violence, and cybercrimes, creating environments where learning becomes secondary to maintaining basic order (Farrington & Ttofi, 2019). The prevalence of these behaviors has escalated in recent years, exacerbated by socioeconomic disparities, fractured family structures, and the pervasive influence of digital

media (Patchin & Hinduja, 2022). Schools, traditionally sanctuaries for intellectual and social development, now grapple with the dual burden of educating students while mitigating behaviors that undermine their core mission. The impact of delinquency extends beyond individual offenders, affecting peer dynamics, teacher morale, and institutional resources, ultimately compromising the quality of education for all (Gottfredson et al., 2020).

The academic consequences of delinquency are profound. Students involved in delinquent behaviors frequently exhibit poor attendance, lower grades, and higher dropout rates, perpetuating cycles of disadvantage (Mallett, 2018). Classrooms plagued by disruptions struggle to maintain instructional continuity, leaving teachers to divert time from curriculum delivery to behavioral management (Gregory et al., 2016). Schools with higher delinquency rates report diminished standardized test scores and college enrollment figures, as the climate of instability hinders cognitive engagement (Welsh & Farrington, 2021). Moreover, non-delinquent peers in these environments often experience anxiety, reduced motivation, and attenuated academic performance, as their learning is continually interrupted by disciplinary incidents or safety concerns (Bottiani et al., 2018). The ripple effects extend to educators, who face burnout and attrition when forced to navigate hostile or chaotic settings without adequate support (Cornell & Huang, 2016).

Socially and emotionally, delinquency corrodes the fabric of school communities. Victims of bullying or violence endure lasting psychological trauma, including depression, PTSD, and diminished self-worth (Espelage et al., 2021). Perpetrators, often themselves victims of adverse childhood experiences, face stigmatization and exclusion, reinforcing antisocial identities (Berger, 2019). The school-to-prison pipeline a phenomenon where punitive disciplinary practices funnel students into the criminal justice system disproportionately targets marginalized groups, exacerbating racial and economic inequities (Skiba et al., 2014). Zero-tolerance policies, while intended to deter misconduct, frequently amplify these disparities by removing students from educational opportunities rather than addressing root causes (Losen & Martinez, 2020). Financially, schools bear heavy burdens, allocating funds to security personnel, surveillance systems, and legal liabilities that could otherwise support enrichment programs or counseling services (Osher et al., 2020).

Solving this crisis requires multifaceted strategies. Restorative justice models, which emphasize accountability and reconciliation over punishment, have shown promise in reducing recidivism and fostering inclusive climates (Fronius et al., 2019). Social-emotional learning (SEL) curricula equip students with conflict-resolution skills and emotional regulation tools, mitigating the impulsivity underlying many delinquent acts (Durlak et al., 2022). Community partnerships that integrate mental health services, mentorship programs, and family support systems can disrupt the external factors driving delinquency (Hawkins et al., 2020). Crucially, educational leaders must champion trauma-informed practices, recognizing that behavioral issues often stem from unmet needs rather than moral failings (Bethell et al., 2022). The path forward demands a paradigm shift from reactive punishment to proactive nurturing, ensuring schools remain citadels of hope rather than incubators of crisis.

Case Studies of the Prevalence of Juvenile Delinquency in Schools around the Globe, Africa, and Nigeria

Juvenile delinquency in educational settings presents a complex global challenge, with varying manifestations across different regions. International case studies reveal how socioeconomic

factors, cultural contexts, and institutional policies shape the nature and prevalence of delinquent behaviors among students. In the United States, research documents a strong correlation between neighborhood violence and school-based delinquency, with urban schools in high-poverty areas reporting higher rates of weapon possession, gang activity, and substance abuse (Gottfredson et al., 2020). European studies highlight different patterns, such as Sweden's experience with cyber-delinquency, where online harassment and digital piracy among adolescents have risen sharply alongside increased technology access (Sorbring & Lundin, 2012). Meanwhile, Asian contexts like South Korea demonstrate how extreme academic pressure contributes to delinquency, with students engaging in school violence, truancy, and self-harm as responses to educational stress (Park, 2023). These global disparities underscore how juvenile delinquency adapts to local environments while maintaining core elements of antisocial behavior and norm violation.

Across Africa, juvenile delinquency in schools reflects the continent's unique socioeconomic challenges. South African studies reveal alarmingly high rates of school-based violence, with 12% of students reporting physical assault and 9% experiencing sexual violence on school premises (Burton & Leoschut, 2013). This crisis stems from intersecting factors including community gang infiltration, inadequate school security, and normalization of violence post-apartheid. In Kenya, research identifies rampant substance abuse in schools, particularly in urban areas where 22% of students admit to using alcohol or illicit drugs, often facilitated by corrupt school staff and nearby vendors (Mugisha et al., 2021). East African nations also grapple with truancy-driven delinquency, where children skipping school frequently engage in petty theft and vandalism (Oketch et al., 2016). These patterns demonstrate how Africa's delinquency epidemic intertwines with poverty, weak governance, and historical trauma, requiring culturally grounded interventions that address both institutional and societal drivers.

Nigeria presents a particularly complex case study of school-based delinquency, where regional disparities and security crises exacerbate youth misconduct. In Northern Nigeria, Boko Haram's insurgency has devastated educational infrastructure while creating a generation of traumatized students prone to aggression and radicalization (Omenma et al., 2020). Contrastingly, Southern Nigeria's urban centers face delinquency fueled by cultism, with secret student gangs engaging in ritualized violence, examination malpractice, and extortion (Adeniran, 2022). Nationwide surveys indicate that 34% of Nigerian secondary school students have participated in bullying, 18% in vandalism, and 12% in physical assaults (Adebayo & Adegboyega, 2021). The Nigerian Educational Research and Development Council attributes these trends to deteriorating family structures, teacher absenteeism, and the proliferation of violent media (NERDC, 2023). While some states have implemented school-based delinquency prevention programs, their effectiveness remains limited by corruption, underfunding, and cultural tolerance of corporal punishment (Ojo et al., 2022). Nigeria's experience underscores how juvenile delinquency both reflects and perpetuates broader societal dysfunction, demanding coordinated responses across education, justice, and community development sectors.

The Transformative Role of Educational Leaders

Educational Leaders who adopt transformative leadership style or model will be able to curb juvenile delinquency to the barest minimum by doing the following:

Cultivating a Culture of Belonging

Educational leaders play a pivotal role in shaping school environments that foster belonging, a critical factor in reducing juvenile delinquency and enhancing school climate. Research indicates that students who feel connected to their school community are significantly less likely to engage in disruptive or criminal behaviors (Cornell et al., 2013). When students perceive their school as inclusive and supportive, they develop stronger social-emotional skills, resilience, and a sense of accountability - key deterrents to delinquency (Voight et al., 2015). Educational leaders must prioritize relationship-building by implementing mentorship programs, peer support networks, and restorative justice practices that replace punitive discipline with opportunities for reconciliation and growth (Gregory et al., 2016). Restorative approaches have been shown to reduce recidivism by addressing underlying causes of misconduct while reinforcing students' sense of value within the school community (Fronius et al., 2019).

A culture of belonging also requires intentional efforts to recognize and address systemic inequities that marginalize certain student groups, particularly those disproportionately affected by delinquency, such as students of color and those from low-income backgrounds (Skiba et al., 2014). Leaders must advocate for policies that promote equity, such as culturally responsive teaching and trauma-informed practices, which help mitigate the school-to-prison pipeline (Bottiani et al., 2018). Furthermore, integrating social-emotional learning (SEL) into curricula equips students with conflict-resolution skills and emotional regulation strategies, reducing impulsive behaviors linked to delinquency (Durlak et al., 2022). When educational leaders model empathy, consistency, and high expectations, they create a climate where students feel seen, heard, and motivated to succeed. Schools not only curb delinquency but also transform into spaces where all students can thrive academically and socially, by cultivating belonging.

Restorative Justice over Punitive Measures

Educational leaders are increasingly recognizing that traditional punitive disciplinary approaches often exacerbate juvenile delinquency rather than prevent it. Exclusionary punishments like suspensions and expulsions disproportionately target marginalized students while failing to address root causes of misbehavior (Losen & Martinez, 2020). In contrast, restorative justice practices - which emphasize repairing harm, rebuilding relationships, and reintegrating offenders have shown remarkable success in reducing recidivism and improving school climate (Fronius et al., 2019). Schools create opportunities for meaningful accountability while preserving students' educational access by implementing restorative circles, peer mediation, and community conferencing (Gregory et al., 2016). Oakland Unified School District's implementation of restorative practices yielded a 56% reduction in suspensions and 75% drop in chronic absenteeism, demonstrating how relationship-focused approaches outperform zero-tolerance policies (Jain et al., 2022).

The transformative power of restorative justice lies in its capacity to address the social-emotional needs underlying delinquent behavior. Where punitive measures often breed resentment and disconnection, restorative processes foster empathy and belonging critical protective factors against delinquency (Cornell & Huang, 2016). Educational leaders must champion this paradigm shift by training staff in restorative techniques, allocating resources for implementation, and modeling non-punitive conflict resolution (Payne & Welch, 2018). Particularly for trauma-affected youth, restorative approaches provide the psychological safety

needed for behavioral change (González, 2021). When schools replace punishment with restoration, they not only reduce delinquency but also cultivate climates where all students can thrive academically and socially. This evidence-based strategy represents a crucial step toward equitable, effective school discipline systems that break the school-to-prison pipeline while improving outcomes for entire school communities.

Strengthening School-Community Partnerships

Educational leaders play a pivotal role in bridging schools with their surrounding communities to address juvenile delinquency holistically. Schools operating in isolation cannot effectively combat delinquency, as its roots often extend beyond campus boundaries into neighborhoods and homes (Epstein, 2018). School leaders create a web of support that addresses risk factors while promoting protective factors for at-risk youth by forging strategic partnerships with local law enforcement, social services, businesses, and faith-based organizations (Bryan & Henry, 2012). These collaborations enable early identification of struggling students and provide access to critical resources like mentoring programs, mental health services, and after-school activities that keep youth engaged during peak delinquency hours (3-6pm) (Durlak et al., 2022). The Chicago Community Schools Initiative exemplifies this approach, where schools serving as community hubs saw a 37% reduction in juvenile arrests through integrated social services and family engagement (Moore & Emig, 2014).

Effective school-community partnerships require educational leaders to adopt an outward-facing leadership style that prioritizes trust-building and shared responsibility. When schools collaborate with local stakeholders to develop neighborhood safety initiatives, vocational training programs, and family support services, they address the systemic contributors to delinquency (Warren et al., 2020). Particularly impactful are police-school partnerships that focus on mentorship rather than surveillance, as demonstrated by Boston's Operation Homefront which reduced school-based arrests by 63% through officer-student relationship building (Theriot, 2016). Educational leaders can transform schools into centers of collective efficacy where delinquency prevention becomes a shared mission by viewing the community as an extension of the learning environment rather than a separate entity (Sampson et al., 2013). This collaborative approach not only reduces antisocial behaviors but also cultivates school climates where students feel supported by an entire village invested in their success.

Data-Driven Interventions

Educational leaders today recognize that combating juvenile delinquency requires more than intuition - it demands evidence-based strategies rooted in reliable data. Data-driven interventions enable schools to identify at-risk students early, tailor prevention programs, and measure their effectiveness with precision (Gottfredson et al., 2020). Administrators can detect warning signs such as sudden drops in grades or increased disciplinary referrals that often precede delinquent behavior by analyzing behavioral records, attendance patterns, and academic performance (Cornell & Huang, 2016). Schools utilizing early warning systems, like those implemented in Baltimore City Public Schools, have reduced suspension rates by 30% by proactively addressing behavioral issues before they escalate (Balfanz et al., 2014).

Effective data use extends beyond identification to intervention design. Schools employing Positive Behavioral Interventions and Supports (PBIS) leverage data to customize

strategies for specific student needs, resulting in significant reductions in misconduct (Bradshaw et al., 2012). For example, a longitudinal study in Oregon found that schools using PBIS saw a 22% decline in bullying incidents and a 15% improvement in overall school climate (Horner et al., 2018). Additionally, real-time data dashboards allow educators to monitor progress and adjust interventions dynamically, ensuring resources are allocated where they are most needed (Marsh et al., 2016). Critically, data-driven approaches must be implemented ethically, with safeguards to prevent stigmatization and ensure equity (Shapiro et al., 2021). When used responsibly, data empowers educational leaders to shift from reactive punishment to proactive support, fostering safer, more inclusive school environments where all students can thrive.

The Ripple Effect: When Educational Leaders Take Decisive Action Against Juvenile Delinquency for Improved School Climate

Juvenile delinquency in schools manifesting as truancy, vandalism, bullying, substance abuse, and even violence has long posed a threat to the academic, emotional, and physical wellbeing of students and staff alike. It creates an atmosphere of fear, distracts from teaching and learning, and impedes the development of a positive school culture. However, when educational leaders take bold and intentional steps to curb juvenile delinquency, the effects can resonate far beyond discipline - setting off a ripple effect that transforms the entire school climate for the better. When educational leaders take such decisive action, the ripple effects are remarkable:

Improved Student Behavior

When educational leaders take decisive action to address juvenile delinquency, the positive ripple effects transform student behavior and school climate. Proactive leadership strategies - such as implementing restorative justice, strengthening school-community partnerships, and adopting data-driven interventions create environments where positive conduct becomes the norm rather than the exception (Gregory et al., 2016). Schools with strong administrative commitment to delinquency prevention report significant reductions in behavioral incidents, as clear expectations and consistent support systems foster accountability and mutual respect among students (Cornell et al., 2013). For example, a longitudinal study in Chicago Public Schools found that schools employing comprehensive anti-delinquency strategies saw a 40% decline in disciplinary referrals and a 25% improvement in student engagement within two years (Steinberg et al., 2021).

The behavioral improvements extend beyond rule-following to deeper social-emotional growth. When leaders prioritize inclusive practices such as peer mediation programs and culturally responsive discipline, students develop conflict-resolution skills and empathy, reducing aggression and bullying (Farrell et al., 2018). A meta-analysis of 52 schools revealed that restorative justice programs not only decreased recidivism by 35% but also enhanced prosocial behaviors like cooperation and leadership (Fronius et al., 2019). These shifts create virtuous cycles: as more students model positive behavior, peer influence amplifies the impact, further stabilizing the school climate (Osher et al., 2020). On the long run, decisive leadership against delinquency reshapes school culture. Students in well-led schools report feeling safer, more connected to staff, and more motivated to succeed - factors linked to long-term behavioral and academic gains (Voight et al., 2015). Educational leaders unlock the potential for lasting

change, where improved behavior becomes a cornerstone of a thriving learning community by addressing delinquency at its roots.

Enhanced Academic Achievement

Educational leaders who implement targeted strategies to reduce juvenile delinquency create conditions that foster significant academic improvements across their schools. Schools addressing behavioral challenges through restorative practices, positive behavioral interventions, and improved student-teacher relationships see measurable gains in standardized test scores and graduation rates (Boccanfuso & Kuhfeld, 2019). When disruptive behaviors decline, instructional time increases—Chicago schools that reduced suspensions by implementing restorative justice saw a 15% improvement in math proficiency and a 12% rise in reading scores within three years (Steinberg et al., 2021). The correlation is clear: safer, more supportive school climates directly enable cognitive engagement and learning retention (Cornell et al., 2018).

The academic benefits extend beyond test scores to foundational learning skills. Students in schools with effective delinquency prevention programs demonstrate enhanced executive functioning, including improved attention regulation and problem-solving abilities - critical predictors of academic success (Diamond & Lee, 2019). A longitudinal study of 150 high-poverty schools found that those implementing systemic behavior support frameworks achieved 25% greater literacy growth and 18% higher STEM course completion compared to control schools (Bradshaw et al., 2022). These outcomes emerge because well-structured behavior systems free teachers to focus on pedagogy rather than classroom management, while students gain the emotional security needed for intellectual risk-taking (Kraft et al., 2021). Educational leaders who treat delinquency reduction as an academic improvement strategy unlock transformative potential. Schools that pair behavioral supports with rigorous instruction create virtuous cycles where improved climate drives achievement, which in turn reinforces positive behavior (Voight et al., 2022). This evidence confirms that decisive action against delinquency isn't just about discipline - it's a powerful lever for elevating the entire academic enterprise.

Stronger Teacher Morale

Educational leaders who implement effective strategies to combat juvenile delinquency inadvertently create conditions that significantly boost teacher morale and professional satisfaction. When administrators prioritize proactive discipline approaches like restorative justice and positive behavior interventions, teachers experience reduced classroom management stress and greater instructional efficacy (Herman et al., 2022). Schools that systematically address delinquency through collaborative frameworks report 32% lower teacher turnover rates, as educators feel better supported in maintaining productive learning environments (Sutcher et al., 2023). The correlation is clear: improved student behavior resulting from strong leadership directly translates to enhanced teacher well-being and job commitment (Collie et al., 2021).

The morale benefits extend beyond stress reduction to professional empowerment. Teachers in schools with comprehensive anti-delinquency programs report feeling more confident in their ability to handle behavioral challenges and more valued as partners in school safety initiatives (Kraft et al., 2020). A longitudinal study of high-needs schools found that educators working under principals who implemented trauma-informed discipline practices showed 27% higher engagement levels and 19% greater satisfaction with school leadership

(McIntyre et al., 2023). These outcomes emerge because effective delinquency prevention creates predictable, supportive environments where teachers can focus on pedagogy rather than constant behavior correction (Clotfelter et al., 2022). Educational leaders who address juvenile delinquency through systemic, relationship-based approaches create virtuous cycles where improved school climate reinforces teacher morale, which in turn enhances instructional quality (Donohoo et al., 2023). This evidence confirms that decisive action against student misconduct serves as both a retention strategy and a powerful catalyst for building collective teacher efficacy.

Increased Parental Trust

Educational leaders who implement effective strategies to address juvenile delinquency foster stronger parental trust in school systems thus, creating a virtuous cycle of community engagement and support. When schools transition from punitive discipline to restorative approaches, parental perceptions of school fairness improve by 42%, according to a nationwide study of urban school districts (Rumberger & Losen, 2022). This trust-building effect is particularly pronounced among historically marginalized families, with Black and Hispanic parents reporting 35% greater confidence in school leadership when transparent behavior policies replace zero-tolerance practices (Welch & Payne, 2021). The mechanism is clear: parents interpret proactive delinquency prevention as evidence of institutional commitment to student welfare rather than mere social control (Bryk et al., 2023).

The trust dividends extend beyond perceptions to active collaboration. Schools implementing community-based delinquency prevention programs document 28% higher parent participation in school events and 19% greater responsiveness to academic interventions (Sheldon & Epstein, 2019). A longitudinal study of Title I schools found that restorative justice implementation correlated with a 33% increase in parent-teacher conference attendance, as families perceived educators as partners rather than adversaries in student development (Anyon et al., 2021). These outcomes emerge because comprehensive anti-delinquency strategies demonstrate institutional reliability - when schools consistently address safety concerns while preserving educational access, parents reciprocate with deeper engagement (Warren & Mapp, 2023). Educational leaders who treat juvenile delinquency reduction as a trust-building exercise create conditions where parental confidence reinforces school climate improvements. This reciprocal relationship transforms schools into true community institutions where safety and learning become shared responsibilities rather than contested domains (Ishimaru, 2024).

Positive Peer Influence

Educational leaders who implement targeted strategies to reduce juvenile delinquency inadvertently cultivate powerful peer networks that reinforce pro-social behavior school-wide. When schools replace exclusionary discipline with restorative practices, students become 27% more likely to intervene when witnessing bullying and 33% more likely to report concerns to adults (Farrell et al., 2023). This shift occurs because institutional approaches to behavior management directly shape student social norms - schools emphasizing collective responsibility over individual punishment create environments where positive peer pressure flourishes (Dishion & Tipsord, 2021). The transformation is measurable: schools implementing Positive Behavioral

Interventions and Supports (PBIS) document 40% increases in student-led conflict mediation and 22% improvements in peer mentorship participation (Bradshaw et al., 2022).

The peer influence mechanism operates through both formal and informal channels. Structured programs like peer courts and mentoring initiatives provide leadership opportunities for pro-social students, while improved school climate organically encourages classmates to model and reward appropriate conduct (Hughes et al., 2023). A longitudinal study of middle schools found that each 10% reduction in delinquency-related suspensions produced a 15% increase in observable peer interventions during classroom disputes (Gregory et al., 2022). These effects are particularly pronounced in adolescence, when students are neurologically primed to value peer approval but will follow institutional cues about which behaviors earn social status (Yeager et al., 2021). Educational leaders who address delinquency through relationship-based frameworks unlock peer networks as natural amplifiers of school climate improvement. The resulting student culture becomes self-reinforcing - as more learners embrace prosocial norms, their collective influence makes delinquency increasingly socially costly (Paluck et al., 2024). This peer-driven transformation proves more sustainable than top-down discipline alone, creating school communities where positive behavior spreads organically through student social ecosystems.

CONCLUSION

The battle against juvenile delinquency is not won with handcuffs and suspensions, but through the quiet revolution of transformative leadership - one relationship, one policy, and one restorative conversation at a time. This position paper has illuminated how educational leaders stand at the crossroads of crisis and possibility, wielding unique power to reshape school climates from punitive battlegrounds into nurturing ecosystems of accountability and hope. The evidence is unequivocal: when principals, administrators, and district leaders embrace trauma-informed frameworks, champion restorative justice, and foster authentic student engagement, they don't just reduce misconduct - they rewrite futures. Yet the true measure of leadership lies not in temporary fixes but in systemic transformation. The most effective leaders understand that delinquency is not merely a disciplinary challenge but a mirror reflecting institutional failures; failed connections, failed supports, failed opportunities to intervene before small missteps escalate into life-altering patterns. Educational leaders become architects of justice by dismantling the school-to-prison pipeline through equitable policies, by replacing zero-tolerance with second chances, and by addressing the root causes of disengagement rather than its symptoms.

This is not utopian idealism - it's a call to action grounded in irrefutable success stories. Schools that have slashed delinquency rates prove that the right combination of SEL integration, community partnerships, and courageous leadership can turn even the most troubled campuses into sanctuaries of growth. The path forward demands leaders willing to trade outdated punitive reflexes for innovative, research-backed strategies that honor students' humanity while holding them to high expectations. As we stand at this educational crossroads, one truth emerges with crystalline clarity: the fight against juvenile delinquency will be won or lost in the daily decisions of school leaders. Their choices - whether to isolate or include, to punish or restore, to maintain the status quo or challenge it - ripple across generations. The time for half-measures has passed. What remains is the urgent, sacred work of reimagining schools as places where every student, especially those teetering on the edge of delinquency, encounters not just rules but

redemption, not just consequences but compassion. This is the leadership our children deserve, and the future our schools must build - one transformed life at a time.

Suggestions

For educational leaders to truly prevent and curb juvenile delinquency for improve school climate, the following suggestions are made:

- Replace punitive disciplinary measures with restorative approaches that emphasize accountability, healing, and community-building. School leaders should train staff in conflict mediation and create spaces where students can repair harm rather than face exclusion.
- Mandate evidence-based SEL programs that teach emotional regulation, empathy, and responsible decision-making. Leaders must embed these skills into daily instruction, ensuring students develop the tools to navigate challenges without resorting to delinquent behavior.
- Collaborate with local organizations, mental health providers, and law enforcement to create wraparound support systems for at-risk youth. Leaders should bridge gaps between schools and communities to address external factors contributing to delinquency.
- Train administrators and teachers to recognize and respond to trauma's impact on behavior. Schools should prioritize psychological safety, ensuring policies accommodate students with adverse childhood experiences rather than penalizing them.
- Empower students through peer mentoring, youth councils, and inclusive decision-making processes. When students feel heard and valued, their sense of belonging reduces disengagement and delinquent tendencies.
- Educational leaders must challenge systemic inequities by lobbying against zero-tolerance policies and disproportionate discipline practices. Push for legislation that funds prevention programs, alternative schooling models, and professional development for trauma-responsive teaching.

THE ROLE OF POLITICS IN ENHANCING STAFF PERFORMANCE IN PUBLIC UNIVERSITIES IN NIGERIA

Joseph Emmanuel ASIKIYA
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

This paper focused on the role of politics in enhancing staff performance in public universities in Nigeria. Politics, both internal (within the university) and external (governmental and policy-driven), significantly influences staff motivation, work conditions, and institutional development. The examined how political decisions shape academic and administrative staff performance. The literature reviewed revealed that political involvement often affects staff recruitment, promotion, funding allocation, and leadership appointments, which in turn impact morale, productivity, and job satisfaction. Furthermore, political influence can introduce much-needed reforms and accountability, it may also lead to favoritism, instability, and reduced autonomy in university governance. The paper concluded that politics, when managed transparently and constructively, can be a catalyst for positive change and improved staff performance. However, excessive politicization undermines meritocracy and institutional integrity. Prominent among others, the paper suggested that universities should strengthen internal governance structures and promote merit-based systems. Policymakers and university administrators must work collaboratively to ensure that political influence is channeled toward strategic development and staff empowerment.

Keywords: Role, Politics, Staff, Performance, Public Universities.

INTRODUCTION

Politics is a field rooted in the ancient philosophies of governance and public affairs, extends to modern practices involving governments, political parties, public policies, international relations and educational institutions. Politics serves as the framework for addressing collective issues, resolving conflicts, and establishing norms and laws that govern social conduct. It is through political engagement and discourse that societies negotiate the competing interests of various groups and individuals, aiming to achieve a balance between order and liberty, equity and efficiency, tradition and progress.

The essence of politics lies in its ability to influence and shape the important aspects of social existence, including economic management, social justice, and cultural identity. Political activities and institutions reflect the underlying values and power dynamics of a society, often

highlighting issues of representation, accountability, and legitimacy. Consequently, politics is not confined to the formal mechanisms of government but permeates everyday interactions and decisions, influencing public opinion, civic participation, and collective action (Oluwaseun, 2019).

In educational development and institutions, politics play different roles which ultimately affect the performance of staff within those institutions. For instance, Politics in higher education refers to the power dynamics, interests, and conflicts that shape decision-making, resource allocation, and social interactions within academic institutions. Effective performance of staff in public universities in Nigeria, is crucial for achieving academic excellence, research productivity, and overall institutional success. Higher education refers to education beyond high school, typically leading to a degree or certification. It is worthy to note that policies that are used to gain and hold power in educational institutions, particularly universities. It encompasses the processes through which decisions are made regarding governance, resource allocation, and the implementation of policies that affect the academic and administrative functions of higher education institutions (Adegboye, 2018).

The existence of Politics in public universities has long been a subject matter, scholarly debate, particularly in Rivers State, the political landscape profoundly influences the operational dynamics of public universities, impacting on the students' performance in academic and the administration of staff. The relationship between politics and higher education has resulted in both positive and negative outcomes, shaping the educational environment and determining the overall efficacy of students Recruitment University and staff (Oluwaseun, 2019).

Adegboye (2018) opined that the establishment of public universities in the state was driven by a need to provide accessible higher education to its populace, aimed at fostering economic and social development for the assessment of students. However, from their inception, these institutions have been influenced by the prevailing political climate, which has often dictated politicizes and administrative practices. The involvement of political actors in university governance has, at times, led to significant advancements but has also introduced challenges that hinder the effective performance of staff and the admission of qualified students. Political interference in the administration of public universities is a pervasive issue in Rivers State. Such interference manifests in various forms, including the appointment of university officials based on political loyalty rather than merit, the imposition of politically motivated policies, and the allocation of resources to projects that align with political interests. These practices disrupt the administrative harmony of universities, creating an environment where academic and administrative staff are unable to perform optimally. The appointment of vice-chancellors and other key administrative officers are often influenced by political considerations, which can lead to the selection of individuals who may lack the necessary qualifications and experience (Oladipo, 2021).

Nnokam (2020) noted that this process does not only affect the leadership quality but also demoralizes staff members who perceive the selection process as unfair and politically biased. Academic freedom, a cornerstone of effective teaching and research, is frequently compromised by political interference. Scholars in Rivers State public universities have reported instances where political pressures have influenced research agendas, curriculum design, and the publication of academic work. This encroachment on academic freedom stifles innovation and critical thinking, as staff members may feel compelled to align their work with the prevailing political ideology to avoid repercussions. Moreover, the morale of university staff is significantly impacted by political interference. When academic and administrative decisions are perceived to

be driven by political motives rather than merit or academic excellence, it leads to a sense of disenfranchisement among staff (Chukwuemeka, 2020).

This, in turn, affects their commitment and productivity, as they may become disillusioned with the institution's governance and question their professional growth prospects within such an environment. The allocation of resources within public universities in Rivers State is another area heavily influenced by political considerations. Politically motivated resource distribution often results in inequitable funding of departments and projects, leading to disparities in infrastructure development and academic resources (Adegboye, 2018).

The politicization of higher education often results in the appointment of unqualified personnel based on political affiliations rather than merit, which compromises the quality of education and administrative operations. The political pressures can lead to the misallocation of resources, favoring politically connected departments or projects at the expense of others, thereby creating imbalances and inefficiencies within the universities in Rivers State. This situation is exacerbated by the lack of a clear and consistent framework for addressing political interference, leaving university staff demotivated and less productive due to perceived inequities and favoritism. Therefore, it is imperative to investigate the extent and impact of political activities on the effective performance of staff in public universities in Rivers State, to identify specific challenges, and to propose strategies to mitigate these issues and enhance staff performance and overall institutional effectiveness.

THEORITICAL BACKING

Organizational Justice Theory

Organizational Justice Theory, developed by Jerald Greenberg in (1987) and expanded by Russell Cropanzano and Jason Colquitt in (2015), explores into the fundamental human need for fairness in the workplace and its profound implications on employee behavior and organizational effectiveness. At its core, the theory dissects fairness into three primary dimensions: distributive justice, procedural justice, and interactional justice, each addressing different facets of organizational fairness and their impacts on employee perceptions and actions. Distributive justice focuses on the perceived fairness of outcome distributions within an organization, drawing from equity theory, which posits that individuals gauge fairness by comparing their input-output ratios (such as effort and rewards) with those of their peers. This form of justice is crucial because it directly influences employees' sense of equity and satisfaction with their compensation, promotions, and other rewards, thereby affecting their overall job satisfaction and motivation.

Procedural justice, on the other hand, pertains to the perceived fairness of the processes used to determine outcomes. Greenberg highlighted the significance of consistency, transparency, bias suppression, accuracy, and representativeness in decision-making processes. This dimension underscores the importance of fair and transparent procedures, which ensure that all employees feel their voices are heard and that the rules are applied uniformly. Procedural justice is vital because it not only influences immediate perceptions of fairness but also fosters long-term trust in organizational systems and leadership. When employees perceive procedural fairness, they are more likely to accept unfavorable outcomes and remain committed to the organization, knowing that the processes are just.

The impact of organizational justice on employee behavior and attitudes is profound. Research consistently shows that perceptions of justice significantly influence job satisfaction, organizational commitment, trust in management, and overall job performance. When employees perceive high levels of justice in their organization, they are more likely to exhibit positive attitudes and behaviors, such as higher job satisfaction, stronger organizational commitment, increased trust in management, and improved job performance. Conversely, perceptions of injustice can lead to negative outcomes, including job dissatisfaction, reduced commitment, distrust in management, and counterproductive work behaviors like absenteeism and turnover.

Trust in management is also a crucial outcome of perceived organizational justice. When employees believe that their managers and leaders are fair, they are more likely to trust them, which is essential for effective leadership and organizational functioning. Trust facilitates open communication, collaboration, and a positive work environment, enabling the organization to navigate challenges and achieve its goals. Moreover, perceptions of justice can directly influence job performance. Employees who perceive fairness are more motivated and engaged in their work, leading to higher levels of performance. In contrast, perceptions of injustice can diminish motivation, reduce productivity, and increase the likelihood of counterproductive behaviors.

Organizational Justice Theory in practical settings can help organizations improve management practices and enhance employee satisfaction and performance. Enhancing distributive justice involves ensuring that reward systems are transparent and based on objective criteria, and regularly reviewing and adjusting compensation and recognition programs to reflect employees' contributions and market standards. Promoting procedural justice requires developing and communicating fair and consistent decision-making procedures, involving employees in decision-making processes, and providing opportunities for employees to voice their concerns and appeal decisions perceived as unfair. Fostering interactional justice involves training managers and supervisors to treat employees with respect and dignity, encouraging open and honest communication, and addressing instances of disrespectful or biased treatment promptly and appropriately.

Organizations that prioritize justice in their processes and interactions are likely to foster positive employee attitudes, enhance job performance, and ultimately achieve greater organizational success. As fairness becomes increasingly recognized as a cornerstone of effective organizational management, the insights provided by Organizational Justice Theory will continue to guide researchers and practitioners in creating more equitable and productive workplaces.

CONCEPTUAL CLARIFICATIONS

Concept of Politics

The word politics emanates from Ancient Greek (politiká) which means 'affairs of the cities'. This is the set of activities that are associated with making decisions in groups, or other forms of power relations among individuals, such as the distribution of resources or status. The branch of social science that studies politics and government is referred to as political science. They may be used positively in the context of a "political solution" which is compromising and non-violent, or descriptively as "the art or science of government", but also often carries a negative connotation. The concept has been defined in various ways, and different approaches have fundamentally differing views on whether it should be used extensively or in a limited way, empirically or normatively, and on whether conflict or co-operation is more essential to it.

Politics in the context of higher education, particularly within public universities in Rivers State, Nigeria, the interplay between political factors and institutional performance reveals critical dynamics that shape the effectiveness of staff and overall institutional success. Politics in this context encompasses a range of activities and influences, including recruitment practices, promotion decisions, assessment of students, appointments to key positions, and government interference in management decisions. Each of these aspects can have profound implications for the performance of academic staff and the quality of education delivered (Ojo, 2021).

This can undermine the credibility of the institution and the value of its qualifications, negatively impacting staff performance and institutional reputation. Ensuring that assessment policies are free from political influence and adhere to rigorous academic standards is vital for maintaining the quality of education and supporting staff effectiveness. Government interference in management decisions of public universities in Rivers State can also significantly impact staff performance. Excessive government involvement can undermine institutional autonomy and hinder the implementation of policies that best serve the educational mission (Adesoji, 2019). For example, political directives on funding allocations or policy decisions can disrupt the institution's ability to plan and execute its programs effectively. While government oversight is necessary for accountability, it is important to strike a balance that allows institutions to operate independently and make decisions aligned with their academic objectives. Politics in the admission of students can similarly affect staff performance.

The extent to which politics enhances or detracts from the effective performance of staff in public universities in Rivers State is influenced by the nature and impact of political influences in each of these areas. Transparent and merit-based processes in recruitment, promotion, assessment, appointments, and admissions are crucial for maximizing staff performance and institutional effectiveness. Political factors that align with institutional goals and support meritocracy can enhance staff performance, while those that introduce biases or undermine academic standards can have detrimental effects. Understanding the concept of politics in higher education requires a comprehensive analysis of how political factors intersect with institutional practices and staff performance (Omotola, 2019).

Examining the impact of politics on recruitment, promotion, assessment, appointments, government interference, and admissions, it becomes clear that the quality of higher education and the effectiveness of staff are deeply intertwined with the political environment. Addressing political influences and ensuring that institutional processes are fair, transparent, and aligned with academic goals are critical for fostering a productive and effective educational environment.

Higher Education

Higher education, a pivotal stage in the educational continuum, represents a transformative period where individuals engage in advanced learning beyond secondary education, encompassing both undergraduate and postgraduate studies at institutions such as universities, polytechnics, and colleges, and is integral to personal development, intellectual growth, and societal advancement, serving as a cornerstone for the cultivation of knowledge, skills, and values necessary for fostering innovation, research, and professional expertise (Ogunyemi, 2018). In the context of Nigeria, higher education plays a critical role in addressing the nation’s developmental challenges by providing the necessary intellectual and technical expertise required to drive economic growth, technological advancement, and social progress (Ojo, 2021).

This sector of education is characterized by its diverse offerings and disciplines, which include sciences, humanities, social sciences, engineering, and health sciences, each contributing to the holistic development of individuals and the advancement of society as a whole (Aina, 2016). The significance of higher education in Nigeria is underscored by its role in producing a skilled workforce that can contribute to various sectors of the economy, from industry and agriculture to healthcare and education. As noted by Akinola (2019), higher education institutions are instrumental in bridging the gap between secondary education and the labour market, equipping students with specialized knowledge and skills that are essential for professional success and economic productivity.

Furthermore, higher education fosters critical thinking, problem-solving abilities, and innovative capacity, all of which are vital for addressing contemporary global challenges and contributing to the knowledge economy. This emphasis on skills development and intellectual capacity building is crucial for Nigeria, given the nation's aspiration to become a leading player in the global knowledge economy (Aina, 2016). The structure of higher education in Nigeria comprises a mix of public and private institutions, each with its own set of characteristics and challenges. Public universities, which are funded and managed by the government, face issues related to underfunding, inadequate infrastructure, and bureaucratic inefficiencies (Ogunyemi, 2018). These challenges often impact the quality of education and research output, leading to concerns about the effectiveness of public higher education in meeting national and global standards (Ojo, 2021).

Conversely, private institutions, which operate on a for-profit basis, tend to offer more flexible and innovative programs but may face issues related to accessibility and affordability for the average Nigerian student (Akinola, 2019). The quality of higher education is a critical factor that influences its effectiveness and impact. Quality assurance mechanisms are essential for ensuring that institutions adhere to established standards and deliver education that meets both national and international expectations (Adamu, 2018). In Nigeria, quality assurance is managed by bodies such as the National Universities Commission (NUC), which sets accreditation standards and monitors compliance across universities (Abdulkareem, 2016). Despite these efforts, challenges such as inconsistent implementation of standards, lack of resources, and political interference can affect the overall quality of higher education (Ogunyemi, 2018).

Another critical aspect of higher education in Nigeria is the alignment between academic programs and the needs of the labour market. The ability of graduates to secure meaningful employment and contribute effectively to their fields is a key indicator of the success of higher education institutions (Ojo, 2021). However, there is often a disconnect between the skills and knowledge acquired through academic programs and the demands of the job market, leading to concerns about graduate employability and the relevance of academic curricula (Akinola, 2019). Addressing this issue requires a concerted effort to align educational programs with industry needs and to foster stronger partnerships between higher education institutions and the private sector (Abdulkareem, 2016). Research and innovation are central to the role of higher education in driving societal progress and economic development. Universities and other higher education institutions are hubs of research activity, where new knowledge is generated and technological advancements are developed (Aina, 2016). In Nigeria, the promotion of research and innovation is critical for addressing local and global challenges, such as healthcare, agriculture, and energy (Ogunyemi, 2018).

However, the research capacity of Nigerian higher education institutions is often constrained by factors such as inadequate funding, limited access to research facilities, and a lack

of collaboration with international research communities (Abdulkareem, 2016). Enhancing research capacity and fostering a culture of innovation are essential for positioning Nigerian higher education institutions as leaders in global research and development. Student experience and support services are also important components of higher education.

Politics in Higher Education for Effective Performance of Staff

Politics in higher education is a complex and multifaceted spectacle that significantly influences the effective performance of staff within public universities, particularly in contexts such as Rivers State, Nigeria, where political dynamics intertwine with academic governance and institutional operations in ways that can both enhance and impede the efficiency and productivity of educational personnel. This complex relationship between politics and institutional performance is evident in various aspects, including recruitment practices, promotion decisions, appointment processes, and government interference, each of which can shape staff effectiveness and overall institutional success (Ogunyemi, 2018).

In the context of recruitment, politics often exerts a substantial influence on the selection and hiring of staff within public universities. Recruitment processes can become entangled with political considerations such as nepotism, patronage, and favouritism, which can undermine the merit-based selection of candidates and lead to the appointment of individuals based on political connections rather than their qualifications and competencies.

Such practices can have detrimental effects on staff performance by introducing less qualified personnel into positions of responsibility, thereby impacting the quality of education and research outputs. A study by Akinola (2019) highlights that when recruitment decisions are driven by political considerations, the alignment between staff capabilities and institutional needs is compromised, leading to a misfit between the skills of the personnel and the demands of their roles. This misalignment can result in reduced productivity, lower morale among staff, and a general decline in institutional effectiveness.

To Ogunyemi (2018), Government's interference in the management decisions of public universities can also affect staff performance. Excessive governmental control or directives on funding, policy implementation, and institutional priorities can undermine the autonomy of universities and disrupt their ability to operate effectively. While government oversight is necessary for ensuring accountability and adherence to national standards, it is important to balance this with institutional autonomy to allow universities to make decisions that align with their academic goals and needs. Government interference that impedes the ability of institutions to manage their resources and implement their strategies can negatively impact staff performance and overall institutional effectiveness.

Politics in the admission of students is another critical factor influencing staff performance. Political pressures to meet certain quotas or admit students based on political affiliations can compromise the merit-based admission process, affecting the academic quality of the student body (Ojo, 2021). A diverse and academically qualified student population is essential for maintaining high educational standards and supporting staff in delivering effective teaching and learning experiences. Political interference in admissions can lead to a mismatch between student capabilities and academic requirements, which can affect staff performance and the overall quality of education. The interplay of political factors with institutional processes and staff performance highlights the need for careful management and oversight to mitigate the potential negative effects of political interference. Ensuring that recruitment, promotion,

assessment, appointments, and admissions are conducted in a fair, transparent, and merit-based manner is essential for fostering a productive and effective academic environment.

Effective Performance of Staff

Effective performance of staff within higher education institutions, especially public universities in Nigeria, is a complex and energetic spectacle that encompasses a range of factors, including individual competencies, organizational culture, management practices, and external influences, all of which contribute to the achievement of institutional goals and the enhancement of educational outcomes. Effective performance of staff refers to the ability of employees to meet or exceed the expectations set for their roles, which includes delivering high-quality teaching, engaging in meaningful research, and contributing to institutional development through various support functions and administrative roles (Ogunyemi, 2018).

In the context of Nigerian higher education, effective staff performance is crucial for the advancement of educational standards and the achievement of institutional objectives. It is influenced by a variety of internal and external factors, including the quality of leadership, availability of resources, and the broader political and economic environment (Ojo, 2021). One of the key determinants of effective performance is the alignment between staff skills and the requirements of their roles. According to Akinola (2019), when staff members possess the necessary knowledge, skills, and experience required for their positions, they are more likely to perform effectively and contribute positively to their institution's goals. This alignment is often facilitated through rigorous recruitment processes, ongoing professional development, and clear performance expectations.

Leadership and management practices play a significant role in shaping staff performance Adamu (2018). Effective leadership is characterized by the ability to inspire and motivate staff, set clear goals, and provide support and resources necessary for achieving those goals. In Nigerian universities, leadership practices can significantly impact staff performance, as leaders who exhibit transformational and supportive leadership styles are more likely to foster a positive work environment and enhance staff motivation and productivity (Aina, 2016). Conversely, ineffective leadership can lead to decreased morale, lack of direction, and reduced performance among staff members. Thus, the quality of leadership and management practices within higher education institutions is a critical factor influencing the effectiveness of staff.

Organizational culture also plays a crucial role in determining staff performance. A positive organizational culture, characterized by collaboration, respect, and a commitment to excellence, can enhance staff motivation and performance (Ogunyemi, 2018). In contrast, a negative organizational culture, marked by conflicts, lack of support, and poor communication, can undermine staff performance and contribute to job dissatisfaction (Ojo, 2021). Creating a supportive and inclusive organizational culture involves fostering open communication, recognizing and rewarding achievements, and providing opportunities for professional growth and development (Akinola, 2019). Resources and support systems are essential for enabling staff to perform effectively. Adequate resources, including financial support, facilities, and technology, are necessary for staff to carry out their roles effectively and achieve institutional goals (Adamu, 2018). In Nigerian higher education institutions, challenges related to inadequate funding and resource constraints can impact staff performance by limiting their ability to access necessary tools and support (Ogunyemi, 2018).

External factors, such as political and economic conditions, also influence staff performance in higher education institutions. Political interference in institutional governance, as well as economic instability, can create uncertainties and challenges that affect staff performance (Ojo, 2021). For example, political pressures related to recruitment, promotion, and funding can impact the ability of staff to perform their roles effectively and achieve their professional goals. Similarly, economic challenges, such as inflation and budget cuts, can affect the availability of resources and support systems, further impacting staff performance (Akinola, 2019).

Effective performance of staff in higher education institutions, particularly in Nigeria, is influenced by a complex interplay of factors, including individual competencies, leadership and management practices, organizational culture, resources and support systems, external conditions, professional development opportunities, performance evaluation mechanisms, and staff engagement. By addressing these factors and fostering an environment that supports and values staff contributions, higher education institutions can enhance staff performance and achieve their educational and institutional objectives more effectively. Understanding and addressing the multifaceted nature of staff performance is crucial for promoting excellence and ensuring the success of higher education institutions in Nigeria and beyond.

Public Universities

Public universities are institutions of higher learning that are primarily funded and operated by government entities. They play a crucial role in the development of a nation by providing accessible education, fostering innovation, and contributing to social and economic advancement. In Nigeria, public universities are essential pillars of the educational system, offering a wide range of academic programs and serving as centers for research and community development. Public universities in Nigeria have their roots in the colonial era when the British established higher education institutions to serve administrative and professional needs. The University College Ibadan, established in 1948, was the first public university in Nigeria, setting a precedent for subsequent institutions (Ajayi & Haastrup, 2019).

Over the years, the Nigerian government recognized the importance of higher education in national development and embarked on establishing more public universities across the country. Today, Nigeria boasts numerous public universities, each with a unique mandate to provide quality education and contribute to national growth. The primary objective of public universities is to provide accessible and affordable education to a broad segment of the population. Unlike private universities, which may charge high tuition fees, public universities aim to democratize education by offering lower tuition rates, making higher education attainable for students from diverse socio-economic backgrounds (Ogunode, 2020). This inclusivity is vital for fostering social mobility and reducing inequality, as it enables individuals from less privileged backgrounds to access opportunities that can transform their lives and contribute to the nation's workforce.

Public universities also play a pivotal role in fostering research and innovation. They serve as hubs for academic research, advancing knowledge in various fields and addressing societal challenges. Through research initiatives, public universities contribute to technological advancements, policy development, and the improvement of public services (Adeniyi, 2018). For instance, research conducted in Nigerian public universities has led to breakthroughs in agriculture, healthcare, and engineering, benefiting the broader society. Additionally, these institutions collaborate with government agencies, industries, and international organizations to

leverage resources and expertise for research and development (Adewumi et al., 2019). The community engagement aspect of public universities is another critical component of their mission. Public universities often engage in outreach programs and partnerships with local communities to address pressing social issues. These engagements can take various forms, such as community health programs, educational outreach, and environmental sustainability initiatives. Integrating community service into their core functions, public universities contribute to the well-being of their immediate environments and foster a culture of social responsibility among students and staff.

Despite their significant contributions, public universities in Nigeria face numerous challenges that hinder their ability to fulfill their mandates effectively. One of the most pressing issues is inadequate funding. Government allocations to public universities are often insufficient, leading to financial constraints that affect infrastructure, staffing, and academic resources (Olufemi, 2021). Many public universities struggle with dilapidated facilities, overcrowded classrooms, and a lack of modern equipment, which hampers the quality of education and research. Additionally, inadequate funding affects the remuneration and motivation of academic and non-academic staff, leading to frequent industrial actions and disruptions in academic calendars.

The problem of brain drain is also a critical concern for Nigerian public universities. Many talented academics and researchers leave the country in search of better opportunities and working conditions abroad. This exodus of skilled professionals, often referred to as "brain drain," depletes the intellectual capital of public universities and affects their capacity to provide quality education and conduct cutting-edge research. The loss of experienced faculty members also impacts mentorship and the development of future scholars, further exacerbating the challenges faced by these institutions. Public universities in Nigeria also grapple with issues related to student enrollment and retention.

Enhancing student support services is another critical area for improving the performance of public universities. Providing adequate support for students, including financial aid, counseling services, academic advising, and career development programs, can help address issues related to student enrollment and retention (Nwosu & Nwosu, 2020). Additionally, investing in student infrastructure, such as modern libraries, laboratories, and accommodation facilities, can improve the overall student experience and contribute to their academic success. By prioritizing student welfare and creating a conducive learning environment, public universities can better fulfill their educational mandates and support the holistic development of their students.

POLITICS IN ENHANCING STAFF PERFORMANCE IN PUBLIC UNIVERSITIES IN NIGERIA

The role of politics in enhancing staff performance in public universities in Nigeria. Politics, both internal (within the university) and external (governmental and policy-driven), significantly influences staff motivation, work conditions, and institutional development. These roles involves the following:

Role of Politics in Recruitment for Effective Performance of Staff

Politics in recruitment for effective performance of staff within public universities in Nigeria reflects a critical intersection where administrative processes and political influences converge, shaping the quality and efficiency of educational institutions. Recruitment, an essential function of human resource management, ideally aims to attract and select the most qualified candidates based on merit and fit for specific roles. However, political dynamics often introduce complexities that can significantly impact this process, influencing both the effectiveness of staff performance and the overall operational success of the institution (Okunade, 2019).

In Nigerian public universities, political influences on recruitment are frequently driven by factors such as patronage, nepotism, and political connections. These influences can disrupt the objectivity of recruitment processes, leading to the appointment of individuals based on political affiliations rather than their professional qualifications and competencies (Alabi, 2020). This politicization of recruitment can undermine the effectiveness of staff and hinder the achievement of institutional goals, as individuals who are selected for their political connections may lack the necessary skills and experience for their roles (Ibrahim, 2018).

Political patronage, a common singularity in Nigerian public universities, involves appointing individuals to positions of power as a reward for political loyalty or support, rather than for their professional merits (Ojo, 2021). This practice can result in the selection of less qualified individuals, which can adversely affect staff performance and institutional effectiveness. For example, when politically connected individuals are appointed to key academic or administrative positions, they may not possess the expertise required to fulfil their roles effectively, leading to subpar performance and a decline in the quality of education and research (Akinbode, 2019). Furthermore, the perception of unfairness and favouritism resulting from political patronage can erode staff morale and motivation, impacting their overall performance and engagement (Ogunyemi, 2018).

To Alabi (2020), the impact of political interference in recruitment extends beyond individual staff performance to affect the overall functioning and success of public universities. When recruitment processes are compromised by political influences, it can result in the appointment of individuals who are not well-suited to their roles, leading to inefficiencies and challenges in achieving institutional goals. For instance, the hiring of inadequately qualified individuals can hinder the institution's ability to deliver high-quality education and conduct meaningful research, affecting its reputation and its capacity to attract and retain top students and faculty (Ibrahim, 2018). Additionally, the presence of politically appointed staff may create conflicts of interest and disrupt institutional governance, as these individuals may prioritize political loyalty over institutional performance and goals (Ogunyemi, 2018).

Engaging in advocacy and dialogue with policymakers to address systemic challenges related to political interference in higher education can also be beneficial. By working with policymakers to develop and implement supportive policies and regulations, institutions can create an environment that supports fair and merit-based recruitment practices while addressing broader political and economic challenges (Ojo, 2021). Politics in recruitment for effective performance of staff within public universities in Nigeria is a critical issue that reflects the interplay between administrative processes and political influences. Political patronage, manipulation of recruitment processes, and lack of transparency can undermine the effectiveness of staff and hinder institutional success.

Role of Politics in Promotion for Effective Performance of Staff

Politics in promotion for effective performance of staff within public universities in Nigeria is a deeply intricate and often controversial issue that intersects the realms of institutional governance, individual career advancement, and organizational efficiency. Promotion, a critical aspect of human resource management, ideally functions as a merit-based system designed to reward outstanding performance, enhance job satisfaction, and motivate staff. However, in the Nigerian higher education context, political dynamics frequently infiltrate promotion processes, impacting the fairness, transparency, and overall effectiveness of these systems, ultimately influencing staff morale and institutional success (Adewale, 2020).

Politics in promotion typically refers to the influence of political affiliations, favouritism, and power dynamics on the advancement of individuals within an organization. In Nigerian public universities, this phenomenon is often characterized by the appointment and advancement of staff based on political connections rather than merit or professional qualifications. This practice can severely compromise the integrity of the promotion process, leading to the elevation of less qualified individuals while side-lining more deserving candidates (Okeke, 2019).

Such political interference can have detrimental effects on staff performance and institutional productivity, as it undermines the principles of fairness and meritocracy that are essential for fostering a motivated and effective workforce. One of the primary ways political considerations impact promotion is through favouritism and nepotism. Favouritism involves giving preferential treatment to certain individuals based on personal relationships or political affiliations, rather than their performance or qualifications. Nepotism, a specific form of favouritism, refers to the preferential treatment of relatives. In the context of Nigerian public universities, these practices often manifest in the promotion of staff who are politically connected or related to influential figures within or outside the institution (Adelakun, 2018). This undermines the credibility of the promotion process and can lead to a culture of resentment and disengagement among staff who perceive the system as biased and unjust.

To Abiola (2017), the impact of political favouritism in promotions extends beyond individual discontent to affect overall institutional performance. When promotions are granted based on political considerations rather than merit, it can lead to the placement of inadequately qualified individuals in positions of authority. This can result in inefficiencies, poor decision-making, and a decline in the quality of academic and administrative functions. Moreover, the perception of an unfair promotion system can demotivate staff, reduce their commitment to their roles, and lower overall morale, which in turn can negatively impact productivity and the achievement of institutional goals (Eze, 2019).

The role of political influence in promotion also extends to the formation and functioning of promotion committees. Ideally, promotion committees should be composed of impartial and competent individuals who can objectively assess the qualifications and performance of candidates. However, in many Nigerian public universities, these committees are often subject to political pressures and manipulation. Members of promotion committees may be selected based on their political affiliations or loyalty to influential figures, rather than their ability to objectively evaluate candidates (Ogundipe, 2017). This can lead to biased decision-making and the promotion of less qualified individuals, further eroding the integrity of the promotion process and the overall effectiveness of the institution. Addressing the challenges posed by political influences in promotion requires a comprehensive approach that involves reforming promotion practices, enhancing transparency, and fostering a culture of meritocracy.

Promoting a culture of meritocracy within higher education institutions is also crucial for addressing issues related to political interference in promotions. This involves creating an organizational culture that values and rewards professional qualifications and performance while actively discouraging practices of favouritism and nepotism (Adebayo, 2020). Encouraging staff to adhere to professional standards and ethical practices in promotion and other administrative functions can help reinforce the importance of merit and competency, contributing to a more effective and equitable work environment (Obinna, 2020). Implementing robust mechanisms for accountability and oversight can help deter political interference in promotions. This includes establishing independent bodies to oversee the promotion process, conducting regular audits of promotion decisions, and creating channels for staff to report instances of favouritism or bias (Eze, 2019).

Role of Politics in the Assessment of Students for Effective Performance of Staff

Politics in the assessment of students for effective performance of staff within public universities in Nigeria is a complex and deeply significant issue. The assessment of students, a fundamental component of the educational process, serves as a measure of academic achievement and a determinant of students' future opportunities. Ideally, assessments should be fair, objective, and based solely on students' academic performance. However, political dynamics often infiltrate this process, introducing biases and practices that can undermine the integrity of assessments, impact staff performance, and ultimately affect the overall quality of education (Adewumi, 2019).

Politics in the assessment of students typically refers to the influence of political considerations, favouritism, and external pressures on the grading and evaluation of students' academic work. In Nigerian public universities, such influences can manifest in various ways, including the manipulation of grades, biased evaluation practices, and the exertion of external pressures on academic staff. These practices can compromise the fairness and objectivity of student assessments, leading to significant implications for both students and staff (Bamidele, 2018). For instance, when grades are manipulated or assessments are biased, it not only affects the academic and career prospects of students but also undermines the credibility and professional integrity of the academic staff involved (Chukwu, 2020).

One of the primary ways political considerations impact student assessments is through grade manipulation. Grade manipulation involves altering students' grades based on political affiliations, favouritism, or external pressures rather than their actual academic performance. In the context of Nigerian public universities, this practice is often driven by political connections, nepotism, or the desire to favour certain individuals. For example, students who are related to or have connections with influential figures within or outside the university may receive higher grades than they deserve, while those without such connections may be unfairly penalized.

This undermines the principle of meritocracy and can lead to a decline in academic standards and the overall quality of education. The impact of grade manipulation extends beyond individual students to affect the entire academic community. When students are assessed unfairly, it creates a sense of injustice and disillusionment among those who have worked hard to achieve their academic goals. This can demotivate students, reduce their engagement with their studies, and ultimately affect their academic performance (Ezeokoli, 2019). Moreover, the perception of an unfair assessment system can erode trust in the institution and its academic staff, leading to a loss of credibility and reputation. For staff, being coerced into manipulating grades can

compromise their professional integrity and create a conflict between their ethical obligations and external pressures, impacting their job satisfaction and performance.

Another issue is the biased evaluation of students' work based on political considerations. Bias in assessment can occur when academic staff are influenced by factors such as students' political affiliations, ethnic backgrounds, or personal relationships, leading to unfair and inconsistent grading practices (Falade, 2020). In Nigerian public universities, such biases can be exacerbated by the political and social context, where ethnic and political loyalties often play a significant role in decision-making processes. When assessments are influenced by bias, it not only affects the fairness of the grading process but also undermines the academic rigor and standards of the institution. This can have long-term implications for students' academic and professional development, as well as the institution's reputation.

Role of Politics in Appointments for Effective Performance of Staff

Politics in appointments for effective performance of staff within public universities in Nigeria is a critical issue that delves into the core of institutional governance, academic integrity, and organizational efficiency. The process of appointing academic and administrative staff in higher education institutions is ideally grounded in principles of meritocracy, transparency, and fairness. However, in the context of Nigerian public universities, political considerations often infiltrate appointment processes, leading to a range of challenges that impact the effectiveness of staff and the overall quality of education provided. This complex interplay of politics and appointments not only influences the individual careers of staff members but also has broader implications for institutional performance and educational outcomes (Adeyemi, 2021).

Politics in appointments typically involves the influence of political affiliations, favouritism, and power dynamics on the selection and placement of individuals in academic and administrative roles. This practice can manifest in various forms, such as the appointment of individuals based on their political connections rather than their qualifications, experience, or professional capabilities. In Nigerian public universities, this phenomenon is often characterized by the appointment of staff who have ties to influential political figures or who belong to certain ethnic or political groups, rather than those who have demonstrated exceptional academic or administrative competencies (Ogunleye, 2018). Such practices undermine the integrity of the appointment process and can lead to the placement of less qualified individuals in key positions, thereby affecting the overall performance and effectiveness of the institution.

One of the primary ways political considerations impact appointments is through the manipulation of selection criteria to favour politically connected individuals. This can involve altering the qualifications and experience required for certain positions to align with the profiles of preferred candidates, thereby excluding more qualified individuals who do not have the necessary political connections (Nwafor, 2019). For example, the criteria for appointing a department head or a senior administrator may be adjusted to emphasize certain qualifications or experiences that are tailored to the preferred candidate, while downplaying other important competencies. This manipulation of criteria not only undermines the fairness and transparency of the appointment process but also leads to the selection of individuals who may not be best suited for the roles they are appointed to, thereby affecting the performance of the staff and the institution as a whole.

The impact of political favouritism in appointments extends beyond individual discontent to affect overall institutional performance. When appointments are driven by political

considerations rather than merit, it can lead to the placement of inadequately qualified individuals in positions of authority. This can result in inefficiencies, poor decision-making, and a decline in the quality of academic and administrative functions (Adebayo, 2020). Moreover, the perception of an unfair appointment system can demotivate staff, reduce their commitment to their roles, and lower overall morale, which in turn can negatively impact productivity and the achievement of institutional goals (Obi, 2018).

Another significant issue is the role of political interference in the formation and functioning of appointment committees. Ideally, appointment committees should be composed of impartial and competent individuals who can objectively assess the qualifications and suitability of candidates. However, in many Nigerian public universities, these committees are often subject to political pressures and manipulation. Members of appointment committees may be selected based on their political affiliations or loyalty to influential figures, rather than their ability to objectively evaluate candidates (Akinola, 2019). This can lead to biased decision-making and the appointment of less qualified individuals, further eroding the integrity of the appointment process and the overall effectiveness of the institution.

Furthermore, implementing robust mechanisms for accountability and oversight can help deter political interference in appointments. This includes establishing independent bodies to oversee the appointment process, conducting regular audits of appointment decisions, and creating channels for staff to report instances of favouritism or bias (Idowu, 2020). The holding of individuals and committees accountable for their decisions and actions, institutions can ensure greater fairness and transparency in the appointment process. Engaging in advocacy and dialogue with policymakers to address systemic challenges related to political interference in higher education can also be beneficial. By working with policymakers to develop and implement supportive policies and regulations, institutions can create an environment that supports fair and merit-based appointment practices while addressing broader political and social challenges (Jaja, 2020).

Politics in appointments for effective performance of staff within public universities in Nigeria is a critical issue that reflects the complex interplay between administrative processes and political influences. Political favouritism, manipulation of appointment criteria, biased appointment committees, and external pressures can undermine the integrity of the appointment process, leading to the selection of less qualified individuals and negatively impacting staff performance and institutional effectiveness. Addressing these challenges requires a comprehensive approach that includes reforming appointment practices, enhancing transparency, promoting meritocracy, implementing accountability mechanisms, and engaging in policy advocacy. By tackling the issues associated with political interference in appointments, public universities can improve staff performance, achieve their institutional goals, and contribute to the advancement of educational standards and societal development.

Role of the Admission of Student for Effective Performance of Staff

Politics in the admission of students for effective performance of staff in public universities in Nigeria is a multifaceted issue that touches upon the principles of equity, fairness, and meritocracy in higher education. Admission processes in universities are ideally designed to select students based on their academic qualifications, potential, and readiness for higher learning. However, political considerations often permeate these processes, influencing decisions in ways that can compromise the integrity of admissions, affect the student body composition,

and ultimately impact the performance of academic staff. This phenomenon is particularly prevalent in Nigeria, where political affiliations, ethnic considerations, and social connections frequently play a significant role in admissions decisions (Okafor, 2020). The implications of this political interference are profound, as it can undermine the effectiveness of staff, distort educational outcomes, and perpetuate inequalities within the higher education system.

The effect of politically influenced admissions extends beyond individual cases to affect the overall student body composition. When admission decisions are based on political considerations rather than academic merit, it can result in a student population that is less prepared for the rigors of higher education. This can pose significant challenges for academic staff, who must then invest additional time and resources in remedial education and support for students who may not meet the university's academic standards (Babalola, 2020). The additional workload and the need to address varying levels of student preparedness can strain staff resources, reduce the quality of education, and ultimately impact the effectiveness of teaching and learning.

Furthermore, the presence of politically favoured students who may not be academically inclined can disrupt the learning environment, affect classroom dynamics, and undermine the academic culture of the institution. Another significant issue is the role of political meddling in the allocation of admission slots through quotas and special considerations. In Nigeria, it is not uncommon for universities to implement quota systems that allocate admission slots based on factors such as state of origin, ethnicity, or political affiliation. While such systems are often justified as a means of promoting diversity and addressing historical inequalities, they can also be exploited for political purposes.

Politicians may lobby for admission slots to be reserved for their constituents, thereby using the education system as a tool for political patronage (Eze, 2019). This can lead to the admission of students who may not be academically qualified, further complicating the role of academic staff in delivering quality education and maintaining academic standards. The pressure to accommodate politically favoured students can also create a culture of complacency and compromise within the institution, affecting the overall performance and integrity of the university.

Political intrusion in admissions can also affect the equitable distribution of educational opportunities. When admission decisions are influenced by political considerations, it can lead to the marginalization of certain groups of students, particularly those who lack political connections or come from less privileged backgrounds. This perpetuates existing inequalities and undermines efforts to create an inclusive and equitable education system. Moreover, it can demotivate academically qualified students who are denied admission due to political favouritism, potentially driving them to seek education opportunities elsewhere or abandon their academic aspirations altogether (Falola, 2018). The resulting loss of talent and potential can have long-term implications for the university and the broader society, as it limits the development of a skilled and educated workforce.

The challenges posed by political interference of student admissions requires a multifaceted approach that involves policy reforms, institutional accountability, and a commitment to meritocracy. Establishing clear, transparent, and merit-based admission policies is essential for ensuring that students are selected based on their academic qualifications and potential, rather than political considerations. This can include implementing standardized admission tests, setting clear academic criteria, and ensuring that the selection process is conducted fairly and impartially (Gbadebo, 2021). Additionally, universities can enhance

transparency by publicly disclosing their admission policies and procedures, as well as the criteria used for selecting students. This can help build trust and confidence in the admission process and reduce the potential for political interference.

According to Hassan (2019), promoting institutional accountability is also crucial for justifying the impact of political interference in admissions. This involves establishing robust oversight mechanisms, such as independent admission committees and audit processes, to ensure that admission decisions are made in accordance with established policies and standards. For example, universities can create independent review boards to oversee the admission process, conduct regular audits of admission decisions, and investigate any instances of irregularities or political influence. By holding individuals and committees accountable for their decisions and actions, institutions can ensure greater fairness and transparency in the admission process, thereby enhancing the effectiveness of staff and the overall quality of education.

Engaging in advocacy and dialogue with policymakers is also essential for addressing systemic challenges related to political interference in admissions. By working collaboratively with government stakeholders, universities can advocate for policies and regulations that support merit-based admissions and protect the autonomy of educational institutions. This includes advocating for legal reforms that establish clear boundaries between political influence and university governance, promoting policies that prioritize academic excellence and equity, and raising awareness about the negative impact of political interference on the quality of education (Ibrahim, 2018). Engaging in constructive dialogue with government officials can help build mutual understanding and foster a collaborative approach to addressing the challenges facing higher education institutions. Politics in the admission of students for effective performance of staff in public universities in Nigeria is a critical issue that reflects the complex interplay between political dynamics and educational governance.

Political interference in admissions undermines the principles of equity, fairness, and meritocracy, affecting the composition of the student body, the morale and performance of academic staff, and the overall quality of education. Addressing these challenges requires a comprehensive approach that includes establishing clear and objective admission criteria, enhancing transparency and accountability, promoting a culture of meritocracy and academic integrity, and engaging in advocacy and dialogue with policymakers. By tackling the issues associated with political interference in admissions, public universities in Nigeria can improve their governance, achieve their educational and research missions, and contribute to the advancement of knowledge and societal development.

CONCLUSION

Politics plays a critical role in shaping the administrative and operational frameworks of public universities in Nigeria. While political influence can offer strategic direction, mobilize resources, and promote policies that support academic excellence, excessive or misdirected political interference often leads to inefficiencies, favoritism, and demoralization of staff. Therefore, to enhance staff performance, it is essential to strike a balance between political involvement and institutional autonomy. Constructive political engagement grounded in transparency, accountability, and meritocracy can significantly contribute to improved staff morale, motivation, and productivity in Nigeria's public university system. Government interference in management decisions within public universities in Nigeria is a critical issue that reflects the complex interplay between institutional governance and political dynamics. Political interference

in the appointment of key personnel, financial management, policy implementation, and academic affairs undermines the autonomy, integrity, and effectiveness of these institutions. Addressing these challenges requires a comprehensive approach that includes policy reforms, enhanced governance structures, accountability and transparency mechanisms, and advocacy efforts. By tackling the issues associated with government interference, public universities in Nigeria can improve their governance, achieve their educational and research missions, and contribute to the advancement of knowledge and societal development.

Suggestions

The following suggestions were made:

- Political actors should support the appointment and promotion of staff based on merit, qualifications, and performance, rather than political affiliations or favoritism.
- Governments should ensure that universities have the autonomy to make key decisions regarding staff development, resource allocation, and academic planning without undue political interference.
- Political leaders should avoid abrupt changes in university policies with regime changes. Continuity in education-related policies will provide a stable environment for staff to thrive.
- Politically driven initiatives should include sustained investment in training and development programs that empower staff with relevant skills and professional growth opportunities.
- There should be regular communication and collaboration between political stakeholders, university management, and staff unions to ensure that policies and decisions reflect the needs and aspirations of academic staff.

ABSTRACT

This paper examines the potential of delegative leadership to enhance educational outcomes in Federal Unity Schools in Bayelsa State, Nigeria, where autocratic leadership currently dominates. Using a qualitative approach with secondary data from academic literature, performance records, and policy documents, the study examines how delegative leadership characterized by teacher autonomy and minimal supervision can address Bayelsa's unique challenges, including flooding, resource scarcity, and low student achievement. Findings reveal that the prevailing top-down model limits adaptability and teacher morale, contributing to a 38% pass rate in 2023 WAEC exams, below the national 52%. Delegative leadership offers benefits like improved teacher initiative, student engagement, and school resilience, though risks such as oversight gaps and teacher readiness require mitigation. Anchored on Expectancy-Value Theory and a Multi-Level Perspective, the paper suggested policy considerations, including pilot programs, teacher training, and accountability mechanisms, to implement this approach effectively. The study's implications extend to Nigeria's rural schools and global educational leadership discourse, advocating for flexible, context-specific reforms to achieve equity and quality education.

Keywords: Delegative Leadership, Educational Outcomes, Federal Unity Schools, Bayelsa Teacher Autonomy, School Climate, Policy Reform, Nigeria, Qualitative Research.

INTRODUCTION

Education remains a cornerstone of national development, particularly in diverse and multi-ethnic nations like Nigeria, where Federal Unity Schools were established to foster integration and academic excellence across regions. These institutions, founded in the post-independence era, aim to bridge ethnic divides and provide quality education to students from all 36 states and

the Federal Capital Territory (FCT). As of 2025, Nigeria operates over 110 Federal Unity Schools, with each state hosting at least two or three such institution. In Bayelsa State, being a coastal region in the Niger Delta, these schools face unique challenges, including geographic isolation, limited infrastructure, and socio-economic disparities, all of which impact educational outcomes (Eze, 2021). Despite their noble mandate, evidence suggests that Federal Unity Schools, particularly in underserved regions like Bayelsa, struggle to meet national benchmarks for student achievement, teacher performance, and school management (Ogunode & Abubakar, 2020).

Leadership within educational institutions plays an all-important role in shaping these outcomes. Traditional leadership models in Nigerian public schools, often characterized as autocratic or directive, emphasize top-down decision-making and centralized control (Afolabi & Oyetola, 2019). While such approaches may ensure compliance and uniformity, they frequently stifle teacher initiative, limit adaptability to local contexts, and fail to address the diverse needs of students. In contrast, emerging research highlights the potential of alternative leadership styles, such as delegative leadership, to transform educational environments by empowering subordinates and fostering autonomy (Bush & Glover, 2014). Delegative leadership, also known as laissez-faire leadership, involves minimal direct supervision, allowing teachers and school staff to exercise discretion in their roles while holding them accountable for results (Northouse, 2021). This approach has gained attention globally for its ability to enhance motivation, creativity, and responsiveness in educational settings, yet its application in Nigeria's public school system remains underexplored.

In Bayelsa State, with its predominantly rural population and oil-dependent economy, represents the complexities of educational leadership in Nigeria's Niger Delta. The state's Federal Unity Schools, such as Federal Government College, Odi, Federal Science and Technical College, Tungbo and Federal Government Girls' College, Imiringi, operate in an environment marked by poor road networks, annual flooding, and limited access to educational resources. The road network especially Tungbo and Imiringi is nothing short of a death trap (Otiar & Obi, 2025). These conditions exacerbate the challenges of maintaining consistent academic performance and teacher morale. Moreover, the socio-cultural context of Bayelsa, including communal values and reliance on informal leadership structures, suggests that a shift toward delegative leadership could align with local norms of autonomy and collective responsibility (Okeke & Nwankwo, 2023). However, the efficacy of this leadership style in improving educational outcomes depends on its adaptation to Bayelsa's unique circumstances, raising critical questions about policy design and implementation.

The broader discourse on educational leadership underscores its influence on student achievement, teacher satisfaction, and school climate. Studies from various contexts demonstrate that leadership styles directly affect how schools utilize resources, respond to challenges, and achieve their goals (Leithwood et al., 2020). In Nigeria, where educational policy often prioritizes infrastructure over human capital development, leadership remains an underutilized lever for change (Adeyemi & Salami, 2018). Federal Unity Schools, as federally funded institutions, offer a strategic entry point for testing innovative leadership models that could inform national policy. By focusing on Bayelsa State, this paper seeks to bridge the gap between global leadership theories and localized educational needs, proposing delegative leadership as a viable framework for reform.

Federal Unity Schools in Bayelsa State face persistent challenges that undermine their ability to deliver on their mandate of academic excellence and national unity. Data from the West

African Examinations Council (WAEC) and National Examinations Council (NECO) consistently show that students in Bayelsa's public schools, including Federal Unity Schools, perform below the national average in key subjects like mathematics and English (Ogunode & Abubakar, 2020). For instance, in the 2023 WAEC results, only 38% of candidates from Bayelsa achieved five credits, including mathematics and English, compared to the national average of 52% (West African Examinations Council, 2023). This achievement gap reflects broader systemic issues, including inadequate teaching materials, high teacher turnover, and ineffective school management practices.

Leadership within these schools often worsens these problems. The prevailing autocratic model, inherited from colonial and military-era administrative traditions, prioritizes compliance over innovation (Afolabi & Oyetola, 2019). Principals and headteachers typically make unilateral decisions, leaving little room for teachers to adapt curricula to local needs or address student diversity. This rigidity is particularly detrimental in Bayelsa, where environmental factors like seasonal flooding disrupt academic calendars, requiring flexible responses that centralized leadership struggles to provide (Amadi & Eze, 2022). Here, the decision and fierce nature and body language of the principal is final, militarizing, and no one dares to challenge him or her (Otiar and Obi, 2025). Teachers, meanwhile, report low job satisfaction and limited professional autonomy, contributing to absenteeism and poor instructional quality (Okeke & Nwankwo, 2023). These dynamics create a vicious cycle of underperformance, where ineffective leadership perpetuates poor educational outcomes.

Delegative leadership offers a potential solution, yet its application in Nigerian schools remains untested. While studies in Western contexts suggest that delegative leadership can improve teacher morale and student engagement by granting educators greater control over their work (Bush & Glover, 2014), its effectiveness in resource-constrained settings like Bayelsa is uncertain. The risks are notable: without proper oversight, delegative leadership could lead to inconsistency, neglect of struggling students, or misuse of autonomy by unprepared staff (Northouse, 2021). Moreover, the federal structure of Unity Schools, governed by the Ministry of Education, imposes bureaucratic constraints that may resist decentralized approaches (Adeyemi & Salami, 2018). Thus, the problem lies not only in the limitations of current leadership practices but also in the absence of a tailored framework to integrate delegative leadership into Bayelsa's Federal Unity Schools.

The federal unity colleges currently are the only system holding the Nigerian education system aloft (Otiar & Obi 2025). Due to the fact that the stakes are high. If these schools fail to improve, they risk perpetuating inequality, undermining Nigeria's unity agenda, and leaving Bayelsa's students ill-equipped for higher education and economic opportunities (Eze, 2021). Addressing this problem requires a nuanced understanding of how leadership styles interact with local conditions and a clear policy roadmap to guide implementation. This paper contends that delegative leadership, with appropriate safeguards, could break the cycle of underperformance by leveraging teacher expertise and aligning school management with Bayelsa's contextual realities.

The purpose of this paper is to examine how delegative leadership can enhance educational outcomes in Federal Unity Schools in Bayelsa State and to propose policy considerations for its effective adoption. Specifically, it explores the relationship between delegative leadership, teacher autonomy, and key indicators of school success, such as student academic achievement, teacher performance, and overall school climate. Drawing on theoretical

insights and contextual analysis, the paper advocates for a shift from traditional leadership paradigms to a model that empowers educators while maintaining accountability.

Delegative leadership, when effectively implemented, can improve teacher autonomy, student achievement, and overall school performance in Federal Unity Schools in Bayelsa State, necessitating specific policy adjustments to address local challenges and ensure sustainable impact. This argument rests on the premise that Bayelsa's unique socio-economic and environmental conditions require a leadership approach that prioritizes flexibility and local decision-making, qualities inherent in the delegative style (Leithwood et al., 2020). By decentralizing authority and fostering a culture of shared responsibility, schools can better respond to disruptions, optimize limited resources, and cultivate a motivated teaching workforce.

This investigation is both theoretical and practical. It builds on existing leadership frameworks while grounding them in the realities of Bayelsa's educational landscape. The proposed policy considerations aim to provide actionable steps for school administrators and federal policymakers, ensuring that delegative leadership is not merely an academic exercise but a transformative tool for educational reform.

Significance of the Study

This study holds significant implications for multiple stakeholders in Nigeria's educational ecosystem. For policymakers at the Federal Ministry of Education, it offers a fresh perspective on how leadership reforms can address longstanding disparities in Unity Schools, particularly in marginalized regions like Bayelsa. By demonstrating the potential of delegative leadership, the paper challenges the status quo of centralized governance and encourages experimentation with decentralized models (Adeyemi & Salami, 2018). Such reforms could serve as a pilot for broader application across Nigeria's public school system, aligning with the Sustainable Development Goal (SDG) 4 target of inclusive and quality education for all.

For school administrators in Bayelsa, this research provides a practical framework to enhance their leadership practices. Principals and headteachers stand to benefit from strategies that reduce micromanagement, improve teacher morale, and ultimately elevate student outcomes (Okeke & Nwankwo, 2023). Teachers, as key implementers, gain a voice in this discourse, as delegative leadership positions them as active agents of change rather than passive recipients of directives. This shift could reduce burnout and attrition, addressing a critical human resource challenge in Bayelsa's schools (Amadi & Eze, 2022).

The study also contributes to the academic literature on educational leadership. While delegative leadership has been widely studied in Western contexts, its application in developing countries, particularly in Africa, remains nascent (Bush & Glover, 2014). By focusing on Bayelsa State, this paper fills a gap in context-specific research, offering insights that resonate with other resource-constrained, rural settings. It advances the global conversation on how leadership styles can be adapted to diverse educational systems, enriching theories like Expectancy-Value Theory and multi-level leadership models (Leithwood et al., 2020).

Finally, the significance extends to the students and communities of Bayelsa. Improved educational outcomes in Federal Unity Schools could enhance access to higher education, reduce poverty, and strengthen social cohesion in a region marked by economic volatility and environmental degradation (Eze, 2021). As Nigeria approaches the 2030 SDG deadline, studies like this underscore the urgency of innovative solutions to long-standing educational challenges.

In sum, this introduction establishes the foundation for a compelling argument: that delegative leadership, thoughtfully applied, can transform Federal Unity Schools in Bayelsa State. The subsequent sections will delve into the theoretical framework, empirical evidence, and policy recommendations to support this thesis, offering a roadmap for educational progress in one of Nigeria's most challenging contexts.

THEORETICAL UNDERPINNINGS

The conceptual framework for this study draws on two key theoretical frameworks: Expectancy-Value Theory and the Multi-Level Perspective on Leadership. These theories provide a robust foundation for understanding how delegative leadership influences educational outcomes in Bayelsa's Federal Unity Schools.

Expectancy-Value Theory

The theory was developed by Eccles and Wigfield (2002), Expectancy-Value Theory posits that individuals' motivation to perform tasks depends on their expectation of success and the value they assign to the outcome. In the context of delegative leadership, teachers granted autonomy are more likely to feel confident in their abilities (expectancy) and perceive their work as meaningful (value), thus enhancing their effort and performance. For example, a teacher in Bayelsa who can tailor lessons to students' cultural context may feel more invested in their role, leading to improved student engagement (Wigfield & Eccles, 2000). This theory suggests that delegative leadership could boost teacher morale and productivity, critical factors in schools facing high turnover and low motivation (Okeke & Nwankwo, 2023).

Multi-Level Perspective on Leadership

Leithwood et al. (2020) argue that leadership impacts educational outcomes across multiple levels: individual (teachers and students), organizational (school climate), and systemic (policy environment). Delegative leadership operates at the individual level by empowering teachers, at the organizational level by fostering a collaborative school culture, and at the systemic level by aligning with federal goals of quality education. In Bayelsa, where centralized policies often overlook local nuances, this multi-level approach highlights how delegative leadership can bridge the gap between national mandates and regional realities (Bush & Glover, 2014). For instance, a principal delegating scheduling decisions to teachers during flood seasons could improve attendance and learning continuity, affecting both individual and organizational outcomes.

These theories converge on the idea that leadership is not a one-size-fits-all solution but a dynamic process shaped by context. Delegative leadership, rooted in autonomy and trust, aligns with these principles by adapting to Bayelsa's unique challenges while promoting accountability.

CONCEPTUAL CLARIFICATION

Delegative Leadership

Delegative leadership, often referred to as laissez-faire leadership, is a style characterized by a hands-off approach, where leaders provide minimal direct supervision and delegate significant decision-making authority to subordinates (Northouse, 2021). Unlike autocratic leadership, which centralizes control, or transformational leadership, which inspires through vision and charisma, delegative leadership empowers individuals to take initiative, set goals, and execute tasks based on their expertise and judgment. In an educational context, this translates to school principals granting teachers autonomy over classroom management, curriculum implementation, and student engagement strategies, while maintaining accountability for outcomes (Bush & Glover, 2014).

Delegative leadership (also known as laissez-faire leadership) is characterized by minimal direct supervision and a high degree of autonomy given to subordinates (Ololube, 2006). He posited that, while this leadership style can empower competent and experienced staff, it may also lead to chaos or poor performance if used inappropriately especially in schools or organizations lacking skilled personnel. To him, this leadership style assumes that subordinates such as teachers, in this case are competent, self-motivated, and capable of performing effectively without constant oversight. However, its success hinges on the capacity of those delegated to act responsibly and the presence of clear boundaries to prevent neglect or inconsistency (Bass & Riggio, 2006). In Federal Unity Schools in Bayelsa State, delegative leadership could involve principals empowering teachers to adapt teaching methods to local challenges, such as flooding or resource shortages, while ensuring alignment with national educational standards.

Comparatively, autocratic leadership, prevalent in many Nigerian schools, enforces strict compliance but often stifles innovation (Afolabi & Oyetola, 2019). Transformational leadership, while motivational, requires resources and training that may be scarce in Bayelsa's context (Leithwood et al., 2020). Delegative leadership strikes a balance, leveraging existing human capital without demanding extensive external support, making it a potentially viable model for resource-constrained.

Educational Outcomes

Educational outcomes serve as comprehensive indicators of a school system's performance and effectiveness. In the context of this study, educational outcomes are conceptualized as measurable elements that reflect the overall success of a school, including student academic achievement, teacher performance, school climate, and the efficient utilization of resources. These outcomes provide a multi-dimensional lens for evaluating the effectiveness of leadership practices, particularly delegative leadership, in Federal Unity Schools within Bayelsa State.

Student academic achievement remains a primary indicator of educational outcomes, as it directly measures learning through standardized test scores such as WAEC and NECO. It serves as a benchmark for assessing how well students have internalized curriculum content and developed essential cognitive skills. In Bayelsa State, where historical underperformance in national examinations persists, leadership strategies that empower teachers and improve instructional delivery are vital to closing the achievement gap. Delegative leadership, by

allowing teachers greater autonomy in instructional planning and classroom management, can contribute to personalized learning experiences that cater to diverse student needs, thereby improving achievement outcomes.

Secondly, teacher performance is central to educational outcomes, as teachers are the primary agents of curriculum implementation. Their competence, motivation, and engagement have a direct influence on student learning. Under delegative leadership, teachers are granted the discretion to make instructional decisions, innovate pedagogical approaches, and collaborate in shaping school policy. When this autonomy is matched with appropriate professional development and support, it enhances job satisfaction, motivation, and a sense of ownership—factors that are positively correlated with improved performance. In the context of Bayelsa's Federal Unity Schools, where challenges such as staff shortages and uneven teacher quality exist, enabling high-performing teachers to lead in areas of strength could drive overall school improvement.

Thirdly, school climate the quality and character of school life—is a crucial yet often intangible educational outcome. It encompasses interpersonal relationships, school safety, respect, collaboration, and a shared commitment to educational goals. A positive school climate has been associated with improved student behavior, lower dropout rates, and better academic results. Delegative leadership can promote a constructive school climate by fostering inclusiveness and trust among staff and students. By involving all stakeholders in decision-making and recognizing individual contributions, leaders can nurture a sense of belonging and shared responsibility, especially in resource-constrained environments like Bayelsa, where external support may be limited.

Finally, resource utilization reflects how effectively a school manages its physical, financial, and human resources to support learning. Efficient use of resources is especially critical in regions like Bayelsa, where infrastructural and material shortages are common. Delegative leadership can encourage innovation and adaptability, allowing teachers and staff to find creative solutions using locally available materials or community partnerships. Empowering stakeholders to make decisions on resource allocation fosters a culture of accountability and sustainability.

Taken together, these four dimensions such as student achievement, teacher performance, school climate, and resource utilization form a robust framework for evaluating the impact of leadership practices on educational outcomes. In Bayelsa’s Unity Schools, where systemic and contextual challenges persist, the effectiveness of delegative leadership will largely depend on how well it is aligned with the existing capabilities of staff, the socio-cultural realities of the school environment, and the availability of monitoring and support structures. Educational outcomes are not only reflective of student success but also serve as critical feedback mechanisms for school leadership. As Federal Unity Schools strive to fulfill their mandate of promoting national integration and academic excellence, adopting leadership styles that improve these core outcomes like well-executed delegative leadership could be key to sustainable progress.

Student Academic Achievement

Student academic achievement remains a central metric for evaluating the effectiveness of educational systems. In Nigeria, this achievement is commonly assessed through performance in standardized examinations such as the West African Senior School Certificate Examination

(WAEC) and the National Examinations Council (NECO) exams. These assessments not only determine individual academic progression but also serve as a national barometer for education quality and equity. Unfortunately, schools in Bayelsa State often record lower-than-average performance compared to other regions in Nigeria, highlighting the need for targeted interventions that can boost learning outcomes (Ogunode & Abubakar, 2020).

Leadership plays a crucial role in shaping these outcomes. Research has consistently shown that school leadership especially the style adopted by principals has both direct and indirect effects on student achievement. Delegative leadership, when effectively implemented, can be a powerful tool in improving academic performance, especially in contexts like Bayelsa where schools face systemic challenges, including teacher shortages, infrastructural decay, and socio-economic constraints.

One of the key strengths of delegative leadership lies in its ability to empower teachers with the autonomy to tailor their instruction to the unique needs of their students. In regions with cultural and linguistic diversity, such as Bayelsa, a one-size-fits-all curriculum often fails to engage students meaningfully. By granting teachers the discretion to adapt teaching strategies, materials, and even content delivery methods, delegative leadership fosters a more inclusive and responsive classroom environment. This flexibility is particularly important for addressing the learning gaps of students who may come from rural or disadvantaged backgrounds, where home support for education may be minimal.

Teachers who are trusted with responsibility are more likely to take initiative in developing learner-centered approaches, such as differentiated instruction, remedial support, and the integration of local examples into lessons. These strategies not only help students grasp difficult concepts but also build their confidence and interest in school. As Ogunode and Abubakar (2020) emphasize, improving the quality of instruction is a critical pathway to raising student achievement, and leadership that supports teacher innovation is central to this goal.

Moreover, delegative leadership can create a culture of high expectations and collective accountability among staff. When teachers are involved in decision-making and are part of setting academic targets, they become more invested in student success. This collaborative culture encourages shared responsibility for outcomes, reducing the isolation that often characterizes teaching in under-resourced settings. In Bayelsa's Unity Schools, such an environment could help overcome the apathy and low morale that sometimes undermine teaching effectiveness.

However, for delegative leadership to translate into measurable academic gains, it must be accompanied by structures that support continuous professional development and student progress monitoring. School leaders must ensure that the autonomy given to teachers is balanced with clear academic standards, regular performance reviews, and constructive feedback mechanisms. This balance helps to maintain instructional quality while encouraging innovation and adaptability.

To crown it all, student academic achievement in Bayelsa can be significantly improved through leadership models that prioritize teacher empowerment, responsiveness to learner diversity, and a culture of collaboration. Delegative leadership offers a viable pathway to achieving these outcomes, provided it is adapted to the contextual realities of the schools and is supported by ongoing training, accountability structures, and a shared vision for excellence. As Nigeria strives to meet national and global education targets, focusing on leadership that enhances instruction and student engagement remains essential to closing achievement gaps and promoting educational equity.

Teacher Performance

This includes instructional quality, attendance, and professional initiative. Teachers in Bayelsa report low autonomy and job satisfaction, contributing to absenteeism and poor classroom outcomes (Okeke & Nwankwo, 2023). Delegative leadership could enhance performance by giving teachers ownership of their work, potentially reducing turnover and boosting morale.

School Climate

A positive school climate marked by collaboration, trust, and shared goals correlates with better educational outcomes (Cohen et al., 2009). In Bayelsa's Unity Schools, where isolation and resource scarcity strain relationships, delegative leadership could foster a sense of community and resilience among staff and students. However, in many Unity Schools in Bayelsa State, achieving a positive school climate presents a unique set of challenges. Geographic isolation, inadequate funding, poor infrastructure, and the scarcity of teaching and learning resources often erode morale and limit collaborative engagement among staff. These conditions can foster feelings of detachment, burnout, and inefficiency, both in teaching delivery and administrative coordination. In such environments, leadership plays a critical role in either exacerbating or transforming the prevailing culture.

Delegative leadership when applied intentionally offers a promising approach in these contexts. By empowering teachers, non-teaching staff, and even students to take initiative and share in decision-making processes, principals and school heads can create a sense of ownership and mutual accountability. This style of leadership encourages innovation, trust, and the free flow of ideas, all of which are essential to building a cohesive and resilient school environment. For instance, allowing teachers to lead professional development workshops or encouraging student-led initiatives can strengthen bonds and instill a collective purpose.

Moreover, delegative leadership promotes capacity building. As more individuals are trusted with responsibility, they develop problem-solving skills and leadership competencies, which in turn contribute to a more vibrant and dynamic school climate. In Bayelsa's Unity Schools where principals often operate with limited support from educational authorities this approach can decentralize leadership burdens and harness the strengths of the entire school community.

In sum, a positive school climate is indispensable for educational success, and in resource-constrained settings like Bayelsa's Unity Schools, delegative leadership emerges not just as a managerial choice but as a strategic necessity. By fostering inclusiveness, trust, and shared responsibility, it helps mitigate the effects of isolation and scarcity, ultimately leading to improved student outcomes and institutional resilience.

Resource Utilization

With limited funding and infrastructure, efficient use of available resources is vital. Delegative leadership may enable teachers to innovate with scarce materials, such as using local content for lessons, thereby maximizing impact (Adeyemi & Salami, 2018). These outcomes are interconnected: improved teacher performance enhances student achievement, a positive school climate supports both, and effective resource use sustains progress. In Nigeria's educational context, where federal policies emphasize unity and equity, these metrics align with national

priorities while addressing Bayelsa's specific needs. Delegative leadership plays a pivotal role in enhancing resource utilization in such environments. Unlike autocratic leadership styles that centralize decision-making and limit innovation, delegative leadership empowers teachers and non-teaching staff to take initiative, make informed decisions, and contribute meaningfully to problem-solving processes. This empowerment fosters a culture of creativity and ownership, where educators are encouraged to adapt instructional methods and develop alternative teaching resources tailored to the specific needs of their students and community.

Teachers, when given autonomy and support, can draw from indigenous knowledge systems and local materials to enrich their lessons. For example, science teachers may use locally available items such as bottles, seeds, clay, or stones for practical experiments, while social studies educators may incorporate local histories and case studies into their curriculum. This approach not only compensates for the lack of standard materials but also enhances contextual learning, making education more relevant and engaging for students. As Adeyemi and Salami (2018) rightly noted, when teachers are trusted with responsibility, they are more likely to demonstrate ingenuity, which in turn leads to improved classroom delivery and student performance.

Furthermore, delegative leadership fosters collaboration among staff, enabling them to pool resources, share best practices, and support one another professionally. In Unity Schools, where staff morale may be dampened by isolation or lack of incentives, such collaboration becomes a powerful tool for resource optimization. Group lesson planning, peer mentoring, and shared access to instructional materials can significantly reduce duplication of effort and foster a more cohesive teaching approach.

The outcomes of effective resource utilization are deeply interconnected with other facets of school development. When teachers are empowered to innovate and manage scarce resources efficiently, their performance improves, which directly influences student achievement. A positive school climate nurtured through trust, shared responsibilities, and mutual respect reinforces these outcomes, creating an environment where both staff and students can thrive. Moreover, when limited resources are used judiciously and inclusively, schools are better positioned to maintain continuity in education, even during periods of economic or logistical disruption.

From a policy perspective, these practices align closely with national education goals, including the drive for equitable and inclusive education as articulated in Nigeria's National Policy on Education and Sustainable Development Goal 4. Delegative leadership, therefore, is not only a local solution to localized problems; it is a strategic response that fits into broader frameworks of equity, unity, and sustainable development. For states like Bayelsa—where geographic and economic barriers often hamper access to quality education—such leadership practices are especially vital.

The efficient utilization of resources through delegative leadership is essential to addressing the complex challenges facing Unity Schools in Bayelsa. By promoting teacher autonomy, encouraging innovation, and fostering collaboration, this leadership style transforms scarcity into opportunity and aligns school practices with national priorities for educational equity and excellence.

Delegative Leadership in Education

Delegative leadership, often referred to as laissez-faire leadership, occupies a unique space within educational leadership theories. Unlike directive or transactional styles, it emphasizes autonomy, trust, and decentralization of authority. Globally, research has highlighted both the strengths and weaknesses of this leadership model, showing that its effectiveness is largely contingent upon contextual factors such as staff capacity, organizational culture, and institutional clarity.

Bush and Glover (2014) provide a compelling synthesis of evidence indicating that delegative leadership performs best in environments where staff members are highly skilled and motivated. In such settings, leaders can rely on the professional expertise of teachers and department heads to drive innovation and problem-solving. This model not only taps into latent capacity within the organization but also promotes a culture of shared leadership and continuous learning. Harris (2008), in her study of secondary schools in the United Kingdom, found that principals who adopted a more delegative style saw marked improvements in teacher morale and student engagement. By involving staff in curriculum decisions, scheduling, and assessment planning, these schools cultivated an inclusive atmosphere that fostered trust and accountability.

Further strengthening the case for delegative leadership, Bass and Riggio (2006) argue that when it is paired with clear performance expectations and strategic oversight, laissez-faire leadership can significantly enhance organizational adaptability. In dynamic and ever-changing environments, such as those impacted by rapid policy changes, economic uncertainty, or shifting societal needs, this adaptability becomes a valuable asset. Institutions led through a delegative approach often demonstrate greater resilience, creativity, and openness to innovation.

However, the literature is equally clear about the pitfalls of poorly executed delegative leadership. Northouse (2021) cautions that this leadership style can quickly devolve into neglect or inertia if not paired with adequate monitoring and support structures. Where subordinates lack competence, motivation, or clarity of purpose, the absence of active guidance from leadership may result in confusion, fragmentation, or decline in performance. Leithwood et al. (2020), in a study of urban schools in the United States, revealed that laissez-faire leadership when implemented without a strategic framework led to reduced student outcomes and declining test scores due to inconsistent classroom practices and lack of accountability.

These insights offer valuable lessons for Bayelsa's Unity Schools, which are often situated in challenging environments characterized by resource scarcity, professional isolation, and uneven teacher capacity. In such contexts, a blanket application of delegative leadership may be counterproductive if staff members are not adequately trained or motivated. However, when deployed with nuance tailored to the school's specific strengths, needs, and goals delegative leadership can empower teachers, enhance problem-solving capacity, and build collective resilience.

To ensure success, school leaders in Bayelsa must establish clear frameworks of accountability and provide professional development opportunities that build staff competence and confidence. Delegation should be strategic, focusing on areas where staff members demonstrate aptitude and interest. Moreover, mechanisms for feedback, reflection, and performance monitoring must be institutionalized to guard against complacency or misdirection.

Delegative leadership holds significant promise for educational reform and school improvement, particularly in complex and under-resourced systems. However, its implementation must be context-sensitive, capacity-driven, and anchored in a robust structure of

support and oversight. For Unity Schools in Bayelsa, the thoughtful adoption of delegative leadership could pave the way for innovation, inclusion, and sustainable development in education.

Federal Unity Schools in Nigeria

Federal Unity Schools, established in the 1960s, aim to promote national integration and academic excellence (Eze, 2021). With over 110 institutions nationwide, they serve as a microcosm of Nigeria's diversity, drawing students from all states. In Bayelsa, schools like Federal Government College, Odi, operate under federal oversight but face localized challenges. Ogunode and Abubakar (2020) note that Unity Schools in the Niger Delta, including Bayelsa, struggle with poor infrastructure, teacher shortages, and environmental disruptions like flooding. Academic performance data from 2023 show Bayelsa's Unity Schools trailing national averages, with only 38% of students achieving five credits in WAEC exams (West African Examinations Council, 2023).

Leadership in these schools typically follows a top-down model, reflecting Nigeria's bureaucratic traditions (Afolabi & Oyetola, 2019). Adeyemi and Salami (2018) argue that this centralization limits responsiveness to regional issues, such as Bayelsa's geographic isolation. Despite federal funding, resource allocation often fails to address local priorities, exacerbating disparities (Eze, 2021). This rigidity underscores the need for alternative leadership approaches like delegative leadership.

Gaps in Existing Research

While delegative leadership has been studied extensively in Western contexts, its application in African educational systems, particularly Nigeria, is limited. Bush and Glover (2014) call for more research on leadership styles in developing countries, where resource constraints and cultural factors differ from Western norms. In Nigeria, studies focus primarily on autocratic and transformational leadership, with little attention to delegative models (Afolabi & Oyetola, 2019; Okeke & Nwankwo, 2023). This gap is particularly stark in the Niger Delta, were socio-economic and environmental challenges demand innovative solutions.

Moreover, existing research on Federal Unity Schools emphasizes structural issues (e.g., funding, infrastructure) over leadership dynamics (Ogunode & Abubakar, 2020). The few studies addressing leadership lack specificity to Bayelsa's context, overlooking its rurality, oil economy, and cultural heritage (Amadi & Eze, 2022). This paper addresses these gaps by exploring delegative leadership's potential in Bayelsa's Unity Schools, offering context-specific insights and policy recommendations.

The literature establishes delegative leadership as a promising yet context-dependent approach. Its success in education hinges on teacher capacity, clear accountability, and alignment with local needs conditions that Bayelsa's Unity Schools must navigate. Theoretical frameworks like Expectancy-Value Theory and the Multi-Level Perspective provide a lens to predict its impact, while educational outcomes offer measurable benchmarks. However, the scarcity of Nigerian-specific studies highlights the need for this research, positioning it as a contribution to both academic discourse and practical reform.

METHODOLOGY

This study adopts a qualitative research approach to explore the potential of delegative leadership in enhancing educational outcomes in Federal Unity Schools in Bayelsa State. Qualitative methodology is well-suited for this investigation because it allows for an in-depth examination of complex phenomena, such as leadership dynamics and their contextual implications, which cannot be fully captured through quantitative measures alone (Creswell & Poth, 2018). Given the nuanced socio-economic, environmental, and cultural factors in Bayelsa, a qualitative lens provides the flexibility to interpret existing data and theoretical insights within this specific setting.

The choice of a qualitative approach aligns with the exploratory nature of this position paper. Rather than testing a hypothesis with statistical rigor, the study seeks to understand how delegative leadership might function in Bayelsa's Unity Schools, identify its potential benefits and challenges, and propose policy considerations grounded in contextual realities (Merriam & Tisdell, 2016). This method is particularly appropriate given the limited primary data available on leadership practices in Bayelsa's schools, allowing the researcher to leverage secondary sources to construct a robust argument. The data for this study are drawn exclusively from secondary sources, reflecting the practical constraints of conducting primary research in Bayelsa State and the wealth of existing documentation relevant to the topic. Secondary data offer a cost-effective and time-efficient means to synthesize insights from prior studies, official reports, and policy documents, providing a foundation for qualitative analysis (Johnston, 2014). The following secondary data sources were utilized: Peer-reviewed journal articles and books on educational leadership, delegative leadership, and Nigerian education systems were reviewed. Key sources include works by Northouse (2021), Bush and Glover (2014), and Ogunode and Abubakar (2020), which provide theoretical and empirical insights into leadership styles and their impact on schools.

Educational Performance Records

Reports from the West African Examinations Council (WAEC) and National Examinations Council (NECO) were analyzed to assess student academic achievement in Bayelsa's Federal Unity Schools. For instance, the 2023 WAEC results summary (West African Examinations Council, 2023) offers data on pass rates, highlighting performance gaps that leadership reforms might address.

Policy Documents

Federal Ministry of Education reports and guidelines on Unity Schools were examined to understand current leadership structures and national educational priorities. These documents, though not specific to Bayelsa, provide a systemic context for evaluating leadership practices (Eze, 2021).

Regional Studies and Reports

Studies focusing on Bayelsa State, such as those by Amadi and Eze (2022) and Okeke and Nwankwo (2023), offer secondary data on environmental challenges, teacher morale, and school

conditions in the Niger Delta. These sources ground the analysis in Bayelsa's unique circumstances.

The reliance on secondary data introduces limitations, such as potential bias in original studies or gaps in Bayelsa-specific information. To mitigate this, multiple sources were triangulated to ensure credibility and consistency, a common practice in qualitative research (Merriam & Tisdell, 2016). While primary data (e.g., interviews with Bayelsa educators) could enhance specificity, secondary sources suffice for this position paper's purpose of proposing a theoretical and policy framework.

Analytical Framework

The analytical framework for this study integrates thematic analysis with a context-specific lens to evaluate the relationship between delegative leadership and educational outcomes. Thematic analysis, as outlined by Braun and Clarke (2006), involves identifying, analyzing, and reporting patterns (themes) within qualitative data. This method was applied to secondary sources to extract key themes related to leadership practices, teacher autonomy, and school performance in Bayelsa's Unity Schools. The framework consists of three core components:

Leadership Practices

This component examines how delegative leadership differs from current practices in Bayelsa's Unity Schools. Themes include autonomy delegation, oversight mechanisms, and adaptability to local challenges, drawn from literature like Northouse (2021) and Bush and Glover (2014).

Teacher Autonomy and Performance

This focuses on how delegative leadership influences teacher motivation, initiative, and instructional quality. Expectancy-Value Theory (Eccles & Wigfield, 2002) guides the analysis, linking autonomy to performance outcomes, with data from Okeke and Nwankwo (2023) providing regional insights.

Educational Outcomes

This assesses the impact on student achievement, school climate, and resource utilization. Themes are derived from performance records (e.g., West African Examinations Council, 2023) and studies on school effectiveness (Cohen et al., 2009), contextualized for Bayelsa's conditions. The analysis is iterative, moving between data and theory to construct a narrative that connects delegative leadership to Bayelsa's educational landscape. Policy implications are then inferred from these findings, ensuring recommendations are evidence-based and feasible (Creswell & Poth, 2018).

ANALYSIS AND FINDINGS

Current Leadership Practices in Bayelsa State Federal Unity Schools

The analysis of secondary data reveals that leadership in Bayelsa's Federal Unity Schools predominantly follows an autocratic model, characterized by centralized decision-making and limited teacher input. Afolabi and Oyetola (2019) describe this as a legacy of Nigeria's colonial and military past, where school principals act as authoritative figures enforcing federal directives. In Bayelsa, this manifests in rigid adherence to national curricula and schedules, despite local disruptions like flooding, which can halt schooling for weeks (Amadi & Eze, 2022). For example, principals often dictate lesson plans and resource allocation without consulting teachers, a practice that stifles flexibility in a region were environmental and logistical challenges demand adaptability.

This autocratic approach has tangible effects on educational outcomes. Teacher morale is notably low, with Okeke and Nwankwo (2023) reporting high absenteeism and dissatisfaction among Bayelsa educators due to lack of autonomy. Secondary data from WAEC (West African Examinations Council, 2023) corroborate this, showing a 38% pass rate in Bayelsa's Unity Schools—well below the national 52% suggesting that instructional quality suffers under current leadership. School climate also appears strained, as centralized control fosters a top-down culture rather than collaboration, undermining the unity ethos these schools aim to promote (Eze, 2021). The rigidity of this model is particularly ill-suited to Bayelsa's context. Amadi and Eze (2022) note that flooding disrupts up to 30% of the academic year in rural areas like Odi and Imiringi, yet principals rarely adjust schedules or delegate authority to teachers to mitigate these effects. This disconnects between leadership practices and local realities highlights a critical gap that delegative leadership could address.

Potential of Delegative Leadership

Delegative leadership offers a compelling alternative, with secondary evidence suggesting it could improve outcomes by empowering teachers and fostering adaptability. Bush and Glover (2014) argue that delegative leadership excels in contexts where staff are competent and motivated, allowing them to innovate within broad guidelines. In Bayelsa, where teachers often possess local knowledge (e.g., cultural norms, flood patterns), delegating authority could enable them to tailor instruction and schedules to students' needs. For instance, a teacher might shift to project-based learning during flood seasons, using local resources to maintain engagement—a flexibility autocratic leadership precludes.

BENEFITS

Teacher Initiative and Morale

Expectancy-Value Theory (Eccles & Wigfield, 2002) predicts that autonomy increases teachers' sense of efficacy and value in their work. Okeke and Nwankwo (2023) found that rural Nigerian teachers with decision-making power reported higher job satisfaction, suggesting delegative leadership could reduce absenteeism in Bayelsa. This aligns with Harris (2008), who observed improved teacher initiative in UK schools under delegative models. Student Engagement and

Achievement. Allowing teachers to adapt curricula e.g., incorporating Ijaw cultural content or practical skills relevant to Bayelsa's oil economy—delegative leadership could boost student interest and performance. Leithwood et al. (2020) link teacher autonomy to higher student outcomes, a pattern that could lift Bayelsa's lagging WAEC scores.

Adaptability to Local Challenges

Delegative leadership's flexibility is a key asset in Bayelsa. Bass and Riggio (2006) note its effectiveness in dynamic environments, and in Bayelsa, teachers could devise contingency plans (e.g., mobile learning during floods) if empowered by principals.

BARRIERS TO DELEGATIVE LEADERSHIP

Lack of Oversight

Northouse (2021) cautions that delegative leadership can falter without clear accountability, potentially leading to inconsistent teaching quality. In Bayelsa, where teacher training varies, some might misuse autonomy, neglecting struggling students.

Dependency on Teacher Competence

Bush and Glover (2014) emphasize that delegative leadership requires skilled staff. In Bayelsa, uneven professional development (Adeyemi & Salami, 2018) could limit its effectiveness unless paired with capacity-building.

Resistance to Change

Federal oversight and bureaucratic norms may resist decentralization (Eze, 2021), posing implementation challenges. A principal delegating lesson planning during floods might see improved attendance and morale, but without monitoring, some teachers could underperform, widening achievement gaps. Balancing autonomy with structure is thus critical.

CONTEXTUAL FACTORS IN BAYELSA STATE

Bayelsa's unique context shapes the feasibility and impact of delegative leadership. Secondary data highlight three key factors:

Socio-Economic Conditions

Bayelsa's oil-dependent economy and high poverty rates (Amadi & Eze, 2022) mean students often face hunger or work obligations, reducing school focus. Delegative leadership could allow teachers to integrate practical skills (e.g., fishing techniques) into lessons, aligning education with economic realities and boosting relevance.

Cultural Influences

The Ijaw community's emphasis on collective responsibility (Okeke & Nwankwo, 2023) aligns with delegative leadership's collaborative ethos. Teachers rooted in this culture might thrive under autonomy, fostering a school climate that reflects local values.

Resource Availability

Limited infrastructure and funding (Adeyemi & Salami, 2018) constrain innovation. Delegative leadership could optimize existing resources, e.g., using community spaces for classes, but requires initial investment in teacher training to succeed. These factors suggest that while delegative leadership holds promise, its success depends on addressing capacity gaps and leveraging cultural strengths. For example, a principal in Federal Government College, Odi, might delegate flood-response strategies to teachers, improving resilience, but only if supported by professional development and federal policy adjustments.

The analysis reveals that current autocratic leadership in Bayelsa's Unity Schools contributes to poor educational outcomes by limiting adaptability and teacher agency. Delegative leadership offers a viable alternative, potentially enhancing teacher performance, student achievement, and school climate by aligning with Bayelsa's contextual needs. However, its risks—lack of oversight, teacher readiness, and systemic resistance—necessitate careful implementation. These findings underscore the need for policy reforms that balance autonomy with accountability, tailored to Bayelsa's socio-economic and environmental realities.

DISCUSSION

Implications for Federal Unity Schools

The findings of this study illuminate the transformative potential of delegative leadership in Federal Unity Schools in Bayelsa State, while also highlighting the contextual nuances that must guide its implementation. The current autocratic leadership model, as identified in the analysis, perpetuates a cycle of poor educational outcomes by limiting teacher autonomy and adaptability key factors in a region plagued by environmental disruptions and resource scarcity (Afolabi & Oyetola, 2019; Amadi & Eze, 2022). Delegative leadership, with its emphasis on empowering teachers to make decisions, aligns with Nigeria's broader educational goals of fostering unity, equity, and quality education, as outlined in federal policy frameworks (Eze, 2021).

However, its success in Bayelsa hinges on addressing the risks of oversight gaps and teacher readiness, underscoring the need for a balanced approach. One significant implication is the potential alignment of delegative leadership with the unity mandate of these schools. By decentralizing authority, principals can foster a collaborative school climate that mirrors the cultural values of Bayelsa's Ijaw communities, where collective responsibility is prized (Okeke & Nwankwo, 2023). This could strengthen social cohesion among students from diverse backgrounds, a core objective of Unity Schools. For instance, teachers empowered to integrate local content such as Ijaw history or environmental survival skills might enhance student engagement, making education more relevant and inclusive. This resonates with Cohen et al. (2009), who argue that a positive school climate, built on trust and shared goals, is a prerequisite for academic success.

Another implication is the capacity of delegative leadership to address Bayelsa-specific challenges, such as flooding and rural isolation. The analysis suggests that teachers, when given autonomy, could devise innovative solutions like mobile learning or community-based classes during disruptions (Bass & Riggio, 2006). This adaptability contrasts sharply with the rigidity of autocratic leadership, which struggles to respond to such contingencies (Amadi & Eze, 2022). Leithwood et al. (2020) support this, noting that leadership styles that empower subordinates are particularly effective in dynamic environments, a description apt for Bayelsa's volatile conditions. However, the risk of inconsistency highlighted by Northouse (2021) means that autonomy must be paired with clear accountability mechanisms to ensure equitable outcomes across classrooms.

The findings also suggest a pathway to improve teacher performance and retention, critical issues in Bayelsa where absenteeism and low morale prevail (Okeke & Nwankwo, 2023). Expectancy-Value Theory (Eccles & Wigfield, 2002) predicts that teachers who feel trusted and valued will invest more effort, a hypothesis borne out in studies of delegative leadership in other contexts (Harris, 2008). In Bayelsa, this could translate to reduced turnover and better instructional quality, directly impacting student achievement, which lags behind national averages (West African Examinations Council, 2023). Yet, the uneven training of teachers in Nigeria's public schools (Adeyemi & Salami, 2018) poses a challenge, implying that delegative leadership's benefits may be unevenly realized without capacity-building.

From a policy perspective, the implications are twofold. First, delegative leadership offers a low-cost reform option, leveraging existing human capital rather than requiring extensive infrastructure investment—a practical consideration given Bayelsa's funding constraints (Ogunode & Abubakar, 2020). Second, it challenges the federal bureaucracy's preference for centralized control, suggesting a need for flexibility in Unity School governance (Eze, 2021). This tension between local innovation and national oversight must be navigated carefully to ensure alignment with Nigeria's educational objectives.

Broader Relevance

The relevance of this study extends beyond Bayelsa to other Nigerian states and public-school systems, particularly those in rural or underserved regions. The Niger Delta, with its shared challenges of environmental degradation and economic disparity, could benefit from similar leadership reforms (Amadi & Eze, 2022). For example, states like Delta or Rivers, also prone to flooding, might adopt delegative practices to enhance school resilience. Nationally, the findings contribute to ongoing debates about decentralizing educational governance, a topic gaining traction as Nigeria seeks to meet Sustainable Development Goal 4 (quality education) by 2030 (Adeyemi & Salami, 2018).

Globally, this research enriches the discourse on educational leadership in developing contexts. While delegative leadership has been studied extensively in Western settings (Bush & Glover, 2014), its application in resource-constrained, culturally diverse environments like Bayelsa adds a new dimension. The study supports Leithwood et al.'s (2020) multi-level perspective, showing how leadership impacts individual, organizational, and systemic outcomes, but it also highlights the importance of cultural and environmental factors—variables less prominent in Western literature. This positions the paper as a bridge between global theories and localized practice, offering insights for other African nations grappling with similar educational challenges.

The discussion also raises questions for future research. How does delegative leadership perform in urban Nigerian schools with better resources? What specific training models best prepare teachers for autonomy? These inquiries could refine the approach, making it a scalable solution across diverse contexts. For now, the Bayelsa case underscores the need for leadership models that prioritize flexibility and empowerment, challenging the one-size-fits-all policies often imposed on developing education systems (Bush & Glover, 2014).

CONCLUSION

This position paper has argued that delegative leadership, when effectively implemented, can enhance educational outcomes in Federal Unity Schools in Bayelsa State by improving teacher autonomy, student achievement, and overall school performance. The analysis reveals that the current autocratic leadership model fails to address Bayelsa's unique challenges—flooding, rural isolation, and resource scarcity—resulting in low teacher morale and subpar student results (Ogunode & Abubakar, 2020; Okeke & Nwankwo, 2023). In contrast, delegative leadership offers a promising alternative by empowering teachers to innovate and adapt, aligning with theoretical frameworks like Expectancy-Value Theory and the Multi-Level Perspective (Eccles & Wigfield, 2002; Leithwood et al., 2020).

Bayelsa's context amplifies the urgency of this shift. Socio-economic pressures, cultural strengths, and environmental disruptions demand a leadership style that leverages local knowledge and fosters resilience (Amadi & Eze, 2022). While risks such as lack of oversight and teacher readiness exist (Northouse, 2021), these can be mitigated through targeted policies, making delegative leadership a feasible reform strategy. The discussion underscores its alignment with Nigeria's unity and equity goals, as well as its broader relevance to rural education systems globally (Eze, 2021; Bush & Glover, 2014).

Suggestions

To translate these findings into practice, the following suggestions are proposed for policymakers, school administrators, and stakeholders in Bayelsa's Federal Unity Schools:

- The Federal Ministry of Education should initiate pilot programs in select Bayelsa Unity Schools, such as Federal Government College, Odi, to test delegative leadership. Principals would delegate specific responsibilities (e.g., scheduling, curriculum adaptation) to teachers, with outcomes monitored over one academic year. This aligns with Harris's (2008) evidence of successful pilot reforms and allows for data-driven refinement before wider adoption.
- To address the risk of uneven competence (Bush & Glover, 2014), professional development workshops should be implemented, focusing on decision-making, classroom innovation, and accountability. Drawing on Adeyemi and Salami (2018), these could be funded through federal allocations and tailored to Bayelsa's rural context, ensuring teachers are equipped to handle autonomy effectively.
- Delegative leadership requires structure to prevent neglect (Northouse, 2021). Schools should adopt clear performance benchmarks, e.g., student attendance, lesson delivery quality monitored through peer reviews and periodic principal check-ins. Cohen et al.

(2009) emphasize that accountability sustains positive school climates, a principle applicable here.

- Given resource constraints (Ogunode & Abubakar, 2020), teachers should be encouraged to use local assets, such as community leaders or spaces, for learning during disruptions. This builds on Bayelsa's cultural strengths (Okeke & Nwankwo, 2023) and maximizes impact without heavy investment.
- The Ministry should revise Unity School guidelines to allow principals greater discretion in adopting delegative practices, balancing national standards with local needs (Eze, 2021). This could include a framework for decentralized decision-making, piloted in the Niger Delta.

Call to Action

Policymakers must act swiftly to pilot delegative leadership in Bayelsa, leveraging its potential to break the cycle of underperformance. School administrators should embrace this shift, supported by training and resources, to foster a resilient educational system. Further research is urged to validate these findings with primary data, refining the model for national scalability. As Nigeria approaches global education targets, Bayelsa's Unity Schools can lead the way, proving that innovative leadership can transform even the most challenging contexts.

INTEGRATION OF DIGITALIZATION IN EDUCATIONAL PLANNING

Nnamdi Anthony OBIAJULU
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

In this present age of digitalization, several ingenious ICT applications, systems and devices are applied at various locations across the educational landscape yielding great results because it is obvious that digitalization has profoundly transformed both the objectives of education and the means of their achievement. By the way of achieving the objectives of education in Nigeria, educational planning stands at the forefront to make conscious and deliberate decisions on how to attain set educational goals and objectives. Essentially, there is a need for humanely-inspired and digitally-comfortable educational planners and practitioners to creatively ponder on the best approach to re structure the educational systems in Nigeria in order to serve and help shape the nation in order to conform to the ever-evolving global world. Education planning in Nigeria should no longer focus on formal education only, but also on informal learning and virtual learning, making learning more equitable, ethical, enjoyable and far less economics-bound, test-oriented, work-load dominated. Specifically, educational planners in Nigeria should explore the means of digitization in school programs which involves the applications of digital technologies in teaching and learning process and in order to be effective and efficient in the planning process there is a need to integrate digitalization. Therefore, this paper examined the need for digitalization in Nigeria's education system and planning process, the application of digitalization in educational planning and challenges of digitalization in educational planning in Nigeria. The rapid evolution of emerging technologies has reshaped global economies, demanding a shift in educational planning towards digitalization. This paper examines the role of digitalization in educational planning, focusing on how artificial intelligence (AI), big data, blockchain, cloud computing, and other digital innovations enhance decision-making, resource allocation, and curriculum development. The study highlights the benefits, challenges, and strategies for integrating digital tools in educational planning to improve efficiency, accessibility, and global competitiveness. By analyzing best practices and case studies from various countries, this paper provides insights into how educational institutions can leverage digital technologies for sustainable and inclusive educational growth.

Keywords: Integration, Digitalization, Educational Planning.

INTRODUCTION

Educational decisions are made on the regular by nations of the world on the type of education, the curriculum content; the ideological base, and goals to be attained using education. All such

actions leading to decision making in education approximate to educational planning. In order to achieve desired educational goals , educational planning serves as a springboard for future actions and continuous process concerned not only with where to go using education, but how to get there and by what best route(Adiele et al, 2021).Whether it be a secondary school in the west, a technological university in the east or a national technical school in North, the basic educational planning task is identical: to mobilize available resources in order to achieve the agreed (or implied) educational objectives in a pleasurable and stimulating setting. However, if educational programmes are not well planned in educational institutions established to realize national education goals and objectives, there will be a lot of wastage both in terms of educational resources and educational products.

Educational institutions exist in different forms namely; early childhood education, basic education, junior secondary school education, secondary school education, tertiary institutions and other sub form of educational systems which are medium to which every country deliver education to her citizens (Ogunode et al., 2023). Globally, these educational institutions are undergoing transforming from analog to digital because the impact of COVID-19 (the pandemic) on education was bizarre and unprecedented which affected more than 1.5 billion students globally and caused the closure of their educational systems (Jummai, 2021). Consequently, most Nigerian students were more disadvantaged because a large number of educational institutions follow the traditional set-up of face-to-face lectures in the normal classroom settings, however, with the quick embrace of digitalization, educational services became more accessible and flexible, in other words, online education platforms, which were not preferred much before the pandemic, have become prominent, thus accelerating the adaptation process to digitalization in education.

The internet is proven to be one of the most cost-effective methods of educating young brains. It is also a robust mechanism for integrating a world-class learning experience for everybody (Keengwe & Bhargava, 2014). Social media as a learning tool has come a long way, contributing to a large numbers of teachers and students using it as an essential element of the overall e-learning experience. Traditional classroom instructions fall short of providing an immediate learning environment, faster evaluations, and more engagement, In contrast, digital learning tools and technology fill this void serving as a critical venue for exchanging information about crucial topics these days. With smartphones and other wireless technology devices becoming popular among the general public, it only makes sense that schools and educational institutions make efficient use of them by putting technology in the classroom. Indeed, today's technology's adaptability and non-intrusive character make learning more appealing to the next generation.

However, it may be a formidable technique to manage initially since traditional instructors are hesitant to include contemporary technology and gadgets in school, viewing them as a distraction rather than an intelligent learning aid Ololube (2006) viewed that integrating technology into education provides students with an engaging learning experience, allowing them to remain more interested in the subject without being distracted. He explained that the utilization of projectors, computers, and other cutting-edge technical gear in the classroom may make studying fascinating and entertaining for students, more so , student learning can become more dynamic and engaging by establishing tasks in class that incorporate technology resources, oral presentations, and group participation. From the environmental impact of using less paper for handouts and books to the time savings and convenience of research, digital learning is a wonderful way to cut costs, better utilize resources which is one of the nature of educational

planning, promote sustainability and expand both reach and impact for students and teachers (Biletska et al., 2021).

Integration of digitalization in educational planning is an instrumental in the transformation Nigeria's educational system by building learning experiences, enhancing learning outcomes and preparing students for the challenges of the digital age. It involves incorporating digital technologies and tools into the planning process to enhance teaching, learning and administrative tasks .Olaniyonu and Gbenu (2016) presupposes that, educational planning must be in-line withneed and aspiration of citizens and the society. Effective educational planning is the foundation for building a strong, sustainable educational system. In the Nigeria context, Adiele et al. (2021) asserted that comprehensive educational planning involves setting goals, allocating resources efficiently, developing curriculum frameworks, and ensuring equitable access to quality education for all students. With the right planning strategies in place, educational institutions can adapt to the changing needs of students and the demands of the modern workforce. Educational planning has driven Nigeria's educational system to undergo various transformations since gaining independence in 1960 and implement several educational policies and initiatives to improve access to quality education, enhance learning outcomes, and address the diverse needs of its populationand reinforcing economic development of the nation.

With digitalization, a fresh educational era has arrived and educational planning should be done in the sense that there is now the one universal school – the global lifelong learning community (Uys& Douse, 2017). Accordingly, this paper re-examines educational planning – taking the national context as the starting-point model – as it is presently and as what it can and should now become with digital participation across national borders in order effectively to serve and be served by this emerging digital Age not eliminating challenges that are negating it.

CONCEPTUAL CLARIFICATIONS

Digitalization

Digitalization is considered to be an indispensable concept. Digitalization involves the use of digital technologies to change a business model and provide new revenue and value-producing opportunities; it is the process of moving to a digital business. Digitalization in education is conceptualized byOgunde andNdayebom(2023) that digitalization refers to the conversion of materials created in another format into an electronic form; this definition excludes materials that were initially created digitally, such as email communication. Titus (2018) and Ogunode et al. (2021) asserted that it is the process of transferring traditional teaching and learning materials to electronic model such as online learning platforms, educational apps, and multimedia resources online courses, online assessments, and web seminars/conferences or workshops for deployment in the schools. More so, Machekhina (2017) viewed digitalization as the translation of all information kinds, such as text, audio, pictures, video, and other data from multiple sources into digital language.

Pandey and Misra (2014) described digitalization as the course of converting analog information to a digital format and was supported by Aboyade (2012) who views digitalization as all the steps involved in the process of making collections of historical and other materials available online. Ding (2000) highlights digitalization as follows: Digitalization means no new buildings are required; improvement in information sharing and redundancy of collections reduced. From the above, digitalization can be conceptualized as those facilities that

aid the conversion of teaching and learning into platforms like online courses, online assessments, and web seminars/conferences or workshops through the use of electronic platforms. It is categorically a process of transforming physical teaching and learning resources into packages or platforms or electronic forms where they can be stored and manipulated by a computer for the implementation of teaching and learning programmes in schools.

How is Information Digitized

Information is digitized through a process called *encoding*, which converts analog signals into a digital format. Digitizing information typically involves one or more of the following processes:

- Scanning. Using a scanner to capture an image, which can be an image of text, and convert it to an image file, such as a bitmap.
- Optical character recognition. An OCR program analyzes a text image for light and dark areas to identify each alphabetic letter or numeric digit, and converts each character into an ASCII code.
- Recording. Capturing a sound or image on a recording medium, such as magnetic tape or disks, and converting it using an analog-to-digital converter.
- Sampling. Sampling measures the amplitude, or signal strength, of an analog waveform at evenly spaced time markers and represents the samples as numerical values for input as digital data.
- Audio and video digitization. Digitization converts analog audio and video recordings into digital formats, enabling digital storage, editing and playback. This includes digitizing music, speeches, interviews, movies, TV shows and webcam footage.
- Data digitization. Numeric data can be digitized by converting it into a digital format. This enables easier storage, processing and analysis of the data. Data digitization is commonly used in fields such as scientific research, finance and weather forecasting.

The History of Digitization

Digitization gained popularity in the late 20th century with the advent of PCs and the internet. These technologies made it possible to convert many different forms of information -- including text, images, audio and video -- into digital formats. Some key milestones of digitization include the following:

- 1950s. With the evolution of computers, a variety of data formats were converted into computer-friendly 1s and 0s, marking the beginning of digitization. This paved the way for the digitization revolution. In 1956, IBM introduced random access data and magnetic disks with their 305 RAMAC and 650 RAMAC computers. These systems included the 350-disk storage unit, which weighed one ton and had a total capacity of 5 megabytes. It was originally used in the United Airlines reservation system.
- 1960s. The pulse-code modulation technique, which produces a series of numbers in binary form, marked the beginning of the development of digital audio recording technology in the 1960s. Image digitization was made possible with the development of the first digital computer-based image scanner in the late 1960s.

- 1970s. Digital storage became more widely available to the general public with the advent of PCs and the internet.
- 1980s and 1990s. The expanding use of the internet and the acceleration of digital technology in the consumer market accelerated. These technologies made it possible to convert different types of information -- such as text, images, audio and video -- into digital formats.
- 2000s and 2010s. With the growth of digital media players, wireless phones and internet streaming services, digital technology continued to be widely adopted. With the introduction of e-books and online publications, text digitization also increased in popularity.

In the present day, the process of digitization is creating greater opportunities for automation and continues to revolutionize communication, commerce and every aspect of modern life. Especially in the last decade, the rise of digitization has been heavily dependent on newer digital technologies, including cloud computing, machine learning, artificial intelligence (AI), internet of things (IoT) and business intelligence.

Examples of digitization

The following are some common examples of information that can undergo digitization:

- Text, such as books, articles and contracts.
- Images, such as photos, artwork and medical images.
- Audio, such as music, speeches and interviews.
- Video, such as movies, TV shows and webcam footage.
- Data, such as numeric data from sensors, financial data and weather data.
- Data from barcodes and quick response (QR) codes can be scanned into a digital format to make them machine readable.

The Benefits of Digitization

Aside from making information more shareable and easier to access, there are other reasons a business might decide to digitize. Common benefits and use cases of digitization include the following:

- Ease of access. Digital information can be easily stored, accessed and shared. This is especially important in today's business world, where information needs to be quickly and easily accessible by employees, customers and partners.
- Easy data analysis. Digital information can be manipulated more easily than analog information. This means businesses can more easily analyze and use data for better decision making.
- Improved customer experience. Digitization enhances the customer experience through various means such as chatbots, social media, automated ticketing systems and knowledge bases. This helps resolve customer issues more effectively and efficiently.
- Digital libraries and archives. Digitizing books, manuscripts, historical documents and cultural items increases accessibility to these resources while preserving them for future

generations. A wider audience might access these items more easily because of digital libraries and archives.

- Education and online learning. Due to the availability of e-learning resources, remote learning opportunities and interactive digital tools, digitization has made individualized learning experiences and online assessments easier.
- Increased operational efficiency. Businesses can streamline procedures and automate jobs through digitization, resulting in shorter response times and increased productivity. This enhances the overall efficiency of business operations.
- New markets. Businesses can use digitization to expand their consumer base and enter new markets by using the internet and various technology platforms to connect with a global audience.
- Digital transformation in industries. Digitization plays a key role in driving digital transformation initiatives across various industries and supply chains. For example, in the manufacturing sector, it facilitates the creation of smart factories and enables the integration of IoT devices for real-time monitoring and optimization. In the healthcare industry, digitization enhances patient records management, telemedicine service delivery and the ability to monitor patients remotely.
- Reduced costs. Digitization can help businesses save money by reducing the need for paper documents and other analog materials.

The key to a successful enterprise digital transformation is a strong understanding of the desired business goals. Once an organization understands these goals, it can select the right digital technologies and partners to help digitize the business.

The disadvantages of digitization

While digitization offers various benefits, it also comes with some downsides. Common disadvantages of digitization include the following:

- Privacy concerns. Digital information can be easily copied and distributed without the permission of the copyright holder. This has led to problems with piracy and intellectual property theft.
- Data alterations. Digital information can be easily altered or deleted. This can result in errors and misunderstandings, especially if the altered information is not properly labeled or identified.
- Dependence on technology. Digitization can lead to a reliance on technology, which can be expensive and difficult to maintain at scale. If a business's digital systems fail, it's difficult to recover the lost data.
- Upfront costs. Adopting digitization can have upfront costs, especially for those organizations that need to convert large amounts of paper documents into digital data.
- Security risks. The process of digitizing involves storing data and documents digitally, which can raise the risk of security lapses involving sensitive information.
- Digital divide. Not everyone has equal access to digital technologies or the abilities needed to use them. This may lead to a digital divide, where some people or communities might not have as much access to digital information.

Digitization vs. digital transformation

Digitization and digital transformation are related concepts. However, it's important to note that digitization is only one aspect of digital transformation:

- Digitization is the process of converting analog information into binary code -- 0s and 1s -- so it can be stored, processed and transmitted by computers. This process is centered around generating a digital representation of tangible objects or features. An example of digitization is the scanning of a physical document and saving it as a digital file, such as a PDF.
- Digital transformation is the process of using digital technologies to create new or improved business processes, products and services. This holistic process requires a strategic approach that considers the overall goals of the business, as well as the specific needs of customers and employees. It also requires a commitment to change from leadership and a willingness to invest in new technologies and digital processes.

Digitalization and Information

Digitalization could have an equalizing effect on societies. The valuable good of accessing and creating knowledge that has been available only to the privileged for centuries, is now widely offered to everyone with a web-enabled device. Never have so many people had access to general and specific information. In spite of different cultural or economic backgrounds, education or geography, everyone can gain information if they have access to a device that can provide an Internet connection. The www (world wide web) is an inclusive place that provides the same services to anyone. However, inclusive Internet Index 2019 pointed out that for internet to be relevant to all and to contribute to the socio-economic development, the following factors should be measured: "Availability: quality and breadth of available infrastructure required for access and levels of Internet usage. Affordability: cost of access relative to income and the level of competition in the Internet marketplace. Relevance: existence and extent of local language content and relevant content. Readiness: capacity to access the Internet, including skills, cultural acceptance, and supporting policy" The Inclusive Internet Index 2018 listed Tanzania, Rwanda and Uganda as part of the top 5 of low-income countries regarding their Internet inclusivity. Especially for Rwanda, access to the Internet has increased unprecedentedly. The proportion of households with Internet access grew by 490.8% from 2017 to 2018 (Economist 2018).

In low-income countries, cost of mobile connectivity is falling.12 From a more specific approach, the digital access to information can, for example, help to solve some of Africa´s education problem: many children don't attend a secondary school. E-learning and digital educational programs could bridge this educational inequality. For instance, a Kenyan start-up allows users to access learning materials using various devices. They can access courses and quizzes via text messages for only 10 USc (US Cents). 13 The amount of accessible information has grown to a extent like never before. This knowledge can have a liberating effect on its consumers. Internet usage can help people gain individual independence, as almost 60% of Sub-Saharan Citizens state that they have become more self-determined since they started using the internet.

The access to information and knowledge from the World Wide Web has the potential to transform African citizens into self-determined and responsible actors in their societies. The

confidence that comes with the use of the internet can be channeled into private and public engagement and can transform societies from within. It has never been easier to publish own perspectives and opinions. Through the variety of digital media outlets and the possibly to distribute content for free, everyone can tell their story from an individual perspective. The digitalization of media can give the opportunity to change the discourse about Africa, from a troubled continent, as which it is often perceived in the Western world towards a discussion about the potential and prospects it actually bears. However, this uncontrollable amount of information and the fact that everybody can contribute and add creates potential risks.

As the internet itself does not censor any information, there has been an unfiltered rise of dubious news outlets. The term fake news has established itself in the last years as verifiably false or misleading information. Especially when their purpose is to deceive the public, they can have immense consequences. Causes for the rise of misinformation and disinformation are the loss of confidence in traditional media and the rise of new sources for information, especially social media and private outlets such as blogs and podcasts. Fake news can have several influences on societal and political stability, especially when they target minority groups or try to affect political elections. No matter whether the purpose of false information is merely inaccurate research or intended manipulation for a certain (political) cause. Especially in social media, the original source is hard to identify as people pass information by sharing it on their accounts. They often focus rather on the validation and response from their peers on the shared story than on its accuracy. In order to distinguish fake news from serious journalism, digital literacy is necessary. As discussed before, this responsibility primarily lies in the public educational sector.

Education in This Digital World

The World Economic Forum founder mentioned in his speech that as humans stand on the bench of a technological revolution, it will basically alter the way we work, live, and relate to one another in all dimensions and the transformation will be unlike anything humankind has experienced before (Schwab, 2016). As he points out, humans cannot out rightly say how the Fourthrevolution will unfold but one thing is clear: the response to it must be that digitalization is integrated and comprehensive, involving all stakeholders of the global polity, from the public and private sectors to academia and civil society (Schwab, 2016). The Director of UNESCO's International Institute for Educational Planning once said that there has not been one ICT revolution but five which are (i) The Computer; (ii) The PC; (iii) The Microprocessor; (iv) The Internet; and (v) Wireless Links (Hernes, 2002) and Dr Hernesexpound it further that the realization that this development is much more than mere devices implies that it should be regarded as time-shift into a fresh revolutionary dimension. While such a transformation has many roots in current realities, it also possesses the power to create capabilities for flexibility in learning for a largely unknown future.

As globalization and rapid developments in technology continue to transform working life, education systems have become more and more disconnected from the needs of global economies and societies. Today, non-formal education largely aims to meet the uniform talents needed by the mass production system required in the first and second industrial revolutions, however, the third and fourth industrial revolutions required the changes that will provide new productivity models for the needs of innovation economies and the necessary skills to create value (WEF, 2019). At the same time, education institutions have to adapt to the digital transformation process and the usage of the new technologies or the latest tool in order to re

arrange the content of the education system and aim at providing the right tools and skills to prepare the workforce of the future (Bozkurt et al, 2021). On the other hand, educational content should be adjusted to include distance learning and face to face learning. Distance learning with the digitized environment will increase theoretical learning, while the second environment will be beneficial for practical skills. The new skills of the future require education in science, technology, engineering and mathematics, and digital skills (Gupta etc., 2021).

Digitalization in education system improves effective management of education to operate efficiently and proactively in term of adequate supervision of learners and regular assessment of studemts' activities in the classroom.it is the process of turning traditional methods of teaching such as paper document, sounds and more to a digital format that can be understood by students toward the achievement of educational goals and objectives (Falasteen, 2018). According to Akinyemi et al., (2022) it is a concept adopted to ensure the innovative incorporation of modern technology and digital tools to assist the progress of teaching and learning and to create more room for remote learning.

Digital Classroom

Digital classrooms are defined by using electronic devices or platforms such as social media, multimedia, and mobile phones to teaching and learning. With digital technology in education, today's educational landscape has altered for the better or improvements. Digital learning is a learning strategy that employs technology to fulfil the entire curriculum and allows students to learn quickly and rapidly (Oliver, 2005). The digital classroom entirely focuses on teaching via the use of technology in the sense that student use technological or internet-connected gadgets like lap- tops, tablets, Chromebooks, etc. instead of taking notes on what the teacher has taught and most of the curriculum is delivered to students online through an engaging and interactive platform. Despite its many facets, education is fundamentally a kind of communication. The internet has resulted in the rise of new communication channels, which have extended the options for the transmission and access to educational information, these media and virtual venues serve as teaching and learning facilitators (Grek, 2008).

Educational applications and websites are used in digital classrooms to assist students in improving their learning experience. Feedback loops and technology are two critical components of a digital classroom. Feed- back loops are essential for students to obtain real-time feedback from their teachers. Teachers can use feedback loops to provide feedback de- pending on many factors such as student, lesson, group, etc. PPTs, video presentations, e-learning methods, online training, and other digital approaches are increasingly used in the teaching-learning process. Consequently, classroom instruction is becoming more participatory and Students may now learn many topics on their own by using internet resources and digital classrooms. In schools, colour charts, graphs, and models describe the finest instruction of the class. However, they are now considered old-fashioned methods of giving education. Education in the classroom is no longer restricted to reading books, writing on the blackboard to explain chapters and concepts, and taking notes in theirbooks (Ozdamli, 2021).

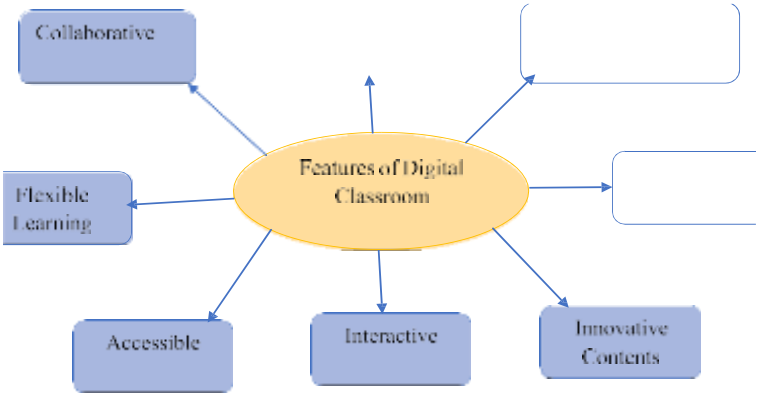

Figure 1: Features of Digital Classroom adapted from Haleem et al. (2022)

Benefits of Digitalization

Obviously, digitalization offers a pathway to transform traditional teaching practices, engage students in meaningful learning experiences, and prepare individuals for success in a digitally driven world. By harnessing the potential of digital technologies and adopting pedagogical best practices, educators can create dynamic, inclusive, and innovative learning environments that empower students to thrive in the 21st century. Benefits of digitalization could include the following among others:

- Personalized Learning: Digital tools enable personalized learning experiences tailored to individual student needs, interests, and learning styles. Adaptive learning platforms, online assessments, and data analytics can help educators customize instruction and provide targeted support to students. Also, the integration of electronic books and learning in the field of education demonstrates the growth of learning and the creation of the possibility for everyone to study anywhere and anytime (Arisoy, 2022).
- Interactive and Engaging Lessons: Digital resources such as educational apps, interactive simulations, multimedia content, and virtual reality can make learning more interactive, engaging, and immersive. These tools can enhance student motivation, curiosity, and active participation in the learning process. (Gbeseovi et al., 2022)
- Collaborative Learning: Technology enables collaborative learning experiences where students can work together on projects, share ideas, and communicate virtually. Platforms like Google Classroom, Microsoft Teams, and online discussion forums facilitate collaboration and communication among students and teachers. (Ogunode et al., 2023)
- Accessibility and Inclusivity: Digital tools can improve access to education for students with diverse learning needs, disabilities, or geographical constraints. Features like closed captioning, screen readers, text-to-speech tools, and video subtitles can enhance accessibility and inclusivity in the learning environment.(Ogunode & Ndayebom, 2023)
- Real-World Connections: Digital resources allow educators to integrate real-world examples, global perspectives, and current events into their lessons. Virtual field trips, guest speakers via video conferencing, and online research opportunities can help

students make connections between classroom learning and the world beyond. (Gbeseovi et al., 2022)

- Data-Driven Instruction: Digital technologies provide valuable data and insights on student‘s performance, engagement levels, and learning progress. Educators can use learning analytics, assessments, and feedback mechanisms to track student growth, identify areas for improvement, and adjust instructional strategies accordingly.
- Professional Development: Pedagogical digitalization also involves ongoing professional development for educators to enhance their digital literacy skills, technology integration capabilities, and knowledge of effective pedagogical practices. Training programs, workshops, and peer learning communities can support teachers in using digital tools effectively in their teaching practice (Ogunode & Ndayebom, 2023).
- Lifelong Learning: Digitalization of pedagogy promotes a culture of lifelong learning by providing opportunities for students and educators to access online courses, self-paced learning modules, and continuous skill development resources. This approach prepares individuals for the evolving demands of the digital economy and fosters a mindset of continuous growth and adaptation (Gbeseovi et al., 2022).

Educational Planning

Educational planning has been variously defined by scholars. It connotes making rationale decision ahead of time on attaining educational objectives judiciously using the available resources. Adiele et al. (2017), defined educational planning as decisions taken by nations on the type of education, the curriculum, content, ideological base and goals to be attained using education. Educational planning is futuristic in approach because it aims at improving or changing existing situations. Hence, it encompasses taking decisions towards the future development of education.

Education is a continuous learning process through which members of a society acquire the requisite knowledge and skills to facilitate the effective performance of assigned social responsibilities (Ogunde et al., 2023), however the linking bridge that is concerned not only with where to go using education but how to get there and by what best route is educational planning. Adiele et al (2021) opined that education occupies a central position in the life of almost everybody. Individuals, households, corporate bodies and institutions are regularly involved in decisions concerning education. They are seemingly involved in “planning education” but are not educational planners. Educational planning is a specialized field of study requiring specialized knowledge and skill, therefore, an educational planner must undergo training to develop a planner’s knowledge and skills in educational administration, economics of education, politics of education, educational statistics, demographic techniques, educational plant management, curriculum planning, education law, educational management information system etc. as highlighted by Agabi (1999) in Adiele et al. (2021).

The history of educational planning in Nigeria has evolved over time, influenced by various factors such as colonial legacies, post-independence development goals, political changes, socio-economic challenges, and shifting educational priorities. Here is a brief overview of key signposts in the history of educational planning in Nigeria stated by Gbesoevi et al. (2021):

Colonial Era (Pre-1960s) Phase:

Before Nigeria gained independence in 1960, education was primarily under the control of British colonial authorities. The educational system was structured to serve the needs of the colonial administration, focusing on basic literacy skills and training a small elite class to assist in governance. The curriculum was largely tailored to Britisheducational standards, with limited opportunities for indigenous languages or cultural content.

Post-Independence Period (1960s-1970s)Phase:

After gaining independence, Nigeria embarked on a series of educational reforms to address the disparities inherited from the colonial era. The government aimed to expand access to education, promote national unity, and foster socio-economic development. The 1969 National Policy on Education outlined key principles and objectives for the educational system, emphasizing the promotion of Nigerian identity, the development of skilled manpower, and the eradication of illiteracy.

Oil Boom Era (1970s) Phase:

During the oil boom of the 1970s, Nigeria experienced increased revenue from oil exports, leading to significant investments in the education sector. The government focused on expanding educational infrastructure, increasing teacher training programs, and enhancing access to education at all levels. Structural Adjustment Programs (1980s-1990s) Phase: In response to economic challenges and pressures from international financial institutions, Nigeria implemented structural adjustment programs in the 1980s and 1990s. These programs led to austerity measures, budget cuts, and challenges in funding education, affecting the quality and accessibility of education in the country.

Structural Adjustment Programs (1980s-1990s) Phase:

In response to economic challenges and pressures from international financial institutions, Nigeria implemented structural adjustment programs in the 1980s and 1990s. These programs led to austerity measures, budget cuts, and challenges in funding education, affecting the quality and accessibility of education in the country.

Democratic Transition and Education Reforms (2000s-Present):

Nigeria's return to democracy in 1999 ushered in a period of education reforms aimed at improving access, quality, and relevance of education. The government introduced initiatives such as the Universal Basic Education (UBE) program, which aimed to provide free and compulsory basic education for all children. Various policies and programs have been implemented to address challenges such as high out-of-school rates, inadequate infrastructure, teacher shortages, and curriculum deficiencies. Efforts have also been made to strengthen technical and vocational education, promote digital literacy, and enhance teacher training.

Integration of Digitalization in Educational Planning in NIGERIA

Educational Planning is a future oriented concept that incorporates past history, present performance, and future direction to achieve educational mission and objectives" (Richardson, Jenkins &Lemoine 2017). Even the realization that integrating technology into the educational process is not a simple, one-step activity. It is an intricate, multifaceted process that involves a series of deliberate decisions, plans, and measures which includes the identifying educational areas for ICT intervention and formulation of corresponding ICT-in-education policies, planning for implementation in line with infrastructure, hardware, ICT-enhanced content, personnel training, and cost. (Infodev, 2007) Until recently, discrete 'ICT and Education' policies and plans have made good sense but is no longer true because today's requirement is for Education Plans and Policies that absolutely acknowledge the centrality of, and are fully focused upon, Digitisation (Uys & Douse, 2017).

The educational planners in Nigeria should embody in their mandate the recognition that 'education' now means 'education in the context of ICT' .That is the key factor in optimising educational planning and management in the Digital Age – the realisation that the 'Digitisation of Education' is 'Education'. Consequently, there is a current call for a systematic, consultative process to formulate and policies related to, and plan for, the deployment and use of educational technologies or even a wider policy formulation and planning process that looks at broader developmental and education goals, and then seeks to investigate and articulate how and where the use of ICTs can help meet these objectives (World Bank, 2016). Of course, as ever, education should be focused upon the learner – skills development starts at birth and is lifetime long . Digitalization empowers that focus to be significantly more effective, just as it involves the world of that child/learner becoming more complex, challenging and, hopefully, enjoyable and fulfilling (Uys&Douse, 2017). Accordingly, the task now is to delineate and integrate aspirations, priorities, strategies, programmes, plans, activities, costs, inputs, responsibilities and appropriate mechanisms for education in the Digital Age.

Throughout its history, Nigeria has navigated a complex landscape of educational planning, policy development, and implementation to address the diverse needs of its population and drive sustainable development through quality education. Gbesoevi et al. (2022) asserted that Continual efforts to reform the education sector, improve access, enhance quality, and ensure inclusivity will be critical for Nigeria's socio-economic advancement and human capital development in the future. On the other hand, digitalization, which refers to the integration of digital technologies into teaching and learning practices to enhance educational outcomes, engage students, and adapt to the demands of the digital age. Gbesoevi and Adeleke (2021) also pointed out that, looking back at the recent past, there is a revolutionary change where new pedagogies are finding a way to replace age-old methods of teaching and learning thereby reinforcing learner-centric approaches, increased use of technology and integration of eclectic delivery platforms have created a new ecosystem of education.In the context of Nigeria's educational system, it is necessary to submit that digitalization will presents an opportunity to enhance the delivery of education, improve student engagement, and foster innovative teaching methods.

By leveraging on digital tools such as interactive learning platforms, educational apps, virtual reality simulations, and online resources, educators can create dynamic and personalized learning experiences for students. This process involves more than just using technology in the classroom; it encompasses a thoughtful and strategic approach to leveraging digital tools to

transform teaching methods, student experiences, and overall educational processes. Equally too, the inclusion of the use electronic book is a book in digital form, consisting of texts and images and readable on a computer or other electronic devices will improve the educational system.(Gbesoevi et al, 2022).

3 WAYS TECHNOLOGY CAN ENHANCE PLANNING

Ways digitalization transforms educational planning

As an integral element in planning for a great digital-based leap forward, the inequalities and injustices within and between nations must be a major consideration as the global school requires basic access to digital technologies and an ability to use these. And, within education, the humane vision should be embodied in systemic, school and classroom arrangements. As a forthcoming World Bank Group (2018) report makes clear, the 'learning crisis is a moral crisis' and overcoming digital as well as other disparities will "better equip people to solve real world problems in their communities and beyond" (Broadband Commission for Sustainable Development, 2017).

Technology can improve efficiency in the planning and management of education systems, including more equitable use of resources

In countries worldwide, IIEP's technical teams are seeing how technology can boost an Education Management Information System - or EMIS - the most important source of educational data. Technology can support everything from the collection, integration, processing, and maintenance, to the dissemination of data and information to improve decision-making, analysis, and policy formulation. EMIS is also key to monitoring progress toward educational goals and targets, both at the national and international levels.

Technology can also help create projections and modelling to manage the allocation of human and material resources. It can help planners find gaps in access to resources (e.g. teacher gaps in rural contexts) and fill them effectively and can help with time management. Tools such as context-specific school calendars, taking into account environmental and social variables (e.g. rainy seasons and harvest times) help to promote equity.

Technology can enhance transparency in the functioning of education.

Technology can provide open access to relevant information about how an education system functions, such as student performance reports. It can help construction **open overnment** where stakeholders can participate in formulating public policies and monitoring.

Technology can boost professional development.

Just like for teachers, technology is also used for the professional development of planners. Online learning platforms and communities of practice can provide resources that support peer-to-peer learning, the acquisition of new skills, and the dissemination of best practices. These examples illustrate how digital tools in education reach far beyond classrooms. It can help

planners do their jobs better and more efficiently, offering new pathways to improving educational quality and equity, now and in the future.
However, as the GEM report on technology and education explores, clear objectives and principles are needed to ensure that the use of technology avoids harm. To do this, it is crucial to understand some of the key challenges facing the integration of technology and its appropriate use in education today:

- Learning Management Systems (LMS): Automate course management, assignments, and grading.
- Data Analytics: Use data to inform planning decisions, track student progress, and identify areas for improvement.
- Online Resources: Utilize digital textbooks, educational software, and online libraries.
- Virtual Classrooms: Facilitate remote learning and collaboration through video conferencing tools.
- Artificial Intelligence (AI): Implement AI-powered adaptive learning systems, chatbots, and virtual assistants.
- Digital Assessments: Conduct online quizzes, exams, and assessments with instant feedback.
- Collaboration Tools: Utilize digital platforms for teacher-student and student-student collaboration.
- Professional Development: Provide online training and resources for educators to enhance digital literacy.
- Student Information Systems: Manage student data, attendance, and performance digitally.
- Accessibility: Ensure equal access to digital resources for all students, including those with disabilities.

By integrating digitalization into educational planning, institutions can:

- Enhance student engagement and outcomes
- Improve teacher efficiency and effectiveness
- Increase accessibility and equity
- Support data-driven decision making
- Prepare students for a digital future

CHALLENGES

- Infrastructure Limitations: Inadequate access to reliable internet connectivity, electricity, computers, and digital devices in schools hinders effective integration of technology in education.
- Digital Skills Gap: Limited digital literacy among teachers and students poses barriers to effectively utilizing technology for learning and teaching purposes.
- Content Relevance: Ensuring that digital content aligns with local curriculum requirements, cultural sensitivities, and educational objectives is essential for meaningful integration.

- Privacy and Security Concerns: Safeguarding student data, protecting online privacy, and ensuring cybersecurity measures are in place are critical considerations in a digital learning environment.
- Funding Constraints: Insufficient funding allocation for technology procurement, infrastructure development, and teacher training initiatives can impede the successful implementation of pedagogical digitalisation efforts. Equally too, despite the vast potential of pedagogical digitalisation, Nigeria faces several challenges in effectively implementing digital technologies in education. These challenges include inadequate infrastructure, limited access to technology in schools, gaps in digital literacy among teachers and students, and affordability issues for low-income populations.

Addressing these challenges requires a concerted effort from government authorities, educational institutions, and technology providers to bridge the digital divide and ensure equal opportunities for all students. Potential Impact of Educational Planning and Pedagogical Digitalization on Improving Access to Quality Education and Enhancing Teaching and Learning Processes Gbesoevi et al (2022), planning and integration of Information and Communication Technology (ICT) plays a significant role in impacting education in modern scenarios. Effective educational planning and the integration of pedagogical digitalisation play crucial roles in improving access to quality education and enhancing teaching and learning processes. By strategically designing education policies, leveraging digital tools, and fostering innovation in pedagogy, countries like Nigeria can address educational disparities, broaden access to learning opportunities, and enhance the overall quality of education for students and educators. Improving Access to Quality Education:

- Addressing Educational Disparities: Educational planning can prioritize resources to bridge the gap between urban and rural areas, underserved communities, and marginalized populations, ensuring equitable access to quality education for all students.

- Enhancing Infrastructure: Through strategic planning and investment, educational institutions can improve infrastructure, including classrooms, libraries, laboratories, and digital resources, to create conducive learning environments that support student achievement.
- Promoting Inclusive Education: Educational planning efforts should focus on inclusive practices that cater to the diverse needs of learners, including those with disabilities, special learning requirements, or those in remote areas, ensuring that no student is left behind.
- Strengthening Teacher Training: By investing in professional development programs and pedagogical training, educators can enhance their teaching competencies, adapt teaching strategies to meet student needs, and effectively integrate digital tools into their instructional practices

CONCLUSION

The supreme task of educational planners, once the transformative consequences and potential of digitisation are understood, is to facilitate the utter reshaping of learning and teaching for our times, and for times to come, locally, nationally and worldwide. Their task may no longer be

limited to securing implementation but it necessarily extends to facilitating continuous experimentation and perpetual innovation. Certainly, the international dimension and the informal learning dimension are paramount. Digitisation, symbolised by the global school, signals a sharing of learning experiences and a coming together of classroom cultures. Schooling will resume its true role of drawing out: less a process of work-preparation and student-comparison, more one of creative stimulation and enjoyable interaction, distributed across the globe. Whether it be of and for a street school or an open university or a low-income country (or all nations generally), the common planning task remains as ever was, save that powerful weapons of mass instruction and universal inspiration are now available to enable education to come to pass more effectively and entirely equitably and completely convivially. As with teachers, digitisation will enable those who plan education to learn by doing in an ever-changing environment, much as the pre-school child or the post-doctoral student is enabled to enjoy grappling in stimulating situations where even that what is being learned and done is changing. y investing in comprehensive planning strategies and embracing digital technologies, Nigeria can equip its students with the skills and knowledge needed to succeed in the digital age. Through collaborative efforts and a commitment to innovation, Nigeria has the opportunity to transform its educational landscape and pave the way for a brighter future for generations to come.

ABSTRACT

Strategic goal setting plays a fundamental role in enhancing institutional productivity, particularly in tertiary institutions where effective planning, leadership development, and performance evaluation drive organizational success. This study explores the impact of structured goal-setting processes on institutional effectiveness, emphasizing how well-defined objectives contribute to improved academic performance, financial sustainability, and workforce efficiency. The significance of this study lies in its examination of how leadership planning fosters sustainable institutional growth by aligning goals with national and global educational standards. This study design is purely qualitative, relying on a high quality peer-review scholarly explorations of extensive review of existing literature to analyze the relationship between strategic goal setting and institutional productivity. The study is strategically anchored on two theoretical foundations: Goal-Setting Theory and Systems Theory. Goal-Setting Theory highlights the importance of specific, measurable, and challenging objectives in driving institutional performance, while Systems Theory highlights the interconnected nature of institutional components and the necessity of cohesive planning. Findings indicate that institutions with well-structured strategic goals experience higher levels of efficiency, accountability, and adaptability to changing educational demands. The study further identifies key challenges in goal-setting implementation, such as resource constraints, leadership inertia, and ineffective evaluation mechanisms. The study amongst others, suggested valuable roadmap for institutional leaders and policymakers, emphasizing the need for comprehensive planning frameworks, significant monitoring systems, and leadership capacity development to enhance institutional effectiveness.

Keywords: Strategic Goal Setting, Institutional Productivity, Performance Evaluation, Resource Optimization, Leadership Commitment, Sustainable Growth.

INTRODUCTION

Strategic goal setting is a fundamental component of institutional management, serving as a structured approach to achieving long-term organizational objectives. In tertiary institutions,

where the pursuit of academic excellence, financial sustainability, and workforce efficiency is paramount, the role of strategic goal setting cannot be overstated. Institutions that establish clear, well-defined goals experience enhanced productivity, streamlined decision-making, and improved overall performance. This study explores how strategic goal setting influences institutional productivity, highlighting its significance in ensuring organizational success within the academic sector. Hence, institutions require strategic goal setting to enhance productivity and efficiency, ensuring that all organizational activities are aligned with their mission and vision.

As noted by Ekewe and Amadi (2018), tertiary institutions that engage in structured goal setting demonstrate higher levels of academic performance, better resource management, and improved administrative efficiency. Conversely, institutions lacking clear strategic objectives often suffer from inefficiency, poor resource utilization, and fragmented leadership structures. When strategic goals are clearly defined, institutions can systematically plan and execute policies that drive sustainable growth. According to Ananyi, Cheta-Maclean and Ololube (2024) social justice and credible leadership in the 21st century university leadership and management. Their structured findings allows institutions to anticipate challenges, allocate resources effectively, and measure progress against predefined benchmarks, fostering a culture of continuous improvement.

Scholarly empirical evidence highlights the importance of strategic goal setting in institutional frameworks. For example, a study by Obi and Chukwuma (2020) emphasized that institutions with clearly articulated goals were better positioned to secure funding, attract competent faculty, and maintain high student satisfaction rates. Similarly, a comparative analysis by Adebayo and Okon (2021) revealed that universities that implemented robust goal-setting strategies demonstrated higher levels of operational efficiency and global competitiveness compared to those without such frameworks. These findings highlight the necessity of structured goal setting in ensuring institutional effectiveness. The absence or inefficiency of strategic goal setting in tertiary institutions remains a significant challenge, leading to organizational inefficiencies and misaligned priorities. Institutions without clear strategic goals often struggle with inconsistent policies, resource wastage, and a lack of cohesive direction.

As argued by Uchenna and Adegbite (2022), the failure to establish well-defined goals results in poor decision-making processes, limited stakeholder engagement, and suboptimal academic outcomes. For instance, many public universities in Nigeria have faced governance crises due to poorly structured strategic plans that fail to address core institutional challenges. These inefficiencies contribute to declining academic standards, financial instability, and weak institutional governance. Similarly, Olorunfemi and Ekong (2024) highlighted how inadequate goal-setting frameworks have contributed to leadership crises and institutional stagnation in various Nigerian universities. These scholarly contributions provide empirical backing for the argument that strategic goal setting is crucial for institutional success.

This study investigates the relationship between strategic goal setting and institutional productivity, focusing on how well-defined goals contribute to efficiency, innovation, and long-term sustainability. As highlighted by Ololube et al. (2024), Infrastructure development strategies for empowerment and inclusion in Nigerian public universities, can utilize core leadership qualities to refine their strategic planning processes, ensuring that goal-setting mechanisms align with national and global educational standards.

Policymakers can leverage the findings to formulate policies that encourage structured planning in tertiary institutions, thereby promoting sustainable academic development. Educators and management scholars can benefit from this study by gaining a deeper understanding of the theoretical and conceptual frameworks that underpin strategic goal setting, enabling them to

contribute to institutional growth and development. Improving goal-setting strategies in institutions can lead to numerous benefits, including enhanced accountability, efficient resource utilization, and better academic outcomes. According to Chukwuemeka and Adigun (2023), tertiary institutions that adopt structured goal-setting frameworks are more likely to achieve long-term sustainability, attract international partnerships, and maintain high accreditation standards. This study aims to provide actionable recommendations that institutions can implement to optimize their goal-setting practices, ensuring that strategic objectives translate into measurable institutional successes.

It is important to clarify that this study does not include empirical data but focuses solely on literature-based discussions, which makes qualitative research design suitable for this exploration. The study's synthesizing of existing scholarly contributions seeks to provide a comprehensive analysis of strategic goal setting and their impact on institutional productivity. The study geopolitical scope is specifically limited to tertiary institutions in South-South Nigeria, where challenges related to strategic planning have been widely documented. However, the insights presented are applicable to broader educational contexts, offering valuable lessons for institutions across Nigeria and other African regions.

Therefore, institutions that prioritize structured goal-setting mechanisms as evidenced in reviewed literatures, are better positioned to navigate challenges, optimize resource allocation, and achieve long-term sustainability. Hence, the study provides a literature-based exploration to juxtapose the relationship between strategic goal setting and institutional effectiveness, offering valuable insights for institutional leaders, policymakers, and educators. The procedural examination of theoretical foundations, conceptual discussions, and empirical evidence, this study sought to contribute to the ongoing discourse on improving institutional productivity through structured planning and goal-setting frameworks.

Theoretical Framework

The theoretical foundation of this study is rooted in Goal-Setting Theory and Systems Theory, both of which provide critical insights into how strategic goal setting contributes to institutional productivity. While Goal-Setting Theory emphasizes the role of specific, measurable, and challenging goals in improving performance, Systems Theory highlights the importance of interdependent components working cohesively within an institutional framework. Together, these theories provide a significant theoretical foundation for understanding the relationship between strategic goal setting and institutional productivity.

Goal-Setting Theory (Locke & Latham, 1990; cited in Nebel et al., 2017, p. 102)

Goal-Setting Theory, developed by Locke and Latham (1990), has been widely recognized as a fundamental theory in organizational and institutional management. It posits that specific and challenging goals, coupled with appropriate feedback mechanisms, significantly enhance individual and organizational performance. The theory highlights the importance of goal clarity, commitment, and continuous assessment in ensuring that institutions achieve desired outcomes. Institutions that define explicit, measurable, and time-bound objectives as highlighted by Nwachukwu and Uchenna (2022) are more likely to achieve efficiency and performance excellence. This perspective aligns with the idea that well-structured objectives drive

institutional success by ensuring that efforts are directed towards well-defined priorities, thus minimizing inefficiencies and redundancies.

A major strength of Goal-Setting Theory is its applicability across various institutional settings, including tertiary institutions. The theory suggests that when institutions establish clear goals, they create an environment that fosters motivation, accountability, and improved performance. For instance, higher education institutions that set strategic goals regarding research output, faculty development, student success, and infrastructural growth tend to experience enhanced productivity (Ogunleye & Chinedu, 2020). The emphasis on goal specificity ensures that all stakeholders understand their roles and contributions towards achieving institutional success. Moreover, the theory advocates for goal difficulty, which states that challenging yet attainable objectives drive better performance than vague or overly simplistic targets (Eze, 2020). This principle is particularly relevant for tertiary institutions aiming to enhance academic excellence, institutional reputation, and overall governance.

Core Principles of Goal-Setting Theory

Goal-Setting Theory is structured around five core principles: specificity, difficulty, commitment, feedback, and task complexity. These principles collectively determine the effectiveness of goal setting in institutional environments:

- Clearly defined goals improve focus and facilitate resource allocation. Specific goals eliminate ambiguity and ensure that all institutional stakeholders work towards a common objective. For instance, tertiary institutions that set explicit academic performance targets tend to exhibit higher student success rates (Adeyemi & Olowookere, 2019). When institutions articulate well-structured strategic goals, faculty members, students, and administrators are more aligned in their activities, leading to measurable improvements in institutional productivity.
- Challenging but attainable goals motivate institutional stakeholders to exert higher effort. Institutions that establish rigorous academic and operational benchmarks tend to experience higher levels of engagement and achievement. Universities with stringent accreditation requirements and research excellence targets often demonstrate improved institutional reputation and academic excellence (Eze, 2020). However, goal difficulty should be balanced to ensure that stakeholders remain motivated rather than discouraged by unrealistic targets.
- Goal commitment is essential for successful implementation. Institutions must ensure that faculty, students, and administrators are actively engaged in the goal-setting process. High levels of commitment increase the likelihood of goal attainment, as individuals feel personally responsible for achieving institutional objectives. When institutional leaders foster an inclusive goal-setting culture, stakeholders demonstrate higher dedication and ownership of responsibilities (Onyekachi, 2018). Commitment is further strengthened through participatory decision-making and institutional policies that encourage goal alignment.
- Regular performance assessment mechanisms enhance productivity. Effective feedback systems enable institutions to track progress, identify gaps, and make necessary adjustments to strategic plans. Institutions that incorporate feedback loops in strategic

planning experience continuous improvement in operational efficiency (Uche & Emeka, 2017). For example, periodic assessment of faculty performance, student outcomes, and administrative effectiveness provides data-driven insights for refining institutional goals.

- Goals should be aligned with institutional capacities. While challenging goals drive performance, overly complex or unrealistic targets may hinder execution, leading to inefficiencies. Institutions must ensure that adequate resources, training, and support systems are in place to facilitate goal achievement (Okon & Adeyemi, 2021). Strategic goals should be broken down into manageable components, allowing for systematic progress monitoring and achievement.

Goal-Setting Theory highlights the necessity of structured objectives in educational institutions. Universities that implement goal-setting frameworks exhibit improved governance, academic performance, and workforce motivation. The relevance of this theoretical underpinning highlights the need for a clear roadmap, outlining institutional priorities and ensuring that efforts are directed towards meaningful outcomes. As institutions strive for continuous improvement, the principles of goal setting serve as a foundational model for institutional leaders seeking to enhance productivity through structured planning and evaluation mechanisms.

Systems Theory (Bertalanffy, 1968 cited in Ololube, 2024)

Systems Theory, developed by Bertalanffy (1968), offers a holistic perspective on institutional management by emphasizing the interconnectedness of various components within an institution. The theory suggests that institutions operate as complex systems composed of interdependent units that must function cohesively to achieve optimal performance. This theoretical perspective is crucial in understanding how strategic goal setting influences institutional productivity. One of the key tenets of Systems Theory is that institutions are open systems that interact with their environment. Educational institutions, for instance, rely on resources such as funding, human capital, and policy directives to function effectively (Ololube, 2024). The successful integration of strategic goal setting within an institution requires that these components work in harmony. When institutions fail to coordinate their goals with internal and external factors, inefficiencies arise, leading to misalignment and suboptimal performance (Nwosu & Chinwe, 2021).

A critical aspect of Systems Theory is the emphasis on synergy among institutional components. For strategic goals to be effective, institutions must align their academic programs, administrative structures, and financial resources with overarching objectives. Institutions that operate in silos, where different departments work independently without a shared strategic vision, often experience inefficiencies and reduced productivity (Okeke & Chukwuma, 2019). For example, if a university sets a goal to improve research output but fails to allocate sufficient funding for faculty development and research infrastructure, the goal is unlikely to be achieved. Furthermore, Systems Theory highlights the role of feedback loops in institutional management. Just as in Goal-Setting Theory, continuous evaluation and adaptation are essential for institutional success. Institutions that implement structured monitoring and evaluation mechanisms ensure that their strategic goals remain relevant and adaptable to changing circumstances (Adigwe & Ugochukwu, 2023). Feedback mechanisms enable institutions to identify areas of improvement, refine strategic plans, and maintain alignment with national and global educational standards.

In applying Systems Theory to strategic goal setting, it becomes evident that institutional success depends on the integration of various functional units. When institutional leaders recognize the interconnectedness of academic programs, faculty engagement, student support services, and financial management, they can develop comprehensive goal-setting frameworks that enhance overall productivity. The theory highlights the necessity of a structured and holistic approach to institutional planning, ensuring that all components contribute meaningfully to achieving institutional objectives. Generally, the theoretical foundation of this study, rooted in Goal-Setting Theory and Systems Theory, provides a comprehensive framework for understanding the impact of strategic goal setting on institutional productivity. These theories emphasize the importance of goal clarity, stakeholder commitment, interdependence, and continuous feedback in driving institutional success. Integrating these theoretical insights, this study explores how tertiary institutions in South-South Nigeria can enhance their strategic planning processes to achieve sustainable growth and academic excellence.

Concept of Strategic Goal Setting

Strategic goal setting is a structured approach to defining an institution's long-term objectives, ensuring that all activities align with a clear vision for sustained growth and performance. Unlike general goal setting, which often focuses on short-term objectives, strategic goal setting is deeply integrated into the governance structure of an institution, providing a roadmap for continuous improvement and adaptation in a dynamic environment. Within tertiary institutions, strategic goal setting serves as a guiding principle for administrative decision-making, ensuring that policies, resource allocation, and performance evaluation align with predefined objectives (Nwachukwu & Uchenna, 2022). The role of strategic goal setting in institutional governance cannot be overemphasized, as it fosters systematic planning and enhances institutional efficiency. This approach ensures that higher education institutions (HEIs) establish goals that are specific, measurable, attainable, relevant, and time-bound (SMART), thereby improving operational effectiveness.

Adeyemi and Olowookere (2019) noted that institutions with well-defined strategic goals often experience improved academic performance, optimized financial resources, and a strengthened workforce. Furthermore, strategic goal setting enables institutions to maintain competitiveness in the global education landscape, ensuring that their programs, research output, and institutional policies align with international best practices (Eze, 2020). A significant distinction between strategic goal setting and general goal setting lies in their scope and impact. While general goal setting often focuses on individual or departmental targets, strategic goal setting encompasses broader institutional objectives that influence governance, policy formulation, and long-term sustainability. For instance, a university aiming to enhance research output may establish a strategic goal of increasing faculty research grants and publications over a five-year period, while a general goal may merely focus on conducting a few research workshops.

This broader, integrative approach ensures that all institutional components function cohesively towards a shared vision (Okon & Adeyemi, 2021). Moreover, strategic goal setting incorporates data-driven decision-making, enabling institutional leaders to rely on empirical evidence in formulating policies and evaluating institutional performance. The use of key performance indicators (KPIs) facilitates the assessment of goal achievement, allowing institutions to identify gaps and implement corrective measures in real time. Institutions that

adopt strategic goal setting frameworks benefit from enhanced adaptability, particularly in responding to changes in government policies, economic fluctuations, and emerging global educational trends (Onyekachi, 2018).

Scholars have also emphasized the role of leadership in strategic goal setting. Institutional leaders, including vice-chancellors, deans, and department heads, play a critical role in defining, implementing, and monitoring strategic goals. Leadership commitment to strategic planning fosters a culture of accountability and transparency, ensuring that all stakeholders actively contribute to institutional development. Research by Uche and Emeka (2017) highlights that universities in South-South Nigeria with proactive leadership in goal setting have demonstrated higher levels of institutional efficiency, innovation, and workforce motivation. Additionally, strategic goal setting fosters an inclusive approach to governance by involving key stakeholders such as faculty members, students, alumni, and industry partners in the planning process. This participatory approach enhances goal ownership, commitment, and alignment with institutional realities, thus minimizing resistance to change and promoting sustainable institutional growth (Eze, 2020). Institutions that engage in inclusive strategic goal setting processes tend to experience greater institutional stability, as stakeholders are more likely to support policies and reforms aligned with the collective vision (Nwachukwu & Uchenna, 2022).

Despite its significance, strategic goal setting faces challenges in implementation. Many tertiary institutions in Nigeria and other African countries struggle with inadequate funding, bureaucratic inefficiencies, and resistance to change, which hinder the effective execution of strategic plans. According to Okon and Adeyemi (2021), institutions that fail to integrate goal setting into their core governance structures often experience stagnation, misaligned priorities, and inefficient resource utilization. To address these challenges, institutions must develop robust monitoring and evaluation mechanisms that track goal progress and provide timely feedback for necessary adjustments (Adeyemi & Olowookere, 2019). Strategic goal setting is an essential component of institutional governance, ensuring that tertiary institutions operate with a clear vision and structured objectives. It distinguishes itself from general goal setting by its long-term focus, integration into institutional policies, and reliance on data-driven decision-making. Institutions that effectively implement strategic goal setting experience enhanced productivity, financial sustainability, and institutional reputation. However, to maximize its benefits, institutions must address implementation challenges through proactive leadership, stakeholder engagement, and continuous performance evaluation.

Institutional Productivity

Institutional productivity encompasses the ability of an educational institution to effectively utilize its resources to achieve predefined goals and deliver high-quality outcomes. In the context of tertiary institutions, productivity extends beyond academic performance to include financial sustainability, workforce efficiency, and institutional reputation. Academic excellence is a critical dimension of institutional productivity. Eze, 2020) highlighted that productive institutions exhibit a high degree of effectiveness in research, teaching, administrative processes, and resource management, thereby contributing to national and global educational development. Universities that prioritize academic performance through rigorous curriculum development, faculty development programs, and student-centered learning strategies often produce graduates who excel in competitive labor markets. Research output, measured by faculty publications, citations, and grants, is a key indicator of academic productivity. According to Adeyemi and

Olowookere (2019), institutions that establish strategic research goals and provide funding support for faculty members tend to achieve higher research productivity, enhancing their national and international rankings.

Financial sustainability is another fundamental aspect of institutional productivity. Tertiary institutions require stable funding sources to support academic programs, infrastructural development, and staff welfare. Productive institutions diversify their revenue streams by leveraging public-private partnerships, alumni contributions, and research grants. Okon and Adeyemi (2021) argue that universities with robust financial management strategies demonstrate higher resilience to economic uncertainties and are better positioned to invest in innovative academic and infrastructural projects. Institutions that rely solely on government subventions often struggle with financial instability, leading to resource shortages and operational inefficiencies (Nwachukwu & Uchenna, 2022).

Workforce efficiency plays a significant role in determining institutional productivity. The motivation and effectiveness of academic and non-academic staff influence the quality of education and administrative processes. Institutions that implement professional development programs, performance-based incentives, and leadership training initiatives often experience higher staff commitment and job satisfaction. Uche and Emeka (2017) emphasize that leadership efficiency is a critical factor in workforce productivity, as competent institutional leaders create enabling environments that foster collaboration, innovation, and accountability. Institutional reputation, both nationally and internationally, is a direct outcome of institutional productivity. Universities with high research impact, strong industry partnerships, and competitive academic programs often gain recognition in global rankings. Public perception of an institution's quality influences student enrollment, faculty recruitment, and funding opportunities.

According to Onyekachi (2018), institutions that consistently align their strategic goals with global educational trends maintain strong reputations, attracting international collaborations and enhancing their competitive edge. The concept of institutional productivity is a multidimensional, encompassing academic excellence, financial sustainability, workforce efficiency, and institutional reputation. Productive institutions establish and execute strategic goals that align with their mission and vision, ensuring sustainable growth and competitiveness. However, achieving high productivity requires effective leadership, innovative financial management, continuous faculty development, and alignment with global educational best practices.

Principles of Goal Setting for Institutional Productivity

Goal setting plays a crucial role in institutional development by providing a structured approach to achieving desired outcomes. Effective goal setting requires a strategic process that ensures alignment with institutional vision, stakeholder engagement, and measurable progress tracking. Institutions that adopt structured goal-setting principles experience improved productivity, resource optimization, and enhanced accountability. The effectiveness of goal setting in institutions is dependent on adherence to fundamental principles, including specificity, measurability, feasibility, alignment, adaptability, and accountability. These principles serve as foundational guidelines for institutions seeking to implement strategic planning frameworks that foster long-term success and sustainability.

Specificity

One of the fundamental principles of effective goal setting is specificity. Specific goals provide clear direction and eliminate ambiguity, enabling institutions to focus their resources and efforts on defined objectives. Institutions that set precise goals, such as improving student academic performance by increasing graduation rates by 15% within five years, tend to achieve better results than those with vague aspirations (Nwosu & Ekene, 2019). Specific goals ensure that all stakeholders understand their roles and responsibilities in achieving institutional targets. In Nigerian universities, for example, institutions that outline clear faculty development goals, such as increasing faculty participation in international research collaborations by 30%, demonstrate higher research productivity (Adebayo, 2020). The specificity of goals allows institutions to develop targeted action plans that enhance efficiency and effectiveness.

Measurability

Measurable goals provide institutions with the ability to track progress and evaluate success using quantifiable indicators. Establishing measurable objectives ensures that institutions can assess their performance and make data-driven decisions to enhance productivity. For instance, universities that aim to improve research output can set measurable goals such as publishing at least 50 peer-reviewed articles annually (Okafor & Eze, 2021). Measurable goals enable institutions to implement performance assessment mechanisms that facilitate continuous improvement. The adoption of key performance indicators (KPIs) in institutional planning helps universities track student performance, faculty contributions, and overall institutional effectiveness (Uche & Emeka, 2022). Without measurable benchmarks, institutions may struggle to determine the effectiveness of their strategies, leading to inefficiencies in goal attainment.

Feasibility

Effective goal setting requires feasibility, ensuring that institutional objectives are realistic and attainable within available resources. Institutions must consider financial constraints, workforce capacity, and infrastructural capabilities when setting goals. Unrealistic goals can demotivate stakeholders and hinder institutional progress. For example, a tertiary institution in South-South Nigeria aiming to build five state-of-the-art research laboratories within a year without adequate funding may face implementation challenges (Ogunleye, 2018). Feasible goals take into account institutional capacities and are designed to be achievable within set timelines. Adeyemi et al. (2019) emphasized that universities that align their goals with available resources demonstrate higher efficiency in project execution and institutional development.

Alignment with Institutional Vision

Goals set by institutions must align with their vision and long-term objectives to ensure coherence in strategic planning. Misalignment between institutional goals and core values can lead to inefficiencies and misdirected priorities. For example, a university with a vision of becoming a global center of excellence in technology must align its strategic goals with cutting-edge research in artificial intelligence, software engineering, and technological innovations (Eze, 2020). Institutions that align their goal-setting frameworks with their mission statements

experience improved organizational synergy and stakeholder commitment (Okon & Adeyemi, 2021). Alignment ensures that all institutional efforts contribute to overarching objectives, fostering consistency in academic, administrative, and financial planning.

Adaptability

Adaptability is a key principle of effective goal setting, allowing institutions to respond to changing circumstances and emerging challenges. The dynamic nature of educational environments requires institutions to establish flexible goals that accommodate technological advancements, policy changes, and global trends. Institutions that fail to incorporate adaptability into their goal-setting frameworks risk stagnation and irrelevance in competitive academic landscapes (Adebisi & Uchenna, 2023). Nigerian universities that integrate adaptive strategies, such as revising academic curricula to align with industry demands, exhibit higher employability rates among graduates (Onyekachi, 2021). Adaptable goal-setting frameworks enhance institutional resilience and facilitate continuous improvement in operational strategies.

Accountability

Accountability is essential in institutional goal setting, ensuring that all stakeholders take responsibility for achieving set objectives. Clearly defined roles and responsibilities enhance institutional transparency and performance evaluation. Universities that implement accountability frameworks, such as performance-based assessments for faculty and administrative staff, demonstrate improved institutional effectiveness (Uche & Emeka, 2017). Accountability mechanisms, such as periodic progress reviews and performance audits, help institutions identify gaps in implementation and make necessary adjustments. The introduction of governance structures that hold institutional leaders accountable for goal attainment promotes ethical leadership and fosters a culture of excellence (Nwachukwu & Uchenna, 2022). Without accountability, goal-setting efforts may lack the necessary oversight and enforcement required for successful implementation.

The principles of effective goal setting in institutions provide a structured framework for enhancing productivity, efficiency, and organizational success. Specificity ensures clear objectives, measurability enables performance tracking, feasibility guarantees realistic target-setting, alignment fosters coherence with institutional vision, adaptability allows flexibility in planning, and accountability ensures responsible execution of goals. Institutions that adhere to these principles experience improved governance, stakeholder commitment, and sustainable development. Implementing structured goal-setting mechanisms is essential for tertiary institutions seeking to optimize performance and achieve long-term academic and administrative excellence.

COMMON GOAL-SETTING FRAMEWORKS

Strategic goal setting in institutions relies on structured frameworks that guide planning, execution, and assessment. Over the years, scholars and practitioners have developed various models to enhance goal clarity, measurability, and execution efficiency. These frameworks provide institutions with methodologies for setting, monitoring, and achieving objectives while ensuring alignment with broader institutional missions. Each model varies in structure, focus,

and applicability, with some emphasizing quantitative measures and others prioritizing qualitative progress markers. The following sections explore key goal-setting frameworks that institutions can employ to drive productivity and efficiency:

SMART Goals

The SMART goal-setting framework, introduced by Doran (1981), emphasizes the need for goals to be Specific, Measurable, Achievable, Relevant, and Time-bound. This model ensures clarity in objectives by breaking them down into structured components that enhance precision in institutional planning. In the educational sector, institutions that adopt SMART goals benefit from improved resource allocation, targeted academic improvement strategies, and measurable student performance outcomes (Adebayo & Nwankwo, 2019). The SMART framework is particularly effective in academic settings where goal specification is crucial in research planning, curriculum development, and administrative decision-making. Moreover, the SMART framework fosters institutional accountability and progress tracking, as clearly defined goals facilitate periodic evaluation and adjustments. Nigerian tertiary institutions implementing SMART principles in faculty performance assessments have reported increased efficiency in instructional delivery and research productivity (Chukwu & Uche, 2021). However, critics argue that the model's rigid structure may limit flexibility in rapidly evolving educational environments (Okafor & Adeyemi, 2020). Despite this limitation, SMART goals remain a widely adopted methodology for enhancing strategic planning in institutions.

Objectives and Key Results (OKR)

Developed by Grove (1970s) and popularized by Doerr (2018), the Objectives and Key Results (OKR) framework provides a dynamic approach to strategic goal setting by aligning institutional objectives with measurable key results. OKRs emphasize ambitious but attainable goals, often set at organizational, departmental, and individual levels to ensure synchronization across an institution (Eze & Maduka, 2021). In the context of higher education, universities leveraging OKRs have reported enhanced administrative efficiency, improved research output, and increased faculty engagement (Nwachukwu & Ololube, 2023). The model's focus on measurable outcomes enables institutions to track progress in real-time, adjusting strategies where necessary. Additionally, OKRs foster a culture of transparency and innovation within institutions. Clearly outlining expected results and aligning them with institutional missions, universities can create a results-driven environment that enhances student performance and operational effectiveness (Obi & Chinedu, 2022). However, the OKR framework requires rigorous monitoring and frequent reassessment, which can be resource-intensive. Despite this challenge, it remains a highly effective strategy for institutions aiming to foster a performance-driven culture.

Key Performance Indicators (KPI)

Key Performance Indicators (KPIs) serve as quantifiable metrics used to evaluate institutional performance over a defined period. This framework enables universities to establish clear benchmarks for success, ensuring alignment between strategic objectives and measurable outcomes (Akinola & Okon, 2020). Common KPIs in higher education include student retention rates, research output, faculty productivity, and financial sustainability. Institutions leveraging

KPIs often experience improved accountability as performance metrics provide clear indicators of success and areas needing improvement (Chinonso & Ugochukwu, 2023). Furthermore, the effectiveness of KPI-driven goal setting depends on selecting relevant metrics aligned with institutional priorities. While this model enhances transparency and efficiency, critics argue that an overemphasis on quantitative metrics may overlook qualitative aspects such as student well-being and faculty job satisfaction (Okafor & Adeyemi, 2022). Nonetheless, integrating KPIs with qualitative assessments can provide a holistic approach to institutional goal setting and performance evaluation.

Backward Goal Setting (BGS)

Backward Goal Setting (BGS) is a strategic approach that emphasizes defining long-term institutional objectives before formulating step-by-step plans to achieve them. This method is commonly employed in educational planning, particularly in curriculum development, where educators first determine the desired student learning outcomes before designing instructional strategies that align with these objectives (Obinna & Chukwuma, 2018). By adopting this approach, institutions ensure that all activities remain aligned with overarching goals, thereby mitigating the risks of misallocation of resources and effort on non-essential activities (Adegbite & Nnamdi, 2021). This structured approach enhances the coherence of institutional strategies by focusing on the ultimate goals and systematically working backward to develop actionable steps.

Furthermore, BGS fosters strategic foresight by emphasizing a long-term vision rather than short-term gains, making it an effective tool for sustainable institutional development. For instance, universities utilizing this approach in infrastructural planning have reported improved project completion rates and optimized resource allocation, as every initiative is aligned with a predetermined objective (Olalekan & Uche, 2023). However, the successful implementation of BGS requires meticulous planning and proactive risk assessment, as institutions must anticipate potential challenges and devise contingency measures to mitigate unforeseen setbacks. Despite the need for rigorous planning, BGS remains a valuable model for institutions seeking to enhance long-term effectiveness and efficiency.

Management by Objectives (MBO)

The goal setting model of Management by Objectives (MBO), introduced by Drucker (1954), is a participatory goal-setting approach where institutional leaders, faculty, and staff collaborate to define clear and measurable objectives. This method promotes inclusivity, shared responsibility, and alignment of individual efforts with institutional goals, leading to increased institutional commitment and performance (Eze & Maduka, 2021). Nigerian universities that have integrated MBO into their administrative frameworks have reported higher staff motivation, improved goal clarity, and enhanced administrative efficiency (Chukwu & Uche, 2023). However, the effectiveness of MBO depends significantly on continuous communication, regular performance reviews, and the presence of structured feedback mechanisms. Institutions that fail to implement robust progress assessment strategies risk experiencing goal misalignment and operational inefficiencies. While MBO provides a systematic framework for aligning institutional objectives with individual performance, its success largely hinges on the commitment of stakeholders to actively participate in the goal-setting and evaluation process.

Big, Hairy, Audacious Goals (BHAG)

The concept of Big, Hairy, Audacious Goals (BHAG), coined by Collins & Porras (1994), revolves around setting ambitious, long-term institutional objectives that challenge organizations to strive beyond their conventional limits. In the academic sector, universities adopting BHAGs often aim for international accreditation, groundbreaking research initiatives, and large-scale infrastructural projects that redefine their global standing (Nwachukwu & Ololube, 2023). These ambitious goals serve as powerful motivational drivers, inspiring institutional stakeholders to pursue excellence beyond routine performance expectations. Despite its advantages, BHAGs require substantial resources, strategic partnerships, and unwavering commitment from institutional leadership. Without adequate planning and resource mobilization, institutions may set unrealistic goals that ultimately result in inefficiencies and disillusionment among stakeholders. Therefore, while BHAGs provide a compelling vision and direction, they must be complemented by pragmatic execution strategies to ensure feasibility and sustainability.

Balanced Scorecard (BSC)

The Balanced Scorecard (BSC), developed by Kaplan & Norton (1992), integrates financial and non-financial performance indicators to provide a holistic assessment of institutional effectiveness. This framework has gained significant traction among Nigerian universities, where it is used to measure academic quality, financial sustainability, student satisfaction, and internal process efficiency (Okon & Adeyemi, 2021). Offering a multidimensional evaluation of performance, BSC enables institutions to balance financial objectives with broader educational missions, ensuring comprehensive institutional growth. However, implementing the BSC model requires substantial investment in data collection, analysis, and reporting, making it a resource-intensive framework. Despite this challenge, the BSC remains a valuable tool for universities seeking a structured and balanced approach to institutional planning and performance assessment.

Entrepreneurial Operating System (EOS)

The Entrepreneurial Operating System (EOS) is a strategic framework designed to streamline institutional processes, enhance leadership efficiency, and improve goal execution. This model is particularly relevant for universities aiming to enhance financial sustainability through entrepreneurial ventures (Obi & Chinedu, 2022). EOS emphasizes structured leadership roles, clear accountability mechanisms, and systematic goal tracking, making it a highly effective tool for institutions looking to improve operational efficiency. While EOS fosters streamlined administration and goal-oriented execution, its business-centric approach may not fully align with the traditional values of academia, which prioritize intellectual freedom and academic exploration over rigid operational structures. Nonetheless, for universities seeking financial independence and administrative effectiveness, EOS principles provide a viable pathway toward achieving strategic objectives.

Agile Management Principles

Agile Management Principles focus on flexibility, continuous feedback, and iterative goal refinement, making them particularly useful for institutions operating in dynamic environments. Universities adapting to digital transformation, for example, benefit from Agile methodologies by remaining responsive to evolving technological trends and student learning needs (Adebayo & Nwankwo, 2019). Agile principles promote adaptability, ensuring that institutions remain competitive in an ever-changing academic system. However, adopting Agile Management requires a cultural shift from traditional hierarchical decision-making structures to decentralized, team-based planning. This transition can be challenging for institutions with rigid administrative frameworks. Nonetheless, universities that successfully integrate Agile methodologies benefit from enhanced responsiveness, innovation, and long-term relevance.

Four Disciplines of Execution (4DX)

The Four Disciplines of Execution (4DX), developed by McChesney, Covey & Huling (2012), offers a structured methodology for achieving institutional goals by emphasizing key priorities, tracking progress, and maintaining accountability. Universities leveraging 4DX principles have reported improved strategic focus, execution efficiency, and enhanced goal alignment (Okafor & Adeyemi, 2022). However, 4DX requires meticulous implementation, as institutions must carefully prioritize essential goals while avoiding overextension. Without disciplined execution, institutions risk diffusing their efforts across multiple competing objectives, leading to suboptimal performance. Despite this challenge, 4DX remains a highly effective framework for ensuring goal-oriented institutional progress and efficiency.

Collectively, these strategic goal-setting frameworks provide higher education institutions with various methodologies for enhancing institutional effectiveness and productivity. While each framework presents unique advantages, successful implementation requires careful planning, stakeholder engagement, and sustained commitment to execution. Institutions that effectively integrate these approaches into their strategic planning processes stand to benefit from enhanced goal clarity, optimized resource allocation, and long-term growth in academic excellence and operational efficiency.

CHALLENGES IN STRATEGIC GOAL SETTING AND IMPLEMENTATION

Strategic goal setting and implementation in institutions are often hindered by several critical challenges that affect the efficiency of planning and execution. These challenges, if not properly addressed, can significantly impede institutional effectiveness, leading to stagnation or failure in achieving set objectives. Some of the prominent challenges include poor leadership commitment, resource constraints, resistance to change, and weak monitoring and evaluation mechanisms. Leadership plays a fundamental role in the strategic goal-setting process, as institutional leaders are responsible for defining objectives, mobilizing resources, and ensuring their execution. However, when leaders lack commitment, strategic initiatives are often left unimplemented or executed with minimal effort, resulting in organizational inefficiencies (Obinna & Chukwuma, 2020). Poor leadership commitment is frequently observed in cases where administrators fail to align personal interests with institutional goals, leading to misallocation of resources and ineffective policy execution.

Furthermore, the absence of visionary leadership affects team motivation and reduces staff engagement in strategic initiatives (Adegbite & Nnamdi, 2021). Without committed leadership, institutions struggle to maintain a long-term focus on their strategic objectives, thereby undermining their growth and competitiveness. One of the most common barriers to effective strategic goal setting is the unavailability of financial, human, and material resources. Institutions, especially in developing regions, often struggle with inadequate funding, which hinders infrastructural development, faculty capacity building, and research advancements (Olalekan & Uche, 2023). Limited resources also affect the ability to implement technological innovations, modernize curricula, and expand academic programs, making it difficult to achieve strategic objectives. In cases where financial constraints persist, institutions may be forced to downscale their strategic ambitions or abandon them entirely (Eze & Maduka, 2022).

The lack of qualified personnel to drive strategic plans further compounds the challenge, as insufficient expertise leads to ineffective execution of policies and programs. Resistance to change is another critical factor that impedes the successful implementation of strategic goals. Organizational inertia, reluctance to adopt new systems, and fear of uncertainty often result in resistance from faculty members, administrative staff, and even students (Chukwu & Uche, 2023). Change resistance is particularly evident in institutions that attempt to introduce digital transformation, workflow automation, or revised management structures without adequate sensitization and training. Employees and stakeholders who feel excluded from the decision-making process tend to resist strategic initiatives, viewing them as disruptions rather than improvements (Nwachukwu & Ololube, 2023). This resistance leads to delays in implementation, reduced efficiency, and, in some cases, total abandonment of planned initiatives.

Overcoming these challenges require proactive leadership, transparent communication, and an inclusive approach to change management. Again, strategic planning is ineffective without a robust monitoring and evaluation framework to track progress, assess performance, and make necessary adjustments. Many institutions fail to establish clear metrics for evaluating the success of their strategic goals, leading to misalignment between objectives and actual outcomes (Okon & Adeyemi, 2021).

Weak monitoring structures also create loopholes for inefficiencies, as progress is rarely reviewed, and corrective measures are not implemented in a timely manner. Without proper evaluation mechanisms, institutions struggle to measure the impact of their initiatives and identify areas for improvement (Okafor & Adeyemi, 2022). Moreover, the lack of accountability in goal execution often results in stagnation, where institutions continue to operate without significant progress toward their long-term vision. Addressing these challenges requires a multi-faceted approach that includes strengthening leadership commitment, ensuring adequate resource allocation, fostering a culture of adaptability, and institutionalizing robust monitoring and evaluation systems. Institutions that proactively address these barriers enhance their capacity for effective goal setting and strategic execution, thereby improving overall productivity and sustainability.

THE INFLUENCE OF STRATEGIC GOAL SETTING ON INSTITUTIONAL PRODUCTIVITY

Strategic goal setting plays a fundamental role in enhancing institutional productivity by providing a structured approach to planning, resource allocation, and performance measurement. Institutions that adopt well-defined goal-setting frameworks experience improved operational

efficiency, increased staff motivation, and enhanced decision-making processes. As aptly noted by Obinna and Chukwuma (2020), the effectiveness of strategic goal setting is evident in its ability to align institutional activities with long-term objectives, ensuring that all stakeholders work collaboratively towards a unified vision. A structured goal-setting process fosters organizational clarity by eliminating ambiguity in institutional operations. When universities and other educational institutions establish specific, measurable, achievable, relevant, and time-bound (SMART) goals, they create a roadmap for success, which helps administrators, faculty, and students maintain focus on priority areas (Adegbite & Nnamdi, 2021). This clarity reduces inefficiencies arising from misaligned efforts and fragmented policies, leading to streamlined operations and better resource utilization.

Furthermore, institutions that integrate strategic goal setting into their leadership models experience enhanced employee engagement and motivation. Goal-setting theories suggest that when individuals understand the objectives of their organization and perceive them as attainable, they exhibit higher levels of commitment and productivity (Eze & Maduka, 2022). Nigerian universities implementing structured goal-setting models, such as the Balanced Scorecard (BSC) and Management by Objectives (MBO), have reported increased faculty involvement in academic and administrative duties, ultimately improving institutional effectiveness (Olalekan & Uche, 2023). Another crucial impact of strategic goal setting is its role in data-driven decision-making. Institutions that establish clear goals can effectively track progress through key performance indicators (KPIs) and real-time analytics, allowing for timely interventions and adjustments where necessary (Chukwu & Uche, 2023). By leveraging structured goal-setting methodologies, institutions can identify inefficiencies, allocate resources more effectively, and make informed policy decisions that enhance overall productivity.

Despite its benefits, the impact of strategic goal setting is contingent upon effective leadership, stakeholder involvement, and continuous performance evaluation. Institutions that fail to establish feedback mechanisms or neglect periodic goal reviews may struggle with stagnation and inefficiencies. Therefore, a well-structured goal-setting process must be complemented by strong leadership commitment, regular assessments, and adaptive strategies to maximize institutional productivity. Moreover, strategic goal setting fosters innovation by encouraging proactive planning and continuous improvement. Universities that adopt frameworks such as Agile Management Principles and the Four Disciplines of Execution (4DX) demonstrate higher adaptability to evolving educational trends, technological advancements, and global academic standards (Nwachukwu & Ololube, 2023). This adaptability ensures that institutions remain competitive and responsive to emerging challenges, thereby sustaining long-term growth and development.

Future Research Directions

To further expand the understanding and application of strategic goal setting in institutional management, future research should explore the various models, such as Backward Goal Setting (BGS) and the Entrepreneurial Operating System (EOS), have been proposed, empirical studies validating their effectiveness in institutional settings remain limited. Future research should focus on assessing the practical outcomes of these models in different organizational contexts, particularly in higher education institutions across Africa. Comparative studies examining the implementation and impact of strategic goal-setting frameworks in different universities, both public and private, would provide valuable insights into best practices and contextual

adaptations. Investigating how different institutions approach goal setting, performance measurement, and strategic execution could help identify the most effective methodologies for enhancing institutional productivity.

With the increasing reliance on digital tools for institutional management, future research should explore how emerging technologies, such as artificial intelligence (AI) and big data analytics, can enhance goal-setting processes (Adebayo & Nwankwo, 2019). Examining the integration of technological solutions in strategic planning can provide a deeper understanding of how institutions can leverage innovation for improved productivity. Future studies should investigate how organizational values, leadership styles, and stakeholder engagement influence the effectiveness of goal-setting processes in academic environments (Obi & Chinedu, 2022). Understanding these cultural dynamics can help institutions tailor strategic frameworks that align with their unique operational landscapes. These areas of inquiry can contribute to future research by providing comprehensive understanding of strategic goal setting, leading to improved institutional planning, execution, and productivity.

CONCLUSION

This study has established that strategic goal setting is a fundamental driver of institutional productivity, providing a structured framework for achieving long-term objectives through systematic planning, resource optimization, and performance evaluation. By leveraging models such as Backward Goal Setting, Management by Objectives, the Balanced Scorecard, and other strategic frameworks, institutions can enhance decision-making processes, align organizational efforts with overarching goals, and improve operational efficiency. However, the effectiveness of strategic goal setting is often hindered by challenges such as poor leadership commitment, resource constraints, resistance to change, and weak monitoring and evaluation mechanisms. Findings revealed that addressing these barriers requires institutions to adopt adaptive, data-driven, and inclusive goal-setting strategies that promote sustainable growth and institutional effectiveness. Furthermore, fostering a results-oriented culture necessitates proactive leadership, adequate financial support, inclusive decision-making, and the integration of technology-driven solutions to ensure seamless execution of strategic objectives. In conclusion, as higher education institutions navigate an increasingly competitive and dynamic landscape, the adoption of well-defined and results-focused strategic goal-setting practices will be essential for driving innovation, sustainability, and global competitiveness in the academic sector.

Suggestions

To enhance the effectiveness of strategic goal-setting in institutions, key stakeholders must adopt proactive measures that promote accountability, resource optimization, and continuous assessment. The following suggestions were made to outline practical steps for improvement:

- Institutional administrators and governing bodies should demonstrate unwavering commitment to strategic planning by fostering a culture of accountability, transparency, and long-term vision alignment in all decision-making processes.

- Federal and state education ministries, along with funding agencies, should allocate sufficient financial resources to institutions to mitigate budgetary constraints that hinder effective goal execution.
- University management should implement participatory decision-making approaches by actively involving faculty, staff, and students in the goal-setting process to promote ownership, shared responsibility, and institutional alignment.
- Institutions should integrate digital tools such as Artificial Intelligence, data analytics, and Learning Management Systems to enhance goal-setting processes, performance tracking, and data-driven decision-making.
- Regulatory bodies and policymakers should establish frameworks that encourage continuous assessment, innovation, and adaptability in institutional strategic planning to ensure sustainable growth and competitiveness.

Ignatius Ajuru University of Education, Nigeria

ABSTARCT

This paper is on the management practices and academic goal attainment in public secondary schools in Port Harcourt. It identifies the benefits of time management in attainment of management in the activities of public secondary schools. This paper points and the challenges principles face in the management of time. To achieve the objective, this paper recommends that individuals and organizations should plan their schedules and stick to time allowed to every activity, prioritize the things you want to do according to their importance, establish a regular routine, reduce interruptions; learn to set long term and short time goals to achieve them within a given time frame. This paper also suggested that similar investigating be carried out in various schools across the local government area in the state. Further, time is a universal phenomenon, it is a management resource that affect on everyday activities, and how far we go in life as individuals or organization is dependent on how well we manage our time.

Keywords: Time, Management, Strategies, Nigeria

INTRODUCTION

Time is very fundamental right from creation. The importance of time cannot be overemphasized. It is also a valuable resources to all and sundry, that is individuals, governments, schools, institutions etc. every institution has parameters for judging its success or otherwise, be it the military, judiciary, medical, legal, company, school, etc. and time is very fundamental to actualization of one's goal, aim and desire.

Many factors usually are identified in the process of accomplishing goals, financial, human, material resources mainly. Time has always remained a background factor, time needs to be managed because, it is secure resource, cannot be recalled back and it is for everything we do and it is measured in seconds, minutes, hours, days, weeks, months, quarterly, years etc. every institution draws up policies, programmes and plans using all resources of human financial, material towards achieving set objectives within time lines, time frame, time limit etc. the major reasons being that regardless of the limitations of other resources, time is of essence or importance to quality or quantity, measurement of success, productivity, effectiveness and efficiency. Time is part of the measuring system used to sequence event, to compare the duration of event, intervals between them to quantity rate of change. Time cannot be stood still.

Furthermore, in every organization, be it the military, church, judiciary, medical, school, company etc. for instance in the medical field, once someone is due for a surgical operation, he or she cannot be held back from going to the theatre for the operation to be carried out within a time frame for the very implications of it. Another example is the judiciary; there is time line in filing cases or suit in a court of law. Be it the magistrate count high court, appeal court and supreme court. Time is the most paramount in all of these in the actualization of set goals.

The school system, though dependent in human capital, material and financial resources, it is also a time frame" instruction. Not only does its efficiency and effectiveness in goal achievement, depend on its ability to continually discharge it basic responsibility in reducing literacy, increasing skill manpower needed in the economy, productive leadership for the socio-economic wellness of society but, also in doing this timely to mitigate or close up gaps fro natural efficiency.

Furthermore, the judicious deployment of time shall enhance planning, reviewing, amending, directing, communicating, implementing to various programmes in the system which are time bound in each of the process. A student has a time frame to be in school, be it in the primary, secondary, tertiary institution as the case may be. Time is very vital in all of these.

The different activities in life talks about time, time to eat, time to drink, time to sleep, time to eat, time to drink, time to sleep, time to lauguh as seven in the Holy Book (Bible) in Ecclesiastes chapter 3:1-8. But, the purpose of this paper is in academic timing and management in school system. School activities are planned, tied to time and managed by those in authority. The persons are seen as principals, vice principals, teachers, students, non-academic staff, administrators, managers, etc., although, the planning and execution of the programmes and policies are executed by the head of school.

Again, time is set or programmed to determine the duration of a particular event or activity to take place. Education managers help in planning, reviewing, amending, directing, communicating implementing various programmes in the system which are time bound in each of the processes. Since time cannot be recalled, efficiency, effectiveness in goal achievement can be measured against the backdrop of set time frame required for events.

The chain of management of function begins with planning. It is a process that requires perception, analysis, conceptual, thoroughness, communication and decision making and also followed by action. Effective time management helps in keeping stages, schedules of a given task plan or activities within a stipulated time frame.

In the modern world, people encounter countless obstacles in managing their time and juggling their personal and professional obligations. It's becoming more and more important to make the most of one's time and maintain a healthy balance between work and life for both productivity and overall wellness. In today's fast-paced and demanding world, individuals face numerous challenges in effectively managing their time and balancing their personal and professional responsibilities. The ability to optimize time usage and maintain a healthy work-life balance has become increasingly crucial for personal productivity and overall well-being. Time management strategies provide individuals with practical tools and techniques to enhance productivity, minimize time wastage, and create a sense of control over their daily activities. This research paper presents a comprehensive review of existing literature on time management strategies and their impact on personal productivity and work-life balance.

Time management refers to the process of planning, organizing, and allocating time to different tasks and activities to achieve desired outcomes efficiently. It involves a range of strategies such as setting goals, prioritizing tasks, scheduling, delegating work, and eliminating

time-wasting activities. It generally has a great impact on the various happenings in personal and professional happenings of every individual. Effective time management allows individuals to make the most of their available time, focus on essential tasks, and maintain a balance between work and personal life which is very important to lead a stress free life and achieve job satisfaction. The importance of time management strategies in enhancing personal productivity and work-life balance has been widely recognized in both academic and professional domains. Numerous studies have shown the positive impact of effective time management on job performance, productivity, and job satisfaction (Britton & Tesser, 2013; Chhokar et al., 2010).

Research has also highlighted the connection between effective time management and reduced stress levels, improved mental well-being, and better work-life integration (Rizzo et al., 2010; Mackenzie et al., 2012). Furthermore, in today's digital age, where distractions and information overload are prevalent, the need for efficient time management practices has become even more crucial.

Time management identifies tasks to be done or performed, planning and scheduling organization activism, prioritizing such activities, allocating time to the activities based in the level of importance as to improved productivity. Managing your time effectively requires a distinction between what is important and what is urgent (MacKenzie, 1990). Experts agree that the most important tasks usually aren't the most urgent tasks. However, we tend to let the urgent tasks dominate our lives. Covey, Merrill, and Merrill (1994) categorize activities into four quadrants in their Time Management Matrix: urgent, not urgent, important, and not important. While activities that are both urgent and important must be done, Covey et al. suggests spending less time on activities that are not important (regardless of their urgency) to gain time for activities that are not urgent but important. Focusing on these important activities allows you to gain greater control over your time and may reduce the number of important tasks that become urgent. Agreeably, the school principals are faced with enormous challenges in the effectiveness of time management that is connected to the inability to prioritize, lack to delegation and also excess responsibilities etc. according to peels (2013), identified four key benefits of effective time management as:

- Time management is an important tool for stress reduction.
- Good time management methods helps in the achievement of work life balance.
- Productivity improves with a more efficient and effective use of time.
- The application of time management enhances the achievement of individual and by extension, organizational goals.

What Is Time Management

- It is the process of planning and exercising conscious control over the amount of time spent on specific activities, especially to increase effectiveness, efficiency of productivity.
- It is a meta activity with the goal to maximize the overall benefits of a set of activities within the boundary condition of a limited amount of time.
- Effective time management allows individuals to assign specific time slots to activities as per their importance.
- Time management refers to making appropriate use of time relative to its fixed nature.

STRATEGIES FOR BETTER TIME MANAGEMENT

People who practice good time management techniques often find that they:

- Are more productive.
- Have more energy for things they need to accomplish.
- Feel less stressed.
- Have more free time to do the things they want.
- Get more things done.
- Relate more positively to others.
- Feel better about themselves. (Dodd and Subdheim, 2005)

Finding a time management strategy that works best for you depends on your personality, ability to self-motivate, and level of self-discipline. By incorporating some, or all the ten strategies below, you can more effectively manage your time.

Know How You Spend Your Time

A time log is a helpful way to determine how you use your time. Record what you are doing in 15-minute intervals for a week or two. Evaluate the results:

- Did everything you needed to do get done?
- Which tasks require the most time?
- What time of day when you are most productive?
- Where is most of your time is devoted (i.e. job, family, personal, recreation)?

Identifying your most time-consuming tasks and determining whether you are investing your time in the most important activities can help you to determine a course of action. Having a good sense of the time required for routine tasks can help you be more realistic in planning and estimating how much time is available for other activities. Many apps exist to help you keep track of your time, as mentioned in Strategy 3.

Set Priorities

Managing your time effectively requires a distinction between what is important and what is urgent (MacKenzie, 1990). Experts agree that the most important tasks usually aren't the most urgent tasks. However, we tend to let the urgent tasks dominate our lives. Covey, Merrill, and Merrill (1994) categorize activities into four quadrants in their Time Management Matrix: urgent, not urgent, important, and not important. While activities that are both urgent and important must be done, Covey et al. suggests spending less time on activities that are not important (regardless of their urgency) to gain time for activities that are not urgent but important. Focusing on these important activities allows you to gain greater control over your time and may reduce the number of important tasks that become urgent.

Urgent	Not Urgent	
Important	Do these tasks as soon as possible. Examples: • Submit job application by 5 p.m. • Pick up sick child from school • Call plumber to fix leaking toilet	Defer these tasks until all urgent and important tasks have been completed. Examples: • Schedule dentist appointment • Reply to coworker's email regarding future event • Plan family reunion
Not Important	Delegate these tasks to the appropriate people who can manage them. Examples: • Help son with homework • Pull weeds from flower beds • Make dinner for family	Delete these tasks – they are often time wasters. Examples: • Respond to social media comments • Online shopping • Finish watching TV show

Creating a "to do" list is an easy way to prioritize. Whether you need a daily, weekly, or monthly list depends on your lifestyle. Be careful to keep list-making from getting out of control. List manageable tasks rather than goals or multi-step plans. Rank the items on your "to do" list in order of priority (both important and urgent). You may choose to group items in categories such as high priority, medium priority, or low priority; number them in order of priority; or use a color-coding system. The goal is not to mark off the most items, but to mark off the highest priority items (MacKenzie, 1990). A prioritized "to do" list allows you to set boundaries so you can say "no" to activities that may be interesting or provide a sense of achievement but do not fit your basic priorities.

Use a Planning Tool

Time management experts recommend using a personal planning tool to improve your productivity. Personal planning tools include planners, calendars, phone apps, wall charts, index cards, pocket diaries, and notebooks. Writing down your tasks, schedules, and items to remember can free your mind to focus on your priorities. Auditory learners may prefer to dictate their thoughts instead. The key is to find one planning tool that works for you and use that tool consistently.

When using a planning tool

- Always record your information on the tool itself. Jotting notes elsewhere that must be transferred later is inefficient and wastes more time.
- Review your planning tool daily.
- Keep a list of your priorities in your planning tool and refer to it often.
- Keep planning tools synchronized. If you keep more than one, make sure your phone, computer, and paper planning tools match.
- Keep a back-up system.

Apps on your phone can be great planning tools. Apps typically fall into one of the following categories

- Time Trackers – Gain an awareness of how you spend your time.
- Time Savers – Increase productivity and break time-wasting habits.
- Task Managers – Prioritize and organize tasks to improve time management.
- Habit Developers – Create healthy habits to encourage time management.

Get Organized

Disorganization leads to poor time management. Research has shown that clutter has a strong negative impact on perceived well-being (Roster, 2016). To improve your time management, get organized.

Set up three boxes (or corners of a room) labeled "Keep," "Give Away," and "Toss." Sort items into these boxes. Discard items in your “Toss” box. Your "Give Away" box may include items you want to sell, donate, or discard.

The next step is to improve the time you spend processing information. For example, tasks such as email can eat up your day. To combat wasted time, implement an email organization system that allows you to process the information in each email as efficiently as possible. Use folders, flagging, or a color-coded system to keep track of what’s what.

Schedule Appropriately

Scheduling is more than just recording what must be done (e.g., meetings and appointments). Be sure to build in time for the things you want to do. Effective scheduling requires you to know yourself. Your time log should help you to identify times when you are most productive and alert. Plan your most challenging tasks for when you have the most energy. Block out time for your high priority activities first and protect that time from interruptions.

Schedule small tasks such as drafting an email, creating a grocery shopping list, reading, watching webinars or listening to podcasts for long commutes or when waiting for a call or appointment. Capitalize on what would otherwise be time lost. Avoid nonproductive activities, such as playing games or scrolling through social media. Limit scheduled time to about three-fourths of your day to allow for creative activities such as planning, dreaming, and thinking.

Delegate: Get Help from Others

Delegating means assigning responsibility for a task to someone else, freeing up your time for tasks that require your expertise. Identify tasks others can do and select the appropriate person(s) to do them. Select someone with the appropriate skills, experience, interest, and authority needed to accomplish the task. Be specific. Define the task and your expectations while allowing the person some freedom to personalize the task. Check how well the person is progressing periodically and provide any assistance, being careful not to take over the responsibility. Finally, reward the person for a job well done or make suggestions for improvements if needed. (Dodd and Sundheim, 2005). Another way to get help is to “buy” time by obtaining goods or services that save time. For example, paying someone to mow your lawn or clean your house, or joining a

carpool for your children's extracurricular activities frees time for other activities. The time-savings from hiring someone for specialized projects is often worth the cost.

Stop Procrastinating

People put off tasks for a variety of reasons. Perhaps the task seems overwhelming or unpleasant. To help stop procrastination, consider "eating the big frog first." A quote commonly attributed to Mark Twain says, "If it's your job to eat a frog today, it's best to do it first thing in the morning. And if it's your job to eat two frogs, it's best to eat the big frog first." Unpleasant tasks we procrastinate completing are "big frogs." Complete these tasks as your first action of the day to get them out of the way. Another option is to "snowball" your tasks by breaking them down into smaller segments, completing preparatory tasks, and eventually completing the larger task at hand. Whether you choose the "big frog first" or "snowball" method, try building in a reward system for completed tasks to help stay motivated.

Manage Time-Wasters

Reduce or eliminate time spent in these activities by implementing some simple tips.

Handheld Devices

- Take advantage of voice-to-text features such as transcribed voicemails or to make notes or draft emails and text messages when you are on the go.
- Avoid small talk. Stay focused.
- Take any necessary action immediately following a call.
- Impose screen time limits and regularly monitor your digital wellness (see Strategy 10).
- Schedule breaks from your devices.

Email

- Set aside a specific time to view and respond to email, but don't let it accumulate to the point it becomes overwhelming to sort.
- Turn off notifications for email.
- Handle each item only once if possible.
- Immediately delete or unsubscribe from junk emails.
- Keep address books up-to-date and organized.
- Utilize built-in shortcuts to sort email.

Unexpected Visitors

- Schedule time for face-to-face visits.
- Inform visitors of your time constraints and politely offer to reschedule.
- Set a mutually agreeable time limit for the visit.
- When someone comes to the door, stand up and have your meeting standing to help keep it brief.

In-Person and Virtual Meetings

- Know the purpose of the meeting in advance.
- Arrive early.
- Start and end the meeting on time.
- Prepare an agenda and stick to it. Use a timed agenda, if necessary.
- Don't schedule meetings unless they are necessary and have a specific purpose or agenda.
- Use recording software or designate a note-taker.

Family Obligations

- Use and sync virtual calendars for easy sharing between busy family members.
- Make each family member responsible for consulting the master calendar for potential conflicts.
- Create a central area or agreed upon app for posting communications such as appointment reminders, announcements, and messages.

Avoid Multi-tasking

Psychological studies have shown that multi-tasking does not save time. In fact, the opposite is often true. You lose time when switching from one task to another, resulting in a loss of productivity (Rubinsteim, Meyer, and Evans, 2001). Routine multi-tasking may lead to difficulty in concentrating and maintaining focus. Do your best to focus on just one task at a time by keeping your area clear of distractions, including turning off notifications on your devices, and set aside dedicated time for specific tasks.

Stay Healthy

The care and attention you give yourself is an important investment of time. Scheduling time to relax or do nothing helps you rejuvenate physically and mentally, enabling you to accomplish tasks more quickly and easily. Be sure to monitor your screen time as a part of your digital well-being, setting boundaries to stay healthy. A study conducted by Google showed that four out of five study participants who took steps to improve their digital well-being believe their overall well-being was positively impacted as well (Google, 2019). To improve your digital well-being, set time limits or utilizing built-in software on electronic devices such as phones and tablets to help maintain your digital wellness. Blue light blockers and grayscale mode may also help you improve your digital well-being. Set a time each night to shut off all digital devices to give your mind time to relax; this can also help improve your sleep schedule.

Unfortunately, poor time management and too much screen time can result in fatigue, moodiness, and more frequent illness. To reduce stress, reward yourself for time management successes. Take time to recognize that you have accomplished a major task or challenge before moving on to the next activity.

THE TIME MANAGEMENT METHODS

The ABC time management method is just one of many time management strategies designed to help you prioritize tasks and manage your time effectively. Whether you use the ABC method and find it lacking or you're interested in combining techniques, these ideas are sure to help.

THE IMPORTANCE OF TIME MANAGEMENT IN STUDENT LIFE:

Time management is not only important for professionals, but also for everyone. Even students need to know how to manage their time in order to use it effectively.
Some of the reasons why time management is important for students are:

- Help them develop a sense of responsibility.
- Can lead to effective learning
- Money management assistance
- Good efficiency gains
- Prepare them for the outside world.

ADVANTAGES AND DISADVANTAGES OF TIME MANAGEMENT

The advantage of time management is not only important for career development. It has a significant impact on personal life. Reasonable scheduling is necessary and leads to self-discipline because punctuality has many advantages.

Reduction of stress levels

Reducing stress is the main content of time management. If you apply time management correctly, you will achieve a better result. You too can relax and enjoy your work. Stress leads to a worsening of working hours and a disrupted workflow can never lead to the best results. The result will undoubtedly come, but no one can say that it will be the best or the worst.

Allows you to concentrate on the task

Time management skills initially relieve you of stress and later help you focus on your goal and performance in the task. A target succeeds in less time than a person who fights harder to achieve their goal in life. People always want to have a successful and pleasant life, and this can be achieved by keeping track of everything and every step.

Reduce the hesitation

There is a lot of time in life and it also causes fluctuations. The special point in introducing time management is the ability to predict results and control situations. Time management is not something that requires additional skills, the only thing you need to know is how to implement it and how to deal with it in your daily activities.

Gain confidence

Self-confidence plays a crucial role in human life and people who are confident always have a better life than dependent people. This feeling usually manifests itself when you plan your work properly and make decisions about the time it takes to improve. “Time management never takes time, but gives you extra time.” A person can do anything with self-confidence and self-confidence takes a person to a higher level.

A path to the goal

Everyone has the desire to achieve their goal in life and dreams of a relaxing future after reaching that goal. Time management gives you time where it has the most effect. The time management system allows everyone to spend time with the things that are most important to them. In this process, time management has a positive aspect and people consider planning as a better option.

Test your productivity

Everyone’s capacity is similar, only habits differ in the results. People who reach 100 out of 100 points are also people and not robots, the fact is that they follow their dreams. The state turns into a turtle with your determination when you plan your next meeting because all the tasks are listed on the to-do list.

Have an instinct for success

The performance of a task is different, while the success of a series of successes is a very different task. Only then will our kitten experience a series of successes if we make our efforts in a pre-defined way. Discipline and personal development are a must. Communication tools that are available in various forms of support, synchronous, such as setting the meeting time as a web conference and asynchronous without a fixed time to contribute as a discussion forum in the form of interaction. This performance is the result of hard work and dedicated behavior. Everyone must introduce time management if they are to be successful.

Time for relaxation and leisure activities

Recreation in this time of rush is a blessing and everyone wants it, but few can do it. Don’t miss an event. You don’t have to worry about missing events as the working day is scheduled with reminders and alerts for urgent events. The blessed are those who work punctually and adopt a schedule in their lives to create daily chaos. Relaxed living motivates people and puts them on the road to success. Leisure activities also give a boost to family life. People feel more connected to their families. The only thing to keep in mind is that relationships need time and love to thrive.

Financial strength

Success brings financial benefits. A person is always in good financial health if he or she has planned his or her life well and has a schedule for his or her personal and professional life.

DISADVANTAGES OF TIME MANAGEMENT

The first fall, while you are managing your time, is an area of your life that influences other areas. To avoid a compromising situation, it is enough to understand that learning time management theory mainly means a change in lifestyle. In other words, it requires a consistent adoption of values for effective time management. This can be very difficult for someone who does not accept punctuality and time. Time management has very few disadvantages. The main disadvantages of management are that it takes longer to create plans. It can also make human life mechanical.

Unclear targets

Productive behavior is certainly one of the main goals of time management. Sometimes it leads to imprecise goals that generally hit people hardest. An unconscious person does not know what to do? If you are not able to manage your workload better, you will be more affected by tasks that are not completed in the shortest possible time.

Bad management

Organized results for less rework and mistakes, but an excess of enthusiasm for the organization leaves a person in error. Articles, details, and instructions are so forgotten that they lead to extra work and blame for mismanagement. A person must do a task more often if he forgets something. This leads to fatigue and occurs due to predictive behavior.

I cannot say "no":

You may have forgotten an appointment or missed an appointment and everything has happened because you have been working on other tasks, because saying "no" will be difficult for you. Such crazy situations promote the friction of life. You can avoid such problems by planning and preparing carefully. No one can create more time, but it can be better used by managing time, no doubt about it. It is always better to stay away because people cannot say no to anyone.

Obstacles

Simple measures such as moving the pendulum or working early lead to more problems in life. Time management leads you to an obstacle. If you know what to do, you hate wasting time in idle activities, which leads to arguments and disruptions. Instead of thinking about what to do next, focus on the steps before work, because everything can go wrong. This results in many problems for people.

Inactivity

Frequent misunderstandings make time management an extra effort. On the contrary, good time management makes human life easier and more inactive. If things take less effort than usual, then time consumption leads to inertia. Managing time to improve life, because time management means spending time in the right places and on the right things, but sometimes the obsession with doing things right makes your life stagnate.

One load of different jobs at a time

When you work after time management, you sometimes take on too many tasks with too much self-confidence. This particular state makes you make a total mistake. People have too many expectations of you simply because of your pompous behavior, and finally, you feel a lot of work on your shoulders. And such confusion leads to mismanagement.

Fatigue and stress are part of life

Fatigue and stress are common problems that lead you into a phase of fatigue. Fatigue makes a person tired of life. They also feel demoralized because they think again and again about their unsuccessful attempt to take charge of time management in their lives. They consider their unsuccessful attempt as a stop in their own way and leave behind them an interest in everything. Most people are susceptible to the disease. Good planning is not a cup of tea for everyone. The first and last grasp only the abilities that allow you to relax from the difficulties of a hectic life, instead of taking you deeper.

No time to rest

Recovery disappears from the lives of people who are more concerned about time management than their personal abilities. They waste most of their time planning instead of acting. Intellectuals generally define actions as speaking louder than words. And people who invest their time and money in planning can never succeed. Leisure has become a necessity in today's life. If someone does not, then these people's lives will become a burden to them and they will lead their lives in a stagnant way.

CONCEPTUAL FRAMWORK

Time is the magnitude measured by clocks Bakman and Pogorelesky (2007). Although time is referred to as second, minute, hour, day, week, month, quarterly, year, decades etc. or a specific time or period. Be that as it may, time is a valuable resource to every man on earth and also helps in the actualization of one's desires, objectives and aims in every institution or organization.

Ugwulashi (2011) states that "Time is a part of the measuring system used to sequence events, to compare the duration of events and the intervals between them, to quantify rates of change such as the motions of objects". This further buttress the fact that time is of essence in every one's life. Institutions, organizations. Etc. every institution places very high importance to time in the actualization of set goals, objectives.

However, educational administrators, educational managers spend more time in planning, organizing, communicating, controlling, holding meetings, conferences and workshops.
Olawolu and Ahaive (2011) postulated that every activity in school that requires effectiveness must be given adequate time and time designed for the required objectives, goals and aims are properly used for the development of the school and the society at large.
Furthermore, Tanz (2003) suggested the ten points guidelines administrations can use for the effectiveness of resources utilization that time can be managed; they are:

- Set objectives for using available resources
- Define tasks to be done
- Group tasks into job
- Initiate work activities
- Formulate plans for achieving the objectives
- Categorize activities into groups or departments
- Supply incentilles to stimulate productivity
- Set up controls and measuring achievement of objectives and monitoring performance
- Take remedial actions for unachieved objectives
- Staff the jobs with people

Furthermore, Wallace (2000), identified some responsibilities principals could need to set standard and also student achievement in show(s). the responsibilities are as follows:

- Cultivating leaders in others: A broad and longstanding consensus in leadership theory hold that leaders in all walks of life and also all kinds of organizations, private, public and schools, need to also repent on others to accomplish or successes in very groups and also needs to encourage the development of leadership across board.
- Managing people, data and processes to foster school improvement. Data use figured prominently and formal evaluation classroom visits or learning walks, principles intent in promoting growth in both students and adults spend in classrooms, observing and commenting in what is working well and what is not.

WORK-LIFE BALANCE AND TIME MANAGEMENT

Achieving a healthy work-life balance is crucial for overall well-being. Time management strategies can play a significant role in maintaining this balance. Clark and Knight (2020) explored the relationship between workplace factors and worklife balance. The importance of time management skills in achieving work-life balance and reducing work-related stress.

CHALLENGES AND SOLUTIONS

While time management strategies offer numerous benefits, individuals often face challenges in implementing them effectively. Distractions, such as technology and interruptions, can hinder time management efforts. Morgenstern (2004) suggested strategies such as setting boundaries, minimizing interruptions, and utilizing technology mindfully to overcome these challenges. Perceived time scarcity is another common challenge. Individuals may feel overwhelmed by the demands on their time, leading to stress and inefficiency. Peeters et al. (2019) emphasized the

importance of self-monitoring and self-awareness to accurately assess how time is used and identify areas for improvement.

TIME MANAGEMENT TECHNIQUES AND STRATEGIES

Effective time management is essential for enhancing personal productivity and achieving a healthy work-life balance. This abstract explores various strategies and techniques that individuals can employ to optimize their time utilization, reduce stress, and create harmony between professional and personal responsibilities. The abstract highlights the significance of prioritization, goal setting, and planning as fundamental pillars of time management. It further delves into the importance of eliminating time-wasting activities, delegating tasks, and utilizing technology tools for enhancing efficiency. Additionally, the abstract emphasizes the significance of self-care and setting boundaries to maintain a healthy work-life balance. By implementing these time management strategies, individuals can increase their productivity, reduce stress levels, and cultivate a more fulfilling and balanced lifestyle.

Pomodoro Technique

A Time Management Strategy for Enhanced Productivity and Work-Life Balance. The Pomodoro Technique is a popular time management strategy that aims to improve personal productivity and work-life balance by breaking tasks into manageable intervals. Developed by Francesco Cirillo in the late 1980s, this technique utilizes focused work sessions coupled with regular breaks to optimize concentration and prevent burnout. It is also beneficial as it helps you become more disciplined and think about your work. This technique is designed to combat multitasking and improve concentration. By adopting the Pomodoro Technique, individuals can effectively manage their time, increase productivity, and strike a better balance between work and personal life.

Time Blocking

The Time Blocking technique is a popular time management strategy that involves scheduling specific blocks of time for different tasks and activities. This technique aims to optimize productivity and work-life balance by allocating dedicated time slots for different priorities and minimizing distractions. By adopting the Time Blocking technique, individuals can better manage their time, increase focus, and achieve a more harmonious integration of work and personal life. The key principle of the Time Blocking technique is to divide the day into distinct blocks of time, each dedicated to a specific task or activity. These blocks can be as short as 15 minutes or as long as several hours, depending on the nature and complexity of the task. During each time block, individuals focus solely on the designated activity and avoid distractions, interruptions, or multitasking. This approach allows individuals to immerse themselves fully in the task at hand, maintain concentration, and achieve a higher level of productivity. Research on the Time Blocking technique and its impact on personal productivity and work-life balance has shown promising results. For instance, a study by Morgenstern (2018) examined the effectiveness of time blocking among knowledge workers. The time blocking reported increased productivity, improved focus and reduced work-related stress. By consciously allocating time for

specific tasks, participants were able to better manage their workload, set realistic expectations, and maintain a healthier work-life balance.

The Action Method Technique

The Action Method technique is a time management strategy that emphasizes capturing, organizing, and prioritizing tasks and ideas to increase productivity and maintain a better work-life balance. Developed by entrepreneur and author Scott Belsky, this technique involves three key steps: Capture, Organize, and Prioritize. By employing the Action Method, individuals can effectively manage their tasks, streamline their workflow, and achieve a sense of clarity and control over their responsibilities.

Creating A Climate Hospital To Education

To create a more conclusive and suitable climate for learning. This will assist the principal and also staff personnel to work with time and also not apportioning blames due to unrealistic climate conditions. The establishment of a friendly school climate influences the commitment of everybody for the achievement of the educational goal.

Improving Instruction

Effective principals work relentlessly to improve achievement by focusing in the quality of institution they help define and promote high expectations; they also attack teacher isolation and fragmented efforts, encourage continued professional learning and they also convert directly with teachers and the classroom

Time Table

Ebong (2011) opined that time table guides the daily academic activities of the curriculum, and the rule and regulations of the instruction. Also, time table is the systematic or specific arrangement for time schedules irrespective to an activity. Time table is used to show how time is arranged for the various activities set asive to be performed by the school principal.

It also helps in the arrangement of school programmes, ranging from opening prayer, closing of the devotion, teaching period break time, labour, sports etc. it helps to guide the school of every activity per day, week and month. This is to ensure that, when any time is lost, it cannot be recalled back and time cannot be stored.

Personnel Time Analysis Chart

This chart shows the various activities the principals spend their our time in. it also helps the principal, in the day to day running and identify the time that are lost due to one issue or the other, also helps to manage and make judicious use of their time.

BENEFITS OF TIME MANAGEMENT OF EDUCATIONAL GOALS

- To gain control over time: The goal is not for sake of control but in order to become more effective, reduce your stress, increases your self esteem and gain a sense of inner peace.
- Increases productivity: Effective time management increases the productivity of the principal to accomplish more with less effort.
- Achieve your goals: it helps to accomplish your important goals by guiding you to direct and focus in the appropriate amount time and energy towards their achievement.
- Find balance: Effective time management helps you lead a more balanced life by helping you find time and energy to devote to all the important areas of your academic goals.

CONCLUSION

The time management practices among principals were minimal and poor; however they were able to manage time well in their job performance. Factors such as protecting their job, to avoid sanctions and not to stall promotion and recognition were found to play significant role in this attitude as well as institutional time bound activities which compelled them to comply with the school time, all combined to make it possible for them to be effective in their job.

Also, time is a universal phenomenon is a management resource that affects our everyday activity, how far we will go in life as individual or organization is dependent on how well as manage our time. Although the times may be hard, it can still be planned and managed to achieve result. Time management strategies you use, take time to evaluate how they have worked for you. Do you have a healthy balance between work and home life? Are you accomplishing the tasks tasks that are most important in your life? Are you investing enough time in your own personal wellbeing? If the answer is “no” to any of these questions, then reevaluate your time management strategies and transition to ones that will work better for you. Successful time management leads to greater personal happiness, more accomplishments at home and at work, and a more satisfying future.

Whatever time management strategies you use, take time to evaluate how they have worked for you. Successful time management leads to greater personal happiness, more accomplishments at home and at work, and a more satisfying future. Time management is a critical skill that individuals need to effectively manage their personal and professional responsibilities while maintaining a healthy work-life balance. Time management methods can directly reduce stress. The process will result in fewer surprises, less time pressure and some urgent events from one task to another and from one place to another. Being productive can be an objective for you and this can be done by introducing time management. It gives an idea of what needs to be done to better manage the workload. It allows a person to be organized and achieve the expected results with less work and errors. Time cannot be increased but can be managed.

Recommendations

Some recommendations on how to manage time for individual and organizational goal attainment. These recommendations are:

- Plan your schedules and stick to the time allotted to every activity. Have an action plan that should include all the things and not one thing more than having only one thing to do.
- Prioritize the things you want to do according to their importance.
- Try to resist unrewarding activities and unnecessary discussions.
- Establish a regular routine
- Reduce interruptions.
- Learn to set short time and long time goals and to achieve them within a given time frame.
- Avoid time wasting habits; evaluate your habits and retain only those that save time.

THE RELEVANCE OF INFRASTRUCTURAL FACILITIES FOR EFFECTIVE LEARNING OUTCOMES IN PUBLIC SECONDARY SCHOOLS IN NIGERIA

Constance AMACHREE
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

Infrastructural facilities play a crucial role in ensuring effective learning outcomes in public secondary schools in Nigeria. Adequate infrastructure, including well-equipped classrooms, libraries, laboratories, and ICT centers, fosters an environment conducive to academic success. However, many public schools in Nigeria suffer from inadequate and poorly maintained facilities, negatively impacting students' performance, motivation, and overall educational development. This paper reviewed the significance of infrastructural facilities in enhancing teaching and learning processes. It highlighted the correlation between improved school infrastructure and students' academic achievements, emphasizing the need for government intervention in funding and maintaining school facilities. The paper established that a well-developed learning environment contributes to better engagement, knowledge retention, and skill acquisition among students. The paper concluded that addressing infrastructural deficiencies in Nigerian public secondary schools is imperative for enhancing educational outcomes. Among others, the paper suggested that, the government and stakeholders should prioritize increased investment in school infrastructure by implementing policies that ensure regular maintenance and upgrading of facilities. This will create a more conducive learning atmosphere, bridging the gap between public and private education and ultimately improving the quality of education in Nigeria.

Keywords: Relevance, Infrastructure, Facilities, Effective, Learning Outcomes.

INTRODUCTION

The importance of school facilities can never be over-emphasized. It is the talk of the day in our national dailies. The availability of human resources and physical facilities ensures effective teaching and learning and is closely correlated with the students' performance. Ike (2007) attributes students' low performance in adult education studies to the lack of qualified staff. According to him, there has been an unprecedented expansion at all levels of education, which has not been matched with a corresponding increase in the number of qualified teachers. Nworgu (2005) on the other hand, asserted that no matter the strength of manpower resources in the system, educational process must require conducive physical accommodation, libraries,

furniture, and play ground. Osobonye (2002) stated that laboratory has been identified as the most suitable place to acquire the right skills and attitudes. In the laboratory, the student is afforded the opportunity to develop and practice the processes of science such as observations, communication, and formulation of hypotheses, experimentation and classification.

Osobonye then concluded by saying that if one was to achieve any or all of the aims of teaching and learning in non-formal and adult education one has to take proper stock of laboratories and identify those factors which constitute a draw back to the use of the laboratory for the purpose it was set up and take appropriate step to correct them. On the issue of dormitory, many schools are day schools because they lack accommodation facilities. This appears to contribute to the low academic performance of students because many of them' absent themselves from school at will, prefer watching films than reading their books. Worst still, some of the students may not be accommodated in the schools and are therefore exposed to the danger of staying in hired houses.

It has also been observed that even the few school facilities available are not properly utilized for the better performance of students. Store keepers, laboratory attendants, librarians and library attendants are conspicuously absent in most of non-formal and adult education centers. What they have are what they call substitutes. The so-called substitutes may not be efficient because it is difficult for one to give what he/she has not. To buttress, this, many schools have teacher librarians without library assistants. The teacher librarian locks up the library when he goes to class to teach. The consequence is that the students are not allowed to make effective use of the library. On the other hand, the teacher librarian may not have fair idea of the use of libraries. He/she may not have an idea about filing, numbering and cataloguing of newly purchased books. The resultant effect is that 'many books may be there but the students cannot have access to them. So, effective performance or poor performance has to do with all the problems identified above. So, since, the main instrument of evaluating the quality of our adult education students' performance in Rivers State; the factors affecting the students performances with particular reference to school facilities give everybody great concern. It is this that inspired, the present researcher to try to investigate into the extent to which the availability and utilization of school facilities relate to students' academic performances in adult education programme.

This would expectedly necessitate a great demand for more school facilities to take care of the teaching school population (Abdulkareem, 2003). Inspite of the importance of these resources in achieving education goals, adequate attention has not been paid to their provision and management in Nigerian schools. As elucidated by Adeboyeje (1999), Inspector’s report over years have indicated that there is abundant evidence of a catalogue of inadequacies in the provision and judicious use of school buildings and materials for instruction in the country.

In the mid-70s, the Federal Government embarked on Universal Free Primary Education (UPE) in all parts of the country. This programme involved physical development of primary schools in addition to teacher training etc. To ensure the success of that programme, the Federal Ministry of Education Issued some technical guidelines for the building programme which consisted of some prototype school designs (Fafunwa, 2004).

The importance of school facilities for the achievement of school goals in secondary schools cannot be emphasized. Principals, teachers and students maximize these facilities for effective teaching and learning outcomes, administration and management of schools. However, public senior secondary schools in Rivers State have witnessed a downward spiral in the provision of adequate school resources and subsequent utilization which has greatly affected the smooth running of schools. Some schools in Rivers State suffer from inadequate classroom

facilities, ill equipped laboratories, poor or dilapidated school libraries, inadequate accommodation and poorly maintained recreational facilities for extracurricular activities. The implication of all this aforementioned challenges can spell doom for the survival of public senior secondary schools in Rivers State. Hence, this study seeks to investigate the provision and utilization of infrastructural facilities for effective learning outcomes in public senior secondary schools in Rivers State

THEORETICAL FRAMEWORK

Human Capital Theory

The Human Capital Theory, originating from Adam Smith in 1776 and expounded upon by Nwaeke (2019), represents a foundational framework for comprehending the dynamics of educational systems, particularly in the context of the study on the provision and utilization of infrastructural facilities for effective learning outcomes in public senior secondary schools in Rivers State. Smith's original insights, as cited in Nwaeke (2019), describe the essence of human capital, conceptualizing individuals not merely as labour but as repositories of inherent skills and knowledge. This perspective forms the bedrock of the theory, asserting that the economic value of an individual, akin to other economic assets, is intricately tied to the competencies, attributes, and knowledge they embody.

At its core, investments in education, facilitated by adequate infrastructural provisions, contribute substantively to economic growth. Thus, understanding and optimizing the correlation between educational infrastructure and economic development becomes imperative for the region's progress. The theory, therefore, postulates that investments in education and training contribute significantly to the development and enhancement of this human capital. Munyon et al. (2011) expand on this foundational concept, emphasizing the critical relationship between a nation's human resources and its economic output. The theory contends that for sustainable socio-economic development, there must be strategic investments in the country's human capital. In the specific context of Rivers State, where the study unfolds, this implicates a nuanced understanding of the role of teachers in shaping the human capital of students and, consequently, the socio-economic fabric of the region.

The theory posits that the educational system's effectiveness is contingent upon provision and well-utilized resources that can contribute meaningfully to the development of students. In the context of public senior secondary schools in Rivers State, this dimension of the theory acquires heightened significance. The theory underscores the need for investments in the quality of education and continuous professional development for teachers. The Human Capital Theory, holds profound insight in unravelling the complexities of the "Provision and Utilization of Infrastructural Facilities for Effective Learning Outcomes in Public Senior Secondary Schools in Rivers State." This theoretical framework operates as a comprehensive lens through which the dynamics of the educational landscape in Rivers State can be elucidated and strategically addressed.

Furthermore, Osemeke (2012) investigates into the allocation and utilization of scarce manpower resources, a tenet integral to Human Capital Theory. Efficient human resource management within the educational system becomes imperative to yield high educational outputs. The theory contends that strategic deployment of teachers in their areas of specialization is essential for optimal utilization of their skills, aligning with the study's exploration of the

provision and utilization of infrastructural facilities. The dynamic nature of Human Capital Theory is exemplified in its acknowledgment of education as an ongoing process (Nwaeke, 2019). The theory implies that continuous investments in the development of educators, aligned with evolving educational methodologies and technological advancements, are essential. This perspective resonates with the multifaceted challenges faced by the educational landscape in Rivers State, requiring adaptability and sustained commitment to human capital development.

Human Capital Theory also resonates with the National Policy on Education (FRN, 2014), guiding the study towards an exploration of how the provision and utilization of infrastructural facilities align with overarching educational goals. The theory reinforces the notion that quality infrastructure is instrumental in nurturing morally upright, effective citizens, and the study navigates these nuances within the specific regional context. Furthermore, the theoretical framework emphasizes the need for educational equity and access. In Rivers State, the study delves into how infrastructural provisions contribute to creating an environment where students, regardless of geographical location or socio-economic background, have equal access to a qualitative education. Human Capital Theory thus becomes a guiding principle for fostering inclusivity and fairness within the educational system.

Moreover, Human Capital Theory introduces a pragmatic perspective on the efficient allocation and utilization of scarce resources, particularly the human workforce. Within the study's purview, this implies that strategic deployment of teachers, coupled with the judicious use of infrastructural facilities, can maximize the impact of limited resources, enhancing overall learning outcomes. The Human Capital Theory provides a comprehensive lens through which to examine the intricate interplay between teachers as human capital, the provision and utilization of infrastructural facilities, and the resultant impact on effective learning outcomes in public senior secondary schools in Rivers State. In summation, the Human Capital Theory emerges as a dynamic framework that not only explicates the intricate interplay between human capital, infrastructural facilities, and learning outcomes but also provides actionable insights for policymakers, educators, and stakeholders in shaping a nuanced understanding of the theoretical underpinnings guiding the study.

CONCEPTUAL CLARIFICATIONS

Infrastructural Facilities in Education

Teaching and learning are very important aspects of education, because the realization of educational objectives depends largely on them. Education involves the inculcation of norms, values and right attitudes in an individual. As such, the significance of infrastructural facilities within educational settings forms the bedrock upon which the overall learning experience and academic outcomes in public senior secondary schools in Rivers State rest. Infrastructural facilities, comprising a diverse array of physical structures and resources, are indispensable contributors to the effective functioning of educational institutions. Their significance extends beyond mere architectural configurations, encompassing the entire ecosystem that shapes the learning environment. Adekunle and Oduwole (2019) aptly emphasized that the availability and quality of infrastructural facilities wield considerable influence over students' academic performance, underscoring the pivotal role these elements play in the educational landscape.

The provision of adequate classrooms, as asserted by scholars such as Adeyemi and Oludare (2021), extends beyond erecting physical structures. It involves a strategic consideration

of spatial arrangements, the incorporation of modern pedagogical techniques, and a meticulous understanding of climatic factors in the specific geographical context of Rivers State. This nuanced approach ensures that classrooms transcend conventional boundaries, evolving into dynamic spaces that foster an optimal learning environment. Similarly, laboratory facilities emerge as crucibles for practical understanding, particularly within the sphere of science education. Nwosu and Ukpabi (2019) assert that well-equipped laboratories are pivotal in enhancing the quality of science education. However, their role goes beyond a mere provision of apparatus; it encompasses the integration of practical experiments into the curriculum. Scholars like Okafor (2020) advocate for a comprehensive strategy that not only ensures the existence of laboratory facilities but also their effective utilization to foster hands-on learning and critical thinking.

Moreover, Akintunde and Adegboye (2017) explore the impact of well-stocked libraries on students' reading habits and academic performance. The provision of library facilities extends beyond the physical context of books. Scholars like Ezeani and Igwe (2018) argue for the incorporation of technology into library services, emphasizing the need to evolve with the digital age to foster information literacy. This dual approach ensures that libraries remain vibrant spaces, adapting to the changing needs of students in Rivers State. Accommodation facilities, often overlooked in their significance, contribute substantially to the overall well-being of students. The impact of accommodation facilities on students' well-being and academic performance involves more than constructing dormitories; it encompasses the creation of living spaces that are not only physically comfortable but also culturally sensitive (Obi & Ani, 2021).

Ogundele (2019) emphasized the importance of addressing local cultural considerations, recognizing the diverse backgrounds and needs of students. This inclusive approach ensures that accommodation facilities not only meet basic requirements but also contribute to a supportive and inclusive living community. Akinola and Adeleke (2022) emphasizes on the importance of aligning sports facilities with local cultural contexts, enhancing students' engagement and participation. The provision and utilization of games facilities extend beyond physical fitness; they incorporate cultural relevance to promote the holistic development of students.

In the educational endeavours, effective learning outcomes stand as the peak of infrastructural excellence, a well-rounded educational environment positively influences cognitive and non-cognitive outcomes. The geographical context of Rivers State educational setting necessitates a comprehensive approach, considering factors such as teacher quality, curriculum relevance, and community engagement (Ojugo, 2022). A nuanced understanding of infrastructural provision and utilization, as discussed in this review, is fundamental to fostering effective learning outcomes in the specific regional context.

The assessment of infrastructural facilities in educational settings on this study underscores the interconnected nature of infrastructural facilities, juxtaposing that they are components of a holistic strategy that, when meticulously provided and effectively utilized, contributes to the overall development of students. This unique perspective, which embraces the relationship between provision and utilization, lays the foundation for educational excellence, offering a nuanced roadmap for stakeholders to navigate as they strive to cultivate optimal learning environments for the students of Rivers State.

A good, advanced and resourceful infrastructure enhanced the quality of education received by the students. It creates innumerable opportunities to takes the evolving world, technology and society. A highly spirited infrastructure boosts their curiosity, interest and motivates them to attend their school regularly which will improve their cognitive development.

With respect to school facilities, McGowen (2007) observed that school facilities are the essential elements that must be established and taken into account in order for the objectives of the school system to be achieved and that the availability of these facilities determines the quality of teaching and student achievement. Research undertaken by McGowen (2007) shows that natural lighting boosts the morale of teachers and students. It also reduces off-task behavior and improves test scores. Environments with little natural light have been shown to produce less than desirable results.

Provision of Infrastructural Facilities

The provision of adequate infrastructural facilities in schools plays a pivotal role in shaping the quality of learning and teaching processes. School infrastructural facilities encompass a wide range of physical structures and amenities that are essential for creating conducive learning environments. These facilities include classrooms, libraries, science laboratories, computer labs, playgrounds, and sports facilities. Well-designed classrooms that are spacious, well-ventilated, and properly lit are essential for creating a conducive learning environment (Okechukwu, 2020). The physical environment of a classroom can significantly impact students' behavior, engagement, and academic performance (Oduwole, et al., 2018). Crowded and poorly maintained classrooms can lead to distractions and discomfort, negatively affecting students' ability to focus and learn effectively. On the other hand, classrooms that are well-equipped and organized can enhance students' concentration and motivation, leading to improved academic outcomes. Libraries play a crucial role in promoting literacy, reading culture, and research skills among students (Igwe, 2021). Access to a well-stocked library with a variety of books and resources can significantly impact students' academic performance. Libraries provide students with opportunities to explore different subjects, conduct research, and develop critical thinking skills.

Additionally, libraries serve as quiet study spaces where students can concentrate and immerse themselves in their studies. Schools with well-equipped libraries tend to have higher academic achievement rates, as students are more likely to excel academically when they have access to a wide range of resources. Science laboratories are essential for hands-on learning in science subjects (Ezeani, et al., 2018). Laboratory experiences allow students to engage in practical experiments and apply theoretical concepts in real-world contexts. Well-equipped science laboratories enable students to develop important skills such as observation, measurement, data analysis, and problem-solving. Moreover, laboratory experiences can enhance students' understanding and retention of scientific concepts, leading to improved academic performance in science subjects.

Proficiency in using computers and technology is essential for academic and professional success in today's digital age. Access to computer labs in schools can enhance students' learning experiences by providing them with opportunities to use educational software, conduct online research, and collaborate with peers. Computer labs also play a crucial role in preparing students for the digital demands of the 21st-century workforce. Schools that provide access to well-equipped computer labs tend to have students who are more proficient in using technology for learning and productivity.

Playgrounds and sports facilities contribute to students' physical health and overall well-being (Okafor, 2020). Physical activity is crucial for maintaining a healthy lifestyle and reducing the risk of chronic diseases. Playgrounds provide students with opportunities for outdoor play,

which is essential for physical development and socialization. Sports facilities enable students to participate in sports and physical education programs, which are essential for promoting physical fitness and teamwork skills. Schools that provide well-maintained playgrounds and sports facilities tend to have students who are more physically active and healthy, which can positively impact their academic performance.

The provision of adequate infrastructural facilities in schools is crucial for enhancing students' learning outcomes and overall well-being of the school. Classrooms, libraries, laboratories, labs, playgrounds, and sports facilities are essential components of a conducive learning environment. Schools that invest in quality infrastructural facilities tend to have students who are more engaged, motivated, and academically successful. Therefore, policymakers, educators, and stakeholders in the education sector should prioritize the provision and maintenance of school infrastructural facilities to ensure optimal learning outcomes for all students.

Utilization of Infrastructural Facilities

In the context of education, the availability and utilization of infrastructural facilities play a pivotal role in shaping the quality of learning and teaching processes. Nigeria, like many developing countries, faces numerous challenges in its educational sector, including inadequate infrastructure. Adequate infrastructure, such as well-equipped classrooms, libraries, and laboratories, has a profound impact on students' academic performance. According to Smith and Johnson (2019), a conducive learning environment enhances students' engagement and motivation, leading to improved academic outcomes. Well-maintained classrooms reduce distractions and discomfort, allowing students to focus better and learn more effectively. Additionally, libraries play a crucial role in promoting literacy and research skills among students (Brown & Lee, 2020). Access to a variety of books and resources can significantly impact students' academic performance by providing them with opportunities to explore different subjects and develop critical thinking skills.

Relevance of Provision of Infrastructural Facilities to Teachers

The utilization of infrastructural facilities also benefits teachers by enabling them to deliver high-quality education. Johnson and Brown (2017) note that well-equipped classrooms and instructional materials enhance teaching practices, allowing teachers to deliver engaging and effective lessons. Furthermore, facilities such as staff rooms and professional development centers support teachers in their continuous learning and growth as educators (Jones & Smith, 2018). The availability of these facilities enhances teachers' ability to provide quality education to their students.

Promotion of Effective Teaching Practices

Effective teaching practices are crucial for student success, and infrastructural facilities play a significant role in promoting such practices. Computer labs, for example, are essential for developing students' digital literacy skills, which are increasingly important in today's digital age. Access to computer labs allows students to use educational software, conduct online research, and collaborate with peers, all of which are essential for academic and professional

success. Similarly, well-equipped science laboratories enable students to engage in practical experiments and apply theoretical concepts in real-world contexts, leading to a deeper understanding of scientific principles (Jones & Smith, 2018).

Promoting a Sense of Community and Collaboration

Infrastructural facilities also contribute to the fostering of a sense of community and collaboration within schools. Libraries and study spaces provide students with opportunities to work together on projects and assignments, helping them develop teamwork and communication skills. Additionally, sports facilities and playgrounds promote physical activity and socialization among students, contributing to their overall health and well-being (Williams & Davis, 2019). The availability of these facilities encourages students to interact with one another, fostering a sense of belonging and community within the school environment.

The adequate utilization of infrastructural facilities in Nigerian education is essential for enhancing the learning environment and improving academic outcomes. By providing students and teachers with access to well-equipped classrooms, libraries, laboratories, and other facilities, educational institutions can create a conducive environment that supports effective teaching and learning practices. Additionally, the availability of infrastructural facilities fosters a sense of community and collaboration within schools, contributing to a positive school culture. Therefore, it is imperative for policymakers and stakeholders in the Nigerian educational sector to prioritize the provision and maintenance of infrastructural facilities to ensure optimal learning outcomes for all students.

Relevance to Academic Performance

One of the primary impacts of adequate provision and utilization of infrastructural facilities is the improvement of academic performance among students. Well-equipped classrooms with modern amenities and comfortable seating arrangements create a conducive learning environment that enhances students' concentration and engagement (Smith & Johnson, 2019). A study conducted by Brown and Lee (2020) found that access to well-stocked libraries with a variety of books and resources positively impacts students' reading habits and research skills, leading to improved academic performance. Additionally, science laboratories equipped with modern equipment and tools enable students to conduct experiments and apply theoretical knowledge, leading to a deeper understanding of scientific concepts and improved performance in science subjects (Jones & Smith, 2018).

Relevance to Teaching Practices

The provision of adequate infrastructural facilities also influences teaching practices. Well-equipped classrooms with interactive whiteboards and audio-visual aids allow teachers to deliver engaging and effective lessons that cater to the diverse learning needs of students (Johnson & Brown, 2017). Computer labs equipped with the latest technology provide students with opportunities to develop digital literacy skills, which are essential for success in the digital age. Furthermore, access to professional development facilities supports teachers in their continuous learning and professional growth, ultimately enhancing the quality of education (Jones & Smith, 2018).

Relevance to Student Well-being

Adequate provision and utilization of infrastructural facilities also contribute to student well-being. Sports facilities and playgrounds provide students with opportunities for physical activity and socialization, which are essential for their physical and mental health (Williams & Davis, 2019). Research has shown that regular physical activity can improve students' concentration, mood, and overall academic performance. Additionally, facilities that support collaboration, such as libraries and study spaces, enhance students' interpersonal skills and contribute to a sense of belonging in the school community.

Relevance to Social and Economic Impact

The impact of adequate provision and utilization of infrastructural facilities extends beyond the classroom and has broader social and economic implications. Education is a key determinant of social mobility and economic prosperity. A well-educated workforce is essential for a country's economic growth and competitiveness in the global market. Adequate provision and utilization of infrastructural facilities in schools can help bridge the gap between urban and rural areas, providing equal opportunities for students to access quality education.

The provision and utilization of infrastructural facilities play a crucial role in shaping the quality of education and ensuring positive educational outcomes. Adequate facilities create a conducive learning environment, enhance teaching practices, and contribute to student well-being. Therefore, it is essential for policymakers and educators to prioritize the provision and utilization of infrastructural facilities to ensure optimal learning outcomes for all students.

Relevance of Provision and Utilization of Infrastructural Facilities for Effective Learning Outcomes

The planning of the educational system in Rivers State is fundamentally hinge on the dual axes of provision and utilization of infrastructural facilities. These twin pillars form the bedrock upon which the educational structure is established, determining the efficacy of learning outcomes. Adequate provision, a foundational pace in this organisation, ensures that schools are endowed with the requisite physical resources. This involves not only the construction of structures but also the strategic allocation of spaces and resources tailored to the unique needs of public senior secondary schools. As Okechukwu (2020) asserts, strategic planning becomes the linchpin, guiding the provision process to meet the specific demands of educational institutions within the nuanced context of Rivers State.

Yet, provision alone is but the initial note in the masterpiece. The utilization of these infrastructural facilities emerges as the harmonizing phrase that brings the educational system to limelight. This is not a mere act of using physical spaces and resources but a nuanced and comprehensive approach that goes beyond the superficial layer. Okeke (2019) advocates for an incorporating strategy, one that considers the intricate dance of maintenance, accessibility, and adaptability to the ever-evolving methodologies of education. It is a dynamic process that demands a thoughtful and agile response to the evolving needs of both educators and learners.

The symbiotic relationship between the provision and utilization of infrastructural facilities unravels as an elaborate insight of not just a act of construction; it is a strategic endeavour that envisions the future of education in Rivers State. Uwazuruike's (2017) emphasis

on strategic planning becomes a clarion call, resonating through the corridors of educational policymaking, urging stakeholders to envision infrastructural provisions not as isolated structures but as interconnected components of an educational ecosystem. In the hands of educators, these provisions metamorphose into vibrant spaces where knowledge is imparted and wisdom cultivated.

The utilization of classrooms, laboratories, libraries, accommodation spaces, and games facilities is not a routine choreography but a dynamic choreography that involves a delicate balance of pedagogy, technology, and adaptability. Ojugo (2022) call for a comprehensive approach finds significance in this study, as the utilization of these facilities demands not only routine maintenance but also an embrace of emerging educational paradigms. It requires educators to navigate the intersection of tradition and innovation, ensuring that these facilities become crucibles of transformative learning experiences. The confluence of provision and utilization of infrastructural facilities is not a mere meeting point; it is a synthesis that determines the character of educational endeavors in Rivers State.

As Uwazuruike (2017) and Okeke (2019) have noted, effective learning outcomes are not a product of isolated efforts but a culmination of a well-rounded strategy that encompasses both provision and utilization. The classrooms, laboratories, libraries, accommodation spaces, and games facilities are not mere structures; they are the conduits through which knowledge flows, and wisdom is garnered. Consider the classroom, the centre of intellectual discourse and academic engagement. Adequate provision ensures that classrooms are not just physical spaces but dynamic arenas where the symphony of teaching and learning unfolds. Adeyemi et al. (2021) call for strategic planning reverberates here, guiding the provision of classrooms to align with the pedagogical needs and demographic nuances of public senior secondary schools in Rivers State. The utilization of these classrooms, in turn, necessitates an adaptive approach. It involves not only the dissemination of information but also the facilitation of interactive and participatory learning experiences. The utilization of classrooms transforms them from static spaces into vibrant hubs where the exchange of ideas and the cultivation of critical thinking flourish.

Similarly, the laboratories, citadels of scientific exploration, demand meticulous attention to both provision and utilization. The utilization of laboratories, therefore, is not a passive act but an active engagement with the scientific method, where students research into the world of experimentation and inquiry, with the objective of academic advancement. Libraries, repositories of knowledge, stand as testaments to the importance of provision and utilization in tandem. Adequate provision ensures that these spaces are not just physical collections of books but evolving entities that embrace technological advancements. Uwazuruike's (2017) strategic planning extends to libraries, envisioning them as spaces where traditional and digital resources converge to cater to the diverse learning needs of students. The utilization of libraries, then, becomes a journey of exploration and discovery. It involves not just reading but engaging with a spectrum of information, from printed volumes to online databases. The utilization of libraries transforms them from static repositories into dynamic ecosystems that foster information literacy and independent inquiry.

Accommodation facilities, often relegated to the boundary, play a pivotal role in the planning of effective learning outcomes. Adequate provision ensures that these spaces are not just dormitories but living environments that contribute to the overall well-being of students. Ogundele's (2019) strategic planning extends to accommodation facilities, recognizing them as integral components of the educational ecosystem. The utilization of these spaces goes beyond providing shelter; it involves creating a conducive atmosphere where students can rest, recharge,

and engage in communal living. The utilization of accommodation facilities transforms them from mere structures into nurturing environments that contribute to holistic student development. Games facilities, considered extracurricular, are instrumental in fostering both physical and mental well-being. Adequate provision ensures that these spaces are not just sports fields but dynamic arenas that cater to a spectrum of physical activities.

Akinola et al. (2022) extends to games facilities, envisioning them as spaces that align with the cultural and recreational preferences of students. The utilization of games facilities, then, involves not just sports but a holistic approach to physical fitness and well-being. It transforms these facilities from mere playgrounds into spaces that promote teamwork, discipline, and a healthy lifestyle. In the synthesis of provision and utilization lies the quintessence of effective learning outcomes. The strategic planning of infrastructural facilities becomes the guiding principle, directing stakeholders to envision an educational landscape where educational resources are not just static entities but dynamic elements that contribute to the holistic development of students.

Provision of Classroom Facilities

Classroom facilities stand as the bedrock of the educational structure, embodying the very essence of the teaching and learning process. In the context of Rivers State, several scholars such as Okorie and Eze (2018); Mbadiwe-Woko, Ogwo, and Taylor (2019) have investigated into the nuanced impact of classroom facilities on the academic performance of students, shedding light on the importance for well-designed and adequately equipped spaces. The provision of classrooms is not merely a logistical consideration but a pivotal investment in the physical spaces that become the crucible for intellectual exploration and knowledge dissemination. Jedo (2017) underscore the significance of well-designed classrooms, emphasizing that the physical environment can significantly influence students' academic performance.

Adequate provision ensures that classrooms are not mere structures but dynamic spaces tailored to facilitate effective teaching and learning. The spatial arrangements, seating configurations, and technological integration all play a role in shaping the classroom environment. These considerations extend beyond the conventional boundaries of construction, encompassing a strategic approach to creating spaces that inspire engagement, collaboration, and effective knowledge transfer. In tandem with provision, the effective utilization of classroom facilities emerges as a critical factor in shaping the educational experience.

Adeyemi and Oludare (2021) contribute to this discourse by highlighting the need for innovative teaching methods and technologies. The utilization of classrooms involves not only the physical presence of students and teachers but also the integration of pedagogical strategies that cater to diverse learning styles. Technological advancements, when judiciously incorporated, can transform classrooms into dynamic hubs of interactive learning, breaking away from traditional models to embrace a more student-centric and participatory approach. Ekeh et al. (2018) draw attention to the climatic considerations that should be factored into the planning and utilization process of educational facilities in Rivers State. In a region characterized by diverse climatic conditions, the provision of classrooms must extend beyond conventional architectural principles. Adequate ventilation, temperature control, and other environmental factors become integral components of a comprehensive strategy to create an optimal learning environment.

This regional nuance underscores the importance of adapting infrastructural provisions to the unique context of Rivers State, ensuring that classrooms are not only well-equipped but also

tailored to the local climate for the comfort and well-being of both students and educators. The provision is the initial brushstroke on the canvas, determining the physical contours and capacities of the educational spaces. Adequate provision ensures that there is a sufficient number of classrooms to accommodate the student population, preventing overcrowding and fostering an environment conducive to concentration and engagement.

The effective utilization of these classrooms, however, transforms them from static spaces into dynamic environments where teaching becomes an art form. Incorporating innovative teaching methods, as suggested by Adeyemi and Oludare (2021), allows educators to transcend traditional boundaries and cater to the diverse learning needs of students. Interactive lectures, group discussions, and hands-on activities become integral parts of the pedagogical repertoire, transforming classrooms into lively forums of intellectual exchange. Therefore, the provision and utilization of classroom facilities are not isolated endeavours but components of a holistic strategy aimed at enhancing the overall educational experience. The insights guide educational stakeholders in Rivers State to envision classrooms not as mere physical structures but as vibrant spaces that play a pivotal role in shaping the academic journey.

The provision and utilization of classroom facilities play a crucial role in enhancing effective learning outcomes. Well-equipped classrooms with modern technology, comfortable seating, appropriate lighting, and ventilation create a conducive learning environment for resources such as textbooks, educational materials, and tools that support the teaching and learning process. When these facilities are readily available and properly utilized, they can help students engage more actively in their studies, leading to improved comprehension and retention of information.

Additionally, having access to specialized facilities like science labs, computer labs, and libraries can further enrich the learning experience and provide opportunities for hands-on learning and research. Overall, the provision and utilization of classroom facilities are essential for creating a positive and stimulating learning environment that can lead to better academic performance and overall educational outcomes.

The provision of adequate classroom facilities in secondary schools is essential for creating a conducive learning environment that supports students' academic growth and overall well-being. This essay critically examines the impacts of providing such facilities, including enhanced learning environments, improved health and safety, increased motivation, support for differentiated instruction, promotion of social interaction, and preparation for future careers.

Enhanced Learning Environment

A well-equipped classroom is more than just a physical space; it is an environment that fosters learning. According to research by Tanner and Tanner (2018), a conducive learning environment includes factors such as lighting, temperature, acoustics, and ergonomic seating. When these elements are optimized, students are more likely to be engaged, focused, and able to retain information.

Improved Health and Safety

Classroom facilities play a significant role in ensuring students' health and safety. Adequate ventilation, for example, is crucial for maintaining good indoor air quality, which can reduce the spread of respiratory illnesses (EPA, 2020). Additionally, classrooms should be equipped with

safety features such as fire extinguishers, smoke detectors, and emergency exits to protect students in the event of an emergency.

Increased Motivation

Modern classroom facilities, such as computers, projectors, and interactive whiteboards, can enhance students' motivation and interest in learning. For example, a study by Kim and Baylor (2018) found that using interactive whiteboards in classrooms led to increased student engagement and participation.

Support for Differentiated Instruction

Differentiated instruction is an approach to teaching that recognizes and accommodates the diverse learning needs of students. Classroom facilities can support differentiated instruction by providing resources and tools that cater to different learning styles and abilities. For example, flexible seating arrangements can accommodate students who learn better in non-traditional seating environments (Tomlinson et al., 2017).

Promotion of Social Interaction

Classroom facilities can also promote social interaction among students, which is essential for developing communication skills and teamwork abilities. For example, group study areas and collaborative workspaces encourage students to work together, share ideas, and learn from one another (Johnson et al., 2014).

Preparation for Future Careers

In today's technology-driven world, classroom facilities play a crucial role in preparing students for future careers that require technological skills and knowledge. By providing access to computers, internet connectivity, and other technology tools, schools can help students develop the skills they need to succeed in the digital age (Hanushek et al., 2017).

The provision of adequate classroom facilities in secondary schools is essential for creating a conducive learning environment that supports students' academic growth and overall well-being. From enhancing learning environments to promoting social interaction and preparing students for future careers, classroom facilities play a crucial role in shaping the educational experiences of students.

Provision of Laboratory Facilities

Laboratory facilities play a crucial role in enhancing students' learning experiences in science subjects. These facilities provide students with hands-on experiences that complement theoretical learning, helping them develop practical skills, critical thinking abilities, and a deeper understanding of scientific concepts. This essay critically examines the impacts of providing laboratory facilities, including enhanced understanding of science concepts, development of critical thinking skills, promotion of inquiry-based learning, preparation for higher education and careers, development of practical skills, improvement in academic performance, enhancement of problem-solving abilities, and encouragement of creativity and innovation.

Laboratory experiments allow students to observe scientific phenomena first-hand, helping them understand complex concepts that may be challenging to grasp through traditional teaching methods alone. According to research by Hofstein and Lunetta (2004), laboratory experiences enhance students' conceptual understanding of science by providing concrete examples and practical applications of theoretical concepts. This hands-on approach not only improves students' comprehension but also fosters a deeper appreciation for the subject matter.

Laboratory work requires students to engage in critical thinking processes such as observation, analysis, interpretation, and evaluation. By designing and conducting experiments, students learn to formulate hypotheses, design experiments, collect and analyze data, and draw conclusions. This process enhances their critical thinking skills, which are essential for problem-solving and decision-making in various aspects of life (Llewellyn, 2015).

Laboratory experiences promote inquiry-based learning, a pedagogical approach that encourages students to ask questions, seek answers through experimentation, and develop a deeper understanding of scientific processes. This approach shifts the focus from rote memorization to active engagement, empowering students to take ownership of their learning (National Research Council, 2000). By engaging in inquiry-based activities, students develop a lifelong curiosity and passion for learning.

Laboratory facilities are integral components of science education, fostering hands-on learning and critical thinking skills among students. In Rivers State, the significance of well-equipped laboratories in enhancing the overall quality of science education within public senior secondary schools, highlight the transformative potential of adequate provision, where laboratories cease to be static environments and evolve into vibrant hubs of experiential learning.

The profound impact illuminated by Ogujiuba and Okoli (2021) underscores the role of modern equipment, up-to-date resources, and a conducive environment in bridging the gap between theoretical knowledge and practical application. The provision of laboratory facilities becomes an investment not just in infrastructure but in fostering a generation of scientifically literate and critically thinking individuals. This sentiment echoes the broader consensus among scholars that the quality of laboratory provisions directly correlates with the depth and breadth of students' scientific understanding. Moving beyond the provision paradigm, the narrative seamlessly transitions into the dynamic context of utilization. Scholars such as Obi and Nwokocha (2022) contribute to this discourse by emphasizing the need for a hands-on approach to learning.

The utilization of laboratory facilities becomes a linchpin for effective science education, requiring educators to transcend traditional teaching methods. Obi and Nwokocha (2022) underscore the importance of immersing students in the tangible aspects of scientific exploration, guiding them through experiments, and encouraging essential skills such as questioning, observation, and analysis. As the exploration researches into the intricacies of the provision and utilization of infrastructural facilities for effective learning outcomes in public senior secondary schools in Rivers State, it unravels the need for a targeted and nuanced approach in the domain of laboratory facilities. Localized challenges, highlighted by scholars like Afolayan and Okonkwo (2020), draw attention to the availability of skilled personnel for maintenance and the procurement of relevant materials. These challenges, unique to specific regions, emphasize the importance of tailoring strategies to address the distinctive needs and constraints faced by public senior secondary schools in Rivers State.

The provision of laboratory facilities, therefore, goes beyond the initial investment in equipment; it necessitates a sustained commitment to maintenance and upkeep. Adequate

staffing and training become pivotal in ensuring that laboratories remain functional and conducive to learning (Nwosu, et al., 2019). The utilization of laboratory facilities demands a pedagogical shift – a transition from traditional didactic methods to interactive and inquiry-based teaching. Educators, as facilitators of learning, guide students through experiments, encouraging curiosity, and instilling a passion for scientific exploration. This requires foresight in anticipating the evolving needs of science education in Rivers State. Adequate provision extends beyond the quantitative aspects of constructing laboratories; it involves a qualitative investment in ensuring that these facilities align with the changing landscape of scientific research and technology. Ogujiuba and Okoli (2021), prompt educators and policymakers to envision laboratories not as static entities but as dynamic spaces that evolve with the scientific advancements of the 21st century.

Provision is not an isolated act of constructing physical structures; it involves a strategic vision that encompasses equipment, staffing, and adaptability to technological advancements. The utilization of laboratories transcends routine experiments; it involves fostering a culture of scientific inquiry, critical thinking, and problem-solving – skills that are indispensable in the real-world application of scientific knowledge (Okafor, 2020). In the broader context of science education, the provision and utilization of laboratory facilities emerge as catalysts for nurturing a generation of scientifically literate and technologically adept individuals. This is particularly pertinent in the geographical context of Rivers State, where the study focuses on public senior secondary schools. A comprehensive strategy that amalgamates provision and utilization becomes vital in addressing the unique challenges and opportunities inherent in the region.

Provision of Library Facilities

Libraries provide access to a wide range of books, including fiction, non-fiction, and reference materials, which can help improve students' reading skills and promote a love for reading (Krashen, 2014). Reading books from different genres and topics can also help students develop a rich vocabulary and improve their language skills (Cunningham & Stanovich, 1998). Libraries offer access to research materials, such as books, journals, and databases, which are essential for conducting research and completing academic assignments. Libraries provide quiet study spaces where students can concentrate and focus on their studies, which can improve academic performance (Kim & Sin, 2017). Librarians play a crucial role in teaching students how to effectively search for and evaluate information, helping them develop critical thinking and information literacy skills (Bruce, 2008). Libraries also teach students how to properly cite sources, which is essential for academic integrity and avoiding plagiarism (American Library Association, 2000).

Libraries provide access to resources that support lifelong learning, allowing students to continue learning even after they have completed their formal education (Fister, 2015). Libraries offer a wide range of materials on various topics, allowing students to explore their interests and pursue personal enrichment. Many libraries offer access to computers and the internet, which can help students develop technology skills that are essential in today's digital world. Libraries often serve as community hubs, providing a safe and welcoming space where students can socialize, participate in programs, and build relationships with others (Subramaniam et al., 2018).

Libraries can also provide emotional support to students, offering a quiet place to relax and unwind during stressful times, bridge the digital divide by providing access to technology and resources that students may not have at home, ensuring that all students have equal

opportunities to learn. There is a concern about equity, as schools with limited resources may struggle to provide the same level of library facilities as more affluent schools, potentially widening the achievement gap (Lance & Loertscher, 2016).

Library facilities play a crucial role in supporting students' academic, intellectual, and personal development in secondary schools. From promoting literacy and fostering research skills to encouraging lifelong learning and supporting emotional well-being, libraries offer a wealth of benefits to students. However, it's essential to consider the financial implications and ensure equity in access to library resources to maximize their benefits for all students.

The provision and utilization of library facilities in the educational setting are indispensable components that significantly contribute to the overall learning experience in public senior secondary schools, particularly in the context of Rivers State. The scholarly discourse surrounding this vital facet of educational infrastructure reveals a nuanced understanding of how libraries, when adequately provided and effectively utilized, can play a transformative role in shaping students' academic journey. Ibezim and Okeke (2017) emphasize the pivotal role of well-equipped libraries in promoting a culture of reading and research among students. Adequate provision, as highlighted by these scholars, involves not only the physical construction of library spaces but also ensuring a diverse and up-to-date collection of books and resources. It is the amalgamation of these factors that transforms libraries from mere repositories of information into dynamic hubs of intellectual exploration.

Moreover, the utilization of library facilities extends beyond the conventional notion of reading and borrowing books. The integration of digital resources, online databases, and e-books enhances the accessibility and relevance of the library in the digital age (Uzoh, 2018). This shift in utilization aligns libraries with contemporary learning trends and ensures that they remain vibrant and integral to the educational process. As the study explores the details of the provision and utilization of library facilities for effective learning outcomes in public senior secondary schools in Rivers State, it unravels the need for a holistic approach. Localized challenges, illuminated by Nwafor (2019), draw attention to issues of staffing, maintenance, and the creation of a conducive learning environment within libraries. These challenges underscore the significance of tailoring strategies to address the distinctive needs and constraints faced by public senior secondary schools in Rivers State.

The provision of library facilities, therefore, extends beyond the physical structure; it involves a comprehensive investment in curating a collection that caters to diverse academic needs. Nwafor (2019) emphasizes that the relevance of library resources directly influences their utilization. A well-curated library becomes a catalyst for research, critical thinking, and independent learning—a space where students can delve into various subjects beyond the confines of the classroom curriculum. The utilization of library facilities, as Oyelude and Salawu (2020) argue, requires a multifaceted approach involving not only students but also educators. Librarians and teachers collaborate to guide students in navigating information sources, fostering information literacy skills that are indispensable in the information age. The library, thus, becomes a collaborative space where the expertise of educators intersects with the curiosity and exploration of students.

In the broader context of the study's geographical focus on Rivers State, the provision and utilization of library facilities become crucial in addressing the educational landscape's unique challenges. Owhondah (2021) highlight the need for libraries to serve as community learning centers, engaging not only students but also the wider community. This broader utilization contributes to a culture of lifelong learning and community development, aligning with the

evolving role of libraries as dynamic hubs for knowledge dissemination. Provision, in isolation, may result in underutilized spaces, while utilization without adequate provision may lead to resource constraints. Scholars like Oyelude and Salawu (2020) advocate for a balanced and sustainable approach, where the provision of library facilities aligns with the evolving needs of students and educators.

Provision of Accommodation Facilities

The provision of accommodation facilities in schools plays a crucial role in enhancing students' learning experiences, personal development, and overall well-being. One of the primary benefits of providing accommodation facilities to students in schools is improved access to education. For students who live far from school or in areas with limited transportation options, on-campus accommodation provides a safe and convenient place to stay, ensuring that they can attend school regularly (UNESCO, 2017). This increased access to education can have a profound impact on students' academic success and future opportunities.

Living on campus can create a conducive environment for studying and learning, which can positively impact students' academic performance. According to a study by Pascarella and Terenzini (2005), students who live on campus tend to have higher GPAs and are more likely to graduate on time compared to students who commute to school. Access to facilities such as libraries, study areas, and academic support services further supports students in their academic endeavors.

Living away from home teaches students valuable life skills such as time management, organization, and self-discipline. According to research by Baker and Siryk (1984), students who live on campus develop greater independence and self-confidence compared to their peers who live at home. These skills are essential for academic success and are transferable to many other areas of life.

Accommodation facilities bring students from diverse backgrounds together, fostering a rich social and cultural environment. This exposure to different perspectives and experiences can broaden students' horizons and enhance their understanding of the world (Kuh et al., 2005). This cultural exchange can also help reduce stereotypes and promote tolerance and understanding among students.

Living on campus can create a sense of community among students, leading to a supportive and inclusive environment. According to Tinto's (1993) theory of student departure, a sense of belonging is crucial for student retention and success. By providing a supportive community, accommodation facilities can help students feel more connected to their school and motivated to succeed.

Living on campus makes it easier for students to participate in extracurricular activities such as sports, clubs, and student organizations. According to research by Pascarella and Terenzini (2005), students who live on campus are more likely to be involved in campus activities and have a more fulfilling college experience. These activities can enhance students' personal development and provide opportunities for leadership and social interaction.

Accommodation facilities are often equipped with security measures such as access control systems and security personnel, ensuring the safety and well-being of students living on campus. According to research by Fisher and Hood (1987), students who live on campus report feeling safer and more secure compared to those who live off campus. This sense of security can contribute to students' overall well-being and academic success.

Accommodation facilities can provide students with access to healthy meals and wellness programs, promoting better health and well-being. According to a study by Nelson et al. (2008), students who live on campus have better dietary habits and are less likely to engage in risky behaviors such as smoking and excessive drinking compared to students who live off campus. This improved health and nutrition can have a positive impact on students' academic performance and overall quality of life.

The provision of accommodation facilities to students in secondary schools can have a wide range of positive impacts on their education, personal development, and overall well-being. From improved access to education and enhanced academic performance to the development of life skills and promotion of social and cultural exchange, accommodation facilities play a crucial role in shaping students' experiences and preparing them for success in school and beyond. By creating a supportive and inclusive environment, accommodation facilities can help students thrive academically, socially, and personally.

Provision and Utilization of Games Facilities

The provision and utilization of games facilities within the educational framework of public senior secondary schools in Rivers State play a pivotal role in the holistic development of students. The significance of adequately providing and effectively utilizing games facilities, recognizing their impact on physical health, mental well-being, and the overall educational experience (Adeyemi, et al., 2021). The importance of well-designed and well-maintained games facilities in promoting physical activity among students involves not only constructing sports grounds but also ensuring a variety of sports equipment, engaging spaces, and facilities that cater to different interests and skill levels. The scholars argue that such provision fosters a culture of physical fitness, teamwork, and healthy competition among students.

Moreover, the effective utilization of games facilities is essential for maximizing their impact on students' well-being. The role of physical education programs and extracurricular activities in ensuring the optimal utilization of games facilities, and integration of structured sports programs enhances the educational experience, providing students with opportunities for skill development, leadership, and teamwork (Oladunni, et al., 2019). The provision and utilization of infrastructural facilities for effective learning outcomes in public senior secondary schools in Rivers State, becomes evident that games facilities contribute significantly to the comprehensive development of students. Olowu and Adeyemi (2020), draw attention to issues of inadequate maintenance, insufficient sports equipment, and limited accessibility to games facilities. These challenges underscore the importance of tailoring strategies to address the unique needs and constraints faced by public senior secondary schools in the specific regional context of Rivers State.

The provision of games facilities, therefore, extends beyond the mere construction of sports grounds; it involves creating a sports environment that caters to the diverse interests and abilities of students. Nwosu et al. (2019) argue that the quality and variety of games facilities directly influence students' participation and engagement. A well-designed sports facility becomes a hub where students not only engage in physical activities but also learn essential life skills such as discipline, teamwork, and resilience. The utilization of games facilities requires a comprehensive approach that goes beyond casual engagement. The importance of integrating sports into the overall curriculum, ensuring that physical education is treated with the same importance as other academic subjects. The utilization of games facilities, when aligned with a

holistic vision for student development, becomes a tool for enhancing not only physical health but also cognitive and socio-emotional skills (Nwankwo et al., 2018).

Strategies for provision and utilization should consider local sports preferences and traditional games, ensuring that the sports environment is inclusive and respectful of the diverse backgrounds of students. Provision, without effective utilization, may result in underutilized sports grounds or limited engagement from students. Conversely, utilization without adequate provision may lead to overcrowded and insufficiently equipped sports facilities. Scholars like Adesina and Balogun (2021) advocate for a balanced and student-centric approach, where games facilities are not only physically equipped but also integrated into the educational curriculum to ensure meaningful and sustainable engagement. Games facilities, in essence, become not just sports grounds but dynamic arenas where students' physical, cognitive, and socio-emotional development converges with the pursuit of a well-rounded education.

CONCLUSION

Teaching and learning are very important aspects of education, because the realization of educational objectives depends largely on them. Education involves the inculcation of norms, values and right attitudes in an individual. As such to learn, a person must be taught and to teach there must be someone to impact knowledge and there must be facilities to instruct with. For teaching and learning to be effectively carried out, there must be infrastructural facilities such as classrooms, laboratory equipment, playground, hostel facilities, water and light supply. All these facilities help to facilities teaching and learning. Adequate classrooms, laboratory equipment, playground, library and furniture are necessary for effective teaching. Adequate facilities in a school improve the quality of instruction and striving to create healthy school climate. Most instructional facilities in schools are stale, broken, out date and inferior such that they cannot meet up with the standard of the educational system and can result in low performance of students academically. There is the increasing belief in the efficacy of education as a powerful instrument of development, especially among developing nations, including Nigeria. Consequently, the nation’s school system is witnessing a historical expansion in school enrolment and school programmes. School facilities are a key factor in ensuring quality education. This is one of the criteria for measuring the level of growth and development of education, therefore, the relevance of infrastructural facilities for effective learning outcomes in public secondary schools in Nigeria cannot be over emphasized.

Suggestions

The paper made some useful suggestions and they are as follows:

- The government and stakeholders should prioritize increased investment in school infrastructure by implementing policies that ensure regular maintenance and upgrading of facilities. This will create a more conducive learning atmosphere, bridging the gap between public and private education and ultimately improving the quality of education in Nigeria.
- The government should allocate more funds for the construction, renovation, and maintenance of school infrastructure. Budgetary provisions should prioritize the

development of classrooms, libraries, laboratories, and ICT centers to enhance the learning experience.

- School management should establish a routine maintenance plan for existing infrastructure. Facilities such as classrooms, toilets, and electricity supply should be regularly inspected and upgraded to ensure sustainability and functionality.
- The government should invest in digital infrastructure, such as smart classrooms, internet access, and computer labs. This will enhance students' access to modern learning resources and improve their academic performance in line with global educational standards.

ABSTRACT

The study explored improving the quality of student teachers through effective teacher preparation exercises in teacher preparation institutions in Rivers State. Pursuant to the aim and objectives of the study, the study had four research questions with four corresponding null hypotheses. The descriptive-correlational design was adopted by the study. The study population comprised the 393 lecturers of Ignatius Ajuru, together with the final year students of the 2023/2025 academic year of the institution. The sample size was 100 respondents comprising 20 lecturers and 80 students who gave information on teacher preparation exercises and quality of student teachers in the institution. Purposive and convenience sampling techniques were employed to select the sample. The instrument for data collection was a structured questionnaire constructed by the researcher and titled "Effective Teacher Preparation Exercises and Quality of Student Teachers Questionnaire (ETPEQSTQ)". The questionnaire was divided into three main sections: Section A which solicited data on respondents' demographic variables; Section B which solicited data on Teacher Preparation Exercises; and Section C which solicited data on Quality of Student Teachers. The reliability of the instrument was established through test-retest method and Pearson's Product Moment Correlation statistics. It was found to be 0.78. The research questions were answered using mean and standard deviation statistics, while the hypotheses were tested using PPMCC at a significance level of .05. Statistical Package for Social Sciences (SPSS) - Version 28 was used for the analysis.

Keywords: Teacher Preparation Exercises, Student Teachers, Teacher Education, Teaching Practice, Microteaching, Assessment, Mentoring, Quality, Pedagogical Skills.

INTRODUCTION

The need for competent and well-trained teachers, astute in both content knowledge and general pedagogical practices in their subject areas, is a very pertinent one if any nation is to succeed in

developing the required human capital base to foster national development. This is because teachers are the main implementers of educational policies, organized into school programmes in the form of curriculum and syllabus. It is thus very important to ensure that the quality of teacher training programs in teacher training institutions increase year after year, to ensure that the graduating student teachers possess the professional competencies necessary for them to play their roles as teachers effectively. One way to achieve this in Rivers State is through the reinforcement of the teacher preparation exercises carried out in teacher training institutions in the state.

Currently in Rivers State, the three public universities, vis-à-vis University of Port Harcourt, Rivers State University, and Ignatius Ajuru University of Education offer teacher training programs at either their undergraduate or postgraduate levels. These institutions all have departments of education, where student teachers are trained, and from experience, educational programs have enjoyed massive patronage in these schools. Both first degree and postgraduate degree programs are offered in these institutions for trainee teachers. Federal College of Education (Technical) Omoku, equally offers teacher training program at both NCE level and Degree level. This gives a lot of hope for the primary and secondary levels of education in the state, which should ideally not be lacking quality teachers anymore. Unfortunately however, the quality of student teachers graduated from these teacher training institutions appear to be a let down on the hopes of the society in that regard. It thus shows that the quality of the programs has not been as effective as it should be. As such, there is need to improvement in the delivery of teacher training programs in teacher training institutions in Rivers State.

Some prominent exercises are hallmarks of every teacher preparation programs. These include teaching practice, microteaching, supervision of student teachers, student teacher assessment and feedback, and coaching and mentoring, among others (Odunlade & Ebong, 2018; Oyekan, 2018). During the process of the teacher training programs, student teachers are through these exercises made to either experience the real teaching environment or situation through field experience or through simulated programs like the microteaching. These activities are supervises, and the student teachers are assessed and provided feedback. In some cases, they are attached to academic mentors and coaches or supervisors who work closely with them to share experience and impact knowledge to them. All of these aim at equipping the student teachers with enough experiences, knowledge and skills that would lead to their development in the teaching profession.

Some casual observations and informal discussions with a cross section of student teachers moreover seem to suggest that some student teachers appear not to fully appreciate the essence of the exercises they are subjected to on the course of their studies. They appear to regard them as just a requirement for graduation. Such trainee teachers are likely to not take the exercises seriously because it has been established that an individual's perceived benefit of a phenomenon influences the person's general attitude towards that particular phenomenon. In a similar vein, one cannot discount the possibility that trainee subject teachers' perception of the importance of field experience might influence their general attitude towards the exercise. A positive perception of the importance of field experience to trainee teachers is likely to influence the level of importance they would attach to the exercise and this might affect the general effectiveness of the exercise.

Statement of the Problem

Efforts made by the government and relevant stakeholders towards raising quality teachers for various levels of education (especially the primary and secondary levels) in the state appear to not be yielding the supposed level of dividends. The quality of teacher education in universities and colleges of education is brought to question, as there appears to be a serious gap between theoretical knowledge and practical knowledge possessed by graduating teachers from these institutions. The existing disparity is having obvious deleterious effects on teacher preparedness, student learning outcomes, and ultimately the quality of education in primary and secondary schools in Rivers State. To buffer this problem, insistence is being made by stakeholders for universities and colleges of education in the state to be more deliberate towaeds effective teacher preparation exercises such as teaching practice, microteaching, mentoring, and assessment of student teachers in these teacher training institutions in the State. These practices seem to be lacking quality in their implementation in these institutions, and the researcher believes that if they are effectively implemented, teacher training institutions may be able to graduate fully-baked teachers who are equipped with requisite skills, knowledge and competence for effective instructional delivery in primary and secondary schools in the state.

Aim and Objectives of the Study

The aim of the study was to explore how the quality of student teachers can be improved through effective teacher preparation exercises in teacher training institutions in Rivers State. Specifically, the study sought to:

- Determine how effective teaching practice exercise improves the quality of student teachers in teacher training institutions in Rivers State.
- Investigate how effective microteaching exercise improves the quality of student teachers in teacher training institutions in Rivers State.
- Explore how effective mentoring exercise improves the quality of student teachers in teacher training institutions in Rivers State.
- Assess how effective assessment exercise improves the quality of student teachers in teacher training institutions in Rivers State.

Research Questions

The following research questions will guide the study:

- How does effective teaching practice exercise improve the quality of student teachers in teacher training institutions in Rivers State?
- How does effective microteaching exercise improve the quality of student teachers in teacher training institutions in Rivers State?
- How does effective mentoring exercise improve the quality of student teachers in teacher training institutions in Rivers State?
- How does effective assessment exercise improve the quality of student teachers in teacher training institutions in Rivers State?

Hypotheses

The following null hypotheses were formulated to be tested at 5% significance level to guide the study:

- There is no significant relationship between effective teaching practice exercise and the quality of student teachers in teacher training institutions in Rivers State.
- There is no significant relationship between effective microteaching exercise and the quality of student teachers in teacher training institutions in Rivers State.
- There is no significant relationship between effective mentoring exercise and the quality of student teachers in teacher training institutions in Rivers State.
- There is no significant relationship between effective assessment exercise and the quality of student teachers in teacher training institutions in Rivers State.

THEORETICAL FRAMEWORK

The study was anchored in the Experimental Learning Theory. Experimental Learning Theory was proposed by David Kolb in 2009, as a holistic learning model that emphasizes the importance of direct experience and reflection in the learning process (De-Ville, 2010). According to Kolb, learning is a continuous process that involves concrete experience, holistic approach, and a learning cycle. Concrete experience in learning entails learning through direct experience and reflection. Holistic learning involves integrating cognitive, affective, and psychomotor learning. The learning cycle on the other hand entails that learning is a continuous process of experiencing, reflecting, conceptualizing, and experimenting. Hence, experimental learning as proposed by Kolb emphasizes practical application of knowledge, accommodates different learning styles preferences thus making it very personalized, and promotes better retention of knowledge through direct experience. Thus, experimental learning theory emphasizes on hands-on learning, or learning by doing.

Kolb's experiential learning theory finds application in the present study as it emphasizes the importance of direct experience and reflection in the learning process. The theory has been widely applied in education (particularly in teacher training and professional development), in corporate training to enhance employee skills and performance, and in personal development, such as learning new skills and hobbies, and continues to be a popular learning model due to its practical and holistic approach to learning. The relevance of the theory to this present study on teaching practice exercise is on several fronts, some of which include:

- Hands-on experience: Experimental learning theory emphasizes the importance of direct experience and hands-on practice, which is essential for teaching practice exercises.
- Reflection and feedback: Experimental learning theory highlights the need for reflection and feedback, which is critical for quality teacher education and teaching practice exercises.
- Learning by doing: Experimental learning theory suggests that learning occurs through doing, which is in line with the idea of teaching practice exercises as a way to learn teaching.
- Teacher development: Experimental learning theory can be used to support teacher development and growth, which is a key aspect of quality teacher education.

- Collaborative learning: Experimental learning theory supports collaborative learning, which can be applied to teaching practice exercises to promote peer learning and support.

CONCEPTUAL REVIEW

Teacher Education cum Teacher Preparation

The concept of teacher education has been viewed by scholars in diverse perspectives, although all the views agreed on the need for professional and career development of the teachers (and to-be teachers) towards production of valuable and resourceful teachers that will guarantee effective service delivery to the society. Adewuyi and Ogunwuyi cited in Usman (2020) opined that teacher education is the provision of professional education and specialized training within a specified period for the preparation of individuals who intends to develop and nurture the young ones into responsible and productive citizens. Uche and Onyemerekeya cited in Usman (2020) viewed teacher education as the training given or provided in an institution to teachers to enable them acquire, inculcate and impart knowledge to their pupils or students. Teacher education according to Osuji (2019) refers to professional education of teachers towards attainment of attitudes, skills and knowledge considered desirable to make them efficient and effective in their work in accordance with the need of a given society at any point in time. It includes training and or education occurring before commencement of service (pre-service) and during service (in-service or on-the-job).

Teacher education is a programme that is related to the development of teacher proficiency and competence that would enable and empower the teacher to meet the requirements of the profession and face the challenges therein (Ugwoke et. al, 2012). Afe cited in Usman (2020) comprehended teacher education as the policies and practices designed to equip prospective teachers with the knowledge, attitudes and skills they require to perform their tasks effectively in the classroom, school and wider society whilst Ekpiken and Edet, (2014) conceptualized teacher education as the complex and complete procedure of educating or preparing persons whose profession is teaching in order to play their roles as teachers towards contributing to national development.

Student Teachers Quality Improvement

Improving the quality of student teachers entails bequeathing to them the requisite skills, knowledge, experience and competence that make them assume the status of effective and efficient teachers by the time they are completing their teacher preparation programs. It is about graduating student teachers who possess the skills that the labour market for teachers requires. Quality student teachers are thus human resources in the teaching profession. They would by their status need no further or very little training to fit perfectly into any school system that engages them.

Quality student teachers are student teachers who have been trained to possess the attributes of an effective teacher – capable of delivering effective teaching. Effective teaching is the teacher's ability to deliver lesson contents, monitor and follow-up, and improve students' achievement. A focus on student outcomes and the teacher behaviours and classroom processes that promote better student outcomes are generally the predicators of teacher effectiveness. Hence, student teachers quality improvement exercises aim at making student teachers

competent in improving students' learning outcomes. James et al. (2016) highlighted the attributes of teacher quality to include that the teacher:

- Is clear about instructional goals;
- Is knowledgeable about curriculum content and the strategies for teaching it;
- Communicates to his/her students what is expected of them, and why;
- Makes expert use of existing instructional materials in order to devote more time to practices that enrich and clarify the content;
- Is knowledgeable about his/her students, adapting instruction to their needs and anticipating misconceptions in their existing knowledge;
- Teaches students meta-cognitive strategies and gives them opportunities to master them;
- Address higher- as well as lower-level cognitive objectives;
- Monitors students' understanding by offering regular appropriate feedback; and
- Accepts responsibility for student outcomes.

Training student teachers who possess all of these teacher quality attributes therefore becomes the core values of teacher preparation programs in teacher training institutions in Rivers State.

Teacher Preparation Exercises in Teacher Training Institutions in Rivers State

Teacher preparation exercises are explicit programs particularly designed to prepare student teachers for the actual teaching experience. They are learning experiences or learning opportunities designed in teacher preparation institutions as part of their curriculum content, which the trainee teachers have to undergo for the reinforcement of the trainings that are being given to them. Literature identified some of these exercises to include teaching practice, microteaching, mentoring, assessment, and feedback exercises among others (Ayelaagbe & Bello, 2020; Jekayinfa et al., 2012; Odunlade & Ebong, 2018; Oyekan, 2018). These exercises are deliberately and meticulously planned by the teacher training institution and their implementation can be monitored, tracked, documented and reviewable for continuous improvement. Each of these exercises is examined in the proceeding paragraphs.

Teaching Practice Exercise / Practicum

Teaching practice is one of the core exercises of teacher education programs in teacher training institutions in Rivers State. It is a period where student teachers are sent from their institutions into primary and secondary schools for practical demonstration and mastering of what they are learning in the school with the guidance of Subject teachers in the schools they are sent to and the supervision of supervisors delegated from their own schools. Bakie (2022) conceived teaching practice as the practical mastering of the art of science of teaching by actual participation in classroom encounter under watchful eyes of experts and experienced teachers' supervision. Anupama (2019) described teaching practice as a time when all the theoretical concepts of educational psychology, classroom management, teacher-taught relation, philosophies dealing with education learned are to be applied successfully in real classroom situation. Teaching practice therefore is the first real opportunity given to students to be involved in teaching either in primary or secondary school under the guidance of co-operating teachers.

The role of teaching practice in the development of teacher education program cannot be over emphasized. Its functions are as follows:

- It serves as an opportunity for the student teacher to be exposed to the realities of teaching and performance of professional activities.
- It helps the trainee teacher (i.e. student teacher) to improve his/her communication skills.
- It offers a conscientious student teacher a drive to master his work, and apply himself to it with passionate zeal (Afigbo cited in Onwuzo, 2021)
- Teaching practice creates opportunity for student teacher to develop in teaching profession.
- It provides opportunity for the student teacher to take responsibility, gain confidence in him/herself and improve in classroom management skills.
- It provides a basis for predicting the future success of the pre-service teacher (Aijaz et al. (2010).
- To the teacher training institution, it provides opportunity for establishing the extent student teachers master the theories taught.

Realization of these loud able objectives is dependent on the provision of adequate material resources, and getting all the stake holders to perform their roles effectively. Stake holders in this context are: learners, student teachers, heads of co-operating schools and their teachers' supervisors and teaching practice monitoring team.

Microteaching Exercise

Micro-teaching is technically a scaled-down teaching encounter which helps pre-service and in-service teachers to improve both contents and methods of teaching and develop specific teaching skills such as probing questions, questioning, explanation, illustration and stimulus variation (Aliyu, 2018). It is one of the practices for preparing student teachers for their actual teaching practice exercise. It is a model of what they would experience in the classroom. According to Chuajin and Chammei (2011) in their separate studies, micro-teaching has been in use worldwide since its introduction at the Stanford university in the late 1950s by Dwight, Robert and Romney. Its purpose is to provide teachers with the opportunity for concept lessons in any teaching subject. McNight cited in Romesh (2013) sees micro-teaching as a scaled-down realistic classroom training context in which teachers both experienced and inexperienced may acquire new teaching skills and refine old ones.

This implies that microteaching is a temporal platform created by expert teachers for trainee teachers to interact with mock students, to practice theoretical knowledge and acquire new skills. Therefore, microteaching approach in teacher education prepares the pre-service teachers for the task of classroom teaching ahead of the teaching practice exercise. Also, it exposes the preservice teachers to the rudiments of teaching which enhances effective teaching and learning rudiments (Aliyu, 2018). Micro-teaching cannot be neglected as it provides a formidable platform for acquiring teaching skills that is expected to be practiced in the classroom. As such, it is a veritable practice that can be leveraged upon by school administrators in conjunction with teaching practice supervisors to give teaching practice students the requisite training for quality teacher education on the course of their teaching service exercises.

Mentoring Exercise

Mentoring programs are effective ways of supporting teacher development. This involves pairing experienced teachers with novice teachers to provide guidance, feedback, and support. Student teachers on the course of their teaching practice necessarily need to be mentored and coached by the subject teachers of the subjects they are handling. As a matter of fact, every teacher in the school system ought to see it as a duty to coach and mentor these upcoming teachers.

Mentoring is widely used all over the world and it is operational among individuals who want to acquire certain skills and knowledge. This also applies to student-teachers in Colleges of Education who are under the mentorship of the school of education, academic matters, and other areas of development. Mentoring is one of the most effective ways of developing student teachers' quality during teacher training. Mentoring is about changing lives and it is commonly seen as a situation where an individual assists another individual to develop him/herself in different areas. Mentoring is an effective way of developing professionals and it has been applied in the areas of medicine, building, and the military with effectiveness according to Strong & Baron cited in Ani et al. (2021). The term mentoring describes the support given by one (usually more experienced) person for the growth and learning of another, and their integration into and acceptance by a specific community. Mentoring is a process whereby an older experienced guide acceptable to the young person helps to ease the transition to adulthood by a mix of support and challenge.

It is a hierarchical relationship in which the mentor is more experienced than the mentee, or that the mentor has or can provide knowledge and skills that the mentee wants or needs. Mentoring supports and encourages people to manage their learning so that they may maximize their potentials, develop their skills, improve their performance and become the persons they want to be. Mentoring can also be described as a technique for allowing the transmission of knowledge, skills, and experience in a supportive and challenging environment through coaching (Adeyanyu, 2013). Mentoring is the oldest form of knowledge transfer that uses the skills of questioning, listening, clarifying, and reframing in transferring learning. Mentoring is a particular mode of learning wherein the mentor not only supports the mentee but also challenges him productively so that progress is made (Smith, 2017). It involves supporting and providing feedback to the mentee without judgment or criteria. Mentoring involves guidance and suggestion, as well as the development of autonomous skills, judgments, personal and professional mastership, expertise, trust, and the development of self-confidence over time. Mentoring in education involves pairing young people with an older peer or volunteer, who acts as a positive role model. In general, mentoring aims to build confidence, develop resilience and character, or raise aspirations, rather than to develop specific academic skills or knowledge.

Assessment Exercise

Assessment of student teachers' performance in the course of their teaching practice is a very important activity in teaching practice exercise. This is usually done by the visiting supervisors. The teaching practice exercise often has very high credit load, and students' performance or assessment scores contribute significantly to the student's score in Teaching Practice. The grading is based on the supervisor's observation of the student teachers' performance during the classroom observation session, and also based on out-of-classroom observations and inclusive of reports by the school about the student teacher's behaviour and whereabouts in the school

system. Literature (Oluwatayo & Adebule, 2022) however identified six discrete criteria by which student teachers' teaching practice performance is assessed. These according to them include, plan of the lesson, the use of teaching aids/devices, conduct of the lesson, knowledge of subject matter, class management and teacher's personality. Expectedly, the teaching performance may be rated poor, fair, good, very good or excellent depending on individual's commitment to the exercise.

Improving the Quality of Student Teachers through Teacher Preparation Exercises in Teacher Training Institutions

Teacher preparation exercises are essential for improving the quality of student teachers in Nigeria, even as they provide student teachers with the necessary skills, knowledge, and experience to become effective teachers. Literature has highlighted ways in which teacher preparation exercises improves the quality of teaching practice students in teacher training institutions (Borko & Putnam, 2016; Gay, 2010; Hativa, 2023). Some of the ways include:

- Improved pedagogical skills: Teacher preparation exercises help student teachers develop effective teaching strategies and techniques.
- Increased confidence: Teacher preparation exercises boost student teachers' confidence in their ability to teach.
- Enhanced subject matter knowledge: Teacher preparation exercises help student teachers deepen their understanding of the subject matter they will be teaching.
- Development of classroom management skills: Teacher preparation exercises teach student teachers how to manage a classroom effectively.
- Improved communication skills: Teacher preparation exercises help student teachers develop effective communication skills.

Teaching Practice Exercise for Improved Quality of Student Teachers in Teacher Training Institutions

When effectively implemented, teaching practice possesses the potential of improving student teachers' quality in several ways. Literature highlighted some of these ways to include:

Professionalism: In the opinion of Obunadike and Ughammadu (2015), teaching practice is a worthwhile programme for professionalizing in teaching. Without teaching practice, a student teacher will not be recognized as a teacher. Teaching practice is thus a basic professional requirement, the un-fulfillment of which the student teacher cannot qualify as a teacher.

Exposure: the training gotten during teaching practice no doubt exposes the student teacher to what is obtainable in the teaching profession. In lending credence to this, Ofoegbunam (2017) posited that teaching practice is a period during which the student-teachers are exposed to the practical realities of the teaching profession which form part of their programme. Also, Quick and Sieborger cited in Ngara et al. (2019) opined that "teaching practices exposes student teachers to real teaching world and contextualize their theoretical skills to practical skills".

Mastery of the subject: Practice makes perfect. Thus, teaching practice provides the student teachers with experience in the actual teaching and learning environment which leads to perfection. Ngugi and Thungui (2014) asserted that "the mastery of the subject matter is the foundation upon which the education of a teacher requires among other things the skill of mastering the subject matter and being able to establish the inter-relationships between different subjects. Speaking further, they maintained that it is through the mastery of subject matter that they are able to help their learners to learn and understand the same subject matter, which these are essential for the professional growth of a teacher which contributes to the growth of a teacher as a person.

Confidence: Through the experience gathered during the exercise, the student teachers build confidence in themselves as teachers. Collaborating, Lukman (2021) opined that "teaching practice also improves the level of confidence among student teachers. This gives them the ability to present their seminar projects effectively and also enable them to handle higher classes after graduation".

Microteaching Exercise for Improved Quality of Student Teachers in Teacher Training Institutions in Rivers State

The application of micro-teaching technique in teacher training and especially during teaching practice exercises provides student teachers tremendous opportunity to develop their teaching skills. Apart from being an essential process of transforming and modifying the student teacher's behaviour to demonstrate a given behaviour, it also provides a tremendous opportunity for both pre-service and in-service teachers to develop and improve their pedagogical skills with a small group of students mostly (8-10) using limited period of (7-10) minutes, recorded on video tape for reviewing, responding, refining and re-teaching towards perfection (Peker, 2019). Hence, effective development of teaching skills in teachers should target the teaching practice students as they are future teachers. Incorporating the development of these skills will not only make these skills practicable but also provide a model for the actual and seamless implementation of these skills in normal classroom situations.

The micro-teaching environment enables a pre-service teacher to focus attention on the practice of specific skills at a time until he or she acquires competence in it. Provision of feedback accelerates the process. After acquiring competence in a number of skills in this way, the student teacher takes to micro-teaching so as to demonstrate his/her level of competence. It is a vital technique which provides continuous training to serving teachers.

Most of the professional teachers who have reached the peak of their professional career do not want to improve their skills of teaching. Micro-teaching helps in bridging the gap and overcoming such pitfalls. It provides settings for experimentation. With the introduction of developed curriculum, teachers are required to acquire new skills of teaching. The National Policy on Education (FRN, 2014, p.56) pointed out that "all teachers in our educational institutions, from pre-primary, will be professionally trained". As a modelling instructional skill, the microteaching setting is meant for the demonstration of good teaching skills by student-teachers which can be recorded on video-tape or observed by a supervisor. Consequently, micro-teaching provides a golden opportunity to the pre-service teacher towards exercising control over some variables which may have effect in teaching and learning e.g., the volume of students in a

class, the nature of the student, the length of the period for microteaching administration, the motivation as well as the evaluation of the students.

On the effects of microteaching on the quality of teacher education, Sa'ad et al. (2015) had found that microteaching was useful in improving the teaching skills, classroom management, confidence etc of teacher trainees. Aliyu (2018) averred that the use of micro-teaching skills in teaching practice reduced the teaching anxiety level of student teachers, which would inadvertently bring about greater level of effectiveness in instructional delivery of teachers who engaged in microteaching during their teaching practice exercises. He went further to identify four major skill sets that are acquired by the student teacher through microteaching exercises, and these include: (a) set induction skills, (b) stimulus variation skills, (c) questioning skills, and (d) closure skills. These are skills, which when properly developed, enhance the quality of teachers, hence, their incorporation into the instructional content of the teaching practice for student teachers becomes a veritable strategy for quality teacher education delivery for the administrators of teaching practice.

As described by Isave (2012), set induction is a strategy of attracting the attention of learners towards making them mentally and physically ready to accomplish any task. Stimulus variation is a set of behaviour for bringing about a desirable change in variation in the stimuli which can be used to secure and sustain the student's attention towards classroom activities (Yusuf & Alasoluyi, 2017). Questioning skill is used to draw out ideas from the students, and closure skill provides the pupils with a feeling of fruition, fulfilment and accomplishment which serves as drive for continuous learning (Arikya, 2010). All of these skills are required by teachers to assure their effectiveness in the classroom and microteaching exercise bequeaths them to student teachers.

Mentoring Exercise for Improved Quality of Student Teachers in Teacher Training Institutions in Rivers State

Mentoring plays an important role in enhancing inexperienced teachers' opportunities to learn within the contexts of teaching. It also helps student-teachers to develop teaching behaviours and strategies, involving a nurturing relationship between a less experienced person and a more experienced person where the mentor guides by serving as a role model and advisor. Mentoring in a specific context not only allows student-teachers to acquire context-specific knowledge but also develops situation-based skills, which can be transferred to similar future situations in that context. For the reason that teachers need to learn to teach in a particular context (Feiman-Nemser cited in Ani et al., 2021) and specific mentoring will occur that is dependent on the contextual circumstance. Each educational jurisdiction will, therefore, have different forms and expectations of mentoring. Mentoring, therefore, is a process that involves the mentor, the mentee, and the relationship. In a mentoring relationship, the mentees learn from their mentors to be transformed from passive receivers to active learners; to expand their perspectives; to use the forum as a platform for accelerated learning; to build the confidential relationship, and gain different insights into their career development from the experience of their mentors; to have ownership of self-development, and to initiate most contacts with their mentors.

Mentors nurture the development of the mentee through building rapport. They also use such interpersonal functions as supporting, advising, empathizing, and role modelling. Mentors are therefore advisers, educators, counsellors, and role models who pass their experience on to less experienced people. As a mentor, a more experienced person facilitates the professional

development of a new teacher or someone new to a particular stage in a career. This confirms that mentoring is also used to make newcomers aware of how a specific workplace operates. This aspect of mentoring is partly relevant to the mentoring process in initial teacher education where tutor-mentors have to teach student-teachers the principles of teaching and learning. Mentoring provides the mentee with an opportunity to have a clear career path, options, and consequently progress. Mentoring is considered a valuable process that assists professional and mentoring personal development. For a mentoring process to be complete there is a need for a mentee. A mentee is someone who wants to move up to the academic/career ladder following in the footsteps of the mentor (Adeyanyu, 2013). Student teachers usually experience several different school sites throughout their degree program, thus encountering a variety of mentor teachers. Invariably, the kinds of mentoring relationships that student-teachers form with their mentor may be significantly different to a professional who has mentored for an extended period.

Assessment Exercise for Improved Quality of Student Teachers in Teacher Training Institutions in Rivers State

Assessment exercise improves student teachers' quality through helping them to know how well they are performing and then improving on their performance on various performance indices on which they are assessed on the course of their program (Oluwatayo & Adebule, 2022). One of the areas they are assessed especially during their teaching practice exercises is on lesson planning because a good teacher must necessarily know how to draw an excellent lesson plan. Basically, the student-teachers are expected to plan their lessons appropriately. Good planning underpins flexibility and provides the teacher with structure and security (Pollard, 2016). The plan of a lesson includes formulation of concise and feasible learning objectives, organization of content and technical language of instruction. The learning objectives express what the teacher intends that the students learn in terms of skills, knowledge and understanding. As explained by Pollard (2016), learning objectives are the essential planning tools of the teacher, as without clear and concise objectives linked to specific activities, the teacher has little basis on which to define the purpose of a task clearly for the learner or assess learners' progress. Importantly, the content of the lesson needs to be sequentially organized in order to provide instructional steps to be followed by the teacher so that no aspect of the lesson is omitted. Hence, the quality of student teachers' lesson plans and lesson notes become assessed by supervisors whenever they visit, and it is very important that the student teachers be provided with feedback after the assessment exercise to enable them improve on their lesson plan.

Barriers to Effective Teacher Preparation Exercises in Teacher Training Institutions in Rivers State

It is worrisome that despite the annual massive graduation of student teachers from teacher training institutions in Rivers State, very little iplact is felt in the classroom when these graduates are engaged. The problem has been the quality of teacher preparation they received in their schools. Most teacher training institutions are handicapped in so any ways, which makes it almost impossible for them to equip their trainee teachers with the requisite skills required for the teaching profession. Literature has widely highlighted barriers to the effective implementation of teacher preparation exercises in Nigeria (Ebelechukwu & Eruchalu, 2022):

- Inadequate time: Enough time is not given to teaching practice to microteaching before the commencement of the teaching practice. This no doubt affects the exercise. In some cases, students attend lectures during the teaching practice.
- Financial constraint: The student teachers are not paid during the teaching practice and this is a problem because they need money for.
- Transport and to settle their bills. In most cases, the approved schools for teaching practice within the vicinity wont absorb all the students, thus, accommodation becomes an issue too as some schools do not have accommodation. Abraham Maslow's theory of hierarchy of needs portrays workers effectiveness when their needs are met, thus, student teachers are not exception. Apparently, during the period of teaching practice, they relieve the teachers of their workload.
- Unprofessionalism of supervisors: Only few supervisors understand their duty(ies), ordinarily, supervisors should be friendly with the student teachers but only few are. Cases abound of supervisors embarrassing the student-teachers before their students. Collaborating, Oku (2016) asserted that "…some supervisors especially the neophytes might see it (teaching practice) as an opportunity to terrorize and humiliate student teachers thereby making them lose their self-confidence". Such condescending attitude by the supervisors definitely would mar the objectives of teaching practice. Rather than building the students professionally, it tears or destroys.
- Lack of co-operation from schools and teachers: The schools the student teachers are posted to have a role in ensuring effective exercise. During this exercise, some schools are not friendly. Teachers instead of encouraging them criticize them. Criticism encourages growth but only when it is constructive. Besides, seeing and commenting only on the negative aspect of an individual doesn't encourage growth. In additon, Kiggudu and Nayimuli (2019) opined that "while some mentors overload students teachers, other mentors did not have confidence in the student teachers and consequently they would not leave their classes in the student teachers' care. Others would not let student teachers teach at any time because they felt that student teachers were delaying and wasting learners' valuable time and they need to finish the syllabus before the end of the year. This resulted in the student teachers getting discouraged and expressing feelings of inadequacy and loss of confidence in their ability to teach".
- No feedback: Feedbacks help a great deal in growth, be it in individual life, business or other ventures. Feedback is information about reactions to a product, a persons' performance of a task, etc. which is used as a basis for improvement. It is quite unfortunate that student teachers are not given video feedback, like is done during micro-teaching in some schools. Video feedback goes a long way for the students get to see his or her true performance, devoid of any sentiment or influence.
- Wrong perception of the exercise: It is a fact that wrong perception does harm than good. Thus, student teachers wrong perception of teaching practice poses a great barrier. Teaching practice qualifies a student teacher to a professional as inability to pass the course hinders the student dream to reality. Yet, some students see the exercise as a waste of time. Such wrong perception won't allow them put in their best and also deprive them of what they should benefit from participating.
- Computer illiteracy: A student teacher who is not computer-literate will find it hard to cope in this age and time owing to modernization. Bediga and Banari (2019) asserted that the role of computer in teaching activities is becoming more important because world is

in a continuous and rapid modernization and computer use in school has and will have a great role in the presentations of lessons, and for communication and information. Thus, any student teacher who is not computer literate would not enjoy the teaching practice for there are numerous benefits derivable from using the computer.

- Inadequate time: In as much as the program is tagged "teaching practice". There should be preparations, trainings beforehand. Micro-teaching is a major preparatory avenue for teaching practice. But inadequate time could affect such preparatory programme which also poses a problem to the teaching practice exercise.

METHODOLOGY

The study adopted a descriptive-correlational design, which sought to identify the variables of effective teacher preparation exercises, describe their implementations, and then explore the relationship between these variables and the quality of student teachers in teacher training institutions in Rives State. The population of the study was the 393 lecturers of Ignatius Ajuru, together with the final year students of the 2023/2025 academic year of the institution. The sample size was 100 respondents comprising 20 lecturers and 80 students who gave information on teacher preparation exercises and quality of student teachers in the institution. Purposive and convenience sampling techniques were employed for the study. The instrument for data collection was a structured questionnaire constructed by the researcher and titled "Effective Teacher Preparation Exercises and Quality of Student Teachers Questionnaire (ETPEQSTQ)". The questionnaire was divided into three main sections: Section A which solicited data on respondents' demographic variables; Section B which solicited data on Teacher Preparation Exercises; and Section C which solicited data on Quality of Student Teachers. The reliability of the instrument was established through test-retest method and Pearson's Product Moment Correlation statistics. It was found to be 0.78. The research questions were answered using mean and standard deviation statistics, while the hypotheses were tested using PPMCC at a significance level of .05. Statistical Package for Social Sciences (SPSS) - Version 25 was used for the analysis.

RESULTS AND DISCUSSION

Answer to the Research Question

Research Question 1: How does effective teaching practice exercise improve the quality of student teachers in teacher training institutions in Rivers State?

Table 1: Mean ratings of lecturers and student teachers on how effective teaching practice exercise improves the quality of student teachers in teacher training institutions

s/n	Items	Lecturers (N=20)		Student teachers (N=80)		Mean Set (N=100)		Decision
		$\bar{X}_1$	SD_1	$\bar{X}_2$	SD_2	Mean	SD	
1	Effective teaching practice provides student teachers with hands-on experience in teaching and this improves their quality.	3.53	.541	3.50	.541	3.52	.541	Agree

2	Student teachers learn how to manage classroom behaviours during teaching practice and this boosts their quality.	2.80	.529	2.82	.529	2.81	.528	Agree
3	Effective teaching practice develops student teachers' confidence and self-efficacy for improved quality.	2.69	.444	2.58	.445	2.64	.444	Agree
4	Effective teaching practice equips student teachers with skills and strategies for improving student outcomes and this boosts their quality	2.70	.554	2.64	.556	2.67	.554	Agree
	Grand Mean	**2.86**	**.519**	**2.89**	**.519**	**2.88**	**.515**	**Agree**

Hypothesis 1: There is no significant relationship between effective teaching practice exercise and the quality of student teachers in teacher training institutions in Rivers State.

Table 2: PPMC output on the existence of relationship between effective teaching practice exercise and the quality of student teachers

Variable	N	R	Sig	Remark
Effective teaching practice	20	.631	.000	$H0_1$ Rejected
Student teacher quality	80			

.05 level of significance

Table 1 shows the mean ratings of lectures and student teachers on how effective teaching practice exercise improves the quality of student teachers in teacher training institutions, while Table 2 is the PPMC output on the existence of relationship between effective teaching practice exercise and the quality of student teachers in teacher training institutions in Rivers State. From Table 1, it is seen that all the items have mean ratings and standard deviations which are each greater than the criterion mean of 2.50. This means that majority of the respondents agree on the various ways effective teaching practice improves the quality of student teachers in teacher preparation institutions in Rivers State. The table shows that the various ways include: providing student teachers with hands-on experience in teaching; equipping student teachers with knowledge of classroom management behaviours; developing student teachers' confidence and self-efficacy; and equipping student teachers with skills and strategies for improving student outcomes. Table 2 revealed that there is a strong positive significant relationship between effective teaching practice and quality of student teachers in teacher training institutions in Rivers State.

These finding are in line with Bakie (2022) who revealed that teaching practice is an avenue through which student teachers practically master the art of science of teaching by actual participation in classroom encounter under watchful eyes of experts and experienced teachers' supervision. This means teaching practice makes student teachers to become masters in the teaching profession even before they become formally engaged as teachers. It is however worthy of note that teaching practice is only able to achieve its aim of preparing student teachers when it is implemented effectively.

Research Question 2: How does effective microteaching exercise improve the quality of student teachers in teacher training institutions in Rivers State?

Table 3: Mean ratings of lecturers and student teachers on how effective microteaching exercise improves the quality of student teachers in teacher training institutions

s/n	Items	Lecturers (N=20)		Student teachers (N=80)		Mean set (N=100)		Decision
		$\bar{X}_1$	SD_1	$\bar{X}_2$	SD_2	Mean	SD	
5	The observation of microteaching sessions by experienced lecturers helps in pointing out student teachers' deficiencies and in correcting them.	3.54	.553	3.55	.554	3.55	.552	Agree
6	The recording of microteaching session helps in effective review of student teachers' performance, which improves the quality of teacher education.	3.44	.551	3.48	.556	3.46	.553	Agree
7	The processes of questioning, explanation, stimulus variation, and lesson closure are mastered during microteaching sessions.	3.48	.515	3.51	.530	3.49	.522	Agree
8	Microteaching helps teacher education students to master the act of effectively managing real classrooms.	3.54	.553	3.55	.554	3.55	.552	Agree
	Grand Mean	**3.51**	**.542**	**3.52**	**.549**	**3.52**	**.545**	**Agree**

Hypothesis 2: There is no significant relationship between effective microteaching exercise and the quality of student teachers in teacher training institutions in Rivers State.

Table 4: PPMC output on the existence of relationship between effective microteaching exercise and the quality of student teachers

Variable	N	R	Sig	Remark
Effective microteaching	20	.836	.000	$H0_2$ Rejected
Student teacher quality	80			

.05 level of significance

Table 3 shows the mean ratings of lecturers and student teachers on how effective microteaching exercise improves the quality of student teachers in teacher training institutions, while Table 4 shows the PPMC output on the existence of relationship between effective microteaching exercise and the quality of student teachers. In Table 3, all the items have mean and standard deviation scores that are greater than the criterion mean score of 2.50. This show that majority of the respondents agreed on the items. As revealed in the table, the various ways effective microteaching improves the quality of student teachers include: pointing out and correct student teachers' deficiencies by experienced teachers who observe microteaching sessions; effectively reviewing student teachers' performance through recorded sessions; helping student teachers to master the processes of questioning, explanation, stimulus variation, and lesson closure; and helping student teachers to master the act of effectively managing real classrooms.

Table 4 in the same vein shows that there was a very strong positive and significant relationship ($r = .863$, $p = .000 < .05$) between effective microteaching exercise and quality of student teachers in teacher training institutions in Rivers State. These findings are coherent with the findings of Sa'ad et al. (2015) that microteaching was useful in improving the teaching skills, classroom management, confidence etc. of teacher trainees. Similarly, Aliyu (2018) found that

the use of micro-teaching skills in teaching practice reduced the teaching anxiety level of student teachers, which inadvertently brought about greater level of effectiveness in instructional delivery of teacher trainees who engaged in microteaching during their teacher preparation programs.

Research Question 3: How does effective mentoring exercise improve the quality of student teachers in teacher training institutions in Rivers State?

Table 5: Mean ratings of lecturers and student teachers on how effective mentoring exercise improves the quality of student teachers in teacher training institutions

s/n	Items	Lecturers (N=20)		Student teachers (N=80)		Mean set (N=100)		Decision
		$\bar{X}_1$	SD_1	$\bar{X}_2$	SD_2	Mean	SD	
9	Pairing student teachers with more experienced teachers helps in knowledge and skill transfer, which is necessary for quality teacher education.	2.74	.553	2.80	.554	2.77	.552	Agree
10	Presiding teachers guide and direct student teachers during teaching practice, and this boosts their performance and quality of teacher education.	3.44	.551	3.40	.556	3.42	.553	Agree
11	Teachers and school administrators support and provide feedback to student teachers without being judgmental of their performance, and this improves their teaching practice experience.	2.78	.515	2.70	.530	2.74	.522	Agree
12	Student teachers are always guided on better ways of managing students and school situations, and this boosts the quality of teacher education programs.	2.94	.553	3.32	.554	3.13	.552	Agree
	Grand Mean	**2.97**	**.543**	**3.05**	**.549**	**3.01**	**.546**	**Agree**

Hypothesis 3: There is no significant relationship between effective mentoring exercise and the quality of student teachers in teacher training institutions in Rivers State.

Table 6: PPMC output on the existence of relationship between effective mentoring exercise and the quality of student teachers

Variable	N	R	Sig	Remark
Effective mentoring	20	.675	.000	$H0_3$ Rejected
Student teacher quality	80			

.05 level of significance

Table 5 shows the mean ratings of lecturers and student teachers on how effective mentoring exercise improves the quality of student teachers in teacher training institutions, while Table 6 shows the PPMC output on the existence of relationship between effective mentoring exercise and the quality of student teachers in teacher training institutions in Rivers State. As shown by Table 5, majority of the respondents agreed that all the examined items were ways effective

mentoring improved the quality of student teachers in teacher training institutions in Rivers State (M = 3.01, SD = .546). These ways include: through knowledge and skill transfer from experienced teachers; through regularly receiving guidance and direction from presiding teachers, which enables them to know what is expected of them at any point in time; through receiving support and non-feedback from teachers and school administrators on their performance, which brings about needed improvement; and by gaining knowledge on better ways of managing students.

In the same manner, Table 6 shows that there was a strong positive and significant relationship (r = .675; p=.000<.05) between effective mentoring and the quality of student teachers in teacher training institutions in Rivers State. These findings are in accord with the findings of Maxwell (2024) that mentors nurture the development of the mentees through building rapport, and interpersonal functions as supporting, advising, empathizing, and role modelling. Mentors are therefore advisers, educators, counsellors, and role models who pass their experience on to less experienced people. In receiving the guidance of and modelling from a mentor, student teachers' quality is definitely improved even as they are able to avoid the mistakes made by their doctors, and quickly begin to enjoy the successes of their mentors through shared experiences. As such, by the time the student teacher eventually gets officially engaged in the teaching profession, he would not be coming in as a novice, but with so much wealth of experiences which makes him perform effectively with no or very little further training or supervision.

Research Question 4: How does effective assessment exercise improve the quality of student teachers in teacher training institutions in Rivers State?

Table 7: Mean ratings of lecturers and student teachers on how effective assessment exercise improves the quality of student teachers in teacher training institutions

s/n	Items	Lecturers (N=20)		Student teachers (N=80)		Mean set (N=100)		Decision
		$\bar{X}_1$	SD_1	$\bar{X}_2$	SD_2	Mean	SD	
13	Assessment of student teachers by supervisors and teachers makes them take their teaching practice more seriously and this improves the quality of the exercise.	2.64	.553	2.65	.554	2.65	.552	Agree
14	Feedback provided to student teachers after their assessment helps them improve on their teaching practice and this brings about quality teacher education.	3.04	.551	2.78	.556	2.91	.553	Agree
15	Assessment and feedback helps student teachers to master effective preparation of lesson notes and lesson plans.	2.60	.515	2.70	.530	2.65	.522	Agree
16	Assessment and feedback improve student teachers' teaching skill and this brings about quality teacher education.	2.76	.553	3.04	.554	2.90	.552	Agree
	Grand Mean	**2.77**	**.542**	**2.79**	**.550**	**2.77**	**.546**	**Agree**

Hypothesis 4: There is no significant relationship between effective assessment exercise and the quality of student teachers in teacher training institutions in Rivers State.

Table 8: PPMC output on the existence of relationship between effective assessment exercise and the quality of student teachers

Variable	N	r	Sig	Remark
Effective assessment	20	.795	.000	$H0_4$ Rejected
Student teacher quality	80			

.05 level of significance

Table 7 shows the mean ratings of lecturers and student teachers on how effective assessment exercise improves the quality of student teachers, while Table 8 shows the PPMC output on the existence of relationship between effective assessment exercise and the quality of student teachers in teacher training institutions in Rivers State. As revealed by Table 7, majority of the respondents strongly agreed on the various ways assessment exercises improve student teachers' quality (M = 2.77, SD = .546) with the grand mean set being higher than the criterion mean. The various ways include: making student teacher to be more serious with their teacher preparation programs and exercises; improvement on their teaching engagements; mastery of effective preparation of lesson notes and lesson plans; and improvement in student teachers' skills.

Table 8 in the same vein shows that there exists a very strong positive and significant relationship ($r = .795$, $p=.000<.05$) between assessment exercise and quality of student teachers in teacher training institutions in Rivers State. These findings are in line with that of Oluwatayo and Adebule (2022) that assessment exercise improves student teachers' quality through helping them to know how well they are performing and then improving on their performance on various performance indices on which they are assessed on the course of their program. This also highlights the fact that providing constructive feedback to student teachers to help them improve on their teaching practice performance should be the main goal of assessment exercise. As much as student teachers get graded by their performance in the various forms of assessment during their teacher preparation programs, lecturers and supervisors need to always ensure that feedback is given to the student teachers so that they can know areas where they need improvement.

CONCLUSION

To raise quality teachers in teacher training institutions in Rivers State, administrators, deans, heads of departments, and lecturers need to be innovative with exercises that can bequeath student teachers with requisite skills, knowledge and competences in the teaching profession. Some of these exercises, such as teaching practice, microteaching, mentoring and assessment of student teachers on the course of their programs are actually on ground in these institutions but have lost their efficacies because of poor management. If effectively implemented, they possess the potentials of transforming the outputs of teacher training institutions into the right calibre of teachers that will help in the attainment of education goals of the state.

Recommendations

Based on the forgone findings and conclusion of the study, the following suggestions are made:

- Teacher training institutions should take their teaching practice exercises very seriously, by ensuring that student teachers in the exercise are adequately and properly supervised and assisted to become their best during the teaching practice exercise.

- School administrators should ensure that microteaching laboratories in teacher training institutions are equipped with state of the art facilities to make the exercise achieve its goal of adequately preparing student teachers to possess the quality that is expected of them by their institutions and the society.
- The administration of teacher training institutions should normalize pairing student teachers with experienced faculty members for the purpose of coaching and mentorship to facilitate the transfer of teaching experiences for improved quality of student teachers.
- Supervisors of teacher preparation exercises should always provide student teachers with feedback after assessment to help them know areas where they need improvement and to make necessary adjustment.

UTILIZATION OF SECURITY FACILITIES, PERSONNEL, AND AGENCIES WITHIN SCHOOL COMMUNITIES IN THE MANAGEMENT OF INSECURITIES FOR EFFECTIVE ADMINISTRATION OF PUBLIC SENIOR SECONDARY SCHOOLS IN RIVERS STATE

Pleasant Chile MAXWELL
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

This study investigated the utilization of security facilities, personnel, and agencies within school communities in managing insecurity for effective administration of public senior secondary schools in Rivers State. The study adopted the descriptive survey research design. The population of the study consisted of all 333 principals of the 333 public senior secondary schools in Rivers State. The sample size for the study was 100 principals comprising of 50 males and 50 females. This size was conveniently determined by the researcher. Purposive, stratified and simple random sampling were used to select the participants from the three geopolitical zones of Rivers State. The instrument for data collection was a close-ended questionnaire developed by the researcher and titled "Utilization of Security Facilities, Personnel, and Security Agencies in Managing Insecurity for Effective School Administration Questionnaire (USFPSAMIESAQ)". The reliability coefficient of the instruments was determined using test-retest method and Pearson Product Moment Correlation and was found to be .78. The research questions were answered using mean and standard deviation statistics on a modified 4 point Likert scale rating, while the null hypotheses were tested at .05 level of significance using independent samples t-test. The findings of the study revealed that security facilities, personnel, and agencies within school communities were utilized to a very low extent in managing insecurity for effective administration of public senior secondary schools in Rivers State, and there was no significant difference in the mean ratings of male and female principals in this regard. The study concluded that proactive strategies of managing insecurity in public schools were imperative for effective school administration in Rivers State. The study recommended among others that perimeter fences, gates, barbed wires and necessary security facilities should be installed in all public secondary schools in the state by the Rivers State government through the Senior Secondary Schools' Board, especially those schools in rural areas or in the outskirt of the community.

Keywords: Insecurity, Threats, Effective Administration, Security Gadgets, Security Personnel, Security Education, Security Agencies, Stakeholders' Engagement.

INTRODUCTION

Teachers, students, school administrators, educational curriculums, and educational policy goals and objectives are facing serious physical security threats in Nigeria generally, and this is not faring well with the administrative efforts of senior secondary school administrators in the country. The school is arguably the society's most priced institution. It is an institution intentionally set up by the government of the nation for the delivery of education, which is generally acknowledged as the world's greatest agent of transformation and development at all levels of human existence (personal, community, state, national and global levels). Whatever threatens the effectiveness of school administration directly threatens the realization of national objectives; hence, a threat to the school is a threat to the nation. As such, the need for effective management of insecurity in schools has become sacrosanct.

Insecurity, which Alonge and Awulor-Hephzibah (2019) described as the absence or lack of security for lives and properties in a given place, is fast becoming the order of the day in Rivers State. While heavy attacks from armed men and bandits have been commonly reported in the insecurity prone Northern states over the past few years, the need for the government and school administrators in Rivers State to be proactive in securing secondary schools in the state is simply not out of place, as traces of insecurity litter nooks and crannies of the state. Besides, several other instances of insecurity persist in secondary schools in the state which pose as threats and undermine the effectiveness of school administrations. In Rivers State in particular, activities of cultists in senior secondary schools is prevalent. Fights happen which blow out to uncontrollable proportions. Female students get raped by community boys. School properties get vandalized. Teachers get threatened by students and their gangs. Parents even burst into schools to physically assault teachers for disciplining their wards. Students' unrests and protests happen. Stealing of students' property and even the stealing of school facilities like library and laboratory materials by students are commonly reported. Bullying of students by fellow students is a norm in some schools and even teachers are not spared from this. All of these security threats seem prevalent in public schools unlike in the private schools that are obviously more security-conscious and more intentional at averting threats to insecurities.

The effects of insecurity on the effectiveness of school administration in public secondary schools and consequently on school achievements are simply far reaching. Schools in vulnerable areas are likely to suffer poor quality of education as a result of poor teaching and learning occasioned by fears in the minds of teachers and learners, under-achievement of learners, destruction of school facilities, loss of manpower as teachers turnover may increase, brain-drain, high absenteeism of students, discouragement of students' educational pursuits, discouragement of private investments in education, closure of schools, and many other such negative effects that defeat the goals and objectives of education in the state and country as a whole. This would always result to increasing rate of school dropouts, illiteracy, unemployment, poverty and other consequences of poor education in the society.

Managing insecurity in public senior secondary schools in Rivers State is the shared responsibility of all stakeholders concerned, for example, the government, school administrators, teachers, community heads and parents alike. Literature has suggested a wide range of strategies that could be adopted for the management of insecurity in secondary schools (Sulaimon et al., 2023). However, despite the adoption of most of the suggested strategies, insecurity still persists in public secondary schools in Rivers State. To this end, the study investigates the effectiveness

of the use of security gadgets, personnel and agencies within school communities in managing insecurity for effective administration of public senior secondary schools in Rivers State.

Statement of the Problem

While public senior secondary school administrators and teachers in Rivers State are yet battling with curtailing issues of students' indiscipline and deviant behaviours such as cultism, bullying, stealing, among others, which are threatening the integrity of the senior secondary education system in the state, the greatly feared external attacks with more grievous implications are beginning to rear their ugly heads in the schools, too, in recent times. Kidnapping, hostage taking, physical assaults, vandalism, reinforced cultism and cult activities, theft and vandalization of school facilities, rape and other forms of attacks against students, teachers and school facilities are increasingly making headlines in the news. There is fear in the hearts of stakeholders that if these insecurity issues in the state are not quickly nipped in the board, the situation has the potential of degenerating to what happened (and is still happening) in the Northern states of the country, to the detriment of effective administration of these schools, which would bring about inability for the goals of secondary education to be attainment in the state. It is against this background that the study sought to investigate utilization of security facilities, personnel and agencies in managing insecurities for effective administration of public senior secondary schools in Rivers State.

Aim and Objectives of the Study

The aim of the study was to investigate utilization of security facilities, personnel and agencies in managing insecurities for effective administration of public senior secondary schools in Rivers State. Specifically, the study sought to:

- Assess the extent of utilization of security facilities in managing insecurities for effective administration of public senior secondary schools in Rivers State.
- Determine the extent of utilization of security personnel in managing insecurities for effective administration of public senior secondary schools in Rivers State.
- Evaluate the extent of utilization of security agencies within school communities in managing insecurities for effective administration of public senior secondary schools in Rivers State.

Research Questions

The following research questions were posed to guide the study:

- To what extent is are security facilities utilized in managing insecurities for effective administration of public senior secondary schools in Rivers State?
- To what extent are security personnel utilized in managing insecurities for effective administration of public senior secondary schools in Rivers State?
- To what extent are security agencies within school communities utilized in managing insecurities for effective administration of public senior secondary schools in Rivers State?

Hypotheses

The following null hypotheses were formulated and tested at 5% significance value to guide the study:

- There is no significant difference in the mean ratings of male and female principals on the extent security facilities are utilized in managing insecurities for effective administration of public senior secondary schools in Rivers State.
- There is no significant difference in the mean ratings of male and female principals on the extent security personnel are utilized in managing insecurities for effective administration of public senior secondary schools in Rivers State.
- There is no significant difference in the mean ratings of male and female principals on the extent security agencies within school communities are utilized in managing insecurities for effective administration of public senior secondary schools in Rivers State.

Significance of the Study

Security of schools is an issue of societal concern right now and every single stakeholder is affected either directly or indirectly. As such, this study when completed will be of immense benefit to every member of the society, particularly to school administrators, teachers, parents of students, security agencies within communities, the government and to scholars and researchers, too. The study will in a general sense furnish the audience with information on effective ways of managing insecurity problems in public senior secondary schools in the state and the roles which party can play for self-security and for the security of the school system, too.

School administrators and teachers will find the study very useful as it will be a guide to them on veritable ways of ensuring that their schools and students are safe and secured in the instructional delivery process. Besides, administrators will also be able to see the need for establishing cordial relationships with their host communities in a bid to partnering with them for the security of the schools whose student populations are usually mostly children from these communities.

Much of the security threats to schools usually come from elements within the communities. For those that come from outside the immediate communities, they always pass through the communities to gain access into the schools. As such, this study will become very useful to community leaders and security agencies within the communities as it will acquaint them with knowledge of what they can and should do to secure the schools in their vicinities bearing in mind that the security of these schools is the security of their children and of their communities.

Also, scholars and researchers will benefit significantly from this study as the study will constitute a rich body of knowledge for their referencing. The contributions made to knowledge by the study will be significantly insightful and educative to scholars and the results of the analysis will constitute a veritable source of secondary data to researchers who venture into researching in related fields.

THEORETICAL FRAMEWORK

The study was anchored in school climate theory by Halphin and Croft, 1963 cited in Agbongiasede and Ololube (2021). According to them, a sustainable positive school climate fosters youth development and makes learning necessary for a productive, contributory and satisfying life in a safe and democratic society. The school climate theory thus posits that a positive school environment encourages interpersonal relationship and optimal learning opportunities for all students and reduces disruptive behaviours. The school climate in this regard refers to the quality and character of the school life. It is based on patterns of school life experience and reflects norms, goals, values, interpersonal relationship, teaching, learning and leadership practices, and organizational structures. The school climate theory highlights how various aspects of the school's internal environment influences learners' behaviour.

According to school climate theory, when there is positive school climate, it can provide an enriching environment, both for personal growth and academic success. To improve the school security, Marshall cited in Agbongiasede and Ololube (2021) stated that educators and parents have multiple options which are to enhance school climate and students' overall educational experience. These are: increased parents and community involvement, implementation of character education or the promotion of fundamental moral values in children, use of violence-prevention and conflict-resolution curriculum, peer mutation and prevention of acts of bullying.

Relevance of the School Climate Theory to the Present Study

The school climate theory is relevant to the present study on managing insecurity for effective administration of public senior secondary schools as it highlights how the feeling of positivity, safety and security by the human elements of the school affects their performance. The relationship between a positive school climate and the improvement of school security is that a positive school climate has been associated with fewer behavioural problems and has less of security threats. Halphin and Croft, the proponents of the school climate theory explained that positive school climate can significantly shape the degree of academic success experienced in a school. Students are able to learn in a relaxed, comfortable and convenient atmosphere and teachers are able to teach without the consciousness of threats. Regarding the roles of teachers and administrators, they posited that a positive school climate is associated with increased job satisfaction for personnel. When the school environment is physically safe and secure, positive interpersonal relationships, which bring about optimal learning opportunities for students in all demographic environments ensues. This is imperative for effective administration of public senior secondary schools and very instructional to principals to and educational managers to ensure that the school environment is safe and protected against both internal and external security threats.

CONCEPTUAL CLARIFICATION

Security and Insecurity

The contention about the meaning of security has denied the concept of a single and precise definition. In its simplest offering, Wali (2021) defined it as the condition of feeling safe from

danger or harm. For Mohammed and Ogunode (2022), it implies a situation that encourages stability, economic development and holistic development of the well-being and quality of life of a people.

According to Okene cited in Mohammed and Ogunode (2022), the concept of security refers to the state of being secure or free from danger and risk. It is a situation where either an individual, social group (like a school for example) or geo-political entity is protected against any form of danger, espionage or attack of any sort, internally or externally, and other common themes in its multifaceted definitions in literature include freedom from danger; freedom from fear; freedom from aggression; and freedom from war. It could also be described as being safe and well in a physical location. It transcends the mere feeling of safety to actually being safe and protected against any physical harm or attack. It also means to live without consciousness of impending misfortune. The quest to remain secure and live peacefully to pursue development efforts are the bane of a peaceful and secure society, which cannot be achieved without proper management (Mohammed & Ogunode, 2022). The management of security is paramount to the effective management of schools and it is an issue that has attracted a great deal of attention and concern from learners, educators, parents, and the public at large.

Insecurity on the other hand is the absence of security. Ubong, (2016) noted that insecurity occurs whenever people have a feeling of self-doubt or feel vulnerable and susceptible to injury or harm particularly for a sustained period. Sanni, (2015) in his own definition conceptualized insecurity as the sense of vulnerability, defenselessness, lack of protection and danger present in the study area, influencing females' participation in education programmes. Adebanjoko & Ugwuoke cited in Mohammed and Ogunode (2022) also viewed insecurity as the state of being subject in every respect to terror, threat, risk, molestation, bullying, harassment, etc. Insecurity, for example, can be conceived as a threat to the state that often accounted for the arms and nuclear weapons race to protect the state (Mohammed & Ogunode, 2022). This is to say that insecurity always prompts self-defense, and the reason why there are security agencies in the society is because of insecurity. From experience, every social organization with a worthy course is susceptible to insecurity as miscreants and unscrupulous elements in the society will always want to find a way to exploit or loot or destroy it. The school is not exempted from this. As a matter of fact, the severity with which schools are suffering from insecurity in these modern times and the need to find pragmatic solutions to the phenomena motivated this study.

Insecurity like security is often used in a number of ways. Many people would take it to mean lack of safety or the existence of danger; hazard; uncertainty; lack of trust; doubtful; inadequately guarded or protected; lack of stability disturbed; lack of protection and unsafe (Achumba et al, 2013). It is a state of being unsafe or insecure or a state of mind characterized by self-doubt and vulnerability. For Beland cited in Mohammed and Ogunode (2022), insecurity is "the state of fear or anxiety stemming from a concrete or alleged lack of protection. Oluyomi & Grace (2016) saw insecurity as concerned with feelings of uncertainty, dangers or threats to life while Hassan (2014) viewed insecurity as a negative feeling involving fear, anxiety, uncertainty and injustice, among others. When an individual does not have control over a situation but has to rely on the cooperation of others that cannot be guaranteed, the result may be frustration or insecurity. Insecurity is a threat to learning. Prevailing peace or conflict within communities around the schools often has ripple effects on the teaching and learning activities of such schools. For Beland cited in Mohammed and Ogunode (2022), insecurity is "the state of fear or anxiety stemming from a concrete or alleged lack of protection. It refers to lack or inadequate freedom from danger. This definition reflects physical insecurity which is the most visible form of

insecurity, and it feeds into many other forms of insecurity such as economic security and social security.

Effective Administration of Public Secondary Schools in Rivers State

Administration according to Peretomode cited in Ikegbusi and Iheanacho (2016) is the component part of management concerned with facilitating accomplishment of the objectives of an organization like school through the systematic management of constraints and careful utilization of the available limited resources like human, material, finance and so on. In the view of Okeke cited in Mohammed and Ogunode (2022), secondary school administration involves the provision and maintenance of the necessary manpower to those who teach students with a view to bring about the desired change in the students' behaviour.

Effectiveness connotes pragmatism. It is about producing required or expected result as and when due. It is one thing to be an administrator and another thing to actually be administering. Visible and tangible results differentiate one school principal from the other and effectiveness is measurable. As such, Udoh-Uwah (2015) averred that effectiveness is a measure to which set objectives are being achieved. This implies that secondary school effectiveness is a measure to which the goals and objectives of senior secondary education are being achieved. Judging the performance of public senior secondary schools in Rivers State by the light of this assertion, one can tell that majority of the schools are not administratively effective. Majority of the principals are performing below expectation as the actual instructional outcomes of these schools are really nothing to write home about (Kalagbor, 2016; Larmie & King, 2015; Ogwunte et al., 2022).

By reason of the fact that results are used to judge administrative effectiveness (Adeniran, 2020; Ajayi & Ekundayo, 2011), it would not be out of place to posit that the effectiveness of public senior secondary schools administration in Rivers State is a function of the process and product of the administrative efforts of the human elements in the system, which include the principal, the teachers and the students, together with parents and community within which the schools are located, or rather, the stakeholders of the school system. Every single stakeholder has a role to play in the administrative effectiveness equation.

Forms and Causes of Insecurity in Secondary Schools

Insecurity in secondary schools takes appears in different forms and dimensions. However, the numerous forms could be categorized under internal and external forms of insecurity. The internal forms in this study are the insecurities which emanate from within the school system by reason of the actions and inactions of students and teachers, whereas the external form of insecurity refers to the ones that have their sources outside the school system, or rather the attacks on the school system which come from external actors. The definitions offered for the two broad forms are corroborated by Laura cited in Agbongiasede and Ololube (2021). Common internal security threats in public senior secondary schools include cultism, bullying and stealing while common external threats include kidnapping, vandalism, rape, communal clashes, stealing, politics, and societal decadence, among others. The significant and manifest forms are highlighted as follows:

- Cultism: A cult is a group of persons who come together to executive a particular goal that is only known to group members. Onuma cited in Agbongiasede and Oolube (2021) defined a cult group as assemblage of people who share common ideas, belief and involves themselves in eccentric conduct and manifestations, mostly shrouded in secrecy. Onuma further explain that the motives, members and rules remain unknown to the public. Cultism can manifest in ritual praises of song, chants and worship. It is unquestionable practices that may be difficult to dislodge. There is no public secondary school in Rivers state that did not experience the issue of cultism. The life of many secondary school students has been lost in the hand of cult members in secondary education in Rivers state.
- Bullying: Bullying means aggressive behavior which is in line with the approve standard of behaving in the society. It has to do with abuse of power by an individual or group of individuals against others in a particular environment. Bullying can be inform of physical abuse or verbal and psychological. Bullying in secondary school manifest in gender and sexual harassment and those targeted most time find it difficult to come out of it. Bullying in secondary school environment can result to depression, stress, fear, anxiety, powerless, loneliness and poor academic performance.
- Stealing: Stealing is the illegal act of taking another person's property without the proper knowledge of the owner of the property (Encyclopedia cited in Agbongiasede & Ololube, 2021). It refers to a situation where someone takes away the property of the other without the approval of the owner of the property. These days in secondary schools, stealing is common among students. Most of the secondary school students nowadays are involved in one form of stealing or the other. Even teachers' properties like phones, money, handbags, etc. are not safe. Library books and laboratory equipments and chemicals get stolen by students. All of these constitute serious cases of insecurity in the school system which undermine administrative effectiveness.
- Societal decadence: Societal decadence means behaviours that show low morals and a great love for activities that destroy the image of the whole society. Ogumbaramru cited in Agbongiasede and Ololube (2021) lamented that Nigerian society has willingly or unwillingly provided the enabling environment for high level of crime. The author further explained that Nigeria society has replaced honour for dishonour as a standard in the society. The interpretation of the above statement is that the Nigerian society today celebrates people with dubious character instead of reporting them to the appropriate authorities for investigation and if possible, prosecution. Instead they will hide the deviant. School students nowadays indulge in immoral activities that cause breach of peace within the school system and to the society where the school is located. Ekweme and Ogbonda cited in Agbongiasede and Ololube (2021) concluded that greed and corruption in the society is responsible for the high level of insecurity in the school system and the society at large. In summary, when insecurity thrives in the society, it creeps into the school system, because the teachers, students and administrators, together with the other stakeholders of the school system are all part and parcel of the society, and just as Uriah (2019) described the school as a miniature society, everything that happens in the larger society finds expression in the school system in one way or the other.
- Communal crisis: Communal crisis refers to misunderstanding that broke out between two neighbouring communities. Communal crisis often time result to community versus community fight. It was observed that some years back members of Rumekpe community

engaged the indigene of Elele Alimini in a community fight. Because of these the indigenes of the both communities were not allowed to come to do any activity together. In fact, students from Rumekpe were not allowed to attend school in Elele Alimini during this period. The significant effect of this communal rift is that the school systems in both communities were targeted and destroyed thereby depriving the students' access to school.

- Politics: Politics is part and parcel of every aspect of work and life. In any gathering of human beings, politics must surface and secondary school institutions are not exempted. Politics begins in secondary school during the process of selection of people to handle one position or the other. Ike (2012) Observed that politicians outside the educational sector interfere a lot in the selection of principal officer like educational secretary (ES), Principals and head master and head mistress in the field of education and this situation make it difficult for the management of the secondary school to operate freely without sentiments in there day to day activities.

Effects of Insecurity on Secondary School Administration

Ogunode et al. (2021) identified and expatiated on some effects of insecurity in the administration of Nigerian educational institutions. These include loss of manpower in educational institutions, poor quality of education, increase in educational spending, destructions of infrastructural facilities, brain-drain, closure of educational institutions, educational wastages, discouragement of educational pursuit by students and encouragement of foreign education and internal displacement of learners. Each of these is reviewed below:

- Loss of Manpower in Educational Institutions: The administration of educational institutions depends on the quality and qualities of professional teacher available. Insecurity in Nigeria is affecting the administration of educational institutions because many professional teachers have lost their lives due to the problem of insecurity in the country. This act has reduced the number of teachers for the effective administration of schools especially in the northern part of the country. Insecurity in Nigeria, particularly in Northern part of Nigeria is responsible for the death of professional teachers in the Nigeria.
- Poor Quality of Education: One of the objectives of school administration is to ensure delivery of quality education in all educational institutions. Insecurity in Nigeria is contributing to poor quality education because, school scheme of work and syllables are not covered in most educational institutions due to school closed down. Many educational institutions in the country are always being closed down due to insecurity. The inability of these educational institutions to cover their scheme of work and syllables is reducing the quality of education.
- Destruction of Infrastructural Facilities: School administration depends on the availability of infrastructural facilities to implement educational programmes. Many school facilities like classrooms, administrative block, ICT facilities, tables, chairs and desks have been destroyed by insurgencies and Boko Haram members in the Northern part of the country. Human Right Watch (HRW, 2016) reported that "Boko Haram has destroyed nearly 1,000 schools and displaced 19,000 teachers.

- Brain-Drain: Administration of school is impossible without adequate manpower to man the classrooms and to carry out other academic services within the schools. The insecurity in Nigeria and especially in the Northern Nigeria is causing mass movement of professional teachers from one state to another leaving many educational institutions without teachers. Many teachers and lecturers are resigning their appointment due to insecurity in Northern Nigeria. The implication of this mass migration of teachers from this region is that, less teachers will be available to teach and this will affect the quality of education because, there will be inadequate professional teachers to attend to the students.
- Closure of Educational Institutions: Administration of school is saddled with the responsibility of ensuring stable academic calendar and implementation of programmes as planned. The insecurity in Nigeria has led many states government order closure of all educational institutions in their states to prevent further attacks. Borno State ordered the closure of all educational institutions in the state because of insecurity. Human Right Watch (2016) submitted that in Borno, one of the most affected states, schools at all levels have been closed in 22 out of 27 local government areas for at least two years, and public secondary schools in the state capital, Maiduguri, only reopened in February 2016 after internally displaced people, or IDPs, who occupied most of the schools, were relocated elsewhere (UNICEF, 2017; BBC, 2020). The implication of school closure on students is that, it will affect the quality of education. Scheme of works and syllable meant to be covered are not covered due to the insecurity and school closure.
- Discouragement of Educational Pursuit of Students: One of the functions of school administration is to ensure effective student administration and enrolment but, insecurity in the country is discouraging parents and children from coming to school because of the fear of been kidnapped or been killed by insurgence. Attacks on educational institutions in Nigeria is discouraging parents and students from going to schools especially in Northern Nigeria. Many parents have decided to keep their children at home instead of been killed and kidnapped at schools where safety is not guaranteed. In the face of security threats in Nigeria, parents consider pulling their children out of schools.
- Internal Displacement of Learners: Insecurity in Nigeria and especially in the Northern part of Nigeria is responsible for internal displacement of students. Many students have been displaced from their schools because of insecurity. Insecurity is affecting students' administration in educational institutions across the country. Boko Haram - whose name means "Western Education is forbidden" - has made no secret of its strong opposition to education. Schools are often among the first targets when the terrorist group attacks communities. Oluwa cited in Ogunode et al. (2021) noted that the impact of insecurity included increase in the quantum of internally displaced persons; political, social, and economic disruptions; and slow economic growth. All of the above, impact negatively on the humans that occupy such locations experiencing insecurity.
- Reduction in Private Investment in Education: Insecurity faced by the country is preventing investment in the development of educational institutions in the country because, such investment if embarked upon will be destroyed by the insurgencies attacking public and private educational institutions in the country.
- Inadequate Funding of Education: Inadequate funding of education in Nigeria in recent times, is linked to insecurity facing the country which demands huge funds that are supposed to be used for sectors like education and health. The school administration

required a lot of financial commitment for effective implementation of the various educational policies and programmes. School administration is a very expensive project and it demands a lot of funds to secure the services of human resources and to procure the materials resources for the implementation of educational services. It is unfortunate that funds that are supposed to be allocate for the development of education is been used yearly in security.

Mohammed and Ogunode (2022) were more direct in explaining the effects of insecurity on the administration of secondary schools, using the North-West as an example owing to the prevalence of insecurity incidents in the North-Western states of Nigeria. To them, insecurity affected the teachers, the students, objective of education, enrollment and retention, school administration and the academic calendar to very significant and grievous degrees. The effects are as explained:

Strategies for Managing Insecurity for Effective School Administration

Depending on the form of the threat to security, different approaches or strategies are advanced in literature for managing them in educational institutions. The strategy adopted is determined by whether its source is internal or external and also by the forces behind the insecurity, even as Wali (2021) observed that some internal security threats like students' cult activities are sponsored by agents outside the school system. However, irrespective of the form and degree or severity of the insecurity, some common themes are found in literature on how insecurity may be managed in education. Thus, this section reviews some general approaches and is then streamlined to the five strategies proposed by the researcher in this study.

It is essential to ensure that the school environment is free from any act capable of causing insecurity. In other to achieve this, the principal, teachers, students and members of the society where the school is located must interface with each other with the aim of finding lasting solution to the social problems that may arise as result of the interaction between the stakeholders of the school. Rules and regulations should be properly defined in school to the extent that every student and teacher will understand; economic needs of the students should be adequately provided; students and teachers should be involved in administrative processes; infrastructures should be provided in school to enhance learning and more emphasis should be placed on moral values in the society (Agbongiasede & Ololube, 2021).

In the opinion of Bethel (2020), insecurity management strategies should incorporate corporal punishment on students who violate school rules and regulations; role modelling by teachers and principals for the students and members of the society to emulate and members of the society where the school is located; and channels for reporting cases of deviant behaviour in the school environment and or in the community to relevant authorities. Onoti (2016) disagreed with Bethel on the area of corporal punishment; instead he suggested that effective counseling service be introduced in secondary schools to take care of students who have problems with academic activities such as truancy, delinquency depression and poor performance. Onoti (2016) also suggested that parents should monitor their wards and the kind of associations they keep both in school and at home. This is necessary because the same way the child learn the social norms and values of the society is the same process the child will learn behaviour that do not conform with the social rules in the society (Agbongiasede & Ololube, 2021). Truly, evil communication corrupts good manners, and as such, students associations and peers must be

closely monitored by parents to limit cases of deviant behaviours which transform to security threats in the school and in the society.

Meadow cited in Agbongiasede and Ololube (2021) highlighted the following as strategies for managing insecurity in junior secondary school:

- Principals should not admit students with questionable characters and any student admitted mistakenly and is found guilty of violation of school rules and regulations during lesson should not be allowed to go out for break in order to serve as lesson to other students;
- The school authorities should ensure that any student linked to cultism should be reported to police for full investigation; and
- Parents Teachers Association should be strengthened to enable all the parties join forces together to tackle deviant behaviour within the school environment.
- Oguna (2019) directed his suggestion to the government in managing insecurity in schools, and was of the view that government should ensure the safety and security of schools through employment of competent and capable personnel that can efficiently and effectively take charge of safety and security matters of schools; organize periodic workshops on safety and security issues for school administrators; and mobilize civil society organizations to become active members of the school community police.

Having reviewed a variety of literature suggesting various strategies of managing insecurity at different levels of education in Nigeria and in other parts of the world, and discovering some content and geographical gaps which need to be filled, the researcher in this study proposes there major strategies that could be adopted for managing this menace in public senior secondary schools in Rivers State. These strategies include: (1) utilization of security facilities in the school; (2) employment of security personnel; and (3) involvement of security agencies within school communities in school administration. Each of these is examined in relation to managing insecurity for effective administration of public senior secondary schools in Rivers State.

Use of Security Facilities in Managing Insecurity for Effective School Administration

It is observed that some public secondary schools in Rivers State and especially in the rural communities are access paths to community members as they create track roads through the school to other parts of the community. Even in some schools that were originally fenced with gates, such infrastructures have broken down with age and are left unrepaired. All of these situations and more end up making public secondary schools vulnerable to easy attack and insecurity from both internal and external sources. The installation of necessary security gadgets such as fences, gates, doors and lockable windows, lockers in the classrooms, barbed wires in places where they are required, etc. could be a veritable security measures to protect the school from easy intrusion by external security threats and internal deviant tendencies of students.

According to Mastisa (2021), to help create a safe, attractive and secure school environment, school principals have to enhance the physical security. Okene (2021) posited that principals should be helped by the government to develop some security devices, plans, train staff on security guards and implement systems such as use video surveillance cameras, have physical access controls , perimeter fence, use radio and alarm systems. According to Trump cited in Wali (2021), to ensure security in the school compounds, placing cameras throughout the

school buildings will allow the personnel to see and possible video tape more motion of anyone within the camera, field view will be of a great advantage to monitor the school environment. Tagbo cited in Wali (2021) posited that there should be computer assisted design programmes in 3-D format (digital radio system, digital signage, and desktop videos), that can map how many people that are in a room at a particular location, and also that can be put in place to enhance security of lives and properties in secondary schools.

Use of Security Personnel in Managing Insecurity for Effective School Administration

The need for security personnel like security guards in public secondary schools to man the school environment and facilities and to complement security gadgets and provisions in the school can simply not be overemphasized for effective administration of public senior secondary schools in Rivers State. The security personnel could be a School Security Officer (SSO) or a School Resource Officer (SRO). School security officers are generally defined as individuals employed by the school, either as full or contracted employees, to manage safety and security programs on the school campus or environment. The security personnel could also be a school resource officer (SRO), who in contrast to a school security officer, is a commissioned law enforcement officer typically employed by law enforcement agencies and assigned to work in schools as part of an agreement with the school administration. Whether the security personnel is a security officer or a resource officer, the job roles and responsibilities are practically similar and achieve the same purpose of securing students and school personnel lives and properties and ensuring the security and safety of the school facilities. Among the most important responsibilities of the security personnel are maintaining a visible presence and building trust. Another important responsibility includes touring the campus frequently. High-risk areas that have been identified—such as locker rooms, bathrooms, isolated hallways or stairways, classrooms, playing fields, other out-buildings, and/or isolated areas of the building grounds—are potential trouble spots (Woodruff, 2022).

Effective School Security Officers employ best practices to help prevent and maintain school safety. Woodruff (2022) identified some of these practices to include:

- Maintaining visible presence and trust: Among the most important responsibilities are maintaining a visible presence and building trust. Officers should maintain professionalism at all times, being friendly and impartial, but fair to all without judgment. Effective officers understand the nuances of the job and are capable of reacting at any moment to unpredictable events.
- Touring the school campus frequently. High-risk areas that have been identified—such as locker rooms, bathrooms, isolated hallways or stairways, portable classrooms, playing fields, other out-buildings, and/or isolated areas of the building grounds—are potential trouble spots. By varying the route, it creates unpredictability, thus strengthening the School Security Officer's effectiveness. Checking doors and windows for good repair and noting any security breaches on campus, as well as providing security during athletic and other after-school activities, are vital. Officers identify and plan for hazards in the parking lots and other areas of the campus, as well.
- Being present at a variety of events: This is another effective deterrent to warding off potential security threats. The school security personnel should be visible during student lunches, breaks, sporting events, social events in the school, assemblies, and passing

periods between classes. This helps reduce problems during times when students are more likely to congregate.

- Security personnel establish contact with students and enforce school rules. Determining those who have legitimate business from intruders who may be intent on causing harm or disruption is of paramount importance. Regular communication from office staff and educators keeps the security personnel current with the pulse of what is going on in the school. Officers also brief school personnel on current security concerns and trends.
- Writing incidence report: An essential responsibility is writing incident reports in a way that is consistent with the methodology established by the school/district security department. These reports document action taken during and after an incident or crisis. Photographs further detailing the incident are often included in the report. This helps protect all involved: the community, the security personnel, school staff, and students.
- Collaboration with law enforcement: The security department of the school must work hand in hand with law enforcement and fire departments to establish sound safety and security practices.
- Training of school staff: The school security personnel additionally provide security and safety training to all school staff, students and parents.

Minooka District Office cited in Wali (2021) was very discrete and explicit in explaining the position, roles, experience and qualifications required of an ideal school security personnel. According to them, the primary purpose of the position of school security personnel is to ensure the safety, security, and welfare of all students, teachers, staff, and visitors in the school. The security officer or personnel works under the direction and supervision of the Principal and fosters positive relationships with students and the learning community while also working in tandem with existing administrative practices and building procedures to maintain order, prevent crime, and assist the building administration with the operations of the school on school property or at school-sponsored events when necessary and appropriate.

Use of Security Agencies within School Communities in Managing Insecurity for Effective School Administration

The need to involve security agencies like the police in the administration of public secondary schools in Rivers State was strongly advocated by Wali (2021). According to him, the word police came from a Greek word “Polis” which means safety, health and order of the state; hence, police is used to describe an officially established body of the government whose duty is to maintain order, prevent and detect crime and as well enforce law and order in the society. The police are basically saddled with the responsibility of securing lives and properties in the state - making sure that the country is free from every forms of threat to the peace, stability and progress of the nation.

Section 214(2)b of the 1999 Federal Constitution of Nigeria, together with section 4 of the Police Act (2004) as cited in Akuul (2021) and corroborated by Wali (2021) outlined the scope of the duties of the Nigeria Police Force, which includes:

- The protection of lives and properties;
- Detection and prevention of crimes;
- Apprehension/arresting of offenders;

- Preservation of law and order;
- Due enforcement of law regulations with which they are directly charged;
- Performance of such other delegated duties within and outside Nigeria.

Suggestions for Improving School-Police Relationship

The need to improve the relationship between the Nigeria police and the school was buttressed by Wali (2021). He went on to suggest ways this could be achieved. In his opinion, the relationship between the police and school administration in Nigeria could be improved through:

- Effective police-school relationship to keep the police abreast of situations in the school
- Establishment of police posts in rural areas because most victims kidnapped in schools are kept hostage in rural areas
- Checkpoints should be mounted close to schools to avert criminalities in schools or to enable quick response of police when need be
- Adequate budgetary allocation to the police force to enable them provide adequate security to schools
- Police should be provided with sophisticated weapons to match those of criminals who disturb schools.

In a situation where the police are out of reach to the school, community security outfits like the vigilante and or OSPAC could be reached out to where they are in existence. These local security agencies are even better disposed in tackling local sources of insecurity as they are very knowledgeable about the terrain of school communities and about sources of threat emanating from the community. In cases of students' cult activities or severe cases of fighting, members of local security outlets may possibly know the students better than the police could know them especially as majority of students in public secondary schools come from within the communities of the schools. Besides, issues of stealing and vandalism of school property could be better investigated by local security outlets in collaboration with teacher and students.

Review of Related Empirical Studies

Onyekwere and Ukaigwe (2023) carried out a study that investigated management of school security for academic achievement of secondary school students. Two research questions and two hypotheses guided the study. The research design was descriptive survey. The population consisted of 828 principals in public secondary schools in Rivers State. A sample of 394 principals was chosen using Taro Yamane sampling formula and later stratified using stratified random sampling technique based on the three senatorial zones. It utilized a structured questionnaire that was validated and had a reliability of 0.824. Mean and rank order scores were used to analyze the research questions, while z-test statistics was used to test the hypotheses at 0.05 level of significance. The findings of the study revealed that the ways of implementing school security policies to enhance the academic achievement of secondary school students were: promoting security consciousness amongst staff and students, maintaining minimum standard in security management, utilization of security facilities, provision of a secure and conducive atmosphere in schools, making of adequate plans in anticipation of a risk, involving staff and students in security management, developing school security programmes, engaging staff in

emergency safety drills, and providing adequate security facilities. The hypotheses tested revealed that there was no significant difference in the mean ratings of principals serving in urban areas and principals serving in rural areas on the ways implementation of security policies enhance academic achievement.

Ene (2022) in the same vein investigated principals' application of security management practices in the administration of secondary schools in Enugu state. The study adopted descriptive survey design. The population for the study was 8,816 respondents. It comprised 295 principals and 8,521 teachers among the public secondary schools in Enugu state. The sample size of the study consists of 722 respondents (295 principals and 427 teachers). The instrument for data collection was a structured questionnaire which contained 50 items. The reliability of the instrument was determined using Cronbach alpha and overall reliability coefficient of 0.95 was obtained. Hypotheses were tested at 0.05 level of significance. The findings revealed that the extent to which principals apply staff training, use of video surveillance cameras, physical access control, radio and alarm systems and computer assisted programmes as security management practice was to a low. The study relates with the present study in design and in focus but differs from it in scope.

Onoyase et al. (2018) investigated effective cultism management techniques as perceived by academic staff, non-academic staff and students in higher education in Nigeria (A case study of federal colleges of education in Nigeria). Five hypotheses were formulated to guide the study. The study made use of an instrument known as "Effective Cultism Management Technique Questionnaire (ECMTQ)". The instrument had a reliability coefficient of 0.78. The instrument was administered on a total of 567 respondents. All the respondents returned their copies of questionnaire showing one hundred percent return rate. The analysis of variance (ANOVA) was used to analyse the data and the findings showed that coercion, persuasion, public renunciation, public awareness campaign and school disciplinary measure were found to be effective techniques in the management of cultism. The study relates with the present study in design and in focus but differs from it in scope.

Akpabio et al. (2019) carried out a study that investigated the extent to which school-community collaborations predicted security management in technical colleges in Akwa Ibom State. Four (4) research questions and 4 null hypotheses were formulated to guide the study. The correlational research design was adopted for the study. A sample of 545 respondents, comprising 10 principals, 19 vice principals, 382 teachers and 134 PTA members was drawn from the entire population of 1011 participants, using the purposive and random sampling techniques. Two (2) researcher-developed instruments; School-Community Collaborations Scale (SCCS) and School Security Management Scale (SSMS) were used for data collection. The reliabilities of the instruments, were established, using the test- retest method. The results obtained were 0.92, 0.66, 0.97, and 0.64, for sections A, B, and C, of SCCS respectively while 0.98 was obtained for SSMS showing that the instruments were reliable. Out of the 549 copies of instruments administered, 545 (99%) copies were retrieved and used for data analysis. The research questions were answered using simple linear and multiple regressions while the hypotheses were tested using t-test and analysis of variance (ANOVA). The results revealed that school-community collaborations (planning, parenting, funding and information sharing) predicted security management in technical colleges in Akwa Ibom State. The study relates with the present study in focus but differs from it in design and scope.

METHODOLOGY

The study adopted the descriptive survey research design. The population of the study consisted of all 333 principals of the 333 public senior secondary schools in Rivers State. The sample size for the study was 100 principals comprising of 50 males and 50 females. This size was conveniently determined by the researcher. Purposive, stratified and simple random sampling were used to select the participants from the three geopolitical zones of Rivers State. The instrument for data collection was a close-ended questionnaire developed by the researcher and titled "Use of Security Facilities, Personnel, and Security Agencies in Managing Insecurity for Effective School Administration Questionnaire (USFPSAMIESAQ)". The reliability coefficient of the instruments was determined using test-retest method and Pearson Product Moment Correlation and was found to be .78. The research questions were answered using mean and standard deviation statistics on a modified 4 point Likert scale rating, while the null hypotheses were tested at .05 level of significance using independent samples t-test. Statistical Package for Social Sciences (SPSS) Version 28 was used for the data analysis.

RESULTS AND FINDINGS

Research Question 1: To what extent are security facilities utilized in managing insecurities for effective administration of public senior secondary schools in Rivers State?

Table 1: Mean ratings of male and female principals on the extent security facilities are utilized in managing insecurity for effective school administration

s/n	Items	Male Principals (N = 50)		Female principals (N = 50)		Mean set (N = 100)		Dec.
		$\bar{X}_1$	SD_1	$\bar{X}_2$	SD_2	$\frac{\bar{X}1 + \bar{X}2}{2}$	SD	
1	My school is properly fenced with electric wiring and this helps in managing insecurity for effective school administration.	1.77	.745	1.78	.750	1.77	.746	LE
2	My school has well-mounted gate(s) to regulate movement in and out of the school for managing insecurity for effective school administration.	1.52	.678	1.47	.640	1.49	.659	LE
3	Our classes, laboratories, libraries and offices have lockable windows and doors, which help in managing insecurity for effective school administration.	2.68	.467	2.66	.474	2.67	.470	HE
4	Barbed wires are used in necessary places to prevent unregulated movements and intrusions, necessary for managing insecurity for effective administration.	1.43	.705	1.47	.714	1.45	.709	LE
5	Computerized systems like surveillance camera and alarm systems are also used in my school as security gadgets for managing insecurity for effective school administration.	1.00	.000	1.09	.281	1.04	201	LE
	Grand Mean	**1.68**	**.519**	**1.69**	**.572**	**1.68**	**.557**	**LE**

$H0_1$: There is no significant difference in the mean ratings of male and female principals on the extent security facilities are utilized in managing insecurities for effective administration of public senior secondary schools in Rivers State.

Table 2: Independent t-test result of test of significant difference in mean ratings of male and female principals on the utilization of security facilities in managing insecurity for effective school administration

Respondent's Portfolio	N	Mean	SD	t-cal	DF	Sig.	Decision
Male Principals	145	1.68	.293	-.404	283	.684	H_{02} Accepted
Female principals	140	1.69	.298				
Total	**285**						

Significance level of .05

Table 1 shows the mean ratings of male and female principals on the extent security facilities are utilized in managing insecurity, while Table 2 shows the independent samples t-test result of test of significant difference in mean ratings of male and female principals on the utilization of security facilities in managing insecurity for effective school administration. By the revelation of the study, majority of the respondents are of the opinion that security facilities are utilized to a low extent in managing insecurity for effective administration of public senior secondary schools in Rivers. Furthermore, the study revealed that both males and female principals share similar opinion on the utilization of security facilities in managing insecurity in their schools.

The findings of the study in this regard are in agreement with vast body of literature with related concerns. Tagbo (2015) posited that there should be computer assisted design programmes in 3-D format (digital radio system, digital signage, and desktop videos), that can map activities going on within the school system. Ene (2023) in similar lights highlighted the need for security gadgets such as video surveillance camera, physical access control, radio and alarm system, and computer assisted programmes. Several other authors highlighted the importance of technology-driven security gadgets for managing insecurities (Okene, 2011; Tagbo, 2015; Trump, 2012). Moreover, whereas most of the strategies suggested in literature are technology based, which could have accounted for their low adoption in public schools, this present study stresses the need for the employment of easy-to-afford non-ICT-based strategies like fences, gates and security personnel, which the government can readily put in place.

Research Question 2: To what extent are security personnel utilized in managing insecurities for effective administration of public senior secondary schools in Rivers State?

Table 3: Mean ratings of male and female principals on the extent security personnel are utilized in managing insecurity for effective administration of public senior secondary schools in Rivers State

9	Our security personnel writes and presents reports occasionally in security updates in the school and this is useful for managing insecurity for effective administration.	1.14	.353	1.17	.378	1.16	.365	LE
10	Our security personnel works closely with law enforcement agencies for training and for exchange of security information and this helps in managing insecurity for effective administration.	1.14	.353	1.19	.426	1.16	.390	LE
	Grand Mean	**1.16**	**.385**	**1.16**	**.405**	**1.16**	**.413**	**LE**

$H0_2$: There is no significant difference in the mean ratings of male and female principals on the extent security personnel are utilized in managing insecurities for effective administration of public senior secondary schools in Rivers State.

Table 4: Independent t-test result of test of significant difference in mean ratings of male and female principals on the utilization of security personnel in managing insecurity for effective school administration

Respondent's Portfolio	N	Mean	SD.	t-cal	DF	Sig.	Decision
Male Principals	145	1.17	.269	.130	283	.897	H_{03} Accepted
Female principals	140	1.16	.263				
Total	**285**						

Significance level of .05

The second objective of the study with its corresponding research question sought to evaluate the extent security personnel were utilized in managing insecurity for effective administration of public senior secondary schools in Rivers State. In this regard, the study found that the employment of school security personnel like security guards, security officers and security resource persons to manage insecurities was utilized to a very low extent in public senior secondary schools in Rivers State as shown in Table 3. The test of hypothesis shown in Table 4 reveals that majority of male and female principals of public senior secondary schools in the state were in consensus in this regard. They believed that security personnel were not adequately engaged in their schools to manage insecurities. Security personnel in this regard include security guards, security officers and or security resource persons. The roles of these staff in the school include but are not limited to: mounting the school gate or entrance to regulate entrance and exit in the school environment; having an oversight of lives and property in the school; having oversight of movement around the school system; being on ground in every important school event to ensure that students are secure and safe; writing and presenting security reports

occasionally to the school administration for necessary actions; and working closely with law enforcement agencies for training and for exchange of security information (Woodruff, 2022).

It is however worrisome that as important as these personnel are to the effective administration of public senior secondary schools in the state, they are lacking in these schools. Hardly has the government thought in the direction of employing their services, and majority of principals, too, are hardly making efforts to engage their services through the help of the PTAs or through community engagement. This revelation is simply too risky for the safety of students and teachers, especially in this present times when cases of insecurity are being widely reported in different quarters of the state.

Research Question 3: To what extent are security agencies within school communities utilized in managing insecurities for effective administration of public senior secondary schools in Rivers State?

Table 5: Mean ratings of male and female principals on the extent security agencies within school communities are utilized in managing insecurity for effective school administration

s/n	Items	Male Principals (N = 50)		Female principals (N = 50)		Mean set (N = 100)		Dec.
		$\bar{X}_1$	SD_1	$\bar{X}_2$	SD_2	$\frac{\bar{X}1 + \bar{X}2}{2}$	SD	
11	Principals invite security agencies to schools occasionally and their presence wards off deviants, which helps in minimizing security threats in the school for effective school administration	1.19	.396	1.23	.421	1.21	.408	LE
12	Police patrol vans visit schools once in a while and this is helpful in managing insecurity	1.08	.266	1.09	.281	1.08	.273	LE
13	Security agencies give security advice to schools and this helps in managing insecurity for effective administration	1.94	.658	1.86	.637	1.90	.648	LE
14	Security agencies are invited for investigation of serious crime cases in the school and this helps in managing insecurity for effective school administration.	1.71	.735	1.80	.722	1.75	.729	LE
15	Security agencies make arrests and bring order to the school and community whenever there is crisis.	2.41	.751	2.34	.726	2.38	.738	LE
	Grand Mean	**1.67**	**.561**	**1.66**	**.557**	**1.66**	**.559**	**LE**

$H0_3$: There is no significant difference in the mean ratings of male and female principals on the extent security agencies within school communities are utilized in managing insecurities for effective administration of public senior secondary schools in Rivers State.

Table 6: Independent t-test result of test of significant difference in mean ratings of male and female principals on the utilization of security agencies within school communities in managing insecurity for effective school administration

Respondent's Portfolio	N	Mean	SD.	t-cal	DF	Sig.	Decision
Male Principals	145	1.67	.263	.110	283	.912	H_{06} Accepted
Female principals	140	1.66	.251				
Total	**285**						

Significance level of .05

The last objective of the study sought to assess the extent security agencies within school communities were utilized in managing insecurity for effective administration of public senior secondary schools in Rivers State. The study in this regard found that involving security agencies in school administration to manage insecurities was utilized to a very low extent in public senior secondary schools in Rivers State as shown in Table 5. It was further found that there was no significant difference in the mean ratings of male and female principals on the extent security agencies were involved in the administration of public senior secondary schools in the state (See Table 6). This poor involvement of security agencies in school administration does not in any way hold promises for effective management of insecurities in these institutions at a volatile time as this when terrorist attacks have been reinforced against educational institutions in the country. As a matter of fact, Wali (2021) argued that no school can function effectively without receiving reinforcements from security agencies like community vigilante, the police, civil defense, or the military in the face of serious security threats in the state.

Involving security agencies in the administration of public senior secondary schools in Rivers State would entail that principals invite security agencies to schools occasionally, even as their presence could potentially wards off deviants; **p**olice patrol vans visiting schools once in a while; security agencies giving security advice to schools; Inviting security agencies for investigation of serious crime cases in the school; and security agencies making arrests and bringing order to the school and community whenever there is crisis. Truly, there are security threats that cannot be handled by principals and their teachers, which can only be effectively tackled by security outfits and agencies. As such, involving security agencies in school administration to effectively manage insecurity is simply an effective school variable in the face of security threats.

CONCLUSION

Insecurity is a serious problem in public senior secondary schools in Rivers State as it affects every facet of school administration and the human elements of the school system, disrupting activities of teachers, students, administrators, and school calendars. As such, the need to curb it through proactive strategies is simply sacrosanct. Some of the veritable strategies that could be used in managing insecurity in schools include the use of security facilities; the employment of security personnel; and involvement of security agencies within school communities in school administration. However, these possibilities are poorly utilized in public senior secondary schools in Rivers State, and the need for school administrators keenly consider them is imperative for effective administration of schools in the state.

Recommendations

Based on the discourse, the paper makes the following suggestions:

- Perimeter fences, gates, barbed wires and necessary security facilities should be installed in all public secondary schools in the state by the Rivers State government through the Senior Secondary Schools' Board, especially those schools in rural areas or in the outskirt of the community.
- The Ministry of Education should ensure that security personnel such as guards, officers and security resource persons are attached to every public secondary school in the state. They should be an integral component of the staff in every school in the state, even as their importance in the school system is inalienable for effective school administration in the state.
- Principals of public senior secondary schools in Rivers state should involve security agencies such as community vigilante groups, the police and other official security outfits within school communities in the administration of public senior secondary schools in the state. This they can do by creating a good rapport with personnel of these agencies such that they (principals) can easily call on them whenever the school is in need of them because of threats to school security.

ABSTRACT

This paper examined university-industrial partnership for man power development in universities in Nigeria. University-industrial partnership refers to the mutual and beneficial relationship that exist between universities and industrial for assistance to each other in the areas of infrastructures, finance, manpower and among others. Nigerian universities have often been criticized as ivory towers that churn out graduates and research that are irrelevant to the needs of employers and the social, economic, and technical challenges facing Nigerian economies. There is a growing perception that the knowledge and skills taught to students at Nigerian universities do not meet the requirements of industry and the wider economy. This mismatch, coupled with under-training in the critical skills of problem-solving, analytical thinking and communication necessitated the need for university-industrial partnership. Some of the variables discussed in the paper include, university-industrial partnership, university-industrial partnership in collaborate research, university-industrial in innovation, university-industrial partnership in industrial training, university-industrial partnership in intellectual property man power production, among others. The paper concluded that university-industrial partnership helps translates the fruits of academic theories, concepts, ideas into new products and processes and in return enough employable manpower is being produced to for industrial utilization. The paper went further to suggest that university administration should collaborate with industries in research projects in order to provide students with real-world experience for effective manpower production.

Keywords: University-Industry Partnership, Collaborative Research, Innovation, Industrial Training, Intellectual Property.

INTRODUCTION

The training and provision of manpower to strengthen companies' services and infrastructure requires the development of professionals and knowledge workers with globally equivalent skills, as well as socially responsible and conscious of their role in contributing to the national development effort and social transformation which can be readily actualized through university-industrial partnership. Universities-Industrial partnership is very vital in their bid to supply and

improve man power production, which entails the collaboration with between universities and industries in research and the development of the manpower for speedy economic development. The synergy between academic institutions and industrial enterprises has proven to be a catalyst for technological advancement, ultimately leading to enhanced manpower development. University-Industry partnership helps to facilitate the use of technology in simulating real-life business environments. This University-Industry collaboration benefits both organisations in different ways; for the University, the students are given the opportunity to apply what they learnt in theory which has to successfully facilitate students' exposure to a sample industry environment as well as the development of middle level manpower skills. The new graduates are therefore more skill-ready for the employment market (Uche, 2013).

However, national growth and competitiveness is dependent on continuous technological improvement and innovation, driven by a well-organised, vibrant research and development system which integrates the research and training capacity of higher education with the needs of industry and of social reconstruction. Higher Education has a critical and central role to play in contributing to the development of an information society in terms of skills development and research production. Companies help to provide graduates with the skills and competencies necessary to meet the human resource needs of the country through industrial training of students before they graduate. The content of skill requirements includes academic courses and structured work-based training. Hence, there is need to increase companies' participation rate in the development of manpower skills in higher education system to meet the demand for high-level skills through a balanced production of graduates in different fields of study taking into account labour market trends. This will go a long way to improve the competence of graduates in the labour market. These skills can be acquired only through experience, while the knowledge comes from learning in a real or stimulated environment.

Knowledge and skill that emanate from the pursuit of education are utilitarian because they uplift the individual by giving him the comportment, awareness and the desire to serve and thus transform society. Thus, education is a social project whose object is the relationship between man and nature and how the transformation of this can lead to social development. In principle, every society or community aspires towards stability and progress, thus, education is usually treated with considerable respect and interest (Abubakar, 2004). This is to be expected, especially of developing countries that place a high premium on education as a panacea for socio-economic development. However, the recognition of the utilitarian value of education and the creation of structures and stages for its actualization do not imply that the views on and attitudes towards education as an agent of change and development, are universal, all-embracing and accessible to all. This means that every society's approach to the educational question varies from the perspective of time and place or indeed from the dictates of historical circumstances. Inevitably, the nature, scope and orientation of educational system vary in response to time, perception and interest.

Expectedly, the National Policy on Education (2002) directs the focus of Nigerian university towards achieving the following objectives: development and inculcation of proper value-orientation for the survival of the individual and society; development of the intellectual capacities of the individuals to understand and appreciate their environments; acquisition of both physical and intellectual skills which will enable the individuals to develop into useful members of the community; and the acquisition of an objective view of national and international environments. The global economy in the 21st century is characterized as innovation-driven economy which is powered by knowledge, creativity, and technology. The triple factors engineer

the global value of countries in the new world economy. The trio play a predominant role in wealth creation, particularly when compared with traditional factors of production such as land, labor, and capital. This is partly due to the rise of knowledge-intensive business services - such as computer-related services, research and development (R&D) services, and business services - which provide critical intermediate inputs into other economic activity. The developed countries as a group dominate knowledge, creativity and technology-intensive flows, while developing countries' share is growing at a low pace. Thus, if the less developed countries are going to be relevant in the new world economy, quality manpower development is critical. Manpower development is the process of equipping the human capital with the requisite knowledge, skills and competences through the instrumentality of education to fit into productive economic sectors and occupations. Consequently, manpower development is the building and enhancement of the human resources through formal education and training. The essence of manpower development is that of driving innovation and economic growth.

Adeyeye (2015) in line with this view averred that development of human capital is recognized as an essential pre-condition for a country's economic, political and socio-cultural transformation. The manpower is also developed to continuously adapt to the new challenges of its total environment. This is because the economy is a dynamic entity, which is constantly changing in response to various stimuli such as introduction and discoveries of new products or techniques of production. A vital global trend to ensure appropriate (quality) manpower development that meets the challenges of the new world economy is international collaboration in education. International collaboration in education is a global strategy that calls for helping as many countries as possible raise the game of their entire education system, all the way up to secondary and university education, to meet the demands of the new world economy. Over the past five years and in light of the new UN agenda for the achievement of the Sustainable Development Goals, this new approach has received positive attention.

The partnership of universities in the less developed countries with foreign institutions is seen as an important element for the improvement of university education system. Improvement of university education especially in Nigeria is a sine qua non to the global changes. Improvement of university education entails raising the embodiment of the whole operation of university education to a standard that ensures global relevance. Thus, Townsend (2014) stated that improving the quality and relevance of education relates to improving educational management, facilities, equipment, teacher/tutor competencies and professional development, curricular and resource development, and strengthening capacity in learner-centred and adult learning methodologies. Improvement of these factors guarantees standard of product in terms of its employability and productiveness in the knowledge-driven society and economy (Giami & Solomon-Alufohai, 2020).

Improving quality and efficiency of university education would enable the beneficiaries to satisfactorily achieve academic goals, become relevant in today's knowledge driven society and economy, and enhance the standing of educational institutions in the global ranking. The new world economy, with its knowledge intensity, requires a leap forward in each country's education system - from primary to university education. An international collaboration on this remain sacrosanct. Partnership is vital in solving education issues in developing countries. Partnership will help to trigger improvement in university education system. Recently many universities in the developing countries have trodden this path towards improving the standard of their university education. It is therefore against, this background, this paper examined university-industrial partnership for man power development in universities in Nigeria.

THEORETICAL FRAMEWORK

Modernization theory by Max-Weber in 1890

Modernization theory was established to explain a progressive transition from a pre-modern, traditional, rural and agrarian to a secular, urban, industrial or modern society. The theory was originated from the idea of German sociologist Max-Weber (1864-1920) which provided the basis of the modernization paradigm developed by Harvard sociologist Talcott Parsons (1902-1979). An American economist Whalt Whitman Rowston in 1960 established and suggested that development should be seen as an evolutionary process in which countries progress up 5 stages of a development ladder. These includes, traditional societies, preconditions for take off the stage, take off stage, the drive to maturity and the age of high mass consumption.

Modernization theory attempts to identify both the social values that contribute to social progress and development of societies and seeks to explain the progress of social evolution. It maintains that countries shift from traditional to modern societies, a shift which is usually characterized by higher levels of industrialization, urbanization, rationalization, mass consumption and adoption of democracy, the traditional values and norms are violated by rapid social changes resulting in increase in application of technology.

Based on modernization theory which suggests that traditional societies will develop as they adopt more practices. Kendell, (2007) the economic progress of countries originated from technological changes. According to this theory, increased technological development can make a country more modernized. This theory tried to explain why some countries had success and why some do not. It maintained that as long as traditional customs and culture prevents individuals and societies from gaining achievement, they would remain underdeveloped (Soheila, 2015).

Proponents of modernization theory claim that modern states are wealthier and more powerful their citizens are freer to enjoy a higher standard of living. Kendall (2007) modernization simply means change, with this theory the change was not restricted only to external aspects but rather touched the internal aspect which recently is deeply rooted in education Avdhesh (2016). In other words modernization is crystal clear and felt socially, culturally as well as educationally. He further laid emphases that better and higher education is normally considered to be the foundation to fulfill dreams through a better job and hence better earning.

Recent development is mobile technology and the need to update traditional methods in education is necessary and have shown that aiding technology is not limited to computer any more. Martin and Ertzberge (2013) studied that difference between the use of computer and mobile phone in a classroom setting and found that students show more enthusiasm towards mobile deviled as a result of this change learning institution try to adopt their systems to involve these technologies in their programs. The theory explains that the advancement of technology (social media, website, or network) has helped the pedagogical shift from didactic teacher-centered learning to participating student-centered learning. Brozek and Duckworth (2011). They further stated that implementation of mobile technology serves that as a new way to learn and teach only but rather a complement to specific learning skills in the educative content.

Technology is a key component of education in the 21st century. The increasing use of technology in education has modified teachers methods from traditional approach that often

place them as dispensers of knowledge to a more flexible approach where they act more as facilitators, mentors and motivators to inspire students to participate and learn. Technology facilitates remote learning, distance learning, virtual learning, Blended learning, mobile learning, distributed learning, machine learning, ubiquitous learning, deep learning, cooperative and collaborative learning. Most aspect of education is going digital and education stakeholders including students are confronted with the challenge of transition to online education especially during covid-19 era. This theory is audience focused and exposes how we live in a digital world; from traditional to modern society where use of technologies such as instant messaging, video sharing, social network, tools, postcasting, bologging among others is synonymous with the students lifestyle. Mobile phones are not only used for making calls but also for different other purposes like taking picture, uploading into share space, creating mobile blogs, accessing the web on the move, browsing to write assignment and also for research work.

METHODOLOGY

This opinion paper adopts a qualitative and analytical approach to explore the relevance, practices, and implications of university-industrial partnerships for manpower development in Nigerian universities. The study follows a descriptive and exploratory design, aimed at examining existing literature, policies, and expert opinions regarding the collaboration between universities and industries in Nigeria. The design supports the articulation of informed perspectives on how such partnerships can be leveraged for effective manpower development. The paper relies on secondary data sources, including scholarly articles, institutional reports, policy documents, and official publications from educational bodies such as the National Universities Commission (NUC), the Federal Ministry of Education, and corporate organizations. Relevant literature from peer-reviewed journals published from 2010 onwards was sourced using academic databases such as Google Scholar, JSTOR, and ResearchGate.

A thematic content analysis was employed to synthesize data collected. Patterns, relationships, and insights were drawn from the themes to form the basis for the arguments and suggestions made in the paper. The paper focuses on public and private universities in Nigeria and their engagement with industries in sectors such as oil and gas, ICT, education, agriculture, and manufacturing. The scope is limited to manpower development, particularly in terms of skills acquisition, employability, internship programs, curriculum enhancement, and innovation-driven collaboration. To ensure the credibility of the opinion formed, only reputable and up-to-date sources (from 2010 to 2024) were used. Emphasis was placed on sources that addressed the Nigerian context or offered relevant international comparisons. As a conceptual and opinion-based paper, there was no primary data collection involving human subjects. However, ethical academic practices were observed through proper citation, reference to original authors, and avoidance of plagiarism.

CONCEPTUAL REVIEW

University-Industrial Partnership

Universities engage with industry in field-specific ways (Perkmann et al., 2011) that primarily encompass in two areas: joint research activities and development of educational programmes. Research collaborations may involve joint research projects, the provision of funding by industry

for specific university research (Campbell and Blumenthal, 2000), the establishment of research parks and the leveraging of the research capacity of universities and industry, and the provision of feedback on the practical relevance of university research. Educational collaborations include a wider range of activities, including developing new educational programmes, revising existing programmes, and involving employers in teaching, mentoring, supervising students and activities related to skills and competency development (Salminen-Karlsson & Wallgren, 2008).

Other activities that fall under the UIP umbrella include career fairs, career advisement activities, apprenticeships, internships, recruitment programmes, and investment or equipment loans (Harman, 2010). Other forms of collaboration include faculty consultancies, employers serving on university advisory boards, and lifelong learning activities, such as continuing education courses, skill development for employees of companies, and development of training packages for specific organizations. Collaboration with industry benefits students, faculty, education programmes, research output, and university reputation overall. Engagement with industry informs faculty and senior leadership on labour market needs, allowing them to adjust the relevance and quality of education programmes and further the strategic development of institutions (Prigge, 2005). With access to industry, students gain work-relevant skills, develop entrepreneurialism, and create professional networks. Involvement of outside industry experts can improve the quality of faculty research, foster research area expertise, and provide important opportunities to test practical application of research findings (Lee, 2000).

Most importantly, UIPs help faculty gain access to scarce research resources, such as cutting-edge industrial laboratories and expensive materials (Crespo & Dridi, 2007), creating new opportunities for faculty research, greater research productivity, and increased academic publications (Harman, 2010). Additionally, partnerships can assist universities in cutting costs, particularly those related to students funding, faculty salaries, and research. Studies suggest that faculty who collaborate with industry receive conference support and are more satisfied with research equipment, PhD students, and the intellectual environment of their department (Harman, 2010). Industry can also be an additional source of funding for students' scholarships, fellowships, cultural and athletic events, facilities, and equipment (Crespo & Dridi, 2007). UIPs also provide adjunct faculty, faculty salary, research, and equipment for laboratories (Kauppila et al., 2015).

Broadly, UIPs can have a positive impact on the profile and quality of programmes and prestige of universities (Harman, 2010). While the literature describes many benefits to UIPs, it also points to complexities and risks. The challenges include practical difficulties, cultural differences between universities and industry, disputes over intellectual property rights, and conflicts of interest. One of the key challenges in developing partnerships is the absence of incentives that encourage faculty participation in partnership initiatives (Karlsson et al., 2007).

Furthermore, faculty lack of expertise or skill in establishing and maintaining contacts with industries can hinder the development of collaborations. Yet, when partnerships are developed, lack of role clarity for both partners can present a challenge. Scholars point out that differing organizational cultures and environments, universities' unrealistic expectations, and HEI bureaucracy can all hinder UIP success (Siegel et al., 2003). Other challenges to UIPs involve conflicts of interest over research priorities; allocation of personnel, financial, and material resources; and communication and secrecy. Drawing on evidence from several studies on partnerships, Prigge (2005) argued that UIP risks for HEIs include a shift from basic research to applied research and product development, compromises in academic integrity, constraints on the open and timely dissemination of research results, narrowing of research topics, pre-empting

research and teaching preparation time, and encouraging the migration of faculty to partner organizations. Moreover, industry-funded research can result in conflicts between UIP researchers as well as tensions between university departments. UIPs can also change standards and practices in university promotion and tenure policies. Industries have been criticized for focusing heavily on quick-fix solutions rather than building sustained relationships with HEIs (Kauppila et al., 2015). Some scholars are concerned that large partnerships put at risk the critical value of higher education, arguing that universities are increasingly operating like for-profit organizations.

University-Industrial Partnership in Collaborate Research for Man Power Development

Collaborative research is a research agreement/business action entered with universities, industries, organizations, governments, individuals to bring expertise and fund together to proffer solution to a given problem (Wikipedia, 2017). Research findings simply refers to the outcome in the form of special knowledge that results from research efforts, be it, basic research, applied research or development researcher carried out by higher institutions of learning, research institutes, or industrial firms (Bentley, 2018). In the linear model of innovation, public research especially in the universities generates basic knowledge, which leads to inventions and inventions when commercialized, become innovations (Adeoti, 2016b).

Industries, organization, government, individuals, partner with universities to collaborate in researching for solutions with the aim of making financial benefits. Is a relationship with universities and collaborating partner to seek for solution for complex issues. Universities is an ivory tower which is well known as a breeding ground for knowledge and ideas, theories but lacking the fund to add commercial value to these ideas, knowledge, and theories, industries organizations, government individual collaborates with them (universities) by bringing the required fund so as to produce these ideas, knowledge, theories into commercialize products.

Collaborative research is not only a powerful tool for improvement of practice but also for improvement of the financial, health, managerial culture and market presence of an organization. Research conducted with the active participation of people in an organizational setting with the goal of producing knowledge, ideas, products which is meaningful and useful both for academic purposes and to the society.

Collaborative research is a collaboration between universities and their partners promotes engagement, increase critical thinking and practices, thus, promoting the construction of new knowledge for the participants to restructure and appropriate their knowledge understanding increases market value (Beck & Black, 1991). Collaborative research is a meaningful relationship through which partners/collaborators could use in promoting business relationship and international presence, brings mutual relationship which exposes both the universities and the collaborators to increase the financial status. Thus empowering researchers in the universities community to communicate significant ideas and encouraging them to speak about their concerns and their experiences developing a supportive atmosphere for problem solving.

King and Lonnquist (2018) opined that it served both as an overall strategy to promote specific type of change. Deducing from the above fact, comfortably one can say that collaborative research helps generate and attract developmental benefits for universities. Universities come up with ideas, knowledge, theories, innovations and on the other side the partners/collaborators comes with funds and facilities, thus, increasing their funding base and the research results commercialize to generate more funds for both parties, making the universities to

be business oriented/conscious and having market and international presence. The dwindling economy and inadequate funding of universities by government, collaborative research is an alternative strategy for universities to explore in other to increase their funding base in other to sustain and maintain the universities, because there are available and willing partners ever ready to sponsor researches as long as the results will be commercialized.

Kyle and McCutcheon (2018) opined that collaborative research has the ability to produce prolific results in terms of enhancing the improvement of practices and ensuring the generation and developmental benefits. Increases the credibility of professional theorizing about data as all participants contributes to the interpretations, an outcome vital to good research Johnson (1990).

Collaborative research increases international presence, market relations and brings other benefits, thus as alternative strategy for funding universities, besides the obvious financial benefits it encourages, team work, students/staff exchange, linkage, managerial culture and business consciousness of universities. Collaborative research engaged scholarship in action in which universities, industries, organizations, individuals, policy makers respects the knowledge that each partners brings to the discussion so that together they might know better how to understand the complex problems facing our societies and how to design and implement research results while increasing their financial strength.

Collaborative research enables the universities to learn from the cooperate sector on how to market their ideas, theories, knowledge to the international and national communities and making financial benefits, thus, as an alternative strategy for funding universities. However, Liberman (2018) opined that collaborative research can be morally and politically problematic, supporting Liberman opinion, Miller (1992) collaborative between universities and industries can incorporate a series of value conflict, which is all about financial benefits rather than intellectual development. Collaborative research brings about cross fertilization of ideas, knowledge, innovation which in turn will generate income for both partners. Collaborative research permeates universities all over the world, Campell, William, and Loder in Uche (2013) concluded that universities involvement in Collaborative research activities is mainly because of its financial opportunities and the ability to achieve greater monetary rewards for both partners and general development of the universities.

Collaborative research is important mostly more than one discipline will be involved, team will be formed, network will be established and definitely funds will flow to universities .Heagrty and Blumethal in Uche (2013) asserted that collaborative research has come to stay, its awareness and high level of involvement in it will for a long time remain the most viable alternative strategy to tackle problem of dwindling government support for high education and research. Collaborative research is more reliable alternative strategy for fund raising in universities because of its mutual benefits derived from it, the mutual interest and understanding to both the sponsors of the research and the university. The university in this case is being paid for the service it is rendering and the university/collaborator is paying for the services it is receiving in agreement with terms of contract.

Research is a means of demonstrating one‘s ability and capability in solving an identified problem and it is an important pointer to the national technological capability (Oguwusi & Ibrahim, 2016). One of the major roles of research is in breeding industrialization which brings about jobs and wealth creation, arrests social menace, assists in curbing rural-urban migration and poverty reduction.

University-Industrial in Innovation for Improved Manpower Production

University industry partnership, new companies ventures could be founded on the strength of a discovery in the universities. Uche (2013) opined that universities and industry perform complementary roles. Universities perform basic research and industry applied commercial values to the research results. In Nigeria university industry partnership is being encouraged by government through private public participation (PPP) concept, the idea of this PPP is that universities must continue to foster creativity and advance the frontiers of knowledge through long term basic researches while industries continue to promote, sponsor and process this basic ideas and knowledge to generate funds for both. This role will create a symbiosis relationship which will benefit and sustain both. Universities delivers knowledge theories concepts and system that will help industry to understand the dynamics of the society. Universities also produces middle and high killed manpower who man's the industry and in general helps manage the country economy.

Industrial innovative breakthroughs are conceived within universities. Universities research results generates options new vista, opportunities, enhances knowledge and skills in general and in particular for industries. PPP can help bridge the short fall in finance at the other hand and raises fund for universities. The onus lies on the universities to leverage on PPP as alternative to generate additional revenues needed in the administration of universities. Innovation, on the other hand, is defined as the application of basic knowledge acquired through science and technology research and investment to achieve physical production of goods and services (Roggers, 2007). The transfer, exploitation and commercialization of public research results have become a critical area of science, technology and innovation.

The knowledge and research generated by public research system is diffused through a variety of channels among which are the mobility of academic staff, scientific publications, conferences, contract research with industry and the licensing of university inventions. Effective commercialization of research results in any nation depends on rapid technological innovation, effective strategic management of knowledge and a clear focus on value-added goods, services and industries. According to Bently (2013), the world faces major issues such as climate change, limited natural resources and changing age demographics. Thus the need for transition to a more sustainable economy is creating global market opportunities for entirely new solutions.

Advancement in technology development has radically altered the economic system in the world. Nations and businesses that can achieve higher levels of performance in innovation will be well placed to be leaders of tomorrow. Thus, wealth is no longer being measured in terms of physical winch alone. It must be measured by the degree of access to, and timely use of, knowledge and technology that leads to intensive value-added capabilities.

Thus, commercialization of research findings is becoming an important aspect of economic development. It must be noted that this knowledge might be acquired through learning, research or experience. But until this knowledge is applied in physical production of goods and services and translated to development, it cannot be considered to be innovation. From this simplistic view of the innovation process, the research activities in the universities and public research institutes are isolated from industry. Industrial research and development (R&D) activities that contribute to the real technological change required for economic progress are located outside the ivory towers. However, several studies that illustrated the NSI framework have proven that economies that are innovation-driven (i.e. knowledge economies) are

characterized by evident strong university-industry collaborations, especially in strategic sectors of the economy.

University-Industrial Partnership in Industrial Training for Improved Power Development

Through collaborative training programmes with an industry, universities strive to establish new practices and methods for industries to take advantage of while industrial funding of training programmes becomes the responsibility of the industries. This creates strong channel for knowledge building and skill development. The channels of university-industry interaction are: research support; technology transfer; knowledge transfer; and cooperative research (Santoro, 2000). The industries provide the universities with necessary funds for the provision of facilities and staff development through training and development programmes (Nwabueze & Onyenandu, 2015). These processes and collaborations help to build strong system for the universities to carry out their duties efficiently such as management, teaching and research, as well as equip the staff and students with the entrepreneurial skills/innovations needed for the growth of individuals and the society at large. As pointed out by Altbach (1998), university-industry collaborative training programmes can also come in the form of consultancy services.

Universities have to engage in a number of special manpower training programmes with industry, as well as many research projects relating to local industrial needs, in which university academic staff frequently act as consultants, with the encouragement of university authorities. By doing this, universities will ultimately gain additional funds to carry on their operations. University-Industry collaborative training programmes helps to facilitate the use of technology in simulating real-life business environments. This form of collaboration benefits both organisations in different ways; for the University, the students are given the opportunity to apply what they learnt in theory which has to successfully facilitate students' exposure to a sample industry environment as well as the development of middle level manpower skills. The new graduates are therefore more skill-ready for the employment market. Apart from collaborative services rendered by the industries to the universities, there is a strong place for fund provision.

University Industry-government linkages can take various forms and levels of partnerships from contract or sponsored research, to joint research, professional courses, consultancies to creating opportunities for student placements, staff exchange, and joint curriculum development. University Industry- government linkages are often conceived as a three-way interaction between universities, government, and firms as described in the Triple Helix Theory (Etzkowitz, 2008). Today universities are considered not only as centres of knowledge and learning, but as key institutions in national innovation systems (Nelson, 2006). In order to plan their role within the innovation system, universities need to be welllinked to enterprises, other research institutes, and supported by government policies. The USA, for example, has enacted key legislations such as the 1980 Bayh-Dole Act to incentivize patenting, licensing, and technology transfer of University research. Through state intervention, Brazil has helped centre universities as technology incubators (Etzkowitz, 2008). At the University level, technology transfer departments, technology incubators, and science parks have been set up to encourage and manage entrepreneurial activities (Schiller, 2007).

There is need to bring together universities with productive sector representatives to update and upgrade curriculum to ensure that students graduate with relevant skills for the workforce. In addition to the understanding that universities need to produce work-ready

graduates with the requisite skills for the job market, it is also increasingly recognized that universities should play a pivotal role in applying research and innovation to address socio-economic problems and promote innovation for economic growth by forging strategic partnerships with the productive sectors of the economy and national innovation systems. In the broader literature, perceived benefits from University Industry-government collaboration include: providing new channels of alternative funding in an era of constrained funding; access to or acquisition of state-of-the art equipment; improved curriculum and training in technology-oriented programmes; enhanced employment prospects for students; supplemental income for academic staff; and clearer contribution of universities to the economy, among others (Martin, 2000). In the context of fiscal constraints, graduate unemployment, and the need for universities to demonstrate greater accountability to society and respond to national development imperatives, the topic of university industry-government linkages is becoming increasingly prominent in the discourse on higher education in Africa in general and Nigeria in particular. In terms of promoting entrepreneurialism and practical skills among staff and students, the majority of institutions report employing industry professionals as adjunct.

University-Industrial Partnership in Intellectual Property Man power Production

Intellectual property refers to creation of intellects, minds, inventions, literacy and artistic works, theories, ideas, knowledge for which assess rights privilege is given to designated owner(s) for commercial purpose. Intellectual property could be inform of patent, copyright, trademark, service mark, among others to be commercialize for funds. Knowledge creative ideas or expressions of human mind that have commercial value and protectable under copyright, patent or trademark law for imitation infringement and dilution.

Business dictionary (2017), deducing from the above fact intellectual property is the creation of theories, ideas, knowledge from universities, which is the breeding of ground of knowledge and discoveries of any nation, transmitting the right to produce and process to cooperate organizations to add market value. In the present economic reality, universities should exploit intellectual property since they are into researches, teaching and community service and commission a corporate body to help them package, process and sale the products to the public, thus increasing their financial base, this will serve as alternative strategy for funding universities. Intellectual property is powerful economic tool development for universities, it stimulates creativity, discoveries of human mind for benefit of all by ensuring that advantages derived from exploiting the creation. Intellectual property is obviously what attracts most cooperate organizations to universities is the prospect of bringing solutions to societal issues while increasing financial benefits (Bok, 2003). Intellectual property and cooperate collaborators have greatly improved the process of turning discoveries into useful products that will be beneficial to the public and universities. It enables universities to transfer discoveries and theories arising from universities researchers into commercial ventures.

Universities being the ivory tower should leverage on their researches to increase facilities, such as library, laboratories, buildings, hostels, academic/non-academic emolument and increase financial base, since there is willing and ready organizations, institutions, individuals to sponsor, fund and process their ideas, knowledge, theories into commercial value.

Intellectual property allows universities to carry on researches, discoveries theories, concepts because it enables them to raise fund to sustain the affairs of the universities, gives researchers , universities the right to own and make financial benefits from their ideas, theories

concepts in other word is helps universities to generate funds. Today intellectual property provides opportunities for universities to make financial gain which helps strength the management. Organizations, firms, cooperation partnership with universities have greatly improved the process of turning intellectual property discoveries into useful products and processes. Fundamental academic value is a fidelity to the basic canon of scholarly and scientific discoveries, which can be commercialize to raise fund for universities (Nelsen in Uche, 2013). Is of the view that the possibility of acquiring exclusive right on intellectual property is important for industries because it enables them to stay in close contact with universities, thus making funds easily available for universities.

University-Industrial Partnership in Financial Sustainability for Man Power Development

Financial sustainability is described as the organization's ability to push annual budgets without constraints. Within the context of universities, financial sustainability implies that these institutions generate revenue that is greater than the costs of providing educational services. That is, the income generated by these universities is sort of what is required to cater for salaries, wages and allowances of staff additionally to procuring educational materials and services (Ng'ang'a & Kibati, 2016).

Financial sustainability seems to represent one of the significant challenges confronting government owned universities in Nigeria. As such, institutions with robust and sound financial structures and stable incomes are those which can fulfill their missions and answer challenges caused by dynamic environment. Thus, financial sustainability aims at ensuring that a learning institution is even a position to urge adequate income to enable the institution to discharge its operations efficiently and invest in its academic and research activities without over relying on external sources of funding like government subventions. It is noted that institutions of upper learning like universities should inspect three key pillars so on confirm financial sustainability, that are identifying and better understanding of costs of all activities and projects, maintain reasonably diversified income structure and more so sufficient, reliable and sustainable public funding with adequate accountability measures (Estermann & Pruvot, 2011).

Public universities within the foremost developed and a couple of developing countries have recognized that income from industry and trade are becoming increasingly significant sources of revenue which slowly account for a greater proportion of total revenue towards financial sustainability (Kalomo et al., 2022). Universities around the world are typically funded either by the taxpayer or by individual students and their families. However, university education has become so costly everywhere that there is much debate today about which funding model or combination is economically feasible and sensible, realistic and moral in any given context towards the attainment of monetary sustainability. University funded by the state or federal budget differs relying on the character of the funding framework. For a couple of countries, funding for university education is provided by state or local budgets that use their own budgetary tools, although certain funds might be obtained from the federal or national budget, which is that the case in Germany, the UK, Sweden and Norway.

Throughout the United States of America (USA), about 50 per cent of the overall funding for university education comes from public sources as compared, in Germany, the share of state support for university education is 94%, with the Federal and States accounting for 88.7% of the support, while private sources buy 1.9% of the funding (Maria & Bleotu, 2014). Developing countries around the world with universities education funding in most cases being supported

only by central government budgets, for instance, in Zimbabwe, government funding of the university sector constitutes about 40% of the institutions' income while in Nigeria government allocates a paltry sum of 5 – 7% of the whole budget to education, as against the recommended United Nations standard of a minimum of 27% of annual budget of a nation to education. So, the extent of commitment of resources to education doesn't match our desire for educational development. One of the idea causes of the matter of inadequate funding is as a results of state policy of abolition of tuition fees in Nigerian federal universities in 1977.

Today, there is an unprecedented growth of federal universities cum students' enrollment/ population, without a corresponding increase within the budgetary allocation. Public opinions have clamoring for re-introduction of tuition fees to federal universities in Nigeria as a way of putting an end to annual ASUU strike mostly caused by inadequate funding by the Federal government; however, (state and privately owned universities have already introduced their own). The matter of inadequate funding has led to a general decay in infrastructural development and maintenance. This seems to be affecting the financial sustainability of the public universities in Nigeria. Records have shown that this among other factors fuelling annual ASUU strike within the public universities. Literature have suggested that for public universities in developing countries to experience financial sustainability; the system (universities) must begin to look inward as the way to extend their financial status and one of such readymade avenues is through the commercialization of research output (Kalomo & Chama-Chiliba, 2022).

University research may be a crucial source of great technological innovations that have commercial value (Khademia & Ismaila, 2013). From the knowledge economy point of view, universities are mentioned as talent promoters, which are operating towards building such capacities for nations and regions to survive and prosper during this context (Wonglimpiyarat, 2010). Moreover, the commercialization of research output is treated to be because the method during which ideas, knowledge, and innovations would be conveyed to tangible assets including benefits that satisfy society and economy at large scale. The commercialization of university research output is thus a key element of the innovation system both as an individual's capital provider and a seed-bed of latest firms; and to know the benefits of knowledge and to receive returns from these investments, the resulting innovations must be sold, or commercialized (Ayisi, Kivengea & Ombakho, 2016).

For emerging countries, the creation of conditions conducive to innovation and successful technology transfer is not any more a choice, but a crucial factor that can drives university financial sustainability (Rodriguez-Pose & Hardy, 2014). Research is thus, a crucial component of the mission of universities, and indeed academic institutions conduct a substantial volume of research that is funded by government, industry and philanthropic agencies (Vanderford & Marcinkowski, 2015).

The commercialization of research output should even be a key component of universities research mission such novel ideas, knowledge, skills, innovation, technological advances and products, particularly so within the enabling technologies like information and communications technologies, biotechnology and nanotechnology which can enter the marketplace for the advantage of a selection of stakeholders including inventors, universities and society. Thus, the assembly, distribution and use of knowledge and knowledge will increasingly be a distinguishing factor of strong economies and robust societies within the 21st century. Across the world, universities are therefore being positioned as strategic assets in innovation and economic competitiveness, and as problem solvers of socio-economic challenges affecting their countries, thus placing them at the centre of the national innovation systems (OECD, 1997).

Traditionally, teaching and research are the universities main roles. However, commercialization of research output or entrepreneurial science also mentioned as, technology/knowledge transfer, third stream, third mission or engagement, has emerged as an extra role for universities as stimulators and facilitators of knowledge transfer (Perkmann & Salter, 2012). The third stream is about the interactions between universities, industry and thus the rest of society, and should be said to be the stimulation and direct application and exploitation of knowledge for the advantage of the social, cultural and economic development of society (Ayisi, Kivengea & Ombakho, 2016). According to Ghebregiorgis and Mehreteab (2018), commercialization of research output is, in effect, the process of converting the output of research and development into products that can be exposed to consumer markets, aiming to increase their odds of capturing demand in those markets and thereby generating sales and revenue. The sales and distribution of these new innovative products ultimately generate economic benefits not only for the developers and marketers of the new products, but also the end user, and for the overall economy (Nordicity and The Evidence Network, 2012).

More specifically, Downie and Herder (2007) defined commercialization of research output as the conversion of research results into products, services, and processes that can be the object of commercial transactions. Transferring the knowledge and skills between universities and business and the wider community increases the economic and social returns from this investment. Academic knowledge is essentially a global public resource, and highly educated workers are the primary source of application of global academic knowledge to the domestic economy. This knowledge may be used to generate innovation, and that this innovation leads to productivity improvements in the economy. These productivity improvements translate directly into economic growth, and, hence, standards of living (Ghebregiorgis & Mehreteab, 2018). Minh and Van (2022) lamented that the efficiency of commercializing research output in universities is not high in developing countries.

The rationale is that universities almost exclusively specialize in training and scientific research tasks. Additionally to the active communication system, modern universities within the world also specialize in other jobs like linking with the business and gradually play an important role within the economic development of the country ethnic. Accordingly, many universities have focused on the commercial exploitation of recent companies through scientific research activities, which not only greatly contributes to their revenue size but also to process of development and process of providing cutting-edge technology upgrades to industry players. Among the models of commercialization of scientific research, the establishment of subsidiary enterprises by universities is taken under consideration an important mechanism to reinforce this efficiency. This was first developed in England in the nineteenth century and quickly gained attention and application in developed countries around the world (Minh & Van, 2022).

Studies of Khademia and Ismaila (2013) found that the success of university research output commercialization is influenced by several factors including researchers' perception, time, entrepreneurial team, networking, technology stage, funding, and market research; while Ayisi, Kivengea and Ombakho (2016) assessed the initiatives to commercialize research outputs by Kenyan universities, a cross-sectional study was administered in 17 well established universities (15 public and a few of private), all accredited by the Commission for University Education, Kenya. They acknowledged that the bulk universities are taking precursory steps to incentivize and encourage entrepreneurial activities among their academic staff and students, albeit the extent of resources dedicated to them is low.

Ghebregiorgis and Mehreteab (2018) findings indicated that commercialization efforts result in substantial benefits such as increased industrial growth in revenues, net income, and number of employees; better health and environment and improved quality of life by obtaining certain health and safety products, services, and processes; and more general economic growth leading to lower taxes and greater individual wealth overall. The paper further argued that commercialization of research output could lead to an improvement in a country's competitive position regionally or globally. Bogovin and Vidishcheva (2021) revealed that the commercialization of research output and development outcomes are indispensable to the strategic development of any organization which the insufficiently effective realization of innovation potential in Russia is actually because of the detachedness of innovation activity in education institutions from practice and a scarcity of interest from business – a key agent of innovation commercialization.

University-Industrial Partnership in Technological Advancement for Improved Man Power Development

In the rapidly evolving landscape of technology, the collaboration between universities and industries has become instrumental in fostering innovation, driving economic growth, and enhancing manpower development. Dutse et al., (2021) noted that this synergy creates a symbiotic relationship where academia provides the theoretical knowledge and research capabilities, while industries contribute practical insights, real-world challenges, and resources. For Universities to discharge their functions appropriately, especially in this age of globalization, the use of Information and Communication Technology (1CT) in the management of University education becomes pertinent. The global development in technology has great impact on all sectors of the economy including education.' In recent times, educational establishments including Universities are facing the challenge to do more with fewer resources as they try to meet the complex and changing demands of the society (Akpan, 2008). This calls for the use of ICT in the management of Universities. Information and communication technology (ICT) is a process of creating, processing, storage, retrieval and dissemination of information and data using computers and telecommunications. It allows electronic communication through facsimile, e-mail, voice mail, video conferencing and has led to the widespread use of networking technologies such as internet, World Wide Web, intranet and extranet, online databases, integration of information systems and mobile communication (Akpan, 2008).

In education, it involves the application of digital equipment to all aspects of teaching and learning. According to Johnson (2007), ICT involves a combination of technologies for collecting, storing, processing, communicating and delivering of information related to teaching and learning processes. Information and communication technologies are now the mainstream issues in higher education. It is now an accepted practice to integrate ICT in major logistical, organizational and educational processes of University education. Information and communication are two important processes in the teaching/learning situation. In the classroom, ICT could be used to enhance teaching effectiveness. It could be used to prepare lesson plan, collect and analyze students' achievement (Onuma, 2007).

Curriculum contents could be enriched through search in the internet by lecturers and information and relevant school practices hitherto unknown to students and lecturers that could not be found in textbooks could be easily downloaded for use from the internet. ICT, therefore, provides the needed information for the enhancement of academic development of both lecturers

and students in Universities. Apart from its use in the classroom situation, ICT helps to improve the qualities of research in our Universities through the use of information and quality materials from the internet, it also enhances global sharing of knowledge and skiffs required for the management of universities for national development (Mbakwem, 2007).

Thus, the importance of ICT in the management of Universities cannot be over-emphasized. It provides information concerning problems or challenges and prospects in the management of universities for sustainable development. It could help Nigerian Universities to become competitive in international global scene. This could be possible because ICT enables global communication of information as well as the global retrieval of information from databases and websites regardless of geographical distance. It provides access to current books, journals and other information resources held by global network of on-line libraries, Akpan (2008) maintains that ICT could be used in the management of students' admission, screening, registration, records, instructional delivery and assessment of performance as well as recruitment of staff in higher institutions. Okoli (2007) on the other hand, states that the use of ICT is very necessary in the management of Universities especially in the area of records management. He classifies such records into management, administrative and student records.

Mbakwem (2007) in his study discovers that ICT promotes economic, educational and cultural growth and therefore enhances national development. Further findings of the research reveal that, gender does not significantly relate to undergraduate students' perception of the role of ICT in national development. Traditionally, academia and industry operated in silos, with limited interaction between the two. However, the dynamic nature of technology requires a more seamless integration of theoretical knowledge and practical application.

Okoronkwo et al., (2022) submitted that university-industry partnerships bridge this gap by creating platforms for collaboration, enabling the exchange of ideas, expertise, and resources. Collaboration between universities and industries accelerates the pace of research and development (R&D). Academic institutions, with their focus on cutting-edge research, provide a fertile ground for the exploration of new ideas and technologies. Industries, on the other hand, bring in the financial support and practical applications required to turn theoretical concepts into tangible innovations. This collaboration not only enhances technological advancements but also expedites the process of bringing these innovations to the market. University-industry partnerships often lead to the establishment of innovation hubs and technology transfer initiatives. These hubs serve as collaborative spaces where researchers, students, and industry professionals can work together on projects, fostering a culture of innovation. Technology transfer initiatives facilitate the commercialization of academic research, turning ideas into products and services that can benefit society.

CONCLUSION

The partnership between universities and industries establishes a continuous feedback loop. Regular communication and collaboration between academia and industry ensure that training programs remain responsive to changing industry needs, fostering a dynamic and adaptable approach to high manpower development. Collaboration with industries exposes students to global perspectives and industry trends. Understanding the international context and staying informed about emerging trends in the industrial sector contributes to a more comprehensive and forward-looking approach to high manpower development. Parker (2000) is of the opinion consequently, university-industrial partnerships for networked employment opportunities play a

pivotal role in enhancing industrial training and fostering high manpower development in universities. This collaborative approach not only prepares students with practical skills but also ensures that the workforce is well-equipped to meet the evolving demands of the industrial setting.

Suggestion

From the discussions above, the following are suggested:

- University administration should collaborate with industries in research projects in order to provide students with real-world experience for effective manpower production.
- University community should partner with industries in areas of innovation to provides insights into current and future trends for effective students skill acquisition and functionality in the present and future world.
- Universities are also encouraged to partner with industries to enhance industrial training of students for employability in the labor market.
- Universities are also advised to sough for intellectual properties from industries to foster a holistic development of skills among students and researchers.
- Universities should partner with industries for effective transfer of technology and the commercialization of intellectual property.

PERFORMANCE MANAGEMENT STRATEGIES: A PANACEA FOR EFFECTIVE TEACHERS SERVICE IN SECONDARY SCHOOLS IN NIGERIA

Christian Taagalobari KPENU
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

This paper x-rayed performance management strategies: panacea for teachers' service in secondary schools Nigeria. It saw performance management strategies as concerned with employees at work and spurring out the best in them for effective teacher services. These strategies are supervision, delegation, effective communication, collaboration and among others that are applied with the possession of sound knowledge for positive results. The paper went ahead to reveal the performance of Principals as a Panacea for Effective Teachers Services, asserting that a principal is the head administrator of a school. Also x-rayed in the paper are the constraints to performance management strategies which includes but not limited to lack of capacity, inadequate provision of financial and material resources, not recognizing and rewarding performance of school supervisors, principals and teachers irregularity and delay in payment of salaries. The paper concluded that performance, arguably, is a demonstrative act which embraces results as well as the effective use of appropriate skills, knowledge, competences and behaviours to achieve them. It is the seen output of educational officers in delivering the goals of education at all levels.

Keywords: Performance, Management, Strategies, Constraints, Teachers, Services.

INTRODUCTION

Educational institutions have been seen as an organization that demands a high level of management effectiveness in the actualization of its aims and objectives. Most times, these educational institutions are unable to perform effectively in the attainment of the goals and objectives upon which they are set up. Education, sometimes experiences setbacks which may be due to failure to adopt effective performance strategies such as supervision, staff appraisal, effective communication, consultation, delegation, in-service training among others. Subsequently, they are unable to achieve stated goal and objectives of the school system. These strategies are regarded as systematic processes which facilitate the maximum achievement of the goal of the school system. Performance of the school as an organization can be enhanced to improve the performance of individuals within a team framework. It is a means for promoting

superior performance by communicating expectations, defining roles within a required competence framework and establishing achievable benchmarks.

The value of performance management to the wellbeing of schools can be fully understood in the view of Aguinis (2009), who concurs with Armstrong (2006), and sees performance management as a continuous process of identifying, measuring and developing the performance of individuals and teams and aligning performance with the strategic goals of the organisation. The performance management strategies can be used to communicate organizational goals and objectives, reinforce individual accountability for meeting those goals, and track and evaluate individual and organizational performance outcome. It reflects a partnership in which managers share responsibility for developing their employees in such a way that enables employees to make effectual contributions to the organization. It is evidently a defined process for managing people that will result in success for both the individual employee and the organization.

The need for performance management strategies as an administrative tool for teachers services in public secondary schools cannot be overemphasized. This is because performance management strategies can be used for goal setting and to improve self-evaluation and appraisal. To improve effective performance at the secondary school level, personal experience has shown that some supervisors of schools, principals and teachers have outstanding roles to play in the attainment of institutional goals and objectives. This implies that performance management strategies if implemented in secondary schools will enable supervisors of schools, principals and teachers to evaluate individual or group performance. It will also help in optimizing productivity by providing visible and clear accountability related to performance expectation for effective goal attainment.

The aim of applying performance management strategies is to develop individuals with the required commitment and competencies for working towards the shared meaningful objectives within an organizational framework. This can be related to performance targets during a specific performance period from the supervisors or administrators. Goals on one hand motivate individuals to exert extra effort, to persist and focus attention on relevant task features. On the other hand, it directs behaviour of an individual or group and provides guidelines for how much effort is to be put into work performance for an expected result. Personal contact with some supervisors of schools, principals and teachers has shown that people are likely to perform better if they are convinced that they will be rewarded promptly and appropriately after evaluation and assessment. This implies that teachers services is necessary in order to identify the performance of an individual - what a staff should be doing and how he should be doing it, how long it should take and the things required for its accomplishment. However, for a reliable goal attainment, school administrators should adopt and apply effective performance management strategies to enhance smooth measurement, evaluation and appraisal of employees in public senior secondary schools.

Supervision is the act of monitoring the employees in an organization with the aim of assisting them to achieve the goal of the organization. Supervision includes conducting basic management skills (decision-making, problem solving, planning, delegation, and meeting management), organizing teams, noticing the need the need for and designing new jobs roles in the group, hiring new employees, training new employees, employees performance management (setting goals, observing and giving feedback, addressing performance, issues among others. It also involves ensuring performance to personnel issues policies and other internal regulations. In secondary school administration, the principals and supervisors from Education Schools Board

have strong working knowledge of the activities of the school system. They know how to identify the teachers through the process of evaluation.

The aim of supervision is to monitor the performance of school staff and students, taking note of their strength, weakness all geared towards improving the standard of performance and also the teaching and learning environment for goal attainment. The concept of supervision is therefore, directed to the changing of the behaviour of staff for effective performance.

Effective communication is of one of the strategies principals or administrators employ to boost the performance of teachers. It helps to understand each other in the line of executing or carrying out task as assigned. According to Graham and Lebron cited in Onogri (2009) posit that organizations have employ communication strategy to resolve conflict that ensued in the process of performing their duties. This is actualized or achieved by breaking down barriers or resistance among workers and promoting their trust and cooperation among them.

Communication is a rational process which involves initiating messages using symbols, signs to express meaning, create similar understanding and influence actions. It is a process or means by which information is shared among individuals through a common system of symbols, signs or behavior (Onyeike, 2013). Appelbaum et al. in Ongori (2009) posited that groups in trying to actualize a common goal encounter internal and external problems which may reduce their performance, hence effective communication is needed for effective understanding that will promote high performance.

It is necessary to state that no positive action can occur in organization in the absence of effective communication. In order to achieve secondary education goals, principals must develop the right channel that will aid effective communication for efficient functioning of the school. Effective Communication is a strategy which allows free flow of information between superiors and their subordinates. It entails providing necessary and timely information to members of staff on issues, administrators adopting the right communication skill, not using abusive words, not attacking, not threatening or making accusation

Collaborative or consensus decision making style is a style of decision where by the administrator ask for the teams information, ideas, opinions and contributions either individually or collectively while he takes the final decision as an administrator (Stoner, 2018 in Ololube, 2018).The management group are involved in the decision-making in the organization and its implementation. In case of occurrences of any challenge emanating from the concluded decisions by the team or group, they collectively stand together to tackle the challenge believing they are the stakeholders in the organization (school). Collaboration of the administrators with the staff in decision making is very crucial as a performance strategy to achieve the goals of secondary education. According to Kayode (2014), collaborative decision making occur when the decision maker (administrator) makes decision together with his staff. He further stated that, if the staffs are expertise, he will be endowed with enough information from the staff.

A team of external supervisors from the Post Primary Schools Board (PPSB) visit each school periodically to monitor, inspect and supervise the school to ensure that the standard stipulated by the Ministry of Education are attained. The supervisors of schools, principals and teachers, in addition to their roles as supervisors and managers of the teaching and non-teaching staff, students and school activities, are saddled with the responsibility of educational management and administration. In fulfilling their role, they are called upon to perform a variety of tasks, most of which are related to student actions, curriculum development, community relations and performance management. As leaders of a group of teaching and non-teaching staff, the supervisors of schools have been conferred with the power to interact, communicate

and supervise the activities of every principals and staff, principals the activities of teachers and students while teachers, the activities of students. The aim of such supervisory role is to improve their performance and stipulate standards for teachers' services in secondary schools.

Secondary education is a critical level of education in Nigeria's educational system. It represents the bedrock on which higher education is built and constitutes the foundation of whatever a student desires to become in life. However, it is sad to note that the performance management strategies applied at this level of education in Rivers State public senior secondary schools and Nigeria at large is insufficient. A number of reasons have been adduced as being responsible for this ugly trend that has affected attaining positive goals. On the part of the staff, lack of supervision, effective communication, non-payment of salaries and poor reward system by the government hinder the interest of staff in keeping up their performance whereas, on the part of the student, staffs have been blamed particularly for their failure to update and evaluate their knowledge on modern pedagogical strategies and skills with a consequent abysmal performance and poor goal attainment.

To correct this discrepancy, the introduction and sustenance of performance management strategies in public secondary schools becomes pertinent and indispensable. Performance management strategies according to Koko (2006) are systematic processes for improving an organizational performance by developing the performance of individuals and groups. Performance management strategies are based on the principle of management by agreement or contract rather than management by command. It involves managing, administering, measuring, assessing, evaluating and appraisal, effective communication, etc. This implies that a performance management strategy emphasizes the development and the imitation of self-managed learning plans as well as integration of individual and corporate objectives. It is concerned with provision of an integrated and coherent range of personnel management processes that are mutually supportive and contributing as a whole to improve organizational effectiveness for goal attainment.

Armstrong (2009) contended that performance management strategy is a process for establishing a shared understanding about what is to be achieved, how it is to be achieved and an approach of managing people to increase productivity by attaining a successful goal. The steps of performance management strategies are therefore effective supervision, job enrichment, measurement, recognizing, etc. among others and rewarding top performances, effective communication, establishing focus for skill development and control mechanism. If these aforementioned steps are applied in public secondary schools, it will enhance job performance for effective goal attainment.

These strategies however, when applied involve the process of supervision, inspection, staff appraisal and evaluation and are considered comprehensive and appropriate enough for administrators to assess, appraise and evaluate staff performance to achieve maximum cooperation and result. It is the process through which various performance problems militating against attaining effective goals could be corrected and turned around.

But it is quite sad that some supervisors of schools, principals and teachers are yet to apply these strategies to improve performance standard. It is also sad that some supervisors of schools, principals and teachers encourage favoritism in measuring, assessing and evaluating staff and student's performance in public secondary schools. All these result in low performance and thereby desired goals are not achieved since the appropriate strategies are not applied. Hence, this paper examined performance management strategies: a panacea for effective teachers' service in secondary schools.

METHODOLOGY

This paper adopts a descriptive and analytical research design. The descriptive aspect focuses on outlining various performance management strategies, while the analytical aspect evaluates their effectiveness in improving teachers' service delivery. The paper relies on secondary data sources such as peer-reviewed journal articles, government reports, policy documents, and case studies from educational institutions. Scholarly databases such as Google Scholar, ResearchGate, and academic repositories will be utilized to source relevant materials. Recent literatures published will be prioritized to ensure the inclusion of recent findings and trends in performance management strategies in education. The selection will focus on research addressing teacher evaluation, feedback mechanisms, professional development, motivation, and accountability frameworks. The paper will be guided by goal-setting theory and performance management theory to provide an in-depth understanding of how structured performance evaluation, incentives, and professional development contribute to effective teaching services.

A thematic analysis approach will be used to identify key themes in the literature related to performance management and teacher effectiveness. Findings will be synthesized to draw meaningful conclusions on best practices and policy recommendations. This paper focuses on public secondary school teachers, emphasizing performance management strategies applicable within this educational setting. However, it may not extensively cover performance management in private schools or higher education institutions. Since this study is based on secondary data, ethical considerations involve ensuring proper citation of sources, avoiding plagiarism, and maintaining academic integrity throughout the paper.

Theoretical Framework

Chester Barnard's (1938) Efficiency and Effectiveness of Organization Theory cited in Johnnie (2019) states that the function of the chief executive of an organization is to ensure efficiency and effectiveness in the organization, efficiency being employee centered and effectiveness being employer and task oriented. The theory suggests that authority flows down but depends on acceptance by the subordinates. Barnard originated much of the behavioural science approach. O'Connor cited in Peretomode (2013) pointed out that Barnard had long said that managers need to know more about human behaviour, and in particular more about informal groups of an organization, especially the relationships between workers and outsiders. He stated that the willing of employees to accept authority depends on four conditions:

- Employees must understand what the manager wants them to do (employees must understand the communication).
- Employees must be able to comply with the directive. That is if they feel mentally and physically able to carry out the order.
- Employees must think that the directive is in keeping with organizational objectives.
- Employees must think that the directive is not contrary to their personal goals.

Barnard is probably best known for his concept of "zones of indifference" he believed that each person has a zone of indifference or a range within each individual in which he or she would willingly accept orders without consciously questioning authority. Barnard as cited in Peretomode (2013) asserted that the chief executive of the organization will regulate how and

even if employees will obey and work for the effectiveness of the organization by providing all necessities for optimum productivity. There are only three types of orders that can be given by managers to employees:

- First are orders that are unquestionably acceptable and that are always obeyed because they lie within what Barnard called their zone indifference, or typically dealt with things that are part of an employee's job description and are routine.
- Second are orders that may or may not be followed, depending upon the employee and the conduct accepted by the employee's informal organization because such orders come close to being unacceptable.
- Third are orders that are completely unacceptable and that will always be disobeyed because these kinds of orders go way beyond an employee's zone of indifference (O'Connor, 2012:4).
- The zone of indifference represent degree of freedom that provides significant direction for executives and the wider the zone, the greater flexibility of action they enjoy in furthering the work of the organization and the less time and energy they must spend justifying their decision or soliciting agreement.

The relevance of this theory to this study is that, school principals/managers in the course of carrying out their task to ensure effective performance of the staff under them should from time to time delegate duties, supervise teachers and ensure effective communication with them in order for them to be effective in their job performances to achieve educational goals and objectives. The school principals, who must be human in the discharge of his duties, must be aware of various human behaviours. The knowledge of these behaviours will enable him to see staff and students as fellow humans as he will equally collaborate with teachers for improved productivity.

However, it is evident from the theory that if management of any institution wants increased performance from her staff, their supervision, staff appraisal and effective communication, among others should be considered. In essence, the principal must be aware of the various management strategies and understand when to use any of them for effective goal attainment in secondary schools in Rivers state.

CONCEPTUAL REVIEW

Performance

What is actually meant by 'performance' is perhaps debatable and probably regarded differently in different contexts and among different occupational groups. A dictionary definition offers the following: 'the act or process of performing or carrying out; the execution or fulfilment of a duty; a person's achievement under test conditions' (Allen, 1991: 885). In one sense this refers to something accomplished: the outcomes or the outputs. However, and as Armstrong (2000: 3) argues, 'performance is about doing the work as well as being about the results achieved'. Considered as a more holistic concept then, Forrester (2011) saw performance to encompass behaviour and activity and the way individuals, teams and organisations carry out their work.

Management

Management and administration are frequently used synonymously. The efforts of scholars to define the concepts have ended up in listing all the activities that describe the functions of administrators or the managers. However management is more often used to describe industrial activities while administration is used to refer more to government business (Okoroma, 2006). This description of management and administration suggest a variety of styles of school management. Cole (2006) opined that management is derived from the word "to manage" which means "to handle, plan, coordinate, direct, organize, forecast, control and to carry out a purpose". Cole however defines management as a process. This definition above implies that management can be referred to the controlling process in an organization like the secondary level of education in Nigeria.

In the words of Resser in Akilaiya (2008) management is the utilization of physical or material and human resources through cooperative effort accomplished by performing the functions of planning, staffing, organizing, directing, forecasting and controlling. He went further to explain that managers are saddled with the responsibility of setting goals and to ensure that the goals are attained (Akilaiya, 2008). From the foregoing, management could be seen as a collection of processes. These will include such things as setting a goal, working towards the process of attaining a goal, planning, supervision, assessment and evaluation. According to Umoh and Ekanem (2015) management could be seen as a discipline which to them simply means a field of study. This explanation defines the position of educational management in Nigerian educational system.

Educational management therefore is the arrangement of human and material resource programmes available for education and carefully using them systematically for the attainment of educational goals. According to Okoroma (2000) educational management or administration is the process of bringing men and materials together for effective and functional teaching and learning in school. It is a process concerned with using methods, principles and practices to establish, develop and execute the goals and objectives of education. However, the human resources are the key factors with which educational goals can be attained by applying the various performance management strategies.

Performance Management

Performance management is that part of management which is concerned with employees at work and their relationship within the educational enterprise and seeks to bring together and develop into an effective educational organization, men and women who make up the administrative and academic workforce, enabling each to make his or her contribution to its success. According to Armstrong (2009) performance management is a systematic process for improving organizational performance by developing the performance of individuals and teams. It is a means of getting better results by understanding and managing performance within an agreed framework of planned goals, standard and competency requirements. Agreeing with the above assertion Weiss and Hartle in Armstrong (2009) define performance management as a process for establishing a shared understanding about what is to be achieved and how it is to be achieved, and an approach to managing people that increases the probability of achieving success. From the above definitions, performance management strategies refer to the processes and techniques employed by the employers to improve and bring the best input from the

employees. In secondary school administration, the principals who is the chief administrator employs different strategies to spur the teachers to put in their best performance in attainment of the goal of the school.

Furthermore, it is concerned with inputs such as the knowledge skills and attitudes of staff and administration. This results into the output which is achieved by the end of the process. Performance management is also concerned with measuring these results and reviewing progress in the achievement of targets and striving for continuous improvement and continuous development by creating a learning culture. Performance management is a management concept that involves redesigning jobs so that they are more challenging to the employee and are less repetitive. In other words, it is a type of management design intended to reverse the effects of tasks that are repetitive requiring little autonomy. Nwabueze (2010) contended that the main concern of performance management is aligning individual objectives to organizational objectives and encouraging individuals to uphold corporate value. It is sometimes assumed that performance appraisal is the same thing as performance management. However, performance appraisal can be defined as the formal assessment and rating of individuals by their managers at or after a review meeting (Armstrong, 2009). In contrast, performance management is a continuous and much wider, more comprehensive and more natural expectations. It emphasizes the support role of managers who are expected to act as coaches rather than judges and focuses on the future.

The overall objectives of performance management according to Cole (2006) and Armstrong (2009) is to develop the capacity of people to meet and exceed expectations and to achieve their full potential to the benefit of themselves and the organization. Performance management provides the basis for self-development but importantly, it is also about ensuring that the support and guidance people need to develop and improve is readily available.

Performance Management Strategies

Strategies, according to Nicholas (2012), are the means by which policy is implemented. Bush and Coleman (2000) opined that strategy is an overview of an organization which encompasses all its activities. Strategies used by principals or educational administrators within the context of this study are the various ways that principals used to implement policies in education effectively and efficiently for teachers to be productive. As such Performance management, therefore, can on the one hand be seen as a mechanism of subjugation, stripping teachers of professional autonomy and imposing ever more sophisticated strategies of surveillance upon their work. On the other hand, performance management can be seen a means to prioritise the needs of learners and professional development by maximising the quality of teaching and removing incompetence whenever it is found.

Armstrong (2009) defined performance management strategies as a process which aims at providing more opportunities in job performance for some measure and assessment of personnel and group performance to attain set goal. Performance management strategies however is the process through which various problems militating against teachers services could be corrected and turned around. It is a way of motivating employees by giving them increased responsibility and variety in their jobs. The strategies involve performance planning, monitoring, joint goal setting, conducting a performance review meeting, reporting in form of feedback, rewarding good work, coaching (Armstrong, 2009). Koko (2012) opined that strategies of performance management involve inspections of individual, evaluating their performance and

reporting in form of feedback mechanism. These strategies can only be achieved through effective supervision and inspection, monitoring, measurement, evaluation and staff appraisal of teaching and non-teaching staff in the school and can serve us control mechanisms.

Supervision as a Panacea for Effective Teachers Service

The term supervision is derived from the word "super video" meaning to oversee (Oluwuo, Onyeike & Asodike, 2016). The aim of supervision is to monitor the performance of school staff and students, taking note of their strength, weakness all geared towards improving the standard of performance and also the teaching and learning environment for goal attainment. The concept of supervision is therefore, directed to the changing of the behaviour of staff for effective performance. Supervision is a process of stimulating growth and the means of helping teachers to help them.

Firz (2006) described supervision as a process of directing, helping, guiding and stimulating growth in the subordinates in order to improve the quality of instruction. Supervision involves providing expert assistance to teachers to help them acquire more skills and competencies for effective teaching. Normakoh (2019) is of the view that supervision intends to supervise, guide and direct the instructional activities of teachers in line with the professional conduct. From these definitions above, it can be deduced that the main center of focus of supervision is the classroom teacher who as a curriculum implementer, tries to shape the destiny of class instruction. To this end, it is a service rendered to teachers, focusing on how to help them understand and accept themselves, their abilities patterns of interest, emotional make-up and background preparation and helping them set realistic goals for themselves. The principals is saddled with this responsibility of provide expert assistance to the teachers in all areas of instruction due to his wealth of experience and trainings received continuously. Effective supervision tends to bring out the best in teachers and prepare them for future supervisory roles as well.

The reason for supervision is to assist staff to assess their work and performance with a view to reinforce effective pedagogical methods and appropriate remedial action where professional lapses have been observed to improve their performance for effective goal attainment (Ogbizo, 2011). Supervisors need to take initiative to assist a group to move towards productive goals that are acceptable to dispose needs of individuals within the groups. The supervisor as an evaluator provides assistance to teachers in evaluation instruction and curriculum. The supervisor helps teachers to find answers to curriculum and instructional problems, evaluate their classroom performance, assess their own strength and weaknesses and select means of overcoming their deficiencies (Hoy & Forsyth in Obasi, et al., 2015).

Therefore, supervision can help staff of secondary schools to become focused, self-directed and competent in performing their task for goal attainment. It also involves guiding, coordinating and persuading staff to cultivate good working personal attitudes for the attainment of the set goals. To Normakoh (2019), supervision as a strategy for effective performance is geared towards strategies whether they fall in any of the above strata are specifically geared towards: Curriculum development, Teacher development, Students‟ academic performance and Administrative excellence. It therefore means that supervision is intended to spur high performance of staff. Stoner (2002) posited that the duties and responsibilities of principals has expanded further to include task areas like instructional supervision, communication, decision-making, provision of incentives for teachers and students, financial management, plant

management, professional development, conflict resolution strategies, adherence to statutory regulations in school administration, public relations and utilization of ICT resources to meet global best practices. Thus, success in school management to increase students' achievement and inculcation of relevant skills and aptitudes for sustainable development is perceived to hinge upon principal's ability to effectively perform his duties within the context of these critical task areas.

Instructional supervision is a vital area in the management of secondary schools. Supervision of instruction is the process of ensuring that effective teaching and learning takes place in the school system (Watson & Ajekere, 2020). According to Mgbodile (2004), supervision of instruction involves the school administrators' ability to effectively see that aspects of instructional delivery in the school system are properly carried out to enhance learning. Watson and Ajekere (2020) saw supervision as one of the indispensable task of an effective administrator in the operation of a good school system because in addition to arranging and organizing for effective teaching and learning to take place, the school head must undertake to supervise the instruction going on. It is the duty of the Principal to see that meaningful learning is taking place in all the classes and that the teachers are teaching what they are supposed to teach, and in a manner that the students understand and enjoy their lessons. This is because, the teacher plays a significant role in response of the need to employ curriculum in the direction of sustainable development. This is so because according to Oghiagbephan (2017), the teacher kindles the learners' interest during the instruction process to stimulate thinking, making learning enjoyable, exciting and concrete.

The essence of instructional supervision seems not to be achieved in most schools. The principal need to properly supervise instruction to ensure that teachers help formulate, shape, design and interpret curriculum programmes for optimal success. Effective supervision of instruction is lacking in most Nigerian secondary schools hence the perceived decrepitude in the standard of education. He emphasized that Nigerian society demands qualitative education to give the youth functional education, which cannot be achieved without effective supervision of instruction to check if learning content in the curriculum is taught the students. Therefore, without adequate commitment to the performance of school administrators in their instructional roles, categorized as supervision and curriculum development and innovation, and other aspects of school management, the goals of educational programs towards sustainable national development will continue to be shattered (Watson & Ajekere, 2020). Effective instructional supervision is enhanced by communicating specific issues through advice, direction and discussion to teachers and students by the principals as supervisors.

Effective Communication as a Panacea for Effective Teachers Service

This is one of the strategies principals or administrators employ to in the course of achieving the stated goals of education conflict may arise which will distort the performance of the staff and the school in general, hence effective communication is employed to settle the issue and promote faster achievement of the goals of education in Nigeria through the performance of the staff. Communication is another critical task area of principals in the management of secondary schools. It involves the process of sharing information, ideas, or attitudes in ways that produce a degree of understanding between two or more people. Communication can also be seeing as the ability to convey information or ideas in the simplest form which the recipient can easily understand; and the ability on the other part of the recipient to reciprocate in such a way that he

can easily be understood. Communication is said to have been accomplished if the message is interpreted in the same way by the sender and the receiver.

This strategy helps to communicate the aims and objective s of the school system. According to Graham and Lebron cited in Onogri (2009) posit that organizations have employ communication strategy to resolve conflict, this is actualized or achieved by breaking down barriers or resistance among workers and promoting their trust.

Communication is a rational process which involves initiating messages using symbols, signs to express meaning, create similar understanding and influence actions. It is a process or means by which information is shared among individuals through a common system of symbols, signs or behavior (Onyeike, 2013). Appelbaum et al. in Ongori (2009), posits that groups in trying to actualize a common goal encounter internal and external problems, and one way to resolve or ameliorate the challenge via communication. If these conflict which are most time inevitable in social interaction is not resolved, the performance of the staff will be marred which of course will limit the realization of the goals of the secondary school system. It is necessary to state that no positive action can occur in organization in the absence of effective communication. Principals must develop the right channel that will aid effective communication for efficient functioning and teachers services in the school.

Meyer in Angela (2014) describes effective communication as the best strategy by which conflict can be resolve, because it makes every member understand the kind of communication that could result to problem solving. Communication is important in the daily routine or activities of the school, hence principals manage conflict and promote the achievement of the goals of secondary education by providing the right and adequate information to all in the school. It is imperative to say that the dissemination of accurate and timely information in time of conflict is a veritable tool for conflict management in the school. Effective communication strategy also involves negotiation between two parties involved in a conflict. It could also be a mediatory role undertaken to resolve conflicts situation. In effective communication, there is a promotion of an interaction-based approach through negotiation, enabling the negotiators to see the connection between the situation and the outcome, Donohue (2003). Donohue (2003) brings forward a cylindrical model of communication where different levels of interaction, motivational sources, intensity and regularity of expression are linked together. Donohue (2003), argues that through understanding how these factors affect each other and how they are functioning jointly is the solution how to approach the negotiation and come to an agreement. In furtherance, Donohue (2003) expresses the importance of how one should communicate when negotiating. Effective communication as according to Donohue (2003) is based on the quality, quantity (only the quantity necessary), relevancy and the behaviour. Donohue (2003) states that you should “make your conversational contribution such as is required, neither more nor less”.

The delivery of timely and accurate information before, during and after an incident is an essential component and performance management strategy for teachers’ services in secondary schools. Ensuring that the students and staff members, parents, local agencies, the media, and the community have information is the key duty of the school administrator during a crisis (Omeresie, 2005). By ensuring that there is an effective communication in the school system, crises are settled thereby giving room for effective performance of staff for the attainment of the goals of the school system. During crisis, or any critical incident or emergency, the school administrator uses several models of communication to provide warning to the perpetrators of the crisis, disseminate information to all departments, and make notifications. It is a transactional process where people construct meaning and develop expectations about what is happening

around them through the exchange of symbols. Constructing meaning involves, people using symbols that is, objects or words that stand for ideas, feelings, intentions, and other objects, to describe their experiences with others. Communication is important in any social setting because it is one of the chief means by which its members work together.

Watson and Ajekere (2020) see communication to be vital in the relationship between employers and their employees, supervisors and their subordinates in any organization. It is the process through which work gets done by way of giving instruction. Production and regulation purposes include activities aimed at doing the primary work of the organization, such as teaching and learning in schools. They include setting goals and standards, transmitting facts and information, making decisions, leading and influencing others, and assessing outcomes. Innovation purposes include messages about generating new ideas and changing programmes, structures and procedures in the school. Finally, socialization and maintenance purposes of communication affect the participants' self-esteem, interpersonal relationships and motivation to integrate individual goals with the school objectives.

In the school system, communication is vital in the relationships between principals, teachers, students, parents and the public for the achievement of the goals and objectives of education. Effective communication could play an important part in all forms of relationship between the school and the public. This is because it is the process by which ideas, attitudes, and opinions are exchanged between the school and the public. These include school morning assembly, letters and memoranda, staff meetings, school rules and regulations, signs, meeting with school functionaries, and prefectural representatives. If the principal's communication style is unfavorable to teachers working with him, there is the tendency that the teachers would not co-operate with the principal and productivity would be affected. The communication climate created by the school management directly influences the extent to which communication is positive or negative in an organization. Meanwhile, an open or supportive communication climate promotes co-operative working relationship and it is therefore conducive for effective information gathering and transfer. A closed or defective information climate has the opposite effect.

The communication climate influence productivity. An open or supportive communication environment and people are more likely to have a sense of worth and speaks freely without fear of reprisal. This kind of environment created by the school administrator promotes an understanding of what each team member wishes to accomplish and the mutual coexistence towards a common goal of the school (Watson & Ajekere, 2020). They will feel trusted, secured and confident in their jobs for the organizational growth as a whole towards achieving effective teaching and learning to instill in the learner skills, and aptitudes that are lifelong for sustainable national development. Thus, effective team work, flexibility and a sense of involvement all contribute to and benefit from an open and supportive communication climate operated by the principal in the management of secondary schools. Decisions are communicated to subordinates in the school system for implementation.

Collaboration as a Panacea for Effective Teachers Services

Collaboration in school activities and in decision-making enables complementary skills and experiences which allow them to tackle the problems bothering or facing the organization from different perspective and make practical decisions from the different alternative been set (Ololube et al., 2018). Collaborative decision – making in school system involves the leader or

decision – maker (administrator) in helping the staff understand the purpose and nature of the issue, helping the staff focus on working together to solve the challenges faced by the organization and harness their ideas, skills and experiences for the optimal achievement of the goals of the school system.

An important characteristic of collaboration appeared to be its task related focus, including working and reflecting together for job-related purposes (James et al., 2007; Kelchtermans, 2006). In the case of collaboration, this working together includes the partners in the process doing all their work together as opposed to cooperation in which partners split the work and combine each of their partial results into the final outcomes (Sawyer, 2006). Collaboration is seen as different from collegiality as the first tends to refer to the cooperative actions (Kelchtermans, 2006) while the latter focuses on the relationships among colleagues (Bovbjerg, 2006; Kelchtermans, 2006). While collegiality has an inherent positive value as described by Kelchtermans (2006), collegiality is defined as consisting of relationships with colleagues as obligations based on mutual sympathy, solidarity based on an equal work situation, etc. in the case of Bovbjerg (2006). Similarly, Datnow (2011) distinguished between collaborative cultures that support and stimulate spontaneous collaboration and contrived collegiality. While a collaborative culture originates from teachers perceiving collaboration to be valuable, productive, and pleasant, contrived collegiality results from administrative regulation obliging teachers to collaborate. Based upon the assertions above, collaboration can be defined as a joint interaction in the group in all activities that are needed to perform a shared task (Vangrieken, 2015). This concept is not static and uniform but different types of collaboration can occur with varying depths. In a sense collaboration can be seen as an umbrella term, being part of different collaborative concepts.

Twombly (2015) opined that collaborative decision making is the most time consuming style among other styles of decision making, but also create effective administration and goals attainment when done right. She added that most school administrators and organization adopt this style of leadership especially when the subordinates outlined the ways to handle and accomplished the expected, quick, effective and sound follow-up and discussions. Though Tallyfy (2017), argues that most administrators or managers of schools often avoid adopting team or collaborative decision –making style due to the interference of personal agendas and office politics involving arguments and more so he asserts that it is time consuming thereby leading to time wastage in goal attainment. The decision making style can be formal, or informal due to the goal and environment of the team involves. Collaborative decision making require sharing of information to be deliberated on and listening to contributions and suggestions made (Warner, 2012). However, the school administrator should determine whether or not to adopt collaborative style, considering certain factors. The major factor to consider is time available at his disposal; if time is short, collaborative approach may not be the appropriate decision to adopt as crucial time will be wasted without any meaningful result that will yield to the attainment of the school goals and objectives in educational system. Collaborative style is contingent on others, staff oriented, it is a style of leadership that is considerate, consultative, partite and subordinates- centered (Bass, 2008).

A collaborative principal involve his/her subordinates in the organization in decision – making process, the principal initiate discussion, outline problems that needs to be discussed, addressed and keep track of the entire school system rather than selected issues. Though decisions are made through collaborative process of discussion and some form of consensus agreement. The principal who adopt collaborative decision making style has to let go the need

for control, power and position for effective running of the school system. The goal of collaborative decision making is the ability to share in decision making which develop trust, respect and relationship between the leader and his subordinates. Goleman (2008) finds that by spending time getting people's ideas and mutual agreements a collaborative leader build trust and commitment with their subordinates. Bass (2008) in the same vein added that a collaborative administrator elicit ideas from their staff to achieve the right way of getting things accomplished in the organization, thereby been open to constructive critics, and handling mistakes as opportunities to acquire more knowledge and know what to do at the right time.

Sharing issues and details of decision- making is important to involve people to support the decision (Larson, 2017). The school administrator must communicate the reasons for making the decisions effectively and arrive at a high quality decisions that will lead to the success and growth of school system. The school administrator can set up committees within the school system and mandated them to investigate and seek solution over issues bothering the growth of the school thus effective administration.

Less effective school performances have been shown to be those limited only to the system's structure without considering the human and social elements, such as culture, school climate and human relations. Today, school reform most often includes the aspect of in-school collaboration (Howden & Kopiec, 2002), by promoting professional learning team spirit among staff. In this regard, school principals are increasingly encouraged to facilitate collaboration among their staff (Bouchamma, 2006), as it constitutes the basis of these for achievement of the aims and objectives opf the school system. (Eaker et al., 2004). Teacher collaboration is often linked to effective schools and academic achievement (Eaker et al., 2004; Howden & Kopiec, 2002; Reed, 2003) as well as teacher morale (Bouchamma, 2006). Principal collaborative style of decision making may seem to be inclusive; its dependency on contributions and suggestions of others may not in all cases provide positive results. Goleman (2000) identify that when decision makers (leaders) and subordinates mull over ideas, there is a chance for decisions to become less than effective.

This could result to subordinates becoming unstable and confused about the proposed problem even more than they may be before they began deliberating. Some subordinates may even disunite themselves from collective participation.

Collaboration has an impact not only on students and teachers, but also on the school as a whole. In regards to the general objective expressed in Nigeria National Policy on education (2014), collaboration between teachers as facilitated by the school administrator enables them to achieve academic goals (Boss, 2002; Holland, 2002; Howden & Kopiec, 2002; Linik, 2002; 2001; Reed, 2003; Tschannen-Moran et al., 2000). It also helps them collaborate better among themselves (Holland, 2002; Howden & Kopiec, 2002), as well as affects both their behaviour and their attitude and enables them to experience a greater sense of belonging to the school. Teachers themselves are constantly learning and developing professionally (Spraker, 2003) in terms of, knowledge generated through common discussion, school practices (pedagogical innovations and reforms (Al-Bataineh & Nur-Awaleh, 2000), professional conduct and lasting professional relationships based on respect and reliance, enthusiasm, gratification and satisfaction experienced on a daily basis through interdependence (Tschannen-Moran et al., 2000); and personal growth (with the constant support and feedback of colleagues (Roberts & Pruitt, 2003) and non-hierarchical supervision. As a result, the element of collaboration helps schools become more effective and efficient as it influences climate and culture of the school to achieve the goal of secondary education.

Collaborative decision-making is one among the effective decision-making though it is time consuming, in respect to this Goleman (2002) insist that adopting a collaborative style in time of crisis is wrong. He added that administrator who adopts this style should be flexible when crisis arises in order to calm down situation with prompt authoritative style in the school system, the principal's utilization of decision style in discharging his duties would determine his effective administration and consequently realize the goals of the school system. Sadler (2003) added that school administrators are responsible for the set of ethic or norms that govern the behavior of people in the organization. The type of performance management style adopted will therefore set the time for school, and can be collaborative based on a majority vote after deliberation or dependent on arriving at consensus, with a range of possibilities in between consensus decision making is particularly difficult, it requires everyone to agree before a decision can be made. It takes commitment and patience using this style.

Delegation as a Panacea for Effective Teachers Services

Delegation is the process in which an individual or institution transfers its political or legal authority to a subordinate individual or institution for execution or application. Responding to this, Adams (2001) defined delegation of authority as the process of giving power or work to somebody else so that the person is responsible for part of what you normally do". In secondary education, it is the act of sharing available functions in the school by the principal to the members of the staff according to their abilities and capabilities towards achieving the goals and objectives of the school.

Delegation of function is very important in secondary school administration. No organization can work without proper delegation of function/ responsibilities. For example, Okafor (2002) asserted that in church, the Pope delegate function to the cardinals, bishops, priests or pastors, pastors to brothers/sisters, catechists and down to laity in the church. In the family, the father as a head delegates functions to the mother, mother to children. In an organization, the manager delegates function to his subordinates. He further stated that delegation implies that a hierarchy of position be created in any organization. This is necessary for achievement of organizational goals which again depends on the proper functioning of the organization. In this capacity, the administrative head of the school in a bid to achieve the goal of secondary education, has to share out some of his functions to competent subordinates so as to facilitate the achievement of the school goals and objectives by assigning tasks to subordinates to perform. This is so because, the school head cannot be found in all places at all times, hence delegation is paramount to achieve success in secondary education. It helps him in the decentralization of responsibilities of office. The sharing of duties/ tasks within the school and the grouping of duties into departments with group heads leads to easier management. Since delegation can take place in all levels of management, departmental heads themselves may become involved in delegation. In management studies delegation of function/responsibilities has become a word in vogue in recent years. It is management practice professed by most managers and administrators but least practiced by them (Taylor, 2004).

Delegation of function has been variously defined by different writers/authors. This implies that in an organization, there is always an executive head that is responsible for sharing functions or duties among his subordinate staff. In the school system for instance, the principal is the head who has a number of subordinate staff in both the academic and administrative cadre, among whom he shares responsibilities for the smooth running of the school. Then the

principal takes into account the staff's hierarchy of positions and competences while delegating functions in order to guarantee optimal performance of the staffs. A principal as an executive head cannot possibly deal effectively with all tasks which other people may have the time and energy to do. In view of Akubue (2002) "Delegation of functions can be explained as a process whereby a super-ordinate (leader) vests decision making discretion on a subordinate and make it possible for them to use their judgment… just as no one person in an enterprise can do all the tasks necessary for the accomplishment of group purpose. So it is impossible as an enterprise grows for one person to exercise authority for making decision".

He further asserted that some members of your staff may become unhappy if you do not entrust them with some responsibilities which they are eager and ready to carry. You may strain your relationship with them. Obviously, one definite effect of not delegating responsibilities will be poor organizational inefficiency and ultimate failure to achieve the major goals of the institution. Therefore, you will see the institution not as your own but as an organization which every member of staff is playing some vital role and in which one of your main duties is the coordination and supervision of the various functions. You establish a chain of command to make things work harmoniously and efficiently. Delegation is a process by which managers, such as school heads, transfer part of their authority to subordinates for the performance of certain tasks and responsibilities".

Delegation of function is not the assignment of unpleasant and boring task that a superior wishes to avoid, but rather he believe that it is the assignment of the part of the superior responsibilities and it may be those parts in which the subordinate is an expert. The implication of all these is that delegation creates an additional obligation on the part of the delegate without diminishing the responsibility of the superior. The subordinate shares in higher responsibilities while still ensuring effective and efficient performance. This is therefore the way superior provide for the maximum performance of their duties and it is an essential way for the establishment of an effective administrative structure. This is because the attainment of educational goal is a function of the cumulative inter play of the forces (internal and external) influencing the school system. Principals' expertise is known to effectively and diligently influence individual and collective forces to achieve the specified goals of education by delegating responsibilities to subordinates that are most suitable for a particular responsibility in line with expected outcomes.

In the opinion of Okonkwo (1998) as cited in Ugwu (2009) experience has confirmed that delegation of responsibilities is one of the major factors contributing to good principal, better performance and staff relations. Involvement of staff in decision-making which has been shown to be related to delegation of responsibilities, also promotes good principal and staff relations for the attainment of education goals. Most staff would be unhappy if they are not entrusted with any responsibilities and the denial of responsibility to staff will strain their relationship with the principal. He further asserted that delegation of duties based on expertise practice to staff enables them not only to put in their best but also expose their talents, because in some cases, the heads and staff sit together and formulate school internal policies to satisfy the curiosity of internal happenings. Okonkwo (1998) in Ugwu (2009) also noted that teachers are proud whenever they are involved in school affairs, more importantly those that have to do with delegation and decision making. The head's involvement of subordinates in both delegation of responsibility and decision-making is an indication that he is applying the principles of democratic leadership and so de-emphasizing autocratic leadership which many authors have rejected as an improper way of administering schools. It is expected that in our school system, heads should delegate

duties to staff so as to ensure democratic participation, group effort among staff which will encourage administrative co-operation.

Constraints of Performance Management Strategies

Despite considerable enthusiasm generated by performance management through its strategies, many administrators may find it difficult to implement this concept in the secondary schools. Studies that are specifically concerned with the implementation of performance management indicate challenges and constraints faced by school managers in this respect. Ohemeng (2009) in a research carried out concerning developing countries found that the implementation of performance management is constrained by institutional and capacity problems such as culture, institutional fragmentation, public support and inept leadership. There are a number of reasons why performance management strategies can be ineffective at the public secondary school setting and this according to Ezeonu and Akani (2010) includes:

- Lack of capacity: Most supervisors, principals and teachers are not acquainted with performance management strategies and how they can be applied to achieve educational goals. This is because there is no training before they go into the practice. A good number of supervisors, principals and teachers are not well informed about their responsibilities due to lack of in-service training and workshops. Supervisors can fall back to using the faultfinding techniques because he or she is not knowledgeable about the modern methods and techniques that can be applied to enhance performance of their staff.
- Inadequate provision of financial and material resources: School administrators cannot carry out their duties effectively when there are inadequate facilities such as office equipment, furniture, vehicles etc. Most schools are still in dilapidated buildings and offices. In such places keeping of most school records becomes a difficult task and enforcing certain rules and regulations become difficult. How can you for example effectively monitor late-coming without an attendance register? Funding is also a major challenge in the educational system.
- Not recognizing and rewarding performance: School supervisors, principals and teachers are poorly remunerated. They are not commensurately motivated and rewarded for the jobs they do and so they engage in other gainful activities which distract them from their main duties. Supervisors look out for gratification in exchange for a good report being given on schools. Teachers are not promoted as at when due, even when promoted, there is no financial benefit attached. There is no commendation for high performers. This results to low morale and consequently poor performance and poor educational achievements in our schools.
- Irregular and delay in payment of salaries: This also constitutes a challenge to performance management. School administrators are most times not paid as at when due and this can lead to low performance as reward stands out as a motivation to performance and goal attainment.
- Type of leadership styles: Leadership style in a school affects the behavior staff either negatively or positively. A principal's leadership style be it democratic, autocratic, or lasses faire - could lead to high morale or low morale of the members of staff which invariably affect their performance and teachers services in the school. A supervisor or principal who imbibes favouritism as a style for example, is bound to demoralize

hardworking members of staff and dampen their performance and ability to attainment set goal.

CONCLUSION

An administration of performance management strategies required the school administrator to be proficient in his or her administrative duties in addition with the possession of sound knowledge. This implies that his or her experience should exceed the vision, knowledge and skills of those under the purview of his/her responsibility. Presently, principals and other administrative staff in schools are recruited from pool of teachers who have little or no knowledge of performance management and therefore are unable to apply performance management strategies for effective teachers' services. Their selection is based on their possession of degrees and seniority with no upgrade of their managerial skills. Thus, they do not adequately inspect, monitor, supervise, evaluate and measure the performance of individual staff and students for enhancement of positive teachers' services and students' achievement respectively.

Suggestions

From the above discussions, the following suggestions are made:

- The administrators of various schools should always as a matter of effectiveness, supervise the teachers to ensure they are quickened to deliver their services in a competent manner.
- Collaboration performance management strategy should be adopted to build the team spirit among teachers for effective cooperation and performances in secondary schools.
- In matters of crises, effective communication should be employed to settle the issue and unite the staff for the attainment of the goals of education.
- Principals of various secondary schools are advised to implore their intuition on the performance management strategy to apply in order to achieve maximum result.
- Staff appraisal should often be conducted to find out the competencies of teachers and proffer solution accordingly.
- The administrators are advised to consider the skills and experience of the staff to be delegated a function, else the objective of the delegation will be forfeited. The staff should be trained and monitored before delegation can take place.

STRATEGIC LEADERSHIP SUPPORT FOR PRINCIPALS' EFFECTIVENESS IN PUBLIC SENIOR SECODNARY SCHOOLS IN RIVERS STATE

Emanso Godwin UDONGWO
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria
egudongwo@gmail.com

ABSTRACT

The study investigated strategic leadership support for principals' effectiveness in public senior secondary schools in Rivers State. The study was anchored on the Social Support theory. The descriptive survey research design was adopted. Five specific objectives, five research questions, and five null hypotheses guided the study. The population of the study was all the 333 principals of the 333 public senior secondary schools in Rivers State. Stratified and simple random sampling techniques were employed to select a total of 152 respondents from the three senatorial districts of Rivers State. The instrument for data collection was a questionnaire developed by the researcher and titled "Strategic Leadership Support for Principals' Effectiveness in Senior Secondary Schools Questionnaire (SLSPESSSQ)". The reliability coefficient of the instruments was determined using test-retest method and Pearson Product Moment Correlation and was found to be .86. The research questions were answered using mean and standard deviation statistics while the hypotheses were tested at a significance level of 0.05 using independent samples t-test. SPSS Version-25 was used to perform the analysis. The findings of the study revealed that there were differences in the level of availability of leadership support practices such as mentoring, training, stress management, among others, for principals' effectiveness in public senior secondary schools in Rivers State. It was also found that these support practices enhanced principals' effectiveness to a low extent in the schools, except stress management support practices. Further findings revealed that there was no significant difference in the opinions of the male and female respondents on the availability of the support practices and on the extent to which they enhanced principals' effectiveness. The study concluded that supporting principals with resources, tools, training, and guidance boosts their effectiveness. It was recommended among others, that the Ministry of Education should periodically organize professional development programs like instructional leadership workshops, seminars, conference, among others, for the training and professional development of principals for their assured effectiveness.

Keywords: Strategic Leadership, Leadership Support, Principals, Mentoring, Training, Community Support, Stress Management Support, Effectiveness.

INTRODUCTION

The goals of secondary education as articulated in relevant sections of the Nigerian National Policy on Education revolve around two basic subjects: to raise graduates who are capable of self-reliance and of meaningful contribution to community and national development, and to prepare graduates for transition into tertiary education (Federal Republic of Nigeria [FRN], 2014). These goals are given a head start by the appointment of principals over secondary schools in Nigeria to man the affairs of the schools. Principals thus come through as both administrators and leaders of this level of education in Nigeria, saddled with the responsibility of managing both the human and non-human resources of the schools. Their job disposition thus places them on a position of accountability to their employers (the government), to their immediate community, and importantly to parents of students. It thus becomes obvious that the workload of principals is never an easy one, and their job demands become so overwhelming sometimes, such that their effectiveness begins to dwindle. The extent to which principals are effective as school leaders may therefore be said to be strongly dependent on the amount and quality of support they receive from the stakeholders of the school system. As such, it becomes important for stakeholders to be inundated with the roles of supporting principals if principals must continually deliver on their jobs.

Leadership support refers to the resources, guidance and encouragement provided to leaders, such as school principals, to help them succeed and excel in their school leadership roles (Egboka, 2018). The principal cannot do it all alone. No leader ever succeeds alone without the help and support of the organization and subordinates whom he is leading. As a matter of fact, the level of effectiveness of a principal is dependent on the level of support he receives from the school community. The task of managing school and the functions involved in the management process are not things that can be handled by one person alone. Even where the principal possesses perfect knowledge of management, he cannot be at all places at the same time to plan, organize, direct, control, supervise, and perform all the leadership functions that are attendant with the principalship position. It was in this regard that Obulor (2024) averred that exceptional principals are those who are able to optimize the principles of participative management, where participative management is the type of management that welcomes the participation of all categories of stakeholders in the management of the school. The supports provided by teachers, parents, the community, and the government go a long way in enabling principals become more effective on their jobs for the attainment of school goals and objectives.

Imperatively, principals must be provided with requisite support for the assurance of continuous improvement in their administrative functions and school effectiveness. This needed support can come from teachers, parents, the community, the schools management board, the Parents Teachers Association, the Senior Secondary Schools Board, the Ministry of Education, the government, civil societies, or from any other agent interested in the wellbeing of secondary schools within the locality of the principal. When principals are effectively supported, it could bring about self-efficacy and improved leadership confidence, enhanced teacher morale and retention, increased student achievement and outcomes, better school culture and climate, more effective decision-making and problem-solving, increased innovation and creativity, and improved leader retention and succession planning, among other benefits to the school system.

It is one thing for stakeholders to be aware that they need to support principals and another thing for them to know where and where their supports are required. Experiences and interactions with principals have revealed that majority of them need support in the areas of

coaching and mentoring, professional development, evaluation and regular feedback on their performance, recognition and celebration, community involvement and partnership/collaboration in school administration, access to resources and finances, and importantly in work-life balance and stress management, among others. The practice of supporting principals will not only boost principals' job satisfaction and performance, but will also come with other benefits that rub off positively on the entire school process, which could lead to better school climate that is supportive of teachers' and students optimal performance and school success.

A study conducted by Onuma (2015) investigated principals' management support practices for enhancing teachers' performance in secondary schools in Nigeria. The study adopted the survey research design, with a population of 5,083 (221 principals and 4862 teachers) and a sample of 1803 respondents selected using propionate random sampling techniques. A structure questionnaire was used for data collection. The finding revealed that principals needed training support for supervisory skills development. It was also revealed that principals needed support for teachers' welfare and motivation. In another study by Gbeke-Kalagbor (2023) which investigated the challenges of effective leadership and teachers motivation on secondary education service delivery in Rivers State, utilizing descriptive survey design, and with a population of 8,356 secondary school teachers in Rivers State and a sample of 836 teachers, the finding from the instrument analysis showed that secondary school leadership was confronted with challenges such as: lack of leadership skills; poor knowledge of education law; poor funding of schools; and inadequate provision of school facilities. All these areas of concern for school leadership and more necessitated the conduct of this study to investigate leadership support for principals' effectiveness in Nigeria.

Statement of the Problem

Public secondary school principals in Nigeria are mostly burdened and hard pressed with having to look out for the good, wellbeing, growth and development of their teachers, students, and the school community all the time without anyone really looking out for them despite the fact that they are humans as well who face similar or even more daunting personal and professional challenges than those faced by other staff members of the school system. The attitudes of educational employers, teachers and co-administrators towards these principals sometimes show that they erroneously perceive principals to be superhumans who have it all and know it all. As such, helps, guidance, supports, and acknowledgements are hardly accorded principals. This really makes a lot of principals to be weighed down with workload, personal challenges, and societal expectations, culminating in their declining effectiveness in the school system.

Furthermore, majority of principals are so occupied with administrative engagement that they hardly have time for professional development towards career advancement or even for performance improvement amidst the ever-evolving requirements placed on their administrative skills by the dynamics of the educational system and changing global best practices in school administration. For some, they are administratively handicapped by poor financing and inadequacy of educational resources in their schools. Majority of others find themselves in situations where their communities are hardly partnering with their schools to ease the administrative burdens on them. For others, it is the challenge of non-recognition of their efforts by their employers and school community. All of these factors and more are perceived by the researcher to be contributing to loss of motivation and decline in effectiveness of most school

leaders in the country. As such, the study investigated strategic leadership support for principals' effectiveness in public senior secondary schools in Rivers State.

Aim and Objectives of the Study

The aim of the study was to investigate strategic leadership support for principals' effectiveness in public senior secondary schools in Rivers State. The specific objectives included to:

- Identify available leadership support practices for principals' effectiveness in public senior secondary schools in Rivers State.
- Assess the extent mentoring support practices enhance principals' effectiveness in public senior secondary schools in Rivers State.
- Determine the extent training support practices enhance principals' effectiveness in public senior secondary schools in Rivers State.
- Examine the extent community support practices enhance principals' effectiveness in public senior secondary schools in Rivers State.
- Assess the extent stress management support practices enhance principals' effectiveness in public senior secondary schools in Rivers State.

Research Questions

The study was guided by the following research questions:

- What are the available leadership support practices that enhance principals' effectiveness in public senior secondary schools in Rivers State?
- To what extent do mentoring support practices enhance principals' effectiveness in public senior secondary schools in Rivers State?
- To what extent do training support practices enhance principals' effectiveness in public senior secondary schools in Rivers State?
- To what extent do community support practices enhance principals' effectiveness in public senior secondary schools in Rivers State?
- To what do stress management support practices enhance principals' effectiveness in public senior secondary schools in Rivers State?

Hypotheses

The following null hypotheses were stated and tested to guide the study at a significance level of 0.05:

- There is no significant difference in the mean ratings of male and female principals on the available leadership support practices for principals' effectiveness in public senior secondary schools in Rivers State.
- There is no significant difference in the mean ratings of male and female principals on the extent mentoring support practices enhance principals' effectiveness in public senior secondary schools in Rivers State.

- There is no significant difference in the mean ratings of male and female principals on the extent training support practices enhance principals' effectiveness in public senior secondary schools in Rivers State.
- There is no significant difference in the mean ratings of male and female principals on the extent community support practices enhance principals' effectiveness in public senior secondary schools in Rivers State.
- There is no significant difference in the mean ratings of male and female principals on the extent stress management support practices enhance principals' effectiveness in public senior secondary schools in Rivers State.

THEORETICAL FRAMEWORK

The study was anchored in the Social Support theory. Social support theory emerged from publications by Don Drennon-Gala and Francis Cullen in the early 1980s, both of whom drew on insights from several theoretical traditions (Atta et al., 2024). The theory is centered on the proposition that instrumental, informational, and emotional supports impact on people's wellbeing and has the potential to reduce the likelihood of deviance or unacceptable performance. In the context of leadership support, suggests that leaders' social support networks can enhance their emotional wellbeing, job satisfaction, performance, resilience, and ability to manage stress, and burnout. Cohen cited in Atta et al. (2024) identified four key components of social support. These included: (a) emotional support, like empathy and encouragement; (b) instrumental support, like tangible aid and resources; (c) informational support, like advice, guidance, counselling, coaching and mentoring; and (d) appraisal support, like feedback, validation, celebration, etc.

The social support theory finds application in this present study as it highlights how the social networks of principals could provide them with leadership support needed for their effectiveness. Such support could come from their peers and colleagues, teachers, mentors and coaches, parents of students, supervisors and managers, professional networks and the school community, family and friends, and from their employers. This is imperative for effective educational management at the senior secondary level of education as it elicits stakeholders' support for principals for the effective attainment of the goals and objectives of this level of education in the country.

Conceptual Framework

The conceptual framework adopted for the study is as presented in Figure 1. It shows the independent and the dependent variables of the study.

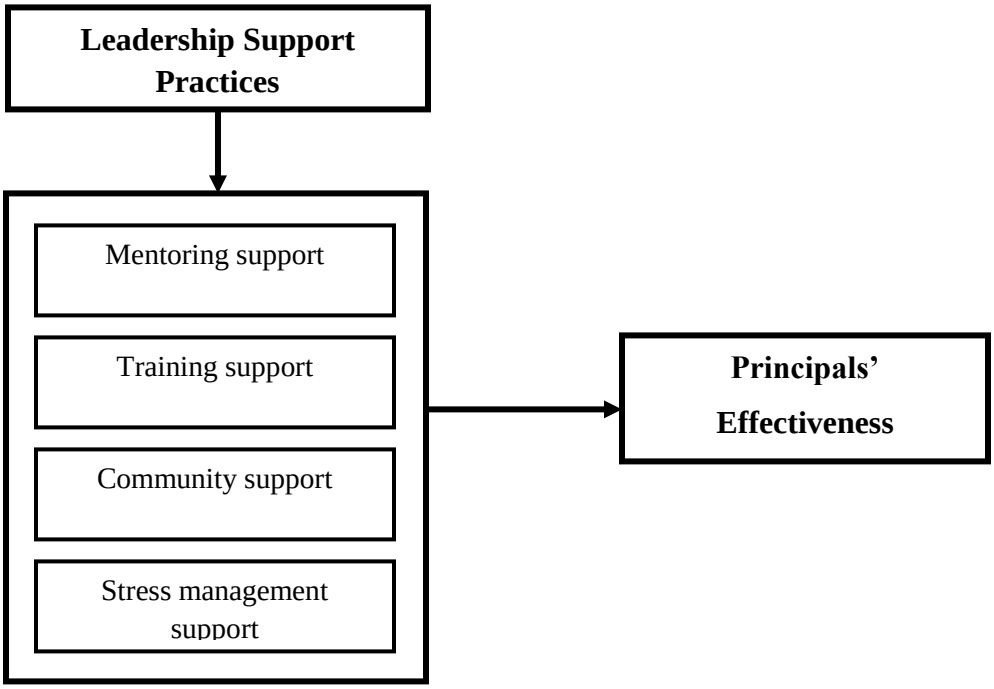

Figure 1: Conceptual Framework
Source: Researcher's Conceptualization (2024)

Principalship and Leadership of Secondary Schools in Nigeria

A principal is the chief administrator and instructional leader of a secondary school in Nigeria. He is popularly referred to as the head teachers (Hornby cited in Ogonor & Omajuwa, 2020). In the view of Olaitan (2014), the principal is the chief executive of post-primary institution. According to Ijeoma cited in Luga (2016, p.23), the secondary school principal is the chief executive of the school who occupies the apex position in the organization structure of the school. He is the administrator of the school responsible for the major decision making activities which are necessary for the achievement of the goals of the school. He brings into the school the elements and processes of administration to bear on his specific functions (as the educational administrator) to enhance teaching and learning (Ogonor & Omajuwa, 2020).

Principals' Effectiveness Conceptualized

Effectiveness insinuates the ability to produce an effect as and when desired. With respect to organizational settings, different authors associate effectiveness with knowledge, skill, acumen, attitudes, thought patterns, judgments, which when used regularly or in various combinations, consistently result in the successful performance of tasks (Olaitan et al. cited in Luga, 2016). Effectiveness can also be seen as the degree to which objectives are achieved and the extent to which targeted problems are solved (Luga, 2016). Principals' effectiveness therefore implies the

degree to which principals are able to synergize different kinds of knowledge for the realization of the goals of secondary school administration. In a nutshell, effectiveness refers to producing the desired result and on a timely basis.

Effectiveness in relation to the study then implies that the principals have to produce the desired result by their supervision and leadership of the school system. An effective principal therefore is one who possesses the right and appropriate personal, professional and academic qualifications that will enable him/her to manage the school, promoting student learning, teacher growth, and community engagement. Effective principals are able to foster a positive school culture, and climate, develop and implement effective instructional strategies, build and maintain strong relationship with teachers, students, and parents, manage resources and budgets efficiently, empower teachers to take ownership of their professional growth, address conflict and challenge proactively, and celebrate success and recognize individual contributions (Adejumobi & Ojikuta, 2013; Ibukun et al., 2021; Kurland et al., 2012; Ukpong et al., 2018; Uzoigwe et al., 2021).

Strategic Leadership Support Practices

Leadership support was described by Egboka (2018) as the provision of resources, guidance and encouragement for leaders, such as school principals, to help them succeed and excel in their school leadership roles. This definition encompasses the provision of both tangible and intangible resources (material and immaterial) to assist principals in effectively carrying out their duties. It is the process of empowering leaders with the tools, skills, and knowledge necessary to effectively lead and manage their teams (Graham, 2022). Leadership support encompasses the actions and behaviours of individuals, teams, and organizations that enable leaders to succeed in their roles (Center for Creative Leadership, 2019). It involves providing leaders with the support, resources, and guidance needed to develop their leadership skills and achieve their goals (Rowlings, 2024). These definitions highlight the importance of providing leaders with the necessary support to excel in their roles, achieve their goals, and develop their leadership skills.

Leadership support practices therefore refer to the specific actions, strategies, and behaviours used to support leaders in their roles, helping them to succeed, grow and develop. In the light of supporting principals towards administrative effectiveness, some leadership support practices found in literature include coaching and mentoring, regular feedback and evaluation, professional development opportunities, resource allocation and support, emotional support and wellness initiatives, collaborative leadership and teamwork, clear communication and goal setting, facilitating network and school building, guidance on navigating challenges and conflicts, technical supports, recognition and celebration of success (Egboka, 2018; Kaki et al., 2023; Ohia, 2021), among others. Within the scope of this present study, the practices of focus include mentoring and coaching support, training and development support, community support and stress management support.

Mentoring and Coaching Support Practices for Principals' Effectiveness

Mentoring and coaching support for principals' effectiveness involves providing personalized guidance, feedback, and development opportunities to help principals improve their leadership skills and achieve their school goals. This support can be provided by experienced principals or retired principals, leadership coaches or consultants, educational leaders at the state level, peer

mentoring programs, and professional learning communities (Fenwick & Pierce, 2019; Yirci & Kocabas, 2020).

Mentoring and coaching support is provided by experienced principals to less experienced principals. It is more like a veteran-novice relationship: a scenario where novices are matched with veterans, enabling veterans to share their knowledge and expertise with the novices. This is of utmost importance because principals of public secondary schools have deferring demographic variables of age, experience and qualifications (Crosby cited in Gümüş, 2019; Daresh cited in Aslan and Ocal, 2022). Mentorship and coaching of the younger, less-experienced or less-qualified principals therefore becomes a veritable form of professional development for effective management of public secondary schools. As such, providing mentoring and coaching support to principals could prove highly effective at assuring principals' effectiveness in public senior secondary schools in Rivers State.

Training and Development Support Practices for Principals' Effectiveness

Goldstein cited in Bello and Salahudeen (2020) was of the view that training and manpower development is the prerogative of the employers of every organization. According to him, training is a form of specialized education aimed at giving the employee a particular or specialized knowledge, skill and attitude which he must possess to effectively perform in a given position. It is a way of supporting the employee to become more competent and more productive on the job. He further explained that development on the other hand is concerned with specific program designed to prepare and groom a worker with particular education and training for higher responsibilities. Thus, training and manpower development is seen as a major hallmark of every thriving organization.

Training and development support for principals thus refers to the process of enhancing their knowledge, skills, and abilities to effectively lead and manage their schools. It involves providing principals with opportunities to learn, grow, and develop their leadership capacities, enabling them to improve instructional leadership and teaching practices, enhance student learning outcomes and achievement, develop effective communication and interpersonal skills, build and maintain positive relationships with teachers, students, and the community, manage school operations and resources efficiently, stay current with best practices, research, and educational trends, address challenges and complexities in their schools, foster a positive school culture and climate, develop strategic plans and goals for school improvement, and evaluate and improve their own leadership practice (Eyinna & Chituo, 2021; Singh & Mohanty cited in Bello & Salahudeen, 2020).

Literature has widely advanced some training and development schemes for school leaders, which are imperative for principals' effectiveness. These include but are not limited to workshops, seminars, conferences, online courses and webinars, peer mentoring and support groups, instructional leadership development programs, data analysis and interpretation training, and leadership retreats and institutes (Malaolu & Ogbuabo, 2013; Ogundiran, 2018; Oyitso & Olomukoro, 2015). These training and development schemes could be done on the job, off-the-job, or through formal education (Egungwu cited in Oyitso & Olomukoro, 2015). The goal of training and development for principals is to equip them with the skills, knowledge, and abilities necessary to lead high-performing schools and improve student outcomes.

Community Support Practices for Principals' Effectiveness

Community support for principals' effectiveness refers to the resources, encouragement, and collaboration provided by the community to help principals succeed in their roles. This can include supports from parent and teacher associations, local businesses and organizations, community volunteers, school boards and district officials, higher education institutions, professional organizations, mentorship programs, coaching and consulting services, networking opportunities, and recognition and appreciation programs (Ezugo & Adesina, 2020). Previous studies like those of Ezugoh (2012) and Ogbonnaya (2016) indicated that many educational institutions like the primary and secondary schools cannot function on their own because they need support from their immediate environment, that is, the community, for their continual growth and development.

Community support can help principals build relationships and trust with stakeholders, access resources and expertise, stay informed about community needs and concerns, develop partnerships and collaborations, enhance their leadership skills and knowledge, manage stress and burnout, improve student outcomes and achievement, foster a positive school culture and climate, address challenges and complexities, and celebrate successes and achievements

Community support can be demonstrated through community members attending school events and meetings, volunteering in schools, providing resources and donations, offering expertise and advice, advocating for schools and principals, building relationships with principals and teachers, participating in decision-making processes, providing emotional support and encouragement, recognizing and celebrating principals' achievements, and fostering a positive and supportive community culture (Davies, 2019; Ezugo & Adesina, 2020).

Stress Management Support Practices for Principals' Effectiveness

Executive stress or work-related stress is a common phenomenon with the position of principalship, just as it is with virtually all educational leadership positions in the school system, and to say that public senior secondary school principals in Nigeria need to be supported in this regard is simply to state the obvious. Seyle cited in Sokpuwu and Ibara (2021) averred that executive stress could be managed with three different broad strategies, vis-à-vis personal management strategies, non-personal management strategies and hazardous management strategies. The non-personal management strategies are the concern of this present study. In the application of these strategies, the person being stressed (the principal in this regard) relies on others to support him. The steps include: counseling, pastoral care, medication (that is the use of drugs), and social support (Ibara & Sokpuwu, 2021). Teachers volunteering for delegated responsibilities from the principal could also be a veritable source of workload-relieving and stress management support to principals. Principals could get this support from the school management, parents of students, the host community, and from the schools board at the governmental level.

Review of Related Empirical Studies

Gbeke-Kalagbor (2023) carried out a study that investigated the challenges of effective leadership and teachers' motivation on secondary education service delivery in Rivers State. Descriptive survey design was adopted with two research questions and two hypotheses guiding the study. The population of the study consisted of 8,356 secondary school teachers in Rivers

State. A sample of 836 teachers representing 10% of the population was drawn from the three senatorial zones through stratified random sampling technique. A questionnaire entitled: "Challenges of Effective Leadership and Teachers' Motivation on Secondary Education Delivery Questionnaire (CELTMSEDQ)" developed by the researcher was used for data collection. Mean and standard deviation were used to answer the research questions while z-test was used to test the hypotheses at 0.05 level of significance. The results of the study revealed that the challenges of effective leadership on secondary education service delivery in Rivers State include among others: lack of leadership skills; poor knowledge of education law; poor funding of schools; and inadequate provision of school facilities. All of these challenges have implications for leadership support for principals' effectiveness in public senior secondary schools in Rivers State.

Sokpuwu and Ibara (2021) carried out a study that investigated the work stress management among University staff. Three research question and three hypotheses were raised during this research. The 120 respondents were selected from the six study centres of the National Open University of Nigeria in the Niger delta states. The instrument for data collection involved a constructed questionnaire "Staff Stress Management Questionnaire (SSMQ)". The data collected were analyzed using descriptive statistics (mean and standard deviation) for the research questions and inferential statistics (t-test) was used in testing the hypothesis. Findings from the study indicated that workload; lack of recognition for good effort, and inadequate opportunities for career development was prominent stressors among the respondents. These stressors are also prominent with principals in public senior secondary schools, and helping principals manage them would be a great support towards their effectiveness.

METHODOLOGY

The study adopted the descriptive survey design. This design sought to identify and simply describe the leadership support practices for principals' effectiveness and to establish the extent to which they enhanced principals' effectiveness in public senior secondary schools in Rivers State. The population of the study comprised of all the 333 public senior secondary school principals in Rivers State. The sample size of the study was 152 respondents – representing 46% of the study population and comprising of 96 male principals and 56 female principals. A combination of stratified sampling and simple random sampling technique was employed to select the respondents of the study from the three geopolitical zone of Rivers State (Rivers East, Rivers West and Rivers South-East).

The instrument for data collection was a structured questionnaire constructed by the researcher and titled "Strategic Leadership Support for Principals Effectiveness in Senior Secondary Schools Questionnaire (SLSPESSSQ)". The instrument had 25 items evenly distributed across five clusters pertaining to the five research questions of the study. The reliability of the instrument was established through test-retest method. A reliability coefficient of 0.86 was determined using Pearson's Product Moment Correlation statistics on the test-retest data. The research questions were answered using descriptive statistics (mean and standard deviation) at a criterion mean of 2.50 on 4 points Likert scale, while the null hypotheses were tested using independent samples t-test at a significance level of 5%. Statistical Package for Social Sciences (SPSS) - Version 25 was used for the analysis.

RESULTS AND FINDINGS

This section presents the answers to the research questions and output of the hypotheses testing with their corresponding interpretations.

Answers to the Research Questions

Research Question One: What are the available leadership support practices for principals' effectiveness in public senior secondary schools in Rivers State?

Table 1: Mean ratings of male and female principals on the available leadership support practices for principals' effectiveness in public senior secondary schools in Rivers State

s/n	Items	Male Principals (N = 96)		Female Principals (N = 56)		Mean Set (N = 152)		Dec.
		$\bar{X}_1$	SD_1	$\bar{X}_2$	SD_2	$\frac{\bar{X}1 + \bar{X}2}{2}$	SD	
1	Mentorship support	2.50	.492	2.52	.504	2.51	.498	A
2	Coaching support	2.78	.487	2.84	.572	2.81	.530	A
3	Leadership training support	2.65	.521	2.70	.539	2.68	.531	A
4	Professional development schemes like conferences, seminars, symposia, among others.	2.35	.500	2.39	.493	2.37	.497	D
5	Community support	2.83	.675	2.91	.640	2.87	.658	A
6	Stress management support	2.73	.326	2.70	.414	2.72	.370	A
7	Regular feedback	2.11	.800	2.06	.444	2.09	.622	D
8	Workload management support	2.67	.313	2.55	.417	2.61	.365	A
9	Recognition and rewards	2.08	.521	2.12	.520	2.10	.521	D
10	Wellness programs	1.88	.202	2.02	.214	1.95	.208	D
	Grand Mean	**2.46**	**.484**	**2.48**	**.476**	**2.44**	**.480**	**D**

Table 1 shows the mean ratings of male and female principals on the available leadership support practices for principals' effectiveness in public senior secondary schools in Rivers State. The data was analyzed against a criterion mean of 2.50. The result shows that some of the practices were available to a considerable level with mean scores higher than the criterion mean score, whereas some had mean scores which were lower than the criterion mean, meaning that they were not really available. The available ones based on majority response and their mean set scores include items 1, 2, 3, 5, 6, and 8. These are mentoring support (M = 2.51, SD = .498), coaching support (M = 2.81, SD = .530), leadership training support (M = 2.68, SD = .531), community support (M = 2.87, SD = .568), stress management support (M = 2.72, SD = .370), and workload management support (M = 2.61, SD = .365) respectively. The score for the grand mean set was found to be 2.44±.480, which being less than the criterion mean implies that majority of the respondents disagreed to the collective availability of all the assessed leadership support practices for principals' effectiveness in public senior secondary schools in Rivers State.

Research Question Two: To what extent do mentoring support practices enhance principals' effectiveness in public senior secondary schools in Rivers State?

Table 2: Mean ratings of male and female principals on the extent mentoring support practices enhanced principals' effectiveness in public senior secondary schools in Rivers State

s/n	Items	Male Principals (N = 96)		Female Principals (N = 56)		Mean Set (N = 152)		Dec.
		$\bar{X}_1$	SD_1	$\bar{X}_2$	SD_2	$\frac{\bar{X}1 + \bar{X}2}{2}$	SD	
11	Principals are paired with more experienced principals for transfer of administrative knowledge.	2.09	.712	2.02	.726	2.07	.716	LE
12	Serving principals are paired with retired principals for knowledge-sharing and this brings about administrative effectiveness.	2.10	..703	2.07	.628	2.09	.675	LE
13	Newly appointed principals are paired with experienced principals to enable them learn best administrative practices for effective principalship.	2.16	.701	1.96	.710	2.07	.710	LE
14	Principal are made to belong to professional learning communities which help them in gaining knowledge from more experienced members for enhanced effectiveness.	2.20	.690	2.21	.680	2.20	.684	LE
15	Principals are granted access to leadership coaches and consultants and this enables them to gain professional knowledge for effective administration of their schools.	2.16	.716	2.21	.731	2.18	.720	LE
	Grand Mean	**2.14**	**.704**	**2.09**	**.695**	**2.12**	**.701**	**LE**

Table 2 shows the mean ratings of male and female principals on the extent mentoring support practices enhanced principals' effectiveness in public senior secondary schools in Rivers State. Item 11 to item 15 were assessed in this regard against a criterion mean of 2.50. The result as revealed in the table shows that mentoring support practices enhanced principals' effectiveness to a low extent in public senior secondary school, with a grand mean set of 2.12±.701, which is less than the criterion mean score.

Research Question Three (RQ3): To what extent do training support practices enhance principals' effectiveness in public senior secondary schools in Rivers State?

Table 3: Mean ratings of male and female principals on the extent training support practices enhanced principals' effectiveness in public senior secondary schools in Rivers State

s/n	Items	Male Principals (N = 96)		Female Principals (N = 56)		Mean Set (N = 152)		Dec.
		$\bar{X}_1$	SD_1	$\bar{X}_2$	SD_2	$\frac{\bar{X}1 + \bar{X}2}{2}$	SD	
16	Training workshops are organized for principals to help raise their skills towards greater competences for effective administration of their schools.	1.83	.675	2.00	.688	1.89	.682	LE
17	Seminars are organized for principals to where seasoned educational leaders and management	2.31	.529	2.16	.596	2.26	.558	LE

	experts train them on current best practices in instructional leadership.							
18	The ministry of education organizes conferences for principals to train and retrain them to gain requisite skills for administrative effectiveness.	1.77	.589	1.92	.657	1.83	.617	LE
19	Principals are made to take online courses and webinars to sharpen their administrative effusiveness.	1.72	.691	1.68	.636	1.70	.669	LE
20	Principals are supported to go for further studies for professional development.	1.77	.589	1.66	.611	1.73	.598	LE
	Grand Mean	**1.88**	**.612**	**1.88**	**.638**	**1.88**	**.625**	**LE**

Table 3 shows the mean ratings of male and female principals on the extent training support practices enhanced principals' effectiveness in public senior secondary schools in Rivers State. Item 16 to Item 20 were analyzed in this regard against a criterion mean of 2.50. The grand mean set was found to be 1.88±.625. Since this value is less than the criterion mean, it shows that majority of the respondents were of the opinion that training support practices enhanced principals' effectiveness to a low extent in public senior secondary schools in Rivers State. In other words, these practices were not really implemented or adopted in the school system.

Research Question Four: To what extent do community support practices enhance principals' effectiveness in public senior secondary schools in Rivers State?

Table 4: Mean ratings of male and female principals on the extent community support practices enhanced principals' effectiveness in pubic senior secondary schools in Rivers State

s/n	Items	Male Principals (N = 96)		Female Principals (N = 56)		Mean Set (N = 152)		Dec
		$\bar{X}_1$	SD_1	$\bar{X}_2$	SD_2	$\frac{\bar{X}1 + \bar{X}2}{2}$	SD	
21	Financial supports received from the community by the school helps principals in effective administration of the school.	2.09	.822	2.18	.917	2.13	.856	LE
22	Recognition of principals' efforts in the school by the community gives principals the needed moral support to give their best.	2.00	.649	1.96	.660	1.99	.651	LE
23	Information resources provided by the community to the school enhance principals' effectiveness in administrating the school.	1.95	.759	2.25	.879	2.06	.816	LE
24	Community partnership with the school management makes the work easier for principals and this boosts their effectiveness.	1.95	.701	2.11	.731	2.01	.714	LE
25	When parents recognize and appreciate principals, it is often a great support that boosts principals' effectiveness.	2.16	.716	2.18	.690	2.16	.704	LE
	Grand Mean	**2.03**	**.729**	**2.14**	**.775**	**2.07**	**.748**	**LE**

Table 4 shows the mean ratings of male and female principals on the extent community support enhanced principals' effectiveness in public senior secondary schools in Rivers State. The investigated support practices (Items 21-25) included financial support, moral support through

recognition of principals' efforts, sharing of information, partnership with school management, and recognition and appreciation by patents. All the items had mean sets that were less than the criterion mean score, implying that majority of the respondents were of the opinion that they enhanced principals' effectiveness to a low extent. In other words, they were poorly practiced.

Research Question Five: To what extent do stress management support practices enhance principals' effectiveness in public senior secondary schools in Rivers State?

Table 5: Mean ratings of male and female principals on the extent stress management support practices enhanced principals' effectiveness in public senior secondary schools in Rivers State

s/n	Items	Male Principals (N = 96)		Female Principals (N = 56)		Mean Set (N = 152)		Dec.
		$\bar{X}_1$	SD_1	$\bar{X}_2$	SD_2	$\frac{\bar{X}1 + \bar{X}2}{2}$	SD	
26	Teachers readily volunteer to help principals out with workload to relieve him/her of much stress.	2.93	.700	2.87	.740	2.91	.713	HE
27	The school staff members effectively work with the principal to achieve school goals and this relieves the principal of stress.	2.92	.721	2.87	.740	2.90	.726	HE
28	Principals are provided with counseling services to manage stress for administrative effectiveness.	2.42	.724	2.40	.740	2.41	.729	LE
29	Principals have access to medical care for stress management and this boosts their effectiveness.	1.55	.630	1.87	.854	1.67	.735	LE
30	The principal enjoys social support from the school community and this helps him/her manage stress.	2.96	.679	2.87	.749	2.93	.714	HE
	Grand Mean	**2.56**	**.691**	**2.60**	**.763**	**2.58**	**.727**	**HE**

Table 5 shows the mean ratings of male and female principals on the extent stress management support practices enhanced principals' effectiveness in public senior secondary schools in Rivers State. Items 26 to 30 were analyzed in this regard against a criterion mean of 2.50. Items [26, 27 & 30] had mean scores that were greater than the criterion mean; implying that majority of the respondents agreed that they enhanced principals' effectiveness to a high extent. On the other hand, Item 28 and Item 29 had mean scores that were lower than the criterion mean, which means they had low extent tendency of enhancing principals' effectiveness. The grand mean set was found to be 2.58±.727. Since this is greater than the criterion mean, it means majority of the respondents were of the opinion that stress management support practices enhanced principals' effectiveness in public senior secondary schools in Rivers State to a high extent.

Hypotheses Test Results

H_{01}: There is no significant difference in the mean ratings of male and female principals on the leadership support practices for principals' effectiveness in public senior secondary schools in Rivers State.

Table 6: SPSS output of independent t-test of difference in mean ratings of male and female principals on the leadership support practices for principals' effectiveness

Gender	N	Mean	SD	t	Df	Sig. (2-tailed)	Decision
Male Principals	96	2.46	.484	5.07	150	.357	H_{01} Upheld
Female Teachers	56	2.48	.476				
Total	**152**						

Significance level of .05

Table 6 shows the result of the independent samples t-test of difference in mean ratings of male and female principals on the available leadership support practices for principals' effectiveness in public senior secondary schools in Rivers State. The mean and standard deviation scores of the male and female respondents were found to be 2.46±.484 and 2.48±.476 respectively. Furthermore, it was revealed that $t(150) = 5.07$, $p = .357 > .05$. With the obtained p value greater than the significance value, H_{01} was upheld and the alternate hypothesis declined. This means there is no significant difference in the mean ratings of male and female principals on the available leadership support practices for principals' effectiveness in public senior secondary schools in Rivers State.

H_{02}: There is no significant difference in the mean ratings of male and female principals on the extent mentoring support practices enhance principals' effectiveness in public senior secondary schools in Rivers State.

Table 7: SPSS output of independent t-test of difference in mean ratings of male and female principals on the extent mentoring support practices enhanced principals' effectiveness

Gender	N	Mean	SD	t	Df	Sig. (2-tailed)	Decision
Male Principals	96	2.14	.312	1.017	150	.311	H_{02} Upheld
Female Principals	56	2.10	.300				
Total	**152**						

Significance level of .05

Table 7 shows the result of the independent samples t-test of difference in mean ratings of male and female principals on the extent mentoring support practices enhanced principals' effectiveness in public senior secondary schools in Rivers State. The mean and standard deviation scores of the male and female respondents were found to be 2.14±.312 and 2.10±.300 respectively. Furthermore, it was revealed that $t(150) = 1.017$, $p = .311 > .05$. With the obtained p value greater than the significance value, H_{02} was upheld and the alternate hypothesis declined. This means there was no significant difference in the mean ratings of male and female principals on the extent of mentoring support practices enhanced principals' effectiveness in public senior secondary schools in Rivers State.

H_{03}: There is no significant difference in the mean ratings of male and female principals on the extent training support practices enhanced principals' effectiveness in public senior secondary schools in Rivers State.

Table 8: SPSS output of independent t-test of difference in mean ratings of male and female principals on the extent training support practices enhanced principals' effectiveness

Gender	N	Mean	SD	t	df	Sig. (2-tailed)	Decision
Male Principals	96	1.88	.320	-.088	150	.930	H_{03} Upheld
Female Principals	56	1.89	.272				
Total	**152**						

Significance level of .05

Table 8 shows the result of the independent samples t-test of difference in mean ratings of male and female principals on the extent training support practices enhanced principals' effectiveness in public senior secondary schools in Rivers State. The mean and standard deviation scores of the male and female respondents were found to be 1.88±.320 and 1.89±.272 respectively. Furthermore, it was revealed that t(150) = -.088, p = .930 > .05. With the obtained p value greater than the significance level value of .05, H_{03} was upheld and the alternate hypothesis declined. This means there was no significant difference in the mean ratings of male and female principals on the extent training support practices enhanced principals' effectiveness in public senior secondary schools in Rivers State.

H_{04}: There is no significant difference in the mean ratings of male and female principals on the extent community support practices enhance principals' effectiveness in public senior secondary schools in Rivers State.

Table 9: SPSS output of independent t-test of difference in mean ratings of male and female principals on the extent community support practices enhanced principals' effectiveness

Gender	N	Mean	SD	t	df	Sig. (2-tailed)	Decision
Male Principals	96	2.03	.365	-1.858	150	.065	H_{04} Upheld
Female Principals	56	2.13	.296				
Total	**152**						

Significance level of .05

Table 9 shows the result of the independent samples t-test of difference in mean ratings of male and female principals on the extent community support practices enhanced principals' effectiveness in public senior secondary schools in Rivers State. The mean and standard deviation scores of the male and female respondents were found to be 2.03±.365 and 2.13±.296 respectively. Furthermore, it was revealed that t(150) = -1.858, p = .065 > .05. With the obtained p value greater than the significance value, H_{04} was upheld and the alternate hypothesis declined. This means there was no significant difference in the mean ratings of male and female principals on the extent of community support practices enhanced principals' effectiveness in public senior secondary schools in Rivers State.

H_{05}: There is no significant difference in the mean ratings of male and female principals on the extent stress management support practices enhance principals' effectiveness in public senior secondary schools in Rivers State.

Table 10: SPSS output of independent t-test of difference in mean ratings of male and female principals on the extent stress management support practices enhanced principals' effectiveness

Gender	N	Mean	SD	t	df	Sig. (2-tailed)	Decision
Male Principals	96	2.66	.553	-.127	150	.899	H_{05} Upheld
Female Principals	56	2.67	.635				
Total	**152**						

Significance level of .05

Table 10 shows the result of the independent samples t-test of difference in mean ratings of male and female principals on the extent stress management support practices enhanced principals' effectiveness in public senior secondary schools in Rivers State. The mean and standard deviation scores of the male and female respondents were found to be 2.66±.553 and 2.67±.635 respectively. Furthermore, it was revealed that $t(150) = -.127$, $p = .899 > .05$. With the obtained p value greater than the significance value, H_{05} was upheld and the alternate hypothesis declined. This means there was no significant difference in the mean ratings of male and female principals on the extent of stress management support practices enhanced principals' effectiveness in public senior secondary schools in Rivers State.

DISCUSSION OF FINDINGS

Leadership Support Practices for Principals' Effectiveness in Secondary Schools in Nigeria

The first objective of the study with its corresponding research question sought to ascertain the available leadership support practices for principals' effectiveness in public senior secondary schools in Rivers State. In this regard, the study found the available support practices to include mentoring support practices, coaching support practices, leadership training support practices, community support practices, stress management support practices, and workload management support practices. It was also found that there was no significant difference in the opinions of male and female principals regarding the availability of these support practices.

These findings agree with existing literature on the subject matter. For example, Egboka (2018) was of the view that principals needed to be supported by their employers and the school committee through the provision of resources, guidance and encouragement, to help them succeed and excel in their school leadership roles. Some other authors explicitly highlighted support practices such as the provision of coaching and mentoring services, regular feedback and evaluation, professional development opportunities, resource allocation and support, emotional support and wellness initiatives, collaborative leadership and teamwork, clear communication and goal setting, and recognition and celebration of success as effective strategies of helping school leaders towards administrative effectiveness (Egboka, 2018; Graham, 2022; Kaki et al., 2023; Ohia, 2021).

Extent Mentoring Support Practices Enhanced Principals' Effectiveness in Public Senior Secondary Schools in Rivers State

The second research objective with its corresponding research question sought to assess the extent mentoring support practices enhanced principals' effectiveness in their schools. The findings of the study revealed that such practices, which included pairing of principals with more

experienced principles and with retired principals for knowledge transfer, pairing newly appointed principals with experienced or old principals for guidance and professional support, membership of professional learning communities, and granting principals access to leadership coaches and consultants, were hardly in place and as such enhanced principals' effectiveness to a low extent in public senior secondary schools in Rivers State. Furthermore, majority of the male and female principals who participated in the study shared similar opinions on the low extent to which mentoring support practices enhanced principals' effectiveness.

These findings negate what is considered best practices in organizations like a school system, where it has been established that no leader succeeds without the guidance of more experienced people or persons who have gone that path of leadership ahead of him/her. In a study by Obulor (2024) on participative management for effective administration of public senior secondary schools in Rivers State, it was found that principals greatly relied on the expert knowledge of stakeholders, especially those considered more knowledgeable than them. Nwonodi (2024) in the same vein found that school leaders could tap from wealth of knowledge, experience and expertise of some human resources within their communities for the administrative effectiveness of their schools. Crosby cited in Gumus (2019) was also of the opinion that mentorship and coaching were a necessity for effective principalship because principals of public secondary schools have deferring demographic variables of age, experience and qualifications. Mentoring support is therefore important for the transfer of administrative experience and skills from more experienced to the less experienced principals for effective administration of public senior secondary schools in Rivers State.

Extent Training Support Practices Enhanced Principals' Effectiveness in Public Senior Secondary Schools in Rivers State

Assessment of the extent training support practices enhanced principals' effectiveness in public senior secondary schools in Rivers State was the third objective of the study. In this regard, the findings of the study revealed that training support practices enhanced principals' effectiveness to a low extent, and there was no significant difference in the opinion of the male and female principals regarding this position.

The revelation made by the findings of the study in this regard shows that public senior secondary schools in Nigeria are obviously not on the path to success, even as their success depends significantly on the effectiveness of their principals, which in turn depends on the quality of knowledge, skills, and expertise possessed by the principal at any given time. These needed knowledge, skills, and expertise are the essence of training support practices, of which literature highlighted schemes such as educational conferences, seminars, workshops, online courses and webinars, formal studies, etc. to be the appropriate mediums where principals can acquire such trainings (Malaolu & Ogbuabo, 2013; Ogundiran, 2018; Oyitso & Olomukoro, 2015). The findings of the study therefore reveal the need for relevant authorities to proactively make provisions of these schemes for principals' effectiveness in public senior secondary schools in Rivers State.

Extent Community Support Practices Enhanced Principals' Effectiveness in Secondary Schools in Nigeria

In this regard, the study revealed that community support practices enhanced principals' effectiveness to a low extent in public senior secondary schools in Rivers State. Furthermore, it

was found that majority of the respondents were in consensus on this position as there was no significant difference in the opinions. The situation revealed by this finding places principals in precarious positions of effectiveness, even as literature has widely revealed that community support to schools was a cardinal determinant of administrative effectiveness and school success (Kamkwis & Zumo, 2019; Osadolor, 2016). The findings of Nwonodi (2024) corroborated this position. According to him, community support in the areas of school financing, information sharing, security of the school, provision of physical facilities, and availing expert knowledge to principals on how to best handle school matters (especially when the interest of the community was at stake) were worthy determinants of principals' success.

Extent Stress Management Support Practices Enhanced Principals' Effectiveness in Public Senior Secondary School in Rivers State

The fifth objective of the study together with its corresponding research question sought to investigate the extent stress management support practices enhanced principals' effectiveness in public senior secondary schools in Rivers State. The results of the analysis showed that tress management support practices enhanced principals' effectiveness to a large extent. Such supports came through teachers who readily volunteered to help principals out on their workload (by accepting delegated responsibilities), through effective collaboration of members of staff with the principal in achieving school goals and through other forms of social support provided by members of the school community. Majority of the respondents did not also significantly differ in their opinions on the extent these stress management pent practices enhanced principals' effectiveness in public senior secondary schools in Rivers State.

This finding is highly imperative for principals' effectiveness, even as it agrees with Nwiyi (2023) who posited that executive stress (work-related stress) was a silent killer of educational administrators and needs to be nipped in the bud for administrative effectiveness. Sokpuwu and Ibara (2021) equally posited that executive stress could be effectively managed through the combination of personal strategies, non-personal strategies and hazardous strategies. The non-personal strategies encompassed all supports received from colleagues and members of the school community, which is the emphasis of this study.

CONCLUSION

Public senior secondary school principals in Rivers State need to be supported for them to continuously be effective on their roles of school leadership. Such supports, which could come from teachers, parents, the community, the schools board, and the government, are in the areas of mentoring and coaching, training, community partnership in funding school, and in stress management, among others. As revealed by the study, these supports have not been significantly practiced in public senior secondary schools in Rivers State and there is need for stakeholders' intentionality in ensuring that such supports are made available for principals.

Recommendations

Based on the findings and conclusion of the study, the following recommendations were made:

- The management of every public senior secondary school in Rivers State should occasionally sensitize stakeholders of various ways they could support the principal and the school for effective administration of public senior secondary schools in the state.
- The Senior Secondary Schools Board should have provisions for the pairing of newly appointed and less experienced principals with older and more experienced ones for mentoring and coaching support to facilitate the process of learning on the job.
- The Ministry of Education should periodically organize leadership training programs like instructional leadership workshops, seminars, conference, among others, for the training and professional development of principals.
- Community stakeholders and well-to-do individuals should normalize funding secondary schools in their communities, and seeking ways of supporting principals towards effectiveness.

THE ROLE OF SCHOOL CULTURE IN ENHANCING STUDENTS' ENGAGEMENT IN LEARNING

Otorugbaribo-Ofori C. FENIBO
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

This paper discussed the role of school culture in enhancing students' engagement in learning. School culture encompasses the shared values, beliefs, and practices that shape daily interactions, expectations, and learning behaviors among students and staff. Moreover, the paper focused how school culture creates a structured atmosphere that promotes academic responsibility, emotional safety, and cognitive investment. Student engagement is explored through its three dimensions behavioral, emotional, and cognitive with a focus on how these are influenced by cultural norms and school-wide expectations. Furthermore, the paper evaluated the impact of school leadership in fostering a culture that supports student participation and learning. Effective leadership is shown to be central in setting behavioral standards, motivating teachers, and ensuring inclusivity, all of which directly affect how students engage in academic tasks. In addition, the discussion emphasizes the need for school leaders and educators to adopt intentional cultural practices that promote collaboration, respect, and intellectual development. The paper concluded that School culture plays a vital role in shaping how students engage with learning in schools. Amongst others the paper suggested School Administrators should ensure the creation of a supportive school culture that values academic excellence, respect, and collaboration. This can be done by setting clear expectations for behavior, encouraging inclusivity, and fostering a positive learning environment.

Keywords: School Culture, Student Engagement, Learning Environment, Classroom Participation, Educational Practices.

INTRODUCTION

The effectiveness of the teaching and learning process in schools is strongly influenced by the culture that exists within the school environment. School culture refers to the shared beliefs, values, and practices that shape how people interact, make decisions, and respond to expectations in a school setting. It defines the atmosphere in which teaching occurs and learning is either encouraged or hindered. When a school promotes a culture of high expectations, mutual respect, academic focus, and collective responsibility, students are more likely to engage actively in classroom activities, commit to academic goals, and develop a deeper interest in learning.

Moreover, the values embedded in school culture influence students' attitudes, motivation, and sense of belonging, all of which are key to sustaining consistent engagement in learning tasks (Deal & Peterson, 2009). A healthy school culture does not emerge by chance but is deliberately shaped by school leaders, teachers, and other stakeholders who model behavior, establish routines, and promote a clear vision of academic success. The term school culture generally refers to the beliefs, perceptions, relationships, attitudes, and written and unwritten rules that shape and influence every aspect of how a school functions, but the term also encompasses more concrete issues such as the physical and emotional safety of students, the orderliness of classrooms and public spaces, or the degree to which a school embraces and celebrates racial, ethnic, linguistic, or cultural diversity.

Furthermore, student engagement in learning is not merely about physical presence in the classroom but involves behavioral participation, emotional involvement, and cognitive investment. These dimensions are greatly influenced by the cultural environment students experience daily. When the culture encourages collaborative learning, values each student's voice, and ensures emotional safety, students are more likely to be attentive, participate in discussions, and apply themselves meaningfully in their studies (Fredricks et al., 2004). In addition, school leadership plays a central role in shaping this culture by setting clear policies, building strong teacher-student relationships, and maintaining a positive school climate. Schools that succeed in aligning their cultural practices with instructional goals often experience higher levels of student engagement, reduced disciplinary problems, and improved academic outcomes (Leithwood & Jantzi, 2006). Therefore, understanding the role of school culture is essential for enhancing student engagement, especially in public secondary schools where learning challenges are often compounded by resource limitations and socio-economic disparities.

THEORETICAL FRAMEWORK

Cultural Capital Theory by Pierre Bourdieu in 1977, cited in Dika (2002)

Cultural Capital Theory, developed by the renowned French sociologist Pierre Bourdieu in 1977, as cited in Dika and Singh (2002), provides a comprehensive and insightful theoretical lens through which to examine the intricate relationship between school culture and students' academic performance in public secondary schools in Rivers State, Nigeria. According to Bourdieu (1977), this theory posits that individuals carry with them a form of capital known as cultural capital, comprising cultural knowledge, values, and practices, which profoundly influence their educational experiences and outcomes. This cultural capital is categorized into three primary forms, each of which plays a critical role in shaping the educational journey of students within the context of this study.

The cultural capital theory represents the internalized cultural knowledge, habits, and dispositions that individuals acquire through their upbringing and socialization (Bourdieu, 1977). It encompasses language proficiency, manners, ways of thinking, and the subtle nuances of cultural practices. Within the framework of this study, embodied cultural capital becomes particularly relevant as it pertains to students' cultural backgrounds, prior educational experiences, and the unique cultural milieu they bring to the school environment. Cultural capital, extends to the tangible cultural goods and resources that individuals possess (Bourdieu, 1977). These can include books, artworks, educational materials, and even access to technological tools. Objectified cultural capital represents the physical manifestation of cultural

knowledge and can provide distinct advantages in educational settings. In the context of public secondary schools in Rivers State, Nigeria, it becomes imperative to consider how the availability of such resources within the school environment influences students' learning experiences and academic performance.

Moreover, the institutionalization of the cultural capital theory revolves around the recognition and validation of an individual's cultural knowledge and practices by formal institutions, particularly educational institutions (Bourdieu, 1977). This form is often linked to educational credentials, qualifications, and degrees. Within this study, it is crucial to investigate how school culture practices such as assessment methods, teaching approaches, and the broader educational environment either validate or devalue specific forms of institutionalized cultural capital. The extent to which these practices align with or diverge from students' cultural backgrounds can significantly impact their engagement and academic success.

The interplay between these forms of cultural capital and the dynamics of school culture practices constitutes a central focus of the study. When school culture practices align harmoniously with the cultural capital that students bring from their backgrounds, it often results in a more supportive and inclusive learning environment (Bourdieu, 1977). In such cases, students are more likely to be motivated and engaged, which can positively influence their academic performance. Conversely, when there are significant discrepancies between the cultural capital of students and the dominant cultural capital within the school culture, challenges in terms of engagement and academic outcomes may arise. Cultural Capital Theory, as articulated by Pierre Bourdieu (1977), offers a robust theoretical framework for comprehending the intricate dynamics between school culture practices and students' participation in learning within public secondary schools in Rivers State, Nigeria. By exploring how specific school culture practices interact with the diverse forms of cultural capital that students possess, this study aims to provide nuanced insights into the complexities of educational achievement within culturally diverse contexts.

CONCEPTUAL CLARIFICATIONS

Concept of School Culture

School culture in the learning environment reflects the prevailing values, norms, and practices shared by teachers, students, and administrators. It defines the social and academic expectations that shape the daily experiences of learners. Moreover, a strong school culture provides a stable foundation that promotes trust, mutual respect, and collective commitment to learning. When students feel included and respected, they tend to adopt attitudes that support academic success (Deal & Peterson, 2009). A healthy school culture emphasizes academic excellence, fosters collaboration, and encourages ethical behavior among members of the school community.

Furthermore, school culture acts as an invisible force that influences behavior and decisions in schools. Teachers' professional conduct, the quality of student-teacher interactions, and peer relationships are often a reflection of the prevailing school culture (Stolp & Smith, 1995). Schools that maintain a culture of shared responsibility and high expectations often experience better student motivation, improved classroom engagement, and fewer behavioral problems. In addition, such an environment helps establish a sense of identity and belonging among students, reinforcing their emotional and cognitive connection to learning.

Additionally, consistent cultural values in schools promote a learning climate where students understand and accept behavioral norms and academic goals. This clarity supports positive discipline, reinforces good habits, and nurtures a learning-oriented atmosphere. When leaders, teachers, and students share a unified understanding of the school's mission, instructional goals become easier to achieve (Sergiovanni, 2005). The concept of school culture, therefore, is essential to shaping students' commitment, engagement, and achievement in a way that supports the school's overall educational vision.

School Culture Practices

School culture practices refer to the shared beliefs, values, traditions, and behaviors that shape how a school community interacts and functions. These practices form the foundation for student learning, teacher collaboration, and overall school improvement. In many public secondary schools in Rivers State, school culture is reflected in daily routines, leadership style, classroom norms, teacher-student relationships, and approaches to discipline and academic expectations. Furthermore, a school's culture often influences the level of student participation in learning, as it determines the kind of environment that is created—either one that is open and supportive or one that is restrictive and discouraging. A positive school culture promotes mutual respect, celebrates academic effort, and encourages collaboration among students and teachers, leading to higher levels of engagement and achievement (Deal & Peterson, 2009).

Moreover, school culture practices are reinforced through visible and invisible mechanisms, such as school assemblies, classroom rules, teacher modeling, and reward systems. These elements communicate the school's priorities and signal to students what is expected in terms of behavior and academic engagement. When teachers consistently reinforce respectful cond⅞uct and promote inclusiveness, students feel valued and are more likely to contribute actively to classroom activities. Additionally, practices such as peer mentoring, open-door policies from school leaders, and regular student feedback meetings contribute to a participatory culture that gives students a voice in their learning process. In such environments, learning becomes a shared responsibility, and students are more invested in their academic progress (Gruenert & Whitaker, 2015).

In addition, leadership plays an essential role in shaping school culture. Principals and other school leaders influence how policies are applied and how teachers and students experience the school environment. When leadership promotes fairness, transparency, and collaboration, school culture becomes more inclusive and learner-centered. This creates conditions that support effective teaching practices and encourage student involvement in both academic and non-academic activities (Leithwood et al., 2004).

Dimensions of Student Engagement in Learning

Student engagement in learning includes three core dimensions: behavioral, emotional, and cognitive engagement. Behavioral engagement involves students' active participation in academic and co-curricular tasks such as attending classes, submitting assignments, and collaborating with peers. Moreover, schools that cultivate structured environments with clear expectations and consistent feedback tend to foster greater behavioral involvement (Appleton, Christenson, & Furlong, 2008). Students are more likely to comply with school routines and expectations when the atmosphere supports active participation and academic responsibility.

Emotional engagement deals with students' feelings of belonging, interest, and value within the school community. In classrooms where students experience positive teacher-student relationships and peer support, emotional engagement often increases (Skinner, Furrer, Marchand, & Kindermann, 2008). Furthermore, students who feel emotionally secure and respected are more inclined to maintain positive attitudes toward learning and school participation. In addition, school cultures that emphasize inclusivity and empathy help in building emotional bonds that improve students' overall learning experiences.

Cognitive engagement involves students' willingness to invest mental effort in learning complex content, solving problems, and applying critical thinking. This type of engagement becomes evident when students show deep interest in exploring concepts, extending their learning beyond surface-level understanding (Fredricks, Blumenfeld, & Paris, 2004). Furthermore, cognitive engagement is enhanced in environments that challenge students intellectually while providing sufficient support. Although each dimension is distinct, they often work in coordination to shape students' overall participation and academic persistence.

Influence of School Leadership on Student Engagement

School leadership influences student engagement through policies, decisions, and practices that shape the overall learning environment. Effective school leaders foster a culture where high academic expectations, discipline, and student voice are prioritized. Moreover, principals who promote open communication, fairness, and shared leadership practices contribute positively to how students engage with schoolwork and relationships (Hallinger, 2005). The presence of visible, supportive leadership helps students feel valued and guided in their educational journey.

Furthermore, leadership impacts student engagement through its influence on teacher behavior and school-wide practices. Teachers are more motivated and innovative when leaders offer consistent professional development, collaborative planning time, and recognition of efforts. These benefits eventually trickle down to students, who are more likely to engage in classrooms that are well-organized and emotionally supportive (Leithwood & Jantzi, 2006). In addition, effective leadership ensures that students are part of the decision-making process through student councils, academic clubs, and feedback mechanisms.

Additionally, school leaders shape engagement by ensuring that learning environments are safe, inclusive, and stimulating. Their ability to allocate resources, manage discipline fairly, and promote a clear instructional vision directly influences how students perceive their role in the academic setting. When leadership promotes equity and models ethical behavior, students respond with improved academic focus and emotional commitment (Robinson, Lloyd, & Rowe, 2008). Therefore, the influence of leadership extends beyond administration it shapes the daily conditions that either encourage or weaken student engagement.

Impact of Classroom Environment on Student Participation

The classroom environment plays a pivotal role in determining the level of student participation. An engaging and well-organized classroom setting can significantly enhance students' willingness to participate in lessons. A positive classroom environment encourages active involvement, reduces anxiety, and provides students with a sense of safety and belonging. Classroom factors such as seating arrangement, teacher-student interactions, and the physical setup contribute to how students engage with the learning process. For instance, classrooms that

are structured to encourage collaborative learning, where students can work together and share ideas, tend to foster higher levels of participation. Moreover, when teachers create a safe space where students feel respected and their opinions valued, students are more likely to participate actively in discussions and activities (Zepke & Leach, 2010).

Additionally, the emotional atmosphere within the classroom, often influenced by the teacher's demeanor and classroom management strategies, plays a significant role in fostering engagement. Positive reinforcement, enthusiasm in teaching, and a supportive tone from the teacher can enhance student participation by making students feel motivated and willing to contribute (Skinner & Belmont, 1993). On the other hand, a negative environment, marked by hostility, lack of support, or indifference, can discourage student involvement and disengage them from the learning process. The classroom environment also influences the cognitive aspect of participation; when students feel that the learning space is conducive to critical thinking and creativity, they are more likely to engage at a deeper cognitive level (Kuh, 2009). Therefore, creating an environment that is physically, emotionally, and intellectually stimulating is essential for promoting student participation and engagement.

Disciplinary Approaches and Their Effect on students Engagement

Disciplinary approaches in schools can have a significant impact on student engagement, as they shape how students experience authority, structure, and behavior expectations. A school culture that relies on punitive disciplinary measures may inadvertently discourage student engagement, as it fosters an environment of fear and disengagement. In contrast, approaches that emphasize positive reinforcement, restorative practices, and consistent behavioral expectations tend to create a more supportive environment where students feel motivated to engage. Restorative discipline practices, for example, focus on repairing relationships rather than punishing students, encouraging accountability and fostering a sense of community (Gregory, Skiba, & Noguera, 2010). When students are given the opportunity to reflect on their behavior and take ownership of their actions, it leads to better emotional engagement, as they understand the consequences of their behavior in a meaningful context.

Moreover, disciplinary approaches that emphasize student involvement in rule-setting and decision-making often lead to higher engagement, as students feel they have a stake in the policies that affect them. This sense of agency and inclusion enhances students' emotional investment in their behavior, making them more likely to engage positively with the learning process (Simonsen et al., 2008). Additionally, clear and consistent expectations for behavior, paired with fair enforcement, reduce confusion and create an environment where students can focus on learning rather than navigating uncertainty about classroom rules. Overall, the disciplinary approach used in a school directly influences the level of student engagement, with restorative and positive strategies being more conducive to promoting active participation and fostering a positive learning environment.

Collaborative Learning Culture and Student Involvement

A collaborative learning culture plays a crucial role in enhancing student involvement in the educational process. In a collaborative learning environment, students work together in pairs, small groups, or whole-class activities, promoting interaction, peer learning, and the sharing of ideas. This approach encourages a sense of community, where students feel accountable not only

to themselves but also to their peers, creating a culture of mutual respect and active participation. Collaborative learning environments often promote higher levels of cognitive engagement, as students are encouraged to think critically, solve problems together, and engage in discussions that deepen their understanding (Johnson & Johnson, 2009). Furthermore, collaboration enhances emotional engagement, as students form relationships and build a sense of belonging within the classroom.

Collaborative learning helps in the development of essential social skills, such as communication, teamwork, and conflict resolution, which are important not only for academic success but also for future professional life. The collaborative culture fosters an environment where students are less likely to feel isolated or disconnected, thus increasing their overall engagement in learning. Research has shown that students who participate in collaborative learning experiences are more likely to demonstrate higher levels of motivation, persistence, and achievement (Slavin, 1995). Moreover, teachers who actively promote and facilitate collaborative learning strategies, such as group projects, peer teaching, and cooperative tasks, create a dynamic classroom culture where students are motivated to engage and contribute. Therefore, fostering a collaborative learning culture in schools can significantly enhance student involvement, providing a rich and engaging learning experience that supports both academic and personal growth.

FACTORS INFLUENCING SCHOOL CULTURE PRACTICES

Leadership Style and Administrative Influence

The leadership approach within a school has a direct effect on the type of culture that is practiced. School principals and administrators set the tone for communication, discipline, and the general school atmosphere. When leadership is inclusive, transparent, and visionary, it encourages teachers and students to engage actively with the school's mission. This style of leadership promotes a culture of collaboration, trust, and shared responsibility. School leaders who provide regular support and allow staff participation in decision-making tend to nurture a culture where both teaching and learning flourish. In contrast, authoritarian or inconsistent leadership often leads to disengagement and low morale. Furthermore, strong leadership is associated with goal alignment, effective policy implementation, and professional development, which are all indicators of a stable and productive school culture (Hallinger, 2011).

Teacher Attitudes and Professional Conduct

Teachers are critical in maintaining and transmitting school culture through their daily interactions with students and colleagues. Their attitudes toward teaching, student welfare, and collaboration affect the overall atmosphere of the school. When teachers are motivated, committed, and approachable, they help create a culture that values learning, respect, and participation. In classrooms where teachers show enthusiasm and fairness, students often feel more encouraged to take part in academic activities. Additionally, the professional conduct of teachers such as punctuality, consistency, and ethical behavior provides a model for students to emulate. Teacher collaboration also contributes to a unified culture, especially when staff members share resources, solve problems collectively, and support each other. In essence, the

role of the teacher goes beyond instruction and extends into shaping the attitudes and behaviors that define a school's culture (Hargreaves & Fullan, 2012).

Peer Influence and Student Relationships

Students' relationships with their peers contribute substantially to the everyday culture of a school. Peer groups often create informal norms about what is acceptable or desirable in terms of academic behavior and social interaction. In schools where peer relationships are built on mutual respect, cooperation, and support, a culture of learning and participation is more likely to thrive. These positive interactions help reduce social isolation and promote a sense of belonging, which is vital for student engagement. On the other hand, toxic peer cultures that involve bullying, mockery, or discrimination can negatively affect student morale and discourage participation. Promoting collaborative projects, peer mentoring, and inclusive extracurricular activities helps strengthen peer connections in a positive direction. The overall influence of peer groups cannot be overlooked in shaping how school culture is expressed among the student body (Wentzel, 2005).

Physical and Learning Environment

The quality of the physical environment in a school directly influences the perception and practice of school culture. When school facilities are clean, organized, and adequately equipped, they communicate care, orderliness, and academic seriousness. Features such as well-lit classrooms, functional libraries, adequate furniture, and access to learning materials provide a supportive setting for both teaching and learning. Moreover, environmental elements like school displays, student work showcases, and motivational posters help reinforce the values and expectations of the school. In contrast, schools that are overcrowded, poorly maintained, or lacking basic resources often create an atmosphere of neglect that can affect student motivation. The school's physical space shapes how learners and teachers interact with their surroundings and with each other, thereby influencing the kind of culture that evolves over time (Uline & Tschannen-Moran, 2008).

Community and Parental Involvement

The involvement of parents and the surrounding community is an important factor in shaping a school's culture. Schools that maintain open lines of communication with parents often experience better student behavior, higher academic performance, and improved attendance. When parents participate in school activities—such as meetings, workshops, or student celebrations—they reinforce the idea that education is a shared responsibility. Additionally, schools that engage with community leaders and organizations are often better positioned to access resources, support services, and local knowledge that enrich learning. This partnership helps build a culture of mutual accountability, where students understand that their academic progress is monitored and valued by both educators and their families. Effective school-community relationships foster trust, openness, and a sense of collective ownership over educational goals (Epstein, 2001).

DIMENSIONS OF SCHOOL CULTURE PRACTICES

School Values

The concept of value has different definitions in the literature. For example; Rokeach defines values as enduring beliefs that indicate whether behaviours are personally or socially acceptable (cited in Lyons, 2003). Another definition suggests that values are systematic and to some extent precise ideas that ensure the interaction of an individual with the environment (Veugelers & Vedder, 2003). According to Yeşil and Aydın (2007), people who use the features obtained through the sense organs in defining the beings can benefit from the impressions they emotionally have in attributing importance to that being and appraising it. These emotion-based impressions are generally called "values". In another definition, values are described as a tendency to prefer certain states in human relations (Hofstede, 1991).

In the most general sense, we can define values as a reflection of the wishes, preferences and desired and undesired situations by defining what individuals consider important (Erdem, 2003, p. 56). However, Ministry of National Education (2005) defines values by determining the features of values. Accordingly, a value consists of criteria which are adopted by society and individuals and believed to be in the interests of society and individuals, judgements involving qualifications, consciousness, emotions and excitement and management and integration of an individual's behaviour. The acquisition of these qualities can be achieved by values education. This is because the common point of the definitions is that values combine the common wishes, preferences and beliefs that are effective in the psychological and sociological well-being of the individual and the society. Therefore, values education becomes even more important for the continuity of societies. Values education starts in family, the first social institution, with the birth of the child.

However, when it comes to the continuity of societies and social peace, it is possible that values education is addressed in a more formal way and at this point schools have come into play. Taylor has emphasized the formal part of values education by using it as an inclusive concept that consists of terms such as moral education, civic education and citizenship education (Thornberg, 2008, cited in Taylor, 1994). An individual's realizing certain values, creating new values, adopting them and displaying them through his behaviours by attributing them to his personality is associated with education (Genc & Eryaman, 2008; Yeşil & Aydın, 2007). Implicit or planned values education in schools plays an active role in transferring values from society to society (Kasa, 2015). Kale (2007) has listed the characteristics of values education in four items as follows:

- To raise individuals' awareness of universal (ethical), cultural values, and their importance
- To relate democratic attitudes and tolerance to multiculturalism,
- To evaluate all values with the criteria of improving people's living conditions and facilities,
- To turn life into knowledge and/or knowledge into life considering concrete problems related to ethical values. When these qualities are taken into consideration, the main purpose of values education is to make values permanent behaviours in students.

Considering that the role of experiences in values education is also essential, if teachers support their students by giving them the opportunity to practice about values in daily life, values can be internalized by students (Eryaman, 2007; Aydın, 2010).

Parental/Community Involvement

Parental and community involvement in student's education is a multifaceted factor that can significantly influence their academic performance (Fan & Chen, 2001). Active parental involvement can provide essential support structures for students. Parents who engage in their child's education by attending parent-teacher meetings, monitoring homework, and discussing school-related matters tend to create a positive learning environment at home (Epstein, 2001). This support can lead to increased motivation and a greater sense of responsibility among students, which in turn can contribute to improved academic performance.

Similarly, community involvement extends the support network. Communities that value education often provide resources such as libraries, afterschool programs, and mentoring opportunities (Henderson, et al., 2002). Students who benefit from these community resources tend to perform better academically, as they have access to additional learning experiences beyond the classroom. Moreover, parental and community involvement can create a culture of high expectations. When parents and community members actively engage with the school, they communicate the importance of education to students (Lawson & Lawson, 2013). This shared value for education can motivate students to excel academically to meet these high expectations.

Communication between parents, teachers, and the school is another critical aspect of involvement (Hill & Tyson, 2009). Effective communication ensures that parents are aware of their child's progress, areas needing improvement, and strategies to support their learning. When parents are well-informed, they can provide targeted assistance, which can positively impact academic performance.

Effective Communication

Dunn and Goodnight (2016:14) defined communication as 'the process of conveying information from one person known as the sender to another person known as the receiver'. Communication is seen as a crucial component in the organisation, as it is the tool that is used to unify all employees and ensure that everyone is doing the work required to execute and achieve the overarching goals, strategies and objectives of the organisation (Liaw et al. 2018:1).

Organisations use various communication types to send suitable and detailed messages to employees (Raina & Roebuck 2016). According to Wambui et al. (2012:2), there are two main types of communication; these include verbal communication and nonverbal communication. According to Olds College OER Development Team (2015), verbal communication includes speaking, listening and writing. The sender utilises words and letters to code the information and speaks the message verbally to the receiver; the receiver then decodes the words for understanding and meaning. This type of communication forms an important part of the professional world as it is used to create work relationships, increase productivity and ensure organisational success. Presentations, discussions, meetings, formal and informal conversations are some of the examples where verbal communication is used (Paramitha 2018).

Despite the importance of verbal communication, the nonverbal aspect of communication has been deemed as more important (Friedman 2019). Research has shown that '55% of in-

person communication comes from nonverbal cues, such as facial expressions, body stance and smell' (Olds College OER Development Team 2015). The nonverbal channel, encompasses any method of communication that could transfer a message that is not contained in words themselves. Friedman (2019) stated that body language, gestures, appearance (dressing, jewellery), facial expressions, sounds, smells are all examples of nonverbal cues which can convey a message to other people.

Credibility of communication

The credibility of information that is communicated throughout the organisation is another factor, which needs to be considered. Gomez and Dailey (2017) stated that trust, credibility, openness and candour are vital properties of an ideal communication climate in organisations. For employers to act towards and successfully implement strategies, they need to believe the information which they receive. Research by Tenhiälä and Salvador (2018) found that there are differences in the levels of credibility between the formal channel and the informal channel of communication. They found that formal communication channels are more specific, transparent and less ambiguous than informal communication channels. These findings were more present in organisations in the aviation or military industry, which are adamant in utilising the formal channels in day-to-day operations and strategy implementation. In contrast, informal communication is more prone to spreading information with errors, ambiguity and deviations from the true message which was intended by the organisation (Gomez & Dailey 2017; Surbhi 2018). Tenhiälä and Salvador (2018) believed that these are all important factors which organisations need to consider as they can affect the way in which strategies can be implemented and overall performance of the organisation.

IMPORTANCE OF STUDENT PARTICIPATION IN LEARNING

Enhances Academic Understanding

Student participation enhances comprehension by involving learners actively in the learning process. When students engage in discussions, answer questions, or contribute to classroom activities, they reinforce what they are taught. This form of active engagement helps them retain information longer and understand content more deeply. Participation gives students the opportunity to clarify doubts and relate new knowledge to real-life experiences. Moreover, it shifts learners from passive listeners to active thinkers, making the learning process more meaningful. Active involvement also encourages peer learning, as students benefit from listening to the perspectives of others. When students participate frequently, teachers are better able to assess learning progress and provide appropriate support. A classroom culture that promotes consistent student participation increases attention, strengthens memory, and improves academic performance (Barkley, 2010).

Builds Communication and Social Skills

Active participation strengthens students' communication and interpersonal skills. Taking part in discussions, group tasks, and presentations, students learn how to express their ideas clearly, listen to others, and respond respectfully. These experiences are vital for their overall

development, as they prepare students for collaboration beyond the classroom. In addition, engaging in structured classroom activities helps students overcome shyness, build self-confidence, and develop the ability to negotiate and lead. When students are consistently involved in learning tasks that require interaction, they learn to work effectively as part of a team. These skills are essential in both academic and professional environments. Classrooms that promote open dialogue also foster respect and tolerance, allowing students to appreciate different viewpoints and learn how to resolve conflicts constructively (Gillies, 2006).

Increases Motivation and Responsibility

Student participation increases motivation and personal responsibility. When learners are involved in setting goals, making decisions, or contributing to classroom discussions, they feel a stronger sense of ownership over their education. This ownership drives them to stay committed and work harder. Students who participate are more likely to take learning seriously, complete tasks with interest, and strive for academic improvement. Participation also gives them a sense of purpose and relevance, showing that their opinions and efforts are valued. This leads to greater self-discipline and a desire to perform well. Moreover, when students are allowed to engage in their learning process, they become more independent and proactive in seeking help or clarifying difficult concepts (Ryan & Deci, 2000).

Promotes a Positive Learning Environment

Moreover, student participation contributes to a supportive and interactive classroom environment. When students are engaged, classrooms become more lively, inclusive, and respectful. Participation helps break down barriers between teachers and students, making the classroom a space where learners feel safe to express themselves. A participatory environment reduces the chances of boredom and misbehavior because students are kept mentally active. It also creates stronger peer connections, as learners collaborate, share ideas, and support one another. Teachers benefit as well, since active students provide immediate feedback about what is understood or misunderstood. This allows teachers to adjust their teaching strategies in real-time. A classroom filled with active participants fosters a culture of mutual respect, shared responsibility, and academic growth for all learners (Mitra, 2004).

CHALLENGES TO STUDENT PARTICIPATION

Overcrowded Classrooms

One of the persistent challenges affecting student participation in public secondary schools in Rivers State is overcrowded classrooms. Most public schools in urban and semi-urban areas operate beyond their capacity, with a high student-to-teacher ratio. This environment limits the teacher's ability to give adequate attention to individual learners or manage interactive activities. In such settings, class discussions become difficult to manage, and students are often not given the opportunity to express their thoughts or ask questions. Furthermore, movement is restricted due to lack of space, making it hard to engage students in group work or collaborative learning. Students in overcrowded classes may also feel neglected, which reduces their willingness to

participate. As the teacher focuses on keeping order, rather than interaction, the overall learning atmosphere becomes rigid and passive (Adeyemi, 2008).

Lack of Instructional Materials

Many public secondary schools in Rivers State lack adequate teaching and learning materials. This includes textbooks, science equipment, writing materials, and audiovisual aids. Without access to these resources, lessons often remain theoretical and teacher-centered. Students cannot fully engage in experiments, role-playing, or hands-on activities that enhance understanding. Moreover, teachers find it difficult to apply learner-friendly methods like project work or demonstration when materials are unavailable. As a result, students become passive recipients of knowledge rather than active participants in the learning process. Some schools attempt to share outdated or damaged materials, which limits effectiveness and motivation. Inadequate teaching aids affect the quality of interaction, as students lack the tools to fully contribute during lessons or assignments. This shortfall continues to hinder meaningful participation in classroom activities (Akinsolu, 2010).

Low Student Motivation

Low levels of student motivation greatly influence participation in learning. Many students in public schools face personal and social challenges that reduce their interest in school activities. These may include poverty, family instability, poor health, or peer pressure. When students feel unsupported or misunderstood, they are less likely to contribute in class, complete assignments, or engage with learning tasks. Some students also experience repeated academic failure, which weakens their belief in their ability to succeed. In such cases, they withdraw from classroom interactions, preferring silence over engagement. Teachers may interpret this as laziness, without recognizing the deeper issues at play. Without targeted efforts to improve motivation, such as mentoring, praise, or personalized support, student participation remains low and inconsistent across subjects (Deci & Ryan, 2000).

Negative Teacher Attitudes

The attitudes of some teachers negatively affect student participation. In schools where teachers are authoritarian, dismissive, or uninterested in student input, learners often become reluctant to speak up or ask questions. Some teachers discourage participation by using harsh tones, ignoring student contributions, or punishing mistakes rather than encouraging effort. This creates a learning environment filled with fear and silence. Additionally, when teachers favor certain students or offer limited feedback, others may feel excluded or unvalued. Teacher behaviors have a strong influence on classroom dynamics, and when learners sense that their voices do not matter, they become disengaged. A participatory culture requires teachers who are patient, responsive, and inclusive in their interactions with all students (Ofoegbu, 2004).

STRATEGIES TO ENHANCE STUDENT ENGAGEMENT

Use of Learner-Centered Teaching Methods

A key strategy for enhancing student engagement is the adoption of learner-centered teaching approaches. This method places the student at the heart of the learning process, allowing them to contribute actively rather than absorb information passively. Activities such as group work, role-playing, debates, peer teaching, and project-based assignments encourage students to collaborate, question, and explore ideas from different angles. These strategies allow students to apply concepts rather than merely recall them, promoting deeper understanding. Moreover, learner-centered methods give students more control over how they approach learning tasks, which strengthens their sense of responsibility and interest. When learners are part of the instructional process, they are more motivated to participate, leading to improved engagement and academic performance. Teachers who implement such strategies often report higher levels of classroom involvement and reduced behavioral disruptions (Hmelo-Silver, 2004).

Provision of Adequate Instructional Resources

The availability of appropriate instructional materials is necessary for sustaining student engagement. These resources include textbooks, visual aids, science kits, maps, audio-visual equipment, and digital tools. When students have access to functional learning materials, they are more likely to be active participants in classroom tasks. Practical tools support exploration, experimentation, and application of knowledge, especially in subjects like science, geography, and ICT. Additionally, instructional resources make abstract concepts more concrete and easier to grasp. The presence of adequate materials enables teachers to implement activity-based strategies that require learner interaction. Without such materials, classroom teaching becomes monotonous and teacher-centered, reducing participation. Investing in updated, accessible learning tools not only supports understanding but also makes lessons more interactive and enjoyable for learners (Onasanya et al., 2008).

Encouraging Positive Teacher-Student Relationships

Fostering a positive teacher-student relationship plays an important role in increasing engagement. When teachers demonstrate patience, approachability, and fairness, students feel more secure in contributing during lessons. A supportive classroom environment allows learners to ask questions, seek clarification, and express their views without fear of embarrassment. Positive relationships also build trust, which encourages students to take academic risks and explore unfamiliar ideas. Teachers who recognize and affirm student efforts help create a sense of belonging that motivates learners to participate. Furthermore, respectful interaction reduces classroom tension and makes students more responsive. A teacher who listens, provides constructive feedback, and shows genuine interest in student progress is more likely to build a participatory classroom culture (Wentzel, 2002).

Motivation through Recognition and Reward Systems

Recognizing student efforts and achievements can significantly increase engagement. Rewards, whether verbal praise, certificates, or small incentives, reinforce positive behaviors and participation. When students see that their efforts are acknowledged, they are encouraged to remain committed to learning. Recognition helps build confidence, especially for students who may struggle academically. It also promotes a healthy competitive spirit, where learners aim to contribute meaningfully during class activities. Teachers can use recognition in various ways, including celebrating improvement, attendance, punctuality, or creativity. These practices foster a sense of achievement and encourage sustained participation. In classrooms where recognition is part of the learning process, students are more likely to take initiative and engage with enthusiasm.

CONCLUSION

School culture plays a vital role in shaping how students engage with learning in schools. A well-established culture grounded in shared values, mutual respect, and academic focus creates a learning environment where students feel motivated, supported, and involved. Moreover, student engagement is strengthened when the school promotes behavioral, emotional, and cognitive connections to learning through clear expectations and consistent support. Furthermore, the influence of school leadership cannot be overlooked, as it determines how policies, teaching practices, and student interactions are structured within the school setting. In addition, fostering student engagement requires the active involvement of all stakeholders including teachers, parents, administrators, and policymakers who must work collectively to sustain a culture that promotes continuous learning and participation. Therefore, cultivating a positive school culture is not only essential for improving student engagement but also for achieving broader educational goals in public secondary schools.

Suggestions

Based on the literature reviewed, the following suggestions were made:

- School Administrators should ensure the creation of a supportive school culture that values academic excellence, respect, and collaboration. This can be done by setting clear expectations for behavior, encouraging inclusivity, and fostering a positive learning environment.
- School Administrators should develop professional development programs for teachers to improve instructional strategies, focusing on enhancing student engagement through active learning methods.
- Teachers should adopt student-centered teaching methods that actively involve students in the learning process. Techniques like cooperative learning, inquiry-based learning, and project-based learning should be employed to boost engagement.
- Policymakers should **e**nsure that educational policies prioritize creating an inclusive, engaging, and safe learning environment. This can include promoting equitable access to resources and addressing barriers to student engagement such as overcrowded classrooms or lack of technological resources.

- Community Leaders and Organizations should partner with schools to create mentorship programs, after-school clubs, and community-based initiatives that engage students beyond the classroom, helping them develop social, academic, and leadership skills.

ABSTRACT

The study investigated implementing 21st century classroom management strategies to enhance instructional quality in public senior secondary schools in Rivers State, Nigeria. The study adopted the descriptive survey design. The study had four research questions with four corresponding null hypotheses. The population of the study was all the 5,833 teachers of the 333 public senior secondary schools in Rivers State. The sample of the study was 300 teachers comprising of 180 male teachers 120 female teachers. Stratified and simple random sampling techniques were employed to select the respondents. The instrument for data collection was a questionnaire constructed by the researcher and titled: Modern Classroom Management Strategies for Quality Instructional Delivery Questionnaire (MCMSQIDQ). The reliability coefficient of the instrument was .89, determined using Pearson's Product Moment Correlation statistics. The research questions were answered using mean and standard deviation statistics while the null hypotheses were tested using independent t-test. Statistical Package for Social Sciences (SPSS) version 25 was used for the analysis. The study found how 21st century classroom management strategies such as student-centred approach, technology integration, active learning, and collaborative learning practices. It was further found that there was no significant difference in the mean ratings of male and female teachers on how the various 21st century classroom management practices cab be implemented for quality instructional delivery in public senior secondary schools in Rivers State. The study recommended among others that teachers should make a total paradigm shift from traditional ways of managing classrooms to innovative and more contemporary ways to boost the effectiveness of the instructional delivery processes of their schools.

Keywords: Innovation, Classroom Management, Technology Integration, Student-Centred Instruction, Instructional Goal.

INTRODUCTION

Classroom management is arguably one of the most frequently discussed subject matters in school administration literatures. This is probably because the classroom comes through as the most important unit of the school system, given the fact that it is in the classroom that the most important business of the school, which is teaching and learning (otherwise referred to as instructional delivery) takes place. It is in the classroom that teachers and students, who are the two most critical stakeholders of the school system, meet and interact to achieve the goals and objectives of education at any given level of education in the country. Classroom management, which refers to the process whereby teachers employ strategies, techniques, and systems to create and maintain a productive, respectful, and safe learning environment for the attainment instructional goals, therefore becomes a major concern of critical stakeholders of public senior secondary schools in Rivers State, even as it is the soul of effective teaching and learning at this level of education in the state.

Importantly, the effectiveness of the instructional delivery process is measured by, among other indices, the extent to which the process responds to and meets students' learning needs (Eze, 2017; Ibara, 2015). The learning needs are often captured in the instructional curriculum. The curriculum itself, which is a blueprint of the learning experiences that are expected to be transferred from teachers to learners, is continually being reformed or amended to meet the ever-changing needs of the society. Hence, the need for continuous innovation in the implementation process of the curriculum. This therefore warrants continuous innovation in classroom management practices, too. As such, the study seeks to explore innovative practices in classroom management for quality instructional delivery in public senior secondary schools in Rivers State.

In recent times, the outcomes of the instructional delivery processes of public senior secondary schools in Rivers State have raised serious concerns among stakeholders regarding the effectiveness and quality of what is going on in the classrooms of these schools. Shadows of doubts are being cast on the appropriateness of the classroom management practices that are being adopted by the teachers, especially as the outcomes of the instructional process do not suggest that teachers have been able to be creative and innovative enough in the management of their classrooms to respond to the changing needs of learners warranted by changes brought about by the 21st century to the society and to the school system which is a miniature society.

While there had been various classroom management practices in times past, such as the use of disciplinary measures, instructional supervision, supportive feedback, delegation of responsibilities, seating arrangement, among others (Nwankwoala, 2021), these practices appear to have lost their efficacy in supporting students' learning, especially with the societal changes that hallmark the 21st century. The society is now more democratic than it used to be. Students' rights are now being emphasized more than ever before, and teaching and learning is now student-centred. Technology has become the order of the day. Teachers are now more of instructional facilities in the classroom unlike before when the entire instructional process appeared to revolve around them (Ololube et al., 2013). As such, pragmatic classroom management can only be ensured through total paradigm shift from the traditional methods of managing classrooms to more innovative practices befitting of a 21st Century learning place. It is against this background that the study sought to explore the employment of innovative practices in managing classrooms for effective teaching and learning in public senior secondary schools in Rivers State.

Statement of the Problem

Instructional delivery, which encompasses all teaching and learning processes and activities that happen in the classroom can hardly be said to have been effective in public senior secondary schools in Rivers State as evidenced by high level of abysmal performance of students in both internal and external summative assessments. Stakeholders from some quotas suspect that the cause of this unwholesome development is likely to be connected with the observation that teachers in these schools are still adopting traditional and obsolete methods of classroom management in a 21st century where various technologically driven and learner-centred instructions have become best practices. The need for paradigm shift in classroom management practices has therefore become one of the most frequent themes in literatures on 21st century instructional delivery, with practices such as student-centred classroom management, technology integration, active learning, collaborative learning and positive reinforcement apparently becoming the most frequently highlighted perceived effective classroom management practices that could yield desired instructional outcomes. Hence, the motivation for meticulous examination of how these practices could bring about quality instructional delivery in public senior secondary schools in Rivers State.

Aim and Objectives of the Study

The aim of the study was to explore innovative practices in classroom management for quality instructional delivery in public senior secondary schools in Rivers State. Specifically, the study sought to:

- Determine how student-centred classroom management can be implemented as a 21st century classroom management practice for quality instructional delivery in public senior secondary schools in Rivers State;
- Investigate how technology integration can be implemented as a 21st century classroom management practice for quality instructional delivery in public senior secondary schools in Rivers State;
- Examine how active learning can be implemented as a 21st century classroom management practice can be implemented for quality instructional delivery in public senior secondary schools in Rivers State;
- Assess how collaborative learning can be implemented as a 21st century classroom management practice for quality instructional delivery in public senior secondary schools in Rivers State.

Research Questions

The study was guided by the following five research questions:

- How can student-centred classroom management be implemented as a 21st century classroom management practice for quality instructional delivery in public senior secondary schools in Rivers State?

- How can technology integration be implemented as a 21st century classroom management practice for quality instructional delivery in public senior secondary schools in Rivers State?
- How can active learning be implemented as a 21st century classroom management practice for quality instructional delivery in public senior secondary schools in Rivers State?
- How can collaborative learning be implemented as a 21st century classroom management practice for quality instructional delivery in public senior secondary schools in Rivers State.

Hypotheses

The following null hypotheses were raised and tested at a significance level of 0.05 to guide the study:

- H_{01}: There is no significant difference in the mean ratings of male and female teachers on how student-centred classroom management can be implemented as a 21st century classroom management practice for quality instructional delivery in public senior secondary schools in Rivers State.
- H_{02}: There is no significant difference in the mean ratings of male and female teachers on how technology integration can be implemented as a 21st century classroom management practice for quality instructional delivery in public senior secondary schools in Rivers State.
- H_{03}: There is no significant difference in the mean ratings of male and female teachers on how active learning can be implemented as a 21st century classroom management practice for quality instructional delivery in public senior secondary schools in Rivers State.
- H_{04}: There is no significant difference in the mean ratings of male and female teachers on how collaborative learning can be implemented as a 21st century classroom management practice for quality instructional delivery in public senior secondary schools in Rivers State.

Significant of the Study

The findings of the study would be of immense usefulness to critical stakeholders of public senior secondary schools in Rivers State, which include teachers, school administrators and policy makers, parents, students, and future researchers in similar areas of concern. Teachers may benefit from the study as the findings of the study would furnish them with relevant information on modern best practices in classroom management and inundate them with what it takes to be efficient in the adoption and implementation of such best practices. School administrators and policy makers may benefit from the study as the findings of the study will inform them of the 21st century needs of teachers, such that they would be able to know which training and development programs to organize for teachers in other to equip them with relevant skills for efficiency in a 21st century learning place. Parents may profit from the study as it will inform them of the changes in the modern school system and help them know how they might best support their children and schools with the provision of relevant instructional resources for 21st century education. As for researchers in the field of educational management, the study will

be useful as its findings will serve as a veritable source of secondary data for future studies in related research areas.

THEORETICAL FRAMEWORK

This study is anchored in the self-determination theory propounded by Richard Ryan and Edward Deci in the 1980s as cited in Nishimura and Joshi (2021). The self-determination theory (SDT) postulates that, it is human nature to be active and curious, to want to acquire new knowledge and skills, and to connect with others if and only if they are in a supportive environment. In other words, when humans (students in this regard) find themselves in a supportive learning environment, they naturally become active and curious in a bid to acquire new knowledge, develop strategies to do so, and to connect with others (socialize with other members of the school community like fellow students and teachers).

The self-determination theory is a theory that focuses on humans' intrinsic (inner or internal, self-driven) motivations to learn and develop themselves, and the theory seeks a way to support them to be more motivated and achieve better outcomes and well-being. The key feature of SDT is a sequence of events starting with support for students' autonomy and proceeding to final outcomes via the satisfaction of students' basic needs, and motivation internalization (Nishimura & Joshi, 2021). Three sequential events can be identified in this theory: (1) autonomy support from teachers or parents satisfies the basic psychological needs of a student; (2) basic psychological needs satisfaction contributes to an increase in the student's perceived competence and the internalization of the student's motivation; and (3) internalized motivation results in higher academic achievement (Nishimura & Joshi, 2021).

The self-determination theory is relevant to this study as it highlights the three core factors upon which students' learning motivation in the classroom depends: autonomy, competence, and relatedness. Satisfying students' needs along this line of motivation is what 21st century classroom management is all about. That is the doctrine of student-centredness. The theory emphasizes the fact that when the school environment, and especially the classroom is made conducive and supportive of students learning through modern classroom management strategies, students become motivated towards learning and seek to connect with members of the classroom in the teaching-learning process. The theory thus highlights the need for teachers and parents to support students' autonomy or freedom to learn in the way that is most convenient for them or to have a sense of control over their own learning strategies, provide resources that meet their basic learning needs so that they are able to feel effective in achieving desired learning outcomes, and to create a socially positive climate where students feel connected and valued by others. In so doing, teachers and school administrators may be able to create learning environments that promote intrinsic motivation, engagement, and students' well-being, which are crucial for effective attainment of education goals in the school.

CONCEPTUAL REVIEW

Classroom Management

Classroom management refers to the orderly and professional arrangement and coordination of classroom activities in order to provide an environment conducive for teaching and learning (Owan cited in Nwankwoala, 2021). It is the application of the principles of management, which

include planning, organizing, directing, coordinating, and controlling (Ogwunte et al., 2022; Peretomode, 2013) to the business of the classroom. Classroom in this regard refers to the venue of instructional delivery where teachers meet and interact with learners for the purpose of impacting knowledge. Nwankwoala (2018) described the classroom as the physical venue purposefully designed for the interaction of teachers, learners, and a curriculum; the curriculum being a body of knowledge of instructional experiences that are to be passed from the teacher and instructional materials to the learners (Abdullahi, 2022; Adio et al., 2021; Alsubaie, 2016). Ahmad et al. (2017) opined that classroom management procedures assume an indispensable part in upgrading learners' learning. Again, Nwankwoala (2018) defined classroom management as all the efforts the classroom teacher puts using the available human and material resources in the classroom to achieve set educational objectives and goals. These set objectives and goals become what are translated into the learning experiences contained in the curriculum to be delivered in the classroom.

Classroom management is a significant part of effective teaching and learning process. Due to an effective classroom management, students flourish in a positive class climate and a compassionate environment. From a students' perspective, effective classroom management provides them the opportunities to socialize themselves while learning. From a teacher's perspective, effective classroom management involves precautionary discipline and fruitful teaching. Furthermore, classroom management is the process of organizing and conducting the business of the classroom.

21st Century Classroom Management Practices

Traditionally, classroom management was perceived as the preservation of order through teacher control (Abdulkareem, 2018; Nwankwoala, 2021; Nwankwoala, 2018; Wadi, 2018). 21st century education focus as however altered this perspective. In the context of 21st century learning, classroom management now involves the establishment and maintenance of the classroom environment so that educational goals can be accomplished (Savage & Savage cited in Tahir et al., 2019). As such, several contemporary and innovative practice have been proposed in literature, some of which include: student-centred learning approach, integration of technology into the instructional delivery process, empathetic leadership, active learning, collaborative learning, use of positive reinforcement, gamification, among others (Ololube et al., 2013; Gacheri, 2019; Kizlik, 2019; Mayeski, 2020; Nwonkwo & Chika, 2020; Tahir et al., 2019). The present study focuses on student-centred approach, technology integration, collaborative learning and positive reinforcement.

Quality Instructional Delivery

Instructional delivery is a generic term for the process of teaching and learning in the classroom. Quality instructional delivery is about effectiveness of the instructional delivery process. The process is said to be effective if it achieves its purpose. This requires that teachers are able to teach effectively and efficiently and students, too, are able to learn appropriately, culminating in improved performance of students and impressive learning outcomes. This is made possible when instructional conditions are favourable. Favourability of instructional conditions according to Nwankwoala (2018) depends on several factors among which are: the class size, availability of instructional materials, conducive learning environment, students-friendly instructional

methodology, positive classroom climate, etc. The end product of quality instructional delivery is often desirable students' outcome in the form of their academic performance in assessments.

Lumpkin (2020) averred that quality instructional delivery is achieved through five sequential steps taken by the teacher. Step one involves the teacher previewing the design of the course's disciplinary content. In step two, the teacher communicates information clearly and specifically to convince and command the listening and learning attention of students. In step three, the teacher leads interactive classes utilizing a variety of instructional approaches interspersed with engaging learning activities. In step four, the teacher reinforces and strengthens learning through the use of a variety of learning assessments. In step five, students take actions by using knowledge and skills learnt. In combination, these five sequential steps facilitate effective teaching and strengthen learning.

Influence of the Application of 21st Century Classroom Management Practices on Instructional Outcomes

The 21st century classroom management practices are essential for improving the quality of instructional delivery in secondary schools in Nigeria. These practices focus on creating a student-centered learning environment, promoting active learning, and using technology to enhance instruction. Literature has highlighted five cardinal ways the application of 21st century classroom management practices can improve the quality of teaching and learning in schools (Bayefa-Asaowei, 2024; Mogboh et al., 2022). These ways include:

- *Improved student engagement:* Making students the centre of instruction, providing them with technology resources, and supporting them all round in the instructional delivery process have a way of bringing about student engagement and motivation in learning, which is a prerequisite condition for improved instructional outcomes.
- *Enhanced instructional delivery:* The application of 21st century classroom management practices also improves the quality of the teaching and learning process. It creates a positive and collaborative learning atmosphere for teachers and students alike.
- *Better classroom management:* Application of 21st century classroom management practices beings about improved classroom management and reduced disruptions.
- *Increased student achievement:* This is as a matter of fact the most important goal of 21st century classroom management practice application. The school system exists to the purpose of the students, and students' performance is rightly used to judge the performance of teachers and administrators. The right application of 21st century management practices would bring about increased student achievement and academic performance.
- *Preparation for the Future:* The application of 21st century classroom management practices also prepares students for success beyond the walls of the classroom and he school system. It prepares students for success in the 21st century.

Application of Student-Centred Classroom Management Practice for Quality Instructional Delivery

Student-centred approach of classroom management is an innovative classroom management practice of empowering students to take ownership of their learning. This approach takes the focus away from the teacher and places it on learners, knowing that the learners are the reason for which the school exists in the first place. The needs, interest and experiences of students are prioritized. Active learning, where students take ownership of their own learning process, and the teacher acts as a facilitator or coach is the main tenet. It is unlike the lecture teaching method (teacher-centred approach) which has been found to have negative impact on subject teaching and learning (Fufa, 2023; Luka, 2018), and consistently makes students passive rather than active learners, decreases interest and does not promote insightful learning and long-term retention (Ezurike et al.,2020).

Dipu (2020) describes student centred Students-Centred Pedagogy (SCP) as a student-centred approach that provides students with personalised pedagogical methods and an appropriate learning environment, allowing students to become self-directed learners (Dipu, 2020). SCP has been extolled as a gold standard or best practise in educational discourse worldwide (Bremner et al., 2023). The key principles of student-centred classroom management approach include:

- Student autonomy: This involves encouraging students to take responsibility for their learning.
- Active learning: This is about engaging students in hands-on, minds-on activities.
- Personalized learning: The teacher tailors instruction to meet individual students' needs.
- Inquiry-based learning: This involves encouraging students to explore and investigate questions and topics.
- Collaborative learning: This involves fostering student-student and student-teacher collaboration.
- Flexible pacing: This is about allowing students to work at their own pace.
- Real-world connections: By this approach, learning is related to real-life scenarios and applications.
- Ongoing feedback: This involves providing continuous feedback to guide student progress.

Student-centred teaching aims to develop: critical thinking and problem-solving skills; creativity and innovation; communication and collaboration skills; self-directed learning and time management skills; and deeper understanding and retention of content (Fufa et al., 2023).

Application of Technology Integration Classroom Management Practice for Quality Instructional Delivery

Technology integration as a classroom management practice is about the digitalization of the classroom and the use of the digital resources to foster student engagement and for instructional delivery purposes. Petrovic (2021) asserted that “digital classroom encompasses digital devices and websites ensconced in a learning environment”. The idea is to equip classrooms with computers, laptops, overhead projectors, interactive whiteboards and other digital devices which capture and engage students’ attention and participation in the instructional delivery process, and enhance teachers’ classroom management efficiency and the productivity of the teaching and learning processes that take place in the classroom.

Ntuli and Kyei-Blankson (2013) referred to technology integration as the use of various digital and hardware tools to facilitate the process of teaching and learning in and outside the classroom. Dockstader cited in Anyanwu et al. (2022) believed that technology integration is about using computers effectively and efficiently in the general content areas to allow students to learn how to apply computer skills in meaningful ways. Similarly, Kafyulilo (2015) maintained that technology integration is using software supported by the business world for real-world applications, so students learn to use computers flexibly, purposefully, and creatively. Belland (2019) believed that technology integration means using technology to make learning more efficient or effective as well as the use of technology to help students solve problems.

The fact that senior secondary school students rightly fall within the age bracket of digital natives makes the integration of technology into classroom processes a veritable approach to classroom management. Hardly is there any instructional aid that catches and engages students' attention and gives them the opportunity to interact, participate and engage with classmates and teachers as much as computers and their accessories do. Teachers, too, are able to carry out lesson planning, teach, assess students, provide feedback and develop their instructional delivery practices through instructional technologies. Hence, the integration of digital technology into instructional delivery processes in the classroom promises to be an effective innovative classroom management practice for quality education delivery in secondary education in Nigeria.

Application of Active Learning Classroom Management Practice for Quality Instructional Delivery

Active learning is a participatory instructional approach that combines both theory and practice, ensuring that the students are actively involved in the knowledge management process in the classroom. According to Mohammed and Al-hassan (2023, p.1), it is a pedagogical method that concentrates not only on what learners are learning, but also on how they learn. Studies has shown that the transmission of understanding is not achievable by simply telling students what they need to know (Araujo & Slomski, 2015). As a matter of fact, classroom management objectives, such as control, coordination, effective learning and others, are best achieved when students are made to actively get involved in the activities happening in the class. Thus, in an active learning environment, instead of passively receiving information from the teacher, students are empowered to build in-depth understanding and knowledge in response to chances provided to them (Araujo & Slomski, 2015; Cambridge Assessment cited in Mohammed & Al-hassan, 2023). Active learning requires that students must talk, collaborate, write, reflect, present, problem-solve, and transfer new information (Mohammed & Al-hassan, 2023).

Active learning concept originates from the theory of constructivism, which emphasizes that students build their own knowledge and understanding via social interaction and by connecting new notions and experiences to finding knowledge (Bransford et al. cited in Mohammed & Al-hassan, 2023). There are tons of advantages from implementing active learning strategies inside the classroom. Active learning techniques assist drive learner motivation that moderate's attention and memory consolidation (Cavenagh cited in Mohammed & Al-hassan, 2023). Active learning techniques positively contribute towards students' emotional health in many ways such as increased interest, creativity, motivation to prepare, as well as appreciation for learning (Owens et al. cited in Mohammed & Al-hassan, 2023). In addition, involving boosting skills, enhanced critical thinking competences, higher knowledge and information retention; improved interpersonal skills, implementation of knowledge to new

contexts. Active learning promotes a level of intimate understanding that empowers and encourages students. Also, active learning experiences lead to raise levels of students' growth and achievement (Carr et al., 2016).

Some manifest advantages of active learning classroom management approach were highlighted by Mohammed and Al-hassan (2023) to include: it ensures that students actively participate in the learning process in the classroom; it maximizes students' chance in discussion and participation; it creates friendly learning situation; it enhances the chance of asking rather than giving explanation; It boosts opportunities for the students talking time; it increases students' motivation through several topics which are relevant to them; fostering learners' creativity through authentic tasks; giving students more encouragement and positive feedback; promoting communicative skills and interaction through many tasks (e.g: group work, pair work, speaking, discussion activity, role play, problem solving, etc.); and enhancing critical thinking and brainstorming. These are important aims sought to be achieved through the management of classrooms. As such, the adoption of active learning classroom management practices promises to be a viable innovative classroom management practice for quality instructional delivery in secondary education in Nigeria.

Application of Collaborative Learning Classroom Management Practice for Quality Instructional Delivery

Collaborative learning is an instructional approach that involves students working together to achieve a common goal or task. By this classroom management practice, the teacher emphasizes on teamwork, communication and mutual support among students and when necessary, between students and teachers, to promote learning and understanding. In a classroom that is managed through this practice, emphasis is on collaboration than on competition. Literature (Okwelle & Owo, 2018; Sada & Adamu, 2023) identified the key characteristics of collaborative learning to include: shared goals and objectives; mutual respect and trust; open communication and feedback; active learning and empathy; shared responsibility and accountability; diverse perspectives and strengths; flexibility and adaptability; and reflective thinking and problem-solving.

Collaborative instructional delivery practice in the classroom promises a lot of benefits as a classroom management practice. Some of these benefits include: Improved academic achievement, enhanced teamwork and communication skills, increased creativity and problem-solving abilities, developed critical thinking and analytical skills, improved self-esteem and confidence, enhanced sense of community and belonging, more effective use of class time and resources, and better preparation for real-world applications and challenges, among others (Sada & Adamu, 2023; Yusuf, 2024).

The practice of collaborative instructional delivery as an innovative classroom management approach could be successfully implemented through strategies such as:

a. Group projects and presentations
b. Peer-to-peer teaching and learning
c. Brainstorming and mind mapping
d. Jigsaw learning and expert groups
e. Cooperative learning and team-building activities
f. Problem-based learning and case studies

g. Collaborative note-taking and summarizing
h. Group discussions and debates (Mbonu, 2023; Sada & Adamu, 2023; Yusuf, 2024).

By implementing collaborative learning strategies, teachers can create a supportive and inclusive learning environment that promotes student engagement, motivation, and academic success. Collaborative instructional delivery approach to classroom management thus becomes a viable innovative classroom management practice for quality instructional delivery in secondary education in Nigeria.

Barriers to the Effective Application of 21st Century Classroom Management Practices in Secondary Schools in Rivers State

Despite the advocacy for the adoption of 21st century classroom management processes in schools, public secondary schools are found to be far behind in making this paradigm shift. This is largely due to severe barriers which literature have identified and categorized under infrastructure and resource-related, teacher-related, student-related, policy and administrative, and cultural and social barriers (Eya, 2020; Mogboh et al., 2022; Obulor, 2025). These are explicitly highlighted below:

- Inadequate funding: Insufficient budget allocation for education, leading to inadequate resources and infrastructure.
- Poor state of school facilities: Dilapidated buildings, overcrowding, and lack of basic amenities hinder effective classroom management.
- Limited access to technology: Inadequate computers, internet connectivity, and digital tools restrict the adoption of 21st-century classroom management practices.
- Lack of training and professional development: Teachers may not receive adequate training on modern classroom management techniques and technologies.
- Inadequate teacher motivation: Low teacher morale, poor working conditions, and inadequate incentives can hinder the adoption of new classroom management practices.
- Resistance to change: Some teachers may resist adopting new classroom management practices due to familiarity with traditional methods.
- Large class sizes: Overcrowding can make it challenging for teachers to implement modern classroom management practices.
- Diverse learning needs: Students with varying learning abilities, styles, and needs can make it difficult for teachers to adopt a one-size-fits-all approach to classroom management.
- Socio-economic challenges: Students from disadvantaged backgrounds may face challenges that affect their behaviour and engagement in the classroom.
- Inadequate education policies: Policies may not support the adoption of modern classroom management practices or provide adequate resources for implementation.
- Bureaucratic bottlenecks: Administrative processes can slow down the adoption of new classroom management practices.
- Lack of support from school administrators: School administrators may not provide adequate support or resources for teachers to implement modern classroom management practices.

- Cultural attitudes towards education: Cultural attitudes may prioritize traditional teaching methods over modern classroom management practices.
- Societal expectations: Societal expectations may emphasize rote learning and obedience over critical thinking and creativity.
- Language barriers: Language differences between teachers and students can create communication challenges that hinder effective classroom management.

Review of Related Empirical Studies

Ahuakwo and Oko-Jaja (2023) carried out a study that investigated the effect of learner-centred instructional approach on students' Biology performance in secondary schools in Opobo/Nkoro Local Government Area in Rivers State with two specific objectives. The research design was Quasi-experimental. The population was 414 students and teachers from the four senior secondary schools in Opobo/Nkoro Local Government Area, Rivers State. The sampling technique was purposive. The sample size was 178 SS1 students in intact classes and the entire 38 biology teachers. Two research instruments were used: "Biology Achievement Test" and "Extent of Use of ASEI-PDSI instructional approach by Biology Teacher Questionnaire". The coefficient of reliability of the instruments were established using test–retest method. Pearson Product Moment Correlation was used to obtain r-values of 0.82 and 0.86 respectively. The findings of the study showed that students taught using activity based learner-centred approach achieved higher scores than those taught using lecture method. The study relates with the present study in focus but differs from it in scope and design.

Aderiye (2024) investigated active learning and students' academic performance in secondary schools in Rivers State. Four research questions were answered and four hypotheses tested in the study. Correlation design was adopted in the study. Population of the study consisted of 6,897 teachers in the public senior secondary schools in Rivers State out of which 378 teachers were sampled for the study using stratified random sampling technique. Two instruments were used for data collection, which were a questionnaire and document on subject pass rate of the teachers. Cronbach alpha was used to estimate the reliability of the questionnaire with a coefficient of 0.84. Research questions raised were answered using simple regression and multiple regression analysis while the hypotheses were tested using t-test associated with simple regression and one-way Analysis of Variance. The findings of the study indicated a moderate, high and low positive relationship of r=0.58, r-0.82 and r-0.35 between experiential learning, discussion method, role-playing on students' academic performance respectively. All of the relationships were significant at 5% significance level. The study relates with the present study in focus but differs from it in scope and in design.

Nwike (2024) examined how the use of active learning techniques effected student's academic performance and retention in Agricultural science. The study was conducted among 300 level final year students of the department of agricultural science Anambra state college of education Asugbe. The design of the study was descriptive survey design. The population of the study were mainly 24 male and 120 female students of Anambra state college of education from the department of agriculture who are 300 level final year students numbering 144. This also comprised the sample size. Three research questions and three null hypotheses were formulated for the study. A-15 item questionnaire titled effects of active learning techniques on student's academic performance in Agricultural science questionnaire was constructed by the researcher. A four-point Likert type questionnaire was constructed to elicit information on the research

topic. PPMC estimated a reliability coefficient of 0.76 for the instrument. The study discovered amongst others that the use of active learning techniques resulted in students involvement, engagement, recalling, developing interest, loving and stimulating/arousing their interest in agriculture. The study relates with the present study in focus and in design but differs from it in scope.

Jekayinfa et al. (2023) carried out a study on the effect of collaborative learning strategy (CLS) on senior secondary school students' anxiety and achievement in geometrical construction (GC) in Abuja. Three research question and three corresponding hypotheses were answered and tested respectively. It was a Quasi-experimental design of the pre-test, post-test, non-randomized and non-equivalent control group type involving one experimental and one control group. A total of 157 (71 males and 86 females) SS1 students were involved in the study, 74 (33 males and 41 females) students for the experimental group and 83 (38 males and 45 females) students for the control group. 4-stage sampling technique involving stratified, simple random sampling and intact class techniques were used to arrive at the samples. Two research instruments, Mathematics Achievement Test (MAT) and Mathematics Anxiety Questionnaire (MAQ) were employed for data collection. Descriptive statistics and percentages were used to answer the research questions while the hypotheses were tested using Analysis of Covariance (ANCOVA) at the level of 0.05 level of significance. The findings of the study revealed that students taught geometric construction using collaborative learning strategy had lower anxiety and higher achievement. There was significant difference between anxiety means score, achievement mean score of those taught using collaborative learning strategy and those taught without this strategy. The study relates with the present study in focus but differs from it in scope and design.

METHODOLOGY

The study adopted the descriptive survey research design. The population of the study was the 5,833 teachers of the 333 public senior secondary schools in Rivers State, made up of 3,490 male teachers and 3,403 female teachers. A sample size of 300 (comprising 180 male teachers and 120 female teachers) was used for the data analysis. This sample was selected using stratified and simple random sampling techniques. The instrument for data collection was a structured questionnaire constructed by the researcher and titled: "Modern Classroom Management Strategies for Quality Instructional Delivery Questionnaire (MCMSQIDQ). The instrument was validated by two lecturers of the department of Educational Management in Ignatius Ajuru University of Education, Port Harcourt. The reliability index of the instrument was determined using Pearson's Product Moment Correlation statistics on test-retest data obtained from a pilot study of 20 teachers from the study population who were not part of the main study. The analysis gave a reliability coefficient of .89. The response pattern of the instrument was the modified 4 points form of Likert scale rated as: Strongly Agree (SA = 4), Agree (A = 3), Disagree (D = 2), and Strongly Disagree (SD = 1). The research questions were answered using descriptive statistics of mean and standard deviation whereas the hypotheses were inferentially tested using independent samples t-test at a significance level of .05.

RESULTS

Research Question 1: How can student-centred classroom management be implemented as a 21st century classroom management practice for quality instructional delivery in public senior secondary schools in Rivers State?

Table 1: Mean ratings of male and female teachers on how student-centred classroom management can be implemented as a 21st Century Classroom Management Practice for Quality instructional delivery

s/n	Item variables	Male Teachers		Female Teachers		Mean set		Dec
		$\bar{X}_1$	SD_1	$\bar{X}_2$	SD_2	$\frac{\bar{X}1 + \bar{X}2}{2}$	SD	
1	By teachers promoting student autonomy by encouraging students to take responsibility for their learning.	3.54	.553	3.55	.554	3.55	.552	Agree
2	By teachers tailoring instruction to meet individual student's learning needs.	3.44	.551	3.48	.556	3.46	.553	Agree
3	By teachers allowing students to learn at their own pace.	3.48	.515	3.51	.530	3.49	.522	Agree
4	By teachers relating instruction to real life scenarios and applications.	3.54	.553	3.55	.554	3.55	.552	Agree
5	By teachers encourage students to explore and investigate questions and topics.	3.48	.515	3.51	.530	3.49	.522	Agree
	Grand Mean	**3.50**	**.537**	**3.52**	**.545**	**3.51**	**.540**	**Agree**

H_{01}: There is no significant difference in the mean ratings of male and female teachers on how student-centred classroom management can be implemented as a 21st century classroom management practice for quality instructional delivery in public senior secondary schools in Rivers State.

Table 2: T-test of significant difference in the mean ratings of male and female teachers on how student-centred classroom management can be implemented practised for quality instructional delivery

Respondent's Portfolio	N	Mean	SD	T	DF	Sig.	Decision
Male Teachers	180	3.50	.421	-.385	298	.701	H_1 Upheld
Female Teachers	120	3.52	.424				
Total	**300**						

Significance level of .05

Data presented in Table 1 shows that the grand mean set of the 5 examined items was 3.51±.540, which is greater than the criterion mean of 2.50. As such, majority of the respondents agreed that the items were ways student-centred classroom management could be implemented as 21st

century classroom management practices for quality instructional delivery. Table 2 data further revealed that there was no significant difference in the mean ratings of male and female teachers in that regard [t(298) =-.385, p=.701>.05]. The p value being greater than the significance value of .05 implies that H_{01} was upheld.

Research Question 2: How can technology integration be implemented as a 21st century classroom management practice for quality instructional delivery in public senior secondary schools in Rivers State?

Table 3: Mean ratings of male and female teachers on how technology integration can be implemented as a 21st century classroom management for quality instructional delivery

s/n	Item variables	Male Teachers		Female Teachers		Mean Set		Dec
		$\bar{X}_1$	SD_1	$\bar{X}_2$	SD_2	$\overline{\bar{X}\bar{X}}$	SD	
6	Providing computers and laptops in classrooms for students learning and engagement.	3.53	.541	3.55	.541	3.54	.541	Agree
7	Equipping classrooms with overhead projectors to engage students' attention during instruction.	2.50	.529	2.49	.529	2.50	.528	Agree
8	Providing access to internet facilities in classroom to help teachers and students access online information,	2.79	.444	2.79	.445	2.71	.444	Agree
9	Providing interactive whiteboards in classrooms to increase visibility of what the teacher is teaching.	2.50	.554	2.51	.556	2.50	.554	Agree
10	Digitalizing classrooms to give students a 21st century access to instruction.	3.05	.638	3.03	.611	3.04	.624	Agree
	Grand Mean	**2.87**	**.543**	**2.87**	**.536**	**2.86**	**.537**	**Agree**

H_{02}: There is no significant difference in the mean ratings of male and female teachers on how technology integration can be implemented as a 21st century classroom management practice for quality instructional delivery in public senior secondary schools in Rivers State.

Table 4: T-test of significant difference in the mean ratings of male and female teachers on how technology integration can be implemented as 21st century classroom management practice for quality instructional delivery

Gender	N	Mean	SD	t	DF	Sig.	Implication
Male Teachers	180	2.872	.256	.010	298	.992	H_{02} Upheld
Female Teachers	120	2.871	.240				
Total	**300**						

Significance level of .05

The data in Table 3 reveals that the grand mean rating of the examined items was 2.86±.537. Since this value is greater than the criterion mean of 2.50, it means majority of the respondents agreed that the items were ways technology integration could be implemented as 21st century classroom management practice for quality instructional delivery. Table 4 further revealed that

there was no significant difference in mean ratings of male and female teachers in that regard [t(298) =.010, p=.992>.05]. Since p is greater than the significance level value, H_{02} was upheld.

Research Question 3: How can active learning be implemented as a 21st century classroom management practice for quality instructional delivery in public senior secondary schools in Rivers State?

Table 5: Mean ratings of male and female teachers on how active learning can be adopted as an innovative practice in classroom management for quality instructional delivery

s/n	Item variables	Male Teachers		Female Teachers		Mean set		Dec
		$\overline{X}_1$	SD_1	$\overline{X}_2$	SD_2	$\overline{XX}$	SD	
11	Teacher ensures that all students actively participate in the instructional delivery process.	3.54	.553	3.55	.554	3.55	.552	Agree
12	Teacher makes the instruction to be practical-oriented.	3.44	.551	3.48	.556	3.46	.553	Agree
13	Students are made to create and communicate solutions to problems.	3.48	.515	3.51	.530	3.49	.522	Agree
14	Students are made to collaborate to produce knowledge.	3.54	.553	3.55	.554	3.55	.552	Agree
15	Students are made to learn through experience and this internalizes the knowledge gained.	3.48	.515	3.51	.530	3.49	.522	Agree
	Grand Mean	**3.50**	**.537**	**3.52**	**.545**	**3.51**	**.540**	**Agree**

H_{03}: There is no significant difference in the mean ratings of male and female teachers on how active learning can be implemented as a 21st century classroom management practice for quality instructional delivery in public senior secondary schools in Rivers State.

Table 6: T-test of significant difference in the mean ratings of male and female teachers on how active learning can be implemented as 21st century classroom management practice for quality instructional delivery

Respondent's Portfolio	N	Mean	SD	t	DF	Sig.	Decision
Male Teachers	180	3.50	.421	-.385	298	.701	H_{03} Upheld
Female Teachers	120	3.52	.424				
Total	**300**						

Significance level of .05

The data in Table 5 revealed that the grand mean set of the five examine items was 3.51±.540. Since this value is greater than the criterion mean, it implies that majority of the respondents agreed to the items as ways active learning can be adopted as an innovative practice in classroom management for quality instructional delivery in public senior secondary schools in Rivers State. Table 6 further revealed there was no significant difference in the mean ratings of male and female teachers in that respect, with the null hypotheses being upheld [t(298)=-.385, p=.701>.05].

Research Question 4: How can collaborative learning be implemented as a 21st century classroom management practice for quality instructional delivery in public senior secondary schools in Rivers State.

Table 7: Mean ratings of male and female teachers on how collaborative learning can be implemented as a 21st Century Classroom Management Practice for Quality instructional delivery

s/n	Item variables	Male Teachers		Female Teachers		Mean set		Dec
		$\bar{X}_1$	SD_1	$\bar{X}_2$	SD_2	$\frac{\bar{X}1 + \bar{X}2}{2}$	SD	
16	Assigning students to work in groups on projects that require collaboration for quality instructional delivery.	3.54	.553	3.55	.554	3.55	.552	Agree
17	Encouraging students to teach each other, promoting peer-to-pear learning.	3.44	.551	3.48	.556	3.46	.553	Agree
18	Using real-world problems to facilitate collaborative learning	3.48	.515	3.51	.530	3.49	.522	Agree
18	Organizing debates were students fall into groups	3.54	.553	3.55	.554	3.55	.552	Agree
20	Dividing students into small groups and assigning each group a specific task or topic to work on.	3.48	.515	3.51	.530	3.49	.522	Agree
	Grand Mean	**3.50**	**.537**	**3.52**	**.545**	**3.51**	**.540**	**Agree**

H_{04}: There is no significant difference in the mean ratings of male and female teachers on how collaborative learning can be implemented as a 21st century classroom management practice for quality instructional delivery in public senior secondary schools in Rivers State.

Table 8: T-test of significant difference in the mean ratings of male and female teachers on how collaborative learning can be implemented as 21st century classroom management practice for quality instructional delivery

Respondent's Portfolio	N	Mean	SD.	t	DF	Sig.	Decision
Male Teachers	180	3.50	.421				
				-.185	298	.801	H_4 Upheld
Female Teachers	120	3.52	.424				
Total	**300**						

Significance level of .05

Data presented in Table 7 shows that the grand mean set of the 5 examined items was 3.51±.540, which is greater than the criterion mean of 2.50. As such, majority of the respondents agreed that the items were ways collaborative learning could be implemented as 21st century classroom management practices for quality instructional delivery. Table 8 data further revealed that there was no significant difference in the mean ratings of male and female teachers in that regard [t(298) =-.185, p=.801>.05]. The p value being greater than the significance value of .05 implies that H_{04} was upheld.

DISCUSSION OF FINDINGS

Implementation of Student-Centred Classroom Management as a 21st Century Classroom Management Practice for Quality instructional delivery

The study in this regard found that student-centred classroom management innovation could be implemented through: promoting student autonomy by encouraging students to take responsibility of their learning; tailoring learning to meet individual student's learning need; allowing students to learn at their own pace; relating instruction to real life scenarios and applications and encouraging students to investigate questions and topics. Additionally, it was found that no significant difference existed in the two groups of respondents' opinions in this regard. These findings are in agreement with Fufa et al. (2023) who posited that student-centred classroom approach aims to help students to develop: critical thinking and problem-solving skills; creativity and innovation; communication and collaboration skills; self-directed learning and time management skills; and deeper understanding and retention of content. As such, student-centred classroom management would involve the practices of active learning, student autonomy, personalized learning, inquiry-based learning, collaborative learning, flexible pacing and real world connections (Mohammed & Al-hassan, 2023).

Implementation of Technology Integration as a 21st Century Classroom Management Practice for Quality instructional delivery

The study in this regard found that the practice of technology integration for classroom management could be carried out through: provision of computers and laptops for students' learning in the classroom, provision of overhead projectors for teaching, provision of internet facilities in the classroom, provision of interactive whiteboards for teaching and learning, and full digitalization of the classroom. It was further revealed that the two groups of respondents did not significantly differ in their opinions in this respect.

These findings are in line with the position of McDonald and Battaglia (2015) who averred that the extent of digitalization of instructional delivery processes in schools is now one of the key indices of the quality of education delivered in that school system, and technology-assisted instruction has become the new normal for quality teaching and quality learning. Dibie (2024) also advanced the idea of digital classrooms, which are classrooms fortified with ICT gadgets such as computers, Internet connectivity, projectors, smart boards, educational soft wares, CR-ROMs, Internet data, digital Apps and tools and all necessary electronic devices that are required for the interconnection and interaction of the digital devices and the human elements of the classroom. The advantages of technology integration, which include student engagement, active learning, collaborative learning, enhanced instructional efficiency and effectiveness, reduced workload and effective management of the classroom for teachers, among others, have also been highly eulogized in literature (Ibrahim et al., 2020; Oso, 2022). As such, technology integration is considered a veritable innovative practice in classroom management for quality instructional delivery in public senior secondary schools in Rivers State.

Implementation of Active Learning as a 21st Century Classroom Management Practice for Quality instructional delivery

The study in this regard found that active learning could be innovatively used by teachers to effectively manage classrooms through: ensuring that all students actively participate in the instructional delivery process; making the instruction to be practical-oriented; making students to create and communicate solutions to problems; making students to collaborate to produce knowledge; and ensuring that students learn through experience to internalize the knowledge gained in the learning process. It was further revealed that the two groups of respondents in the study were unanimous in their opinions in this regard.

These findings agree with Mohammed and Al-hassan (2023) who averred that active learning as an instructional strategy in the classroom involves teachers making students to talk, collaborate, write, reflect, present, problem-solve, and communicate new information. According to them, this keeps students busy on instruction and creates a climate of academic positivity within the classroom which repels distraction and deviation from instructional objectives. In the same vein, the findings are in accord with the position of Bransford et al. cited in Mohammed & Al-hassan (2023) that active learning places emphasis on students building their own knowledge and understanding via social interaction and by connecting new notions and experiences to finding knowledge. Employment of active learning techniques thus proves to be a viable innovative practice in classroom management for quality instructional delivery in public senior secondary schools in Rivers State.

Implementation of Collaborative Learning as a 21st Century Classroom Management Practice for Quality instructional delivery

The results of the study in this regard revealed that collaborative learning could be implemented as a 21st century classroom management practice through: assigning students to work in groups on projects that require collaboration for quality instructional delivery; encouraging students to teach each other, promoting peer-to-pear learning; using real-world problems to facilitate collaborative learning; organizing debates were students fall into groups; and by Dividing students into small groups and assigning each group a specific task or topic to work on. The study further revealed that the male and female teachers did not differ significantly in their opinions on the how collaborative learning could be implement as a 21st century classroom management practice for quality instructional delivery.

The findings of the study in this regard agree with researchers and authors (Okwelle & Owo, 2018; Sada & Adamu, 2023) who identified the key characteristics of collaborative learning to include, shared goals and objectives, mutual respect and trust, open communication and feedback, active learning and empathy, shared responsibility and accountability, diverse perspectives and strengths, flexibility and adaptability, and reflective thinking and problem-solving. All of these are able to happen when students work together in groups. Hence, collaborative learning is a veritable classroom management practice that ensures quality instructional delivery in a 21st century learning place.

CONCLUSION

Effective management of the classroom is central to the attainment of set goals of teaching and learning in public senior secondary schools in Rivers State. Teachers as classroom managers are expected to be creative and innovative in coming up with contemporary best practices in

classroom management in response to the ever-dynamic nature of the needs of learners for quality assurance in students' learning outcomes. This necessitates a total paradigm shift from the traditional approach of classroom management to 21st century practices that guarantee continuous improvement of the instructional delivery process. In this regard, practices such as student-centred classroom management approach, technology integration with instructional processes, active learning approach, and collaborative learning approach were explored in this study and were found to be highly promising in bringing about improvement in instructional outcomes if appropriately adopted. The perceived ways of adopting these practices to guaranty optimal outcomes have thus been examined and established in the study.

Recommendations

Based in the findings of the study, the following recommendations were made:

- Principals of public senior secondary schools in Rivers State should encourage teachers to be proactively innovative in responding to students' learning needs in the classroom rather than always going by conventional classroom management approaches which add no or too little value to instructional outcomes.
- Teachers should normalize centring the instructional delivery process on students rather than on themselves to be able to continually achieve the goal of improving students' learning outcomes.
- The government should equip public senior secondary schools with ICT devices such as computers and other digital resources to foster students' engagement and instructional organization.
- The government and school communities should always partner to equip public senior secondary schools with relevant instructional resources to aid active, practical-based learning within and outside the classroom. Teachers should be provided with sufficient instructional materials to help them in better managing their classrooms.

ABSTRACT

The paper examined "Participative Management Strategies for Effective Administration of Secondary Schools in Rivers State, Nigeria: Conceptual Perspective". The paper argues that for principals to effectively administer secondary schools in Rivers State there is need for them to fully embrace stakeholders' participation in school administrative processes. The rationale for this position is that stakeholders possess enormous mental and physical resources which they could avail for the effective running of schools if they are given the opportunity by principals to involve in school decision-making and implementation processes. The paper went on to explore the concept of participative management, the rationale and benefits of participative management in school administration, the concept of school administration and areas where stakeholders' participation is required in secondary school administration. Special focus was then made on the participative management strategies, which included committee system, collaborative decision-making, delegation of responsibilities, stakeholder consultation, and effective communication. The paper concluded that participative management is a veritable management approach that enhances the effectiveness of secondary schools administration. The paper suggested among others that principals should make it a point of duty to encourage the participation of students, teachers, parents, community leaders and agencies in the administration of their schools as each and every group of stakeholders has potentials to contribute to enhanced effectiveness of school administration.

Keywords: Participative Management, Principals, Secondary School, Administration, Committee System, Collaborative Decision-Making, Delegation of Responsibilities, Stakeholder Consultation.

INTRODUCTION

Secondary schools in Rivers State are blessed with enormous human resources in the persons of teachers and the non-teaching staff, parents and guardians of students, alumni, community leaders, capable and well-to-do lovers of education within the state and both government and non-government agencies whose potentials if fully optimized by school principals are capable of pitching these schools at enviable heights with regards to goals attainment. These stakeholders possess experiences, expertise, skills, knowledge and material and financial resources which can be exploited by school Principals for effective management of secondary schools in Rivers State. The optimization of these stakeholders' potentials by the school Principals would however require that they are invited and motivated to become part of the school management processes. In other words, their participation in the management of the schools is crucial for the effective attainment of the goals and objectives of this level of education both at the national level as articulated by Federal Republic of Nigeria (FRN, 2014) in relevant sections of the National Policy on Education and at the school level.

However, these stakeholders are grossly under-utilized and in some cases are neither even engaged nor involved at all in the management of the schools, and this is seriously robbing secondary schools in Rivers State of helps they could have been receiving on a platter of gold. The consequence has remained the obvious non-attainment of school goals by reason of scarcity of resources, just as Omachonu (2019) rightly observed that the quality of secondary schools in Rivers State is almost nothing to write home about when compared to those of some private schools in the state which have good records of stakeholders' participation in their administrative processes.

Generally and in common knowledge, school management involves the process of planning, organizing, staffing, directing, and controlling of educational resources (both human and the non-human resources) for the effective realization of school goals and objectives, and obviously, all of these activities cannot be singlehandedly carried out by the school Principal without the involvement and participation of other stakeholders in the school system. It therefore holds true to opine that the extent to which school goals and objectives are effectively attained is a function of how well the Principal is able to engage the stakeholders and to ensure their participation in the school management. This is the focus of participative management.

Unfortunately, the reality at hand in most secondary schools in Rivers State is that majority of Principals appear to still stick to the traditional approach to management, in which the flow of authority is one-directional – flowing from the top down to the bottom. In this "out-of-fashion" management approach, the Principal sees himself as the emperor of the school system who calls the shorts and everyone else is simply supposed to assume the position of loyal subordinates whose duties are simply to answer and do the biddings of the Principal. This has not only deprived the schools management of the enormous supports they could be receiving from capable hands from outside the school, but is also internally making some staff to withhold or withdraw their very best efforts from the schools since they are apparently not appreciated by such school Principals. This situation agrees with the supposition of Denga (2015, p.85) that "healthy workers are independent thinking, and independent-thinking workers resist imposition from above. They want to face challenges and create. When they are not given a chance to participate in decision-making, they feel under-utilized and therefore decide to use only their skin-surface abilities to contribute to school growth". As such, progressive decline in quality of outputs of secondary schools in Rivers State has been the order of the day in recent years. This is

evidenced by the abysmal poor performance of students in external examinations and in visibly poor and unexcited school climates in majority of secondary schools in Rivers State. The situation therefore calls for paradigm shift in management approach from Principal-centred approach to participative management approach.

Participative management is a management style or approach that involves the engagement and active participation of all stakeholders in the decisions-making, planning and implementation process of the plans and decisions for the realization of the common goals of the organization. The stakeholders include every individual, group or party who affects or is affected by the operations of the organization. As such, participative management in the administration of secondary schools would entail the involvement of the Principal, teachings and non-teaching staff, parents and guardians of students, the students themselves, the community and every other person or entity whose interest is at stake in the school. It is a management style that is characterized by team and group work. Everybody's contribution in planning, decisions-making, goals-setting and in the implementation and realization of the set objectives of the school is fully welcomed. Denga (2015) opined that the basis of the adoption of participative management is the Principals' acknowledgement of managerial potentials in every stakeholder. As in, every stakeholder has something to offer or contribute in some way to the school's success agenda. He realizes that he cannot do it all alone, and that others in the group possess competencies which could complement his. Besides, he also acknowledges the possibility of others being more knowledgeable and more experienced than himself in some task areas in the school. This, according to Denga (2015) spurs the Principal to make a shift from autocratic/dictatorial leadership style to a democratic leadership style. Importantly, participative management believes that the opinions and efforts of more people are always superior and more rewarding than that of one person.

Through reviews of literature (Ajetunmobi et al., 2020; Ebunu, 2020) and experiential knowledge, some crucial features of participative management have been identified, which constitute the key variables of this paper. The prominent among these include committee system, collaborative or shared decisions-making, delegation of responsibilities, consultation of stakeholders, and effective communication from the Principal to the subordinates and other stakeholders involved in the school administrative process.

CONCEPTUAL CLARIFICATION

Participative Management

The advocacy for participative management approach in educational administration has become global (Benoliel & Somech, 2010; Rolkova & Fakasova, 2015). It is widely recognized as a more effective typology of educational leadership (Sagnak, 2016; Wang et al., 2022). Various authors and researchers have conceptualized it in various ways that yet share common themes. Enarebe (2019) defined participative management as the bringing together of the abilities, experiences and knowledge of two or more persons whose minds are coordinated to function as one for a common purpose. For Njogore and Kathuri (2017), participative management is a process in which there is consultation with stakeholders or subordinates and serious consideration of their opinions before reaching decisions. They saw this management style as a leadership approach that results in reduction in power differential between superiors and subordinates.

Hajzler cited in Rolkova and Fakasova (2015) associated participative management style with freedom at work and identified four characteristics of the concept. These include:

Commitment – when employees are given free hand to participate in decision-making in the organization, they tend to commit voluntarily to their tasks and are willing to negotiate about objectives and procedures of their assignments;

Mastery, autonomy and meaningfulness – these were identified as three needs that create the system. They are core variables of job enrichment (Magaji, 2015; Nzewi et al., 2017). Intrinsic motivation of employees has been found to increase the more these variables are present in the work place and the same is applicable with stakeholders;

Self-management – Employees are able to manage themselves without the manager having to be the one who necessarily does the job of managing. Teachers are able to take initiatives, coordinate themselves and the school without the Principal's askance or supervisory eyes; and

Engagement – the more the needs of mastery and autonomy are met, the more people feel involved and have a greater desire to work. Job satisfaction increases, and there is passion, creativity, freedom and independence in the workplace. Employees outrightly engage more.

Rationale for Participative Management in Public Secondary School Administration

The importance of the school in the community as an institution of socialization, social cohesion, agent of transformation and development is no longer a subject of debate. It is also a well-established fact that the school and the community are part and parcel of each other as both entities are critical stakeholders in the survival and growth of each other (Owan, 2019**)**. As such, the necessity for both the school and the community to share resources available to each other for their common interest becomes sacrosanct. It is also true that the shared interest between secondary schools and the community is not even, as the relationship between them is more like parents and children relationship, where the schools are the children (dependent ones at that). Be that as it may, authors and researchers have advanced supportive arguments on the need for stakeholders to participate in the management of public Secondary Schools (Njoroge and Kathuri, 2017; Osadolor, 2016). Some of these arguments include:

- The school community (made up of parents, teachers, NGOs, companies, business enterprises and well-meaning individuals and agencies within school localities, including students) has shown enormous concern in the development aspiration of their schools. This is self-evident in their supportive efforts such as the provision of educational resources like buildings, seats and desks, financial donations, security of the school properties, and other community resources required by school for instructional and recreational purposes.
- Many schools these days are educating the students out of content. The National Policy on Education explicitly stipulated that teaching and learning in schools (the curriculum content) should reflect the goals of local communities and the nation. However, many schools, especially the privately-owned ones still bear foreign outlook. As a matter of fact, most of them take pride in teaching with foreign curriculum. This results in

situations where students are obviously being prepared for a society which does not exist, or one which is not within their reach. The purpose of education, which is to prepare learners for survival and meaningful contribution to their immediate environment, becomes defeated. The participation of parents and other relevant stakeholders in school management thus helps to correct these educational anomalies.

- The level of crime traceable to public secondary schools is on the increase. Literature and experience show that secondary school students now get involved in capital crimes like cultism, armed robbery, drug abuse, rape, hooliganism, etc (Wali, 2021). The problem of disrespect, adolescent sexual activities, and vandalization are also rampant especially in public schools in Rivers State. All these and more are greatly threatening the quality and integrity of public secondary schools in the state and the school administration alone cannot handle the situation. As such, the participation of stakeholders in the management of secondary schools in Rivers State becomes a basic necessity for the effectiveness of these schools.
- The Nigerian National Policy on Education explicitly stated that communities should participate in school administration. This is in recognition of the fact that the government alone cannot adequately fund education at any level, and community resources would go a long way in augmenting government's efforts. There is no way the communities/stakeholders can be funding these schools and be expected to continue the funding if they are not allowed to participate in the management of the schools.
- There is consensus that proper education of students can only be achieved if the school integrates and reflects the community and community living in their instructional programs. Thompsom cited in Osadolor (2016) thus admonished that the school should not be foreign to the community, but should be an extension of it. This is perhaps why Uriah (2019) rightly described the school as a miniature society.
- When there is devolution of managerial responsibilities to stakeholders, it assists in engineering the spirit of self-reliance in the stakeholders. Teachers become more creative and more confident in their abilities. Parents' trust in the school system becomes reinforced. Other stakeholders feel recognized and appreciated and may thus commit more to the wellbeing of the school.
- There is the belief that local members of the community are in better positions to provide guide required to integrate the school with the local community than teachers who are most times not members of the immediate community. Principals in most cases are also posted to the schools from outside the community and may not be knowledgeable enough about the community. As such, if they try to run the school by themselves in alienation of stakeholders, there is always very little that may be achieved by their administration.
- The present economic downturn in the country makes it extremely difficult for schools to survive without external aids. Communities are endowed with resources which schools can tap from. It is only when the Principal adopts participative management approach that he may be able to leverage on the opportunities of alternatively funding their school and school projects through community/stakeholder assistance.
- The participation of teachers and the community in the management of schools can bring about self-awareness on the part of these stakeholders. When success is recorded on the management process, it can result in their awareness of their own capacity to make meaningful contributions in other areas of social and organizational endeavours. This can

ultimately spill over to self-motivation as one level of success becomes a springboard for higher levels of accomplishments.

Benefits of Participative Management

Different studies have suggested that participative management gives a variety of potential benefits that make it preferable as an organizational management approach to other management typologies. For example, Denga (2015) remarked that the adoption of participative management approach by an organizational leader, which features the consultation of subordinates over issues that affect the organization, brings about the strengthening of the leader's power and authority. He further went on to reiterate that a feeling of obligation to obey the commands of the constituted authority is evident where the making of decisions is a democratically shared activity.

Ayoku and Paramole (2023) in this regard remarked that the engagement of teachers in decision making engenders a positive attitude towards school work and brings about positive productive work. This position was also echoed by Ebete and Ejims (2020) who observed that teachers are more motivated to actively participate and see to the effective implementation of decisions and policies which they were involved in formulating. This was also why Kantabutra (2015) asserted that one sure way a leader or manager can make his followers to run with his vision is to make them own the vision, and one guaranteed way of realizing this is by engaging them in decision making and goal setting for such visions.

Enarebebe (2019) averred that the basic reason for the success of participative management is because the leader (the school Principal in this regard) allows all the subordinates (the stakeholders in this regard) at different levels in the organization (the school) to be involved in the decision making. He went further to outline the benefits and presented them more explicitly in the terms below:

- It increases stakeholders' satisfaction, which brings about greater commitment to the school, thereby resulting in increased efficiency and productivity. It makes them to have a sense of belonging, seeing themselves as part of the school.
- It increases the level of innovation in school administration as employees and employers are open to new ideas. Participative management results in sharing of knowledge and increase in creativity. This brings about improvement in the quality of services and products of the school.
- It increases the quality of decision making, due to the various contributions of all different stakeholders, some of them contributing from their great wealth of knowledge and expertise.
- Participative management in the school enhances the quality of teachers' work life, as teachers are bound to grow if the school administration succeeds. This also brings about teacher retention and reduces the rate of student's turnover, as parents may likely not want to change schools for their children.
- It increases stakeholders' motivation. Teachers work better in such schools knowing that their efforts are contributing to the success of the school, and in some cases getting regarded for their efforts. This also reduces teacher absenteeism and attrition.
- It increases the level of stakeholders' commitment. Teachers are happy to do their jobs. Parents may not struggle to pay students' levies because they are fully carried along in the happening in the school. They also become supportive in seeing that discipline is

upheld with their children as they are part of the decision-making process. Other stakeholders cheerfully do their bits to contribute to overall administrative effectiveness of the school.

- Timeliness: Communication between the school administrators and leaders of different teams is improved. Issues are reported and resolved in a timely manner.
- Better grievance redress: Increase and openness in the channel of communication to all stakeholders in the school system leads to fewer cases of grievances and conflicts, and where there is an incidence, it is quickly resolved in an effective manner.
- Increased collaboration and coordination among teachers and parents, and new teachers and parents are often comfortable.

Administration of Secondary schools in Rivers State

Public secondary schools are educational organizations with goals and objectives which are only achievable through the effective coordination of the educational resources available to the system. This coordination process is an organizational activity that is widely discussed in literature within the purview of administration. Administration in the view of Miewald (2018) is the means by which formal goals are achieved through cooperative human efforts (harmonized services of people). Some other authors conceptualized it as: the process of working with and through others to effectively accomplish organizational goals (Sergiovanni et al. cited in Peretomode, 2013); the capacity to coordinate many and often conflicting social energies in a single organization so adroitly that they shall cooperate as a unity (Adams cited in Peretomode, 2013); the careful and systematic arrangement and use of resources (humans, material and financial), situations and opportunities for the achievement of the specific objectives of a given organization (Nwankwo, 2017); the art and science of getting things effectively done (Peretomode, 2013); and so on. The diverse conceptualizations obviously have one goal in common, which is the attainment of the goals of the given organization. An administrator is thus someone who pioneers or leads the rendering of services within the organization (which by default involves the coordination and harmonization of the potentials of organizational resources) towards the attainment of organizational goals.

Principals, who are the administrators of secondary schools, oversee the running of the schools, assuming roles that cut across instructional leadership, students and teachers personnel services, financial management, supervision and inspection of instruction and of the school facilities, public relations, human resource management, school records keeping, students' and teachers' discipline, and all such activities that lead to the attainment of the goals and objectives this level of education as articulated in the National Policy on Education and at individual school level (Effiong, 2015; Meenyinikor et al., 2013; Nwanwa & Barrah, 2021).

Secondary School administration involves among other things, curriculum administration and teaching, pastoral care, discipline, assessment evaluation and examinations, resource allocation, costing and forward planning, staff appraisal, relationship with the community, use of the practical skills necessary for implementing the policies of organisation such as decision-making, negotiation, bargaining, communication, conflict handling, running meetings and so on (Ojo cited in Nwangwa & Barrah, 2021). A cursory look at all of these activities aimed at realizing the set goals and objectives of education at the secondary level clearly reveals that they cannot be done by the Principal alone without the help of other stakeholders of the school. Sagnak (2016) rightly observed that the effectiveness of a leader (the principal in this regard) can

only be guaranteed through the involvement and engagement of the stakeholders of the organization (the school), as these pool of human resources available to the Principal is often so rich that "neglecting them in the administrative functions of the school would no doubt lead to school underperformance and poor instructional productivity" (Hanushek & Ettema, 2017).

Areas Stakeholders' Participation is Required in the Administration of Schools

The imperativeness of participative management adoption in principals' leadership of secondary schools is that, although the principal is the administrative head of the school, saddled with the responsibility of planning, directing, controlling, coordinating, organizing, advising and problem-solving (Maduabum cited in Nwangwa & Barrah, 2021), he must necessarily carry the critical stakeholders of the school along in the execution of these duties. Carrying them along must not be done passively, but they must be actively involved in the management process and administration of the school. Various ways of involving and engaging these stakeholders in the administration of the school for effective attainment of set goals of education at this level of education are widely captured in literature, and the repetitive themes among them considered expedient in this discourse include school finance management, physical facilities provision and maintenance, curriculum design and implementation and students' discipline (Adesina cited in Abdullahi et al., 2017; Akpabio, 2015; Akpomi & Nwamadi, 2020; Yenagbay-Villena, 2015). These are meticulously reviewed below:

- *Management of school finance:* Financial resources or funds are adjudged the livewire of every level of education in Nigeria (Akpomi & Nwamadi, 2020). The functioning of every other resource and the life of the school are tied to the financial performance of the school, which includes availability of adequate finance for funding the diverse projects and programs of the school and the effective utilization of funds generated in the school or allocated to the school (Okoye & Okorji, 2021). Unfortunately, this critical resource has hardly been adequate in Public Secondary Schools owing to government's poor financial allocation to education which has become the bane of the educational system of the country (Ikegbusi & Iheanacho, 2016; Mohammed et al., 2021). To make the matter of inadequacy of fund worse, misappropriation of funds by school principals and other forms of financial imprudence are also common in public secondary schools to the detriment of school objectives (Mohammed et al., 2021). All of these challenges may be properly tackled through effective administration that involves the participation of other stakeholders such as the teachers, parents, the PTA, Board of Governors, Old Students' Association and Non-Government Organizations within the radius of the school.
- *Provision and maintenance of physical facilities:* This is presently one of the most critical areas of concern to principals, teachers and parents of students in Secondary schools in Rivers State and the principals' ability to mobilize stakeholders to pull their resources together in seeing to the betterment of the status of physical facilities in these schools would be a step in the right direction to administrative effectiveness. Akomolafe and Adesua (2016) identified these facilities in Secondary schools to range from the school plant - that is, the school buildings, classroom, library, laboratories, toilet facilities, learning materials to other infrastructures that would likely motivate students towards learning. These physical facilities are essential for bringing about the desired change in behaviour of students, and their provision and maintenance is an integral aspect of the

whole school management process which must be in tact to achieve effective school administration. FRN (2014) recognizing the inability of the government to singlehandedly see to the provision and maintenance of these facilities, advised that communities, parents, private individuals and non-government organizations within school communities would have to assist schools as much as they can.

- *Curriculum design and implementation:* School administration cannot be talked about without quality discussion of matters about the curriculum. This is because administration is primarily concerned with realizing effective instructional delivery and the curriculum is the nucleus of instruction in any educational system. The qualities of an effective curriculum as articulated by Yenagbay-Villena (2015) makes it obvious that a quality curriculum for Secondary schools is a product of inputs from different quarters other than the principals' efforts alone. These qualities include:

    - The curriculum is based on the needs of the people
    - The evolution of the curriculum is in a continuum
    - Democratic conception underpins the curriculum
    - The Curriculum assumes detailed complexity
    - The Curriculum complements other programs of the community

The implementation of the curriculum equally, as much as its design, requires the full participation of the Principal, teachers, students, parents and all relevant stakeholders of public Secondary Schools in Rivers State. To this end, Mkpa cited in Ofor-Douglas (2020) posited the implementation of the curriculum involves translating curriculum documents into the working curriculum by the collective efforts of the students, teachers, and other stakeholders (like librarians, laboratory attendants, etc.). In the opinion of Ogar and Awhen (2015), the implementation of the curriculum is a process that involves putting the curriculum into work for the achievement of the goals for which the curriculum is designed, and for this to happen, Ivowi cited in Ofor-Douglas (2020) posited that resources which may not be wholly within the affordance of school administrations are often required. These resources would include both human resources and material resources which could be provided by stakeholders of the school who are not from the school system, such as parents, communities and non-government agencies, who should be welcomed into the administrative process of the school.

Students' Discipline: One of the manifest functions of education is the inculcation of discipline into learners (Ngwokabuenui, 2015) and the execution of this function is spearheaded by the school administration. Webster's Ninth Collegiate Dictionary defined discipline as the training that corrects, moulds, or perfects the mental faculties or moral character. For Ukala (2018), discipline is the act of imposing order on others to gain compliance. It is a concept that describes a set of rules governing conduct or activity in an organization. Eke (2021) went further to aver that no worthwhile goal is ever achieved either at individual or at corporate level without discipline.

The role of disciplining students cannot be carried out by the principal alone; neither can it be effectively executed without the involvement of teachers, parents and the community. Literature and experience reveal that issues related to students' discipline have often caused conflicts between school administrators and parents (Thomas and Thinguri, 2017), as different people have different orientations regarding acceptable measures of disciplining

students (Abdullahi et al., 2017). As such, decisions of disciplinary strategies to be adopted in schools, especially as it relates to students' behaviours, may only yield results that enhance administrative effectiveness if all relevant stakeholders are actively engaged in the process. Besides, beyond what happens within schools, students' behaviours outside the school premises could also have far-reaching effects on school administration, and parents and the communities have major roles to play in helping schools keep watchful eyes on the students when they are not within the school premises. This is why their participation in students' discipline cannot be undermined.

Participative Management Strategies for Effective Administration of Schools

Having extensively reviewed existing literature on participative management in organizations and how it applies to secondary schools administration, with particular attention to the different stakeholders who may participate and how they can participate in school administration, it becomes necessary to also review literature on the participative management strategies that can be adopted by secondary school principals in Rivers state for effective administration of this level of education in the state. Njoroge and Kathuri (2017) described participative management strategies as practices adopted by participative leadership of organizations to ensure that the voices and opinions of all stakeholders are loudly captured and reflected in the decision making and implementation processes of the organization. Some of these strategies according to them include teamwork, delegation of responsibilities, school culture and corporate social responsibilities. They found that these strategies had significant positive correlation with school performance in Nakuru North Sub County, Kenya. For Owan (2019), the strategies that correlated with school effectiveness in Calabar - Nigeria, were parent-teachers' relationship through the PTA, school-community use of resources, school-community communication and school-community collaboration. While the number of different strategies is inexhaustible in literature, five fundamental ones are considered within the scope of this present study. These include committee system, collaborative decision-making, delegation of responsibilities, consultation of stakeholders and effective communication. These are reviewed below.

Committee System as a Participative Management Strategy for Effective Administration of Secondary schools

One veritable strategy advanced in literature for effective implementation of participative management in organizations is the committees system - also referred to as the team structure in some parlance. A committee, alternatively called boards, teams, task force or commission of inquiry was described by Koontz cited in Diakpomrere and Uhunmwuangho (2018) as groups of persons, to whom some matters are specifically delegated for deliberations, leading to recommendations, reports or decision-making. Ajayi et al. cited in Diakpomrere and Uhunmwuangho (2018) saw a committee as a group or body of persons, selected from a more numerous people or body to which some special business or assignment is committed for discussions and decision-making. A committee contains more than one person – suggesting that it involves participation of other members of the group other than the manager or administrator in determining the course of events in the organization or institution.

The roles of various committees in birthing administrative effectiveness in secondary schools in Rivers State cannot be undermined. As opined by Ogbogu (2013), committee in

educational institutions provides effective administration to the management and also improves the decision making process (Jaiyeoba and Ojewumi, 2020). Within secondary schools, important committees include among other: disciplinary committee, instructional supervision committee, school plant maintenance committee, examination committee, staff welfare committee, sport committee, staff welfare committee and examination committee among others. The operation of these committees is based on specified terms of reference as indicated by their names, and every one of them is accountable to the school's Principal. These various committees if utilized in the school system could enhance administrative effectiveness in tremendous degrees:

Disciplinary Committees: Disciplinary committee, according to Mbiti (2017) is essential for ensuring that students' discipline in the area of examination malpractice, truancy, bullying, destruction of school property, physical violence by students on fellow students and on teachers, cultism, among others are checkmated. Administrative goals of ensuring that students abide by the laws of the school and remain orderly and peaceful in pursuant of the educational goals of the school are also pursued by this committee. The disciplining of students can simply not be effectively handled by the Principal alone, hence the need for the setting up of this committee. To ensure that the disciplinary committee carries out their duty effectively and without running into problems with parents of children who may not be okay with disciplinary measures meted out on their children, the need for consultation of other stakeholders in deciding disciplinary measures becomes necessary.

Examination Committees: Examinations are rituals in secondary school systems and herald the completion of terms, sections and levels of studies. They give rise to students' promotion to subsequent classes and periods of examinations are always special periods in every school. As such, this special event can simply not be handled haphazardly without proper planning and organization which has got to be handled by a committee. Jaiyeoba and Ojewumi (2020) posited that examination committees are necessary to ensure effective implementation of all aspect of school examination policy and ensure smooth conduct of both internal and external examinations in the school, together with results compilation for various classes.

Staff Welfare Committees: Meeting of social, physical and psychological needs of staff is imperative for staff performance in the school system (Sheikfareeth, 2021; Thuo & Wambugu, 2022). It is a staff motivation strategy of school administrators. This may be effectively carried out through the engagement of the services of a welfare committee in the school, which may be made up of teachers and maybe, parents as the case may be. The rationale for staff welfare committee, according to Jaiyeoba and Ojewumi (2020) is to improve the effectiveness of school administration in the area of co-curricular activities for staff, arrangement of training programme for staff to exchange ideas and up-date their skills and knowledge, award outstanding staff and ensure regular meeting with staff to discuss on-the-job problems affecting them. Jaiyeoba and Ojewumi (2020) added that the staff welfare committee promotes the welfare of staff and students and also facilitates cultural and social development of the secondary schools. When staff welfare is properly taken care of, literature and experience testify that it leads to job satisfaction which boosts productivity consequent upon administrative effectiveness in the school.

Instructional Supervision Committee: The committee system of any school would be deficient if there is no committee in charge of supervising instruction which is the most important activity of the school (that is, teaching and learning). The instructional supervision committee, ideally made up of the Principal and senior and experienced teachers in the school oversee teaching and learning, and ensure that they are done in line with professional ethics and requirements. The supervisory skills of this committee would help in teachers' rating, help the teachers access various self-evaluation measures, and to a large extent make the school administrators provide suitable enabling environment for teaching/learning activities (Babatunde, 2014).

From the foregoing, the importance of committee system as a participative management strategy of Principals can simply not be overemphasized as literature has widely eulogized its enhancing capacity on administrative effectiveness. However, the extent to which this strategy is adopted by Principals is largely dependent on their level of awareness and opinion about it.

Collaborative Decisions-Making as a Participative Strategy for Effective Administration of Secondary schools

Ayoro and Onyeike (2020) defined decision making as the process of identifying and choosing between alternatives based on values and preferences. It is a process concerned with identifying, maintaining, motivating, and unifying a formal and organised human and material resources within an integrated system designed and coordinated to specifically achieve predetermined objectives (Isah, 2012). It is the heartbeat of organizational processes as objectives, plans and policies of organizations are all products of decision making. Decision making is what leaders and managers basically to (Olorunsola & Olayemi, 2011; Omemu, 2018). Several studies carried out on the relationship between stakeholders' participation in decision making in organizations and organizational effectiveness have revealed a significant positive correlation. Organizational commitment, job satisfaction and effectiveness have been the mostly recurrent themes on the effects of this participative management strategy (Arop et al., 2019; Bassey et al., 2019; Madukwe et al., 2019; Mbon, 2017; Osim et al., 2012). Splanger cited in Omorobi et al. (2020) observed that when Principals give teachers free hand to participate in administrative decision making, it results in lower absenteeism rate, enhances teachers' attitude to work, and brings about higher individual performance or productivity. On the contrary, when employees are alienated from decision making in the workplace, job dissatisfaction, decreased organizational commitment and low labour–management relations, all of which reduces productivity become the resultant effects (Omorobi et al., 2020).

Okon et al. (2019) found that parental and community involvement in school matters was a chief predictor of academic performance of secondary school students in Calaba South, Nigeria. Findely cited in Njoroge and Kathuri (2017) and Richarson cited in Njogore and Kathuri (2017) agreed that participation in decision making is positively and significantly related to productivity and reduced resistance to productivity and change. They also stated that participation in decision making helps stakeholders to identify with institutional objectives and goals. Stakeholders who participate regularly and actively in the development of policies and plans and other areas of school management are more likely to be enthusiastic about their schools than those who participate to a limited extent. Udo and Akpa cited in Olorunsola and Olayemi (2011) corroborated this fact that where teachers (as well as other stakeholders) are adequately involved in the decision-making process of their schools, there would be commitment

and adequate support for the principal, which bring about the realization of the school goals, and additionally, there would be reduction in apathy and oppositions to the school's administration. All of these, no doubt, enhance administrative effectiveness.

Despite the advantages advanced in literature for participative decision making of stakeholders in the school system, some scholars have expressed some contrary views on certain aspects of the subject matter. One of the demerits of collaborative decision making which most of them have pointed out is delay in reaching administrative decisions especially when time is of essence (Enarebebe, 2019;). Granick cited in Enarebebe (2019) asserted that there is often pressure on the part of the management and the employees because they have to think about their decisions carefully thereby taking much time before such decisions are finalized upon.

Another concern that has been expressed by some scholars is that of indecisiveness in decision making, which often results when there are conflicts in opinion of stakeholders (Isah, 2012). When such conflicts are not quickly resolved in an amicable manner, it sometimes degenerates into prolonged disagreements that make people work away on the decision, resulting to defeated objectives. In this regard, Liphadzi et al. cited in Ehirim (2022) expressed worry that participative management, which is a form of organizational democratic management process, in a bid to adopting large amount of subordinates' inputs, ends up adopting large amounts of arguments and conflicts, too. Omorobi et al. (2020) also argued that the democratic nature of participative management makes the decision with the highest consensus to be accepted, and in most cases, the decision with the highest consensus is not necessarily the best decision, or does not necessarily result to the ultimate good of the situation being decided upon.

Delegation of Responsibilities as a Participative Management Strategy for Effective Administration of Secondary schools

Delegation of responsibilities is another participative management practice which has become a focal point in improvement agenda of secondary schools around the globe (Amos et al., 2022; Darra, 2016). Delegation of responsibility is the relocation of duties, power and authority to the teachers and other relevant stakeholders of the school system by the Principal in order to ensure that there is a division of labour as well as specialization in the school system (Amos et al., 2022). It is a participative management strategy through which principals pass on their roles or activities to some members of the school whom they have faith in to be able to deliver on such roles. Ayeni (2020) posited that delegates perform the allocated task for which they have competence and talents. The delegate could be a teacher, head of a committee or subject department, class prefect, or even parents of students.

Harper cited in Ayeni (2020) saw delegation of responsibilities as an important aspect of participative management which involves the transferring of accountability, flexibility, duties sharing, the making of decision and the utilization of resources to the school's teaching staff. This, according to them, is done by Principals to ensure that school goals are jointly attained by the workforce of the school. Apart from instructional engagements, there may be some other extra-curricular (non-instructional) deliverables of schools which some parents may be experts at, for example procurement of resources needed for school occasions or functions, security matters, school facility maintenance, etc. These could also be delegated to them by Principals if they are available and willing to handle such responsibilities for the school, and where there are competent and available parents who are not willing to work for the school as delegates, the Principal's human relations skills may be needed for soliciting their willingness (Avis, 2016; Sonsaard & Darbavasu, 2019).

In a study carried out by Undiyaundeye and Julius (2020) to investigate the implications of delegative functions of principals for effective and efficient secondary schools management in Ogoja, Cross River State, found that when Principals delegated supervisory and disciplinary functions to teachers, it resulted in effective running of the school and enhanced the administration of secondary schools in Ogoja, Cross River State, Nigeria. This was corroborated by Okonkwo (2015) who defined delegation as the art of decentralizing function by a higher officer to lesser officers with the overall aim of achieving the goals of the organization. He further stressed that when there is no delegation of responsibilities by principals to teachers, chances are that there will be strained relation between them and him. This could also result in staff loss of self-confidence, which could deter them from putting in their best in their various assignments. The resultant effect of such situations is always impedance to the achievement of school objectives.

Mgbodile cited in Undiyaundeye and Julius (2020) also identified other responsibilities in addition to supervisory and disciplinary functions that are delegated by Principals to teachers and other important stakeholders of secondary schools. According to him, a major function like the preparation of the school timetable is delegated to the Vice Principal with full authority. He (the Vice Principal) is also bestowed with the authority to discipline the staff and students, keep school records, and supervise classes, among others (Mgbodile cited in Undiyaundeye and Julius, 2020). Additionally, the Principal appoints departmental heads that perform supervisory and advisory functions within the various departments of the school. Tasks like maintenance and storage of departmental equipment are also delegated. The revenue accruing to the school are also delegated to the Bursar/school finance clerks. They are also responsible for the school's impress account, preparation of school budget, accounting and payment, among others (Undiyaundeye and Julius, 2020). The form masters are delegated to ensure that there is discipline in classrooms and that the welfare of students is guaranteed. The tasks of equipment, hygiene in classrooms and the surroundings are also delegated to the form masters. Inclusive to these tasks are those of checking class attendance and register. In the same vein, housemasters are delegated appoint house prefects, maintain good hygiene and discipline, and to see to the general welfare of the house. The Principal is able to actualize all of these functions by implementing control of delegation of functions. Control, according to Undiyaundeye and Julius (2020), refers to the ability or power to make someone or something do what you want. The Principal, as the leader of the school has such power and is expected to use it optimally in realizing administrative effectiveness.

Consultation of Stakeholders as a Participative Management Strategy for Effective Administration of Secondary schools

Stakeholder consultation is an active, deliberate, well-planned process of seeking stakeholders' opinion, listening to them and hearing from them in order to get their perspectives on emerging challenges which are currently impacting or will in the future impact on the organization (the school in this regard) (Dey, 2017). According to International Finance Corporation cited in Anyango et al. (2020), stakeholder consultation is a vast term that encompasses many activities and interactions within a project life cycle (the school administration in this regard), which continuously occur between the project initiator (the school administrator) and those (the stakeholders) likely to be affected and impacted on by the project (the school process).

Given the high level of dynamism of the 21st century, and the fact that school goals and processes must necessarily change in response to the ever-changing society so that the school may be able to continually live up to societal expectations in meeting stakeholders' needs, the

importance of stakeholder consultation can simply not be undermined. Numerous studies have outlined the importance of stakeholders' consultation (Darell et al., 2020; Govender & Bussin, 2020), but it is however worrisome that organizations (including public secondary schools) have still not been able to successfully master how to effectively consult with stakeholders and value them as one of the key instruments towards enacting necessary changes within the system for administrative effectiveness (Kajwang, 2022; Mann & Harter, 2016). This has resulted to failure of many change initiatives of schools and led to obvious ineffectiveness in school administration especially in the government-owned schools because the drivers and implementers of the required change (teachers, students, parents and the community) are often found to distance themselves by disengaging and becoming silent spectators rather than active players towards ensuring that set goals are effectively attained (Govender & Bussin, 2020; Islam et al. cited in Van Niekerk, 2022).

Literature has widely attested to the benefits and importance of stakeholders' consultation as a strategy in participative management (Dey, 2017; Mbogo & Mugwe, 2023; Ramasimu, 2023; Schumacher & Stybellists, 2012; UNEP & Accountability cited in Anyango, 2020). According to the UNEP & Accountability cited in Ayango (2020), the benefits of stakeholder consultation are widely encompassing. They include: equitable and sustainable development; better management of risk and reputation in the organization; pooling of resources to meet set objectives of the organization; mutual understanding of an otherwise complex work environment; excellent dissemination, diffusion and absorption of information; and the building of trust among the stakeholders.

Dey (2017) summed up the benefits of stakeholders' consultation in four salient points. These include:

Informed decision making: If stakeholders are consulted before making decisions, the decision making process will be more informed and will be in tune with the people who would be affected by the decision.

Greater satisfaction of stakeholders with the outcomes of administrative decisions: Through the engagement process, those who decisions will affect will feel they have inputted into the final outcome and that everyone's views have been taken into account. Depending on the method of consultation, they will also understand that their perspective may not be shared by all and that there is a need for compromise.

Greater chance of a successful implementation of initiatives: Stakeholders will feel ownership of the venture, and are therefore more likely to want the venture to succeed.

Finally, consulting with people who will be affected by a development is an example of best practice. It represents good governance and transparency, demonstrates a desire to engage in meaningful two-way communication, and recognizes the important contribution stakeholders at all levels can make to future changes which will directly or indirectly affect them.

Effective Communication as a Participative Management Strategy for Effective Administration of Secondary schools

Several studies have revealed that communication is arguably the strongest predictor of quality of relationship in human interactions, and this is more so in organizational settings (Arop et al., 2018; Elegbe & Ibikunle, 2015; Uwandu et al., 2022). Literature reviews also seem to suggest that all the variables of participative management examined in this paper (committee system, collaborative decision-making, delegation of responsibilities and consultation of stakeholders) are each held and sustained by effective communication. According to Ramah cited in Onuoha (2019), the concept of communication refers to the transmission and reception of ideas, feeling and attitudes verbally or non-verbally to produce a favourable response. Draft cited in Onuoha (2019) defined communication as the process by which information is exchanged and understood by two or more people usually with the intention to motivate or influence behaviour.

Effective communication, according to Arop et al. (2018), is a communication between two or more persons wherein the intended message is successfully delivered, received and understood. This is achieved when all the parties in the communication have the same understanding of the message being conveyed and the sender feels heard and understood (Umoren & Agunobi, 2017). Collective decision-making, which is the bedrock of participative management, is itself a communication concept (Elegbe & Ibikunle, 2015). Being a process that involves the identification of possible alternatives and determining which would be optimum for the best good of the school system at every given point in time, there is always the need for the process to be effectively communicated across to all relevant stakeholders, if everyone must be on the same page per time. Elegbe and Ibikunle asserted that the quality of decisions made by the school administration is determined by how the stakeholders who make the decisions are able to communicate with one another in ways that facilitate sharing of information, pooling of knowledge and critical evaluation of available options.

Certain attributes have been identified in literature to characterize effective communication between school leaders and the stakeholders of the school system, taking analogies from organizational communication. Elegbe and Ibikunle identified some of these to include:

Firstly, effective communication among stakeholders occurs within a complex open system which is influenced by internal and external environments. It is important for Principals to always bear in mind that the school is an open system, and as rightly averred by Zorlu and Korkmax (2021), "Organizations managed with an open system approach are in constant interaction with their internal and external environments." Secondly, effective communication between stakeholders involves messages and their flow, purpose, direction, and media. Thirdly, effective communication takes into cognizance people and their attitudes, feelings, relationships, and skills.

Research works on organizational communication are largely founded on these characteristics (Filberth, 2018; Ogunola & Akporaro, 2015; Zorlu & Korkmaz, 2021). Zorlu and Korkmaz (2021) explicitly asserted that "all employees (and stakeholders), who carry out their activities with common purposes within the organizational structure, have to transmit their needs, ideas, goals, knowledge, and experience to each other". Making this possible in the most pragmatic way becomes a participative management strategy of the school principal, which could potentially transform administrative effectiveness to the benefit of all stakeholders of secondary schools in Rivers State.

The benefits of effective communication as a participative management strategy of secondary school Principals may be far-reaching taking cues from what is obtainable in organizations that successfully adopt similar practices. Filberth (2018) found that effective communication brings about good coordination among the teams or units in an organization. Tourish and Hargie cited in Elegbe and Ibikunle (2015) identified the benefits of improved productivity, reduced absenteeism, higher quality of products and services, increased motivation, fewer strikes, and reduced costs in organizations where there is effective communication. For Cole cited in Elegbe and Ibikunle (2015), when employees are kept informed about general matters relating to their roles in the organization, the understanding of management actions is increased. Consequently, there is reduced misunderstandings arising from day-to-day activities, and there is improved in trust between employees and employers. Importantly, an atmosphere of mutual trust and understanding is necessary for attainment of school goals and objectives and effective communication between school stakeholders is one veritable tool for attaining such. As such, it comes out clear that effective communication is a veritable participative management strategy.

CONCLUSION

Based on the research findings, it is concluded that effective administration of secondary schools in Rivers State is strongly dependent on principals' administrative practices, and one of such practices that is proven to be veritable at helping school administrators realize administrative goals and objectives across different levels of education in the world is participative management practices. This involves principals encouraging the participation of all critical stakeholders in the decision making and policy formulation and implementation in the school. The stakeholders that must not be alienated from school administrative processes include the students, the teachers, parents, and community leaders. These have the ability to positively influence administrative effectiveness.

Participative management strategies are strategies employed by principals in the management process of the schools, which ensure that all stakeholders get involved in school administrative processes and the strategies found to be of high effectiveness at enhancing administrative effectiveness include the use of committee system, collaborative decision-making, delegation of responsibilities, consultation of stakeholders and effective communication. Based on the findings of the study, having mastery of the use of these strategies and actually employing them in school administration would by all means help public Senior Secondary School principals in Rivers State to achieve improved productivity in all areas of school administration.

Suggestions

Based on the discourse, the paper makes the following suggestions:

- In addition to the employment of strategies such as committee system, collective decision-making, delegation of responsibilities, consultation of stakeholders and effective communication, principals should periodically liaise with school stakeholders on other ways to better encourage stakeholders' participation in school administration.

- School administrators should support and raise the efficiency and effectiveness of constituted committees in their schools through regular training, to enable them continually deliver credibly on the tasks for which they have been constituted.
- Principals should engage students, teachers and parents in decision making concerning matters of collective concerns, as their involvement in the decision making process determines how they respond towards the implementation and towards the outcomes of such decisions.
- The Ministry of Education should ensure that principals acquire requisite skills, knowledge and competence in the act of delegation of responsibilities through quality periodic training and retraining.
- Principals should always endeavour to consult widely among knowledgeable and experienced stakeholders before taking actions that impact on school administration.
- Administrators of secondary schools in Rivers State should ensure there is downward, upward and horizontal communication among stakeholders. This will give all the categories of stakeholders of the school a sense of belonging and invariably enhance their participation which could bring about effective school administration.

PRINCIPALS' STRATEGIC APPROACHES AND TEACHERS' JOB PERFORMANCE IN PUBLIC SENIOR SECONDARY SCHOOLS IN RIVERS STATE

Ngozi Franca NWACHUKWU
Department of Educational Management
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

This study investigated the relationship between principals' strategic approaches and teachers' job performance in public senior secondary schools in Rivers State, Nigeria. It was guided by three research questions and three corresponding null hypotheses. The study was anchored on the Contingency Theory of Leadership and Herzberg's Two-Factor Theory of Motivation, which respectively emphasize adaptive leadership and the interplay between hygiene and motivational factors in employee performance. Employing a correlational research design, the study targeted a population of 6,893 teachers across 286 public senior secondary schools in the state. A sample of 500 teachers was selected through simple random sampling to ensure representativeness. Two researcher-developed instruments "Principals' Administrative Strategies Questionnaire (PASQ)" and "Teachers' Job Performance Questionnaire Scale (TJPQS)" were used for data collection. The instruments underwent validation by experts and were found reliable using Pearson Product Moment Correlation, with coefficients of .85 and .76. Data analysis was conducted using Pearson correlation statistics at a .05 level of significance. Findings revealed weak and statistically insignificant relationships between principals' administrative, supervisory, and motivational strategies and teachers' job performance, with correlation coefficients of .136, .079, and .074 respectively. These findings suggest that the strategies employed by principals, as currently practiced, do not have a significant impact on enhancing teacher performance. The study concluded that while leadership remains essential in school administration, its effectiveness is contingent on the relevance, quality, and alignment of strategies with teachers' contextual needs. It was recommended that educational stakeholders should provide regular training for principals on contemporary leadership practices, adopt teacher-centered approaches, ensure supportive work environments, and consider other systemic factors influencing teacher performance beyond administrative strategies.

Keywords: Principals' Strategies, Administrative Leadership, Supervision, Motivation, Teacher Job Performance, Secondary Education, Rivers State.

INTRODUCTION

The efficacy of educators in any educational system is crucial to the attainment of educational goals and objectives. The efficacy of senior secondary schools in Nigeria is mostly contingent

upon the proficiency with which teachers execute their instructional, administrative, and co-curricular duties. The quality of leadership offered by school administrators is a significant driver of teachers' job success. Principals function as the administrative leaders and instructional heads of schools, and their strategic methodologies especially in administration, supervision, and motivation significantly influence the performance and productivity of instructors. Olatunji and Alade (2020) assert that a school principal's efficacy in managing human and material resources may either motivate teachers to excel or impede their professional performance.

Administrative tactics used by school administrators include decision-making, distribution of responsibilities, planning, organization, and oversight of school activities. When properly executed, such tactics provide an atmosphere favorable to teaching and learning. In contrast, inadequate administrative methods may result in disarray, diminished morale, and poor work performance among educators. Recent years have seen increasing apprehension around administrative inefficiencies in public senior secondary schools in Nigeria, particularly in Rivers State, which often lead to diminished teacher productivity and subpar student results (Nwosu & Ugboma, 2019). The increasing expectations on educators, along with insufficient administrative support, underscore the need for principals to use effective and creative leadership tactics to elevate teacher morale and improve performance.

A vital strategic role of principals is oversight. Supervision include offering direction, overseeing classroom activities, assessing lesson execution, and ensuring compliance with curricular requirements by instructors. Effective supervision tactics facilitate the identification of instructional improvement areas and function as a feedback mechanism for ongoing professional growth. Teachers subjected to sufficient supervision exhibit elevated levels of dedication and professional responsibility (Adekeye, 2021). In several public schools in Rivers State, supervision is either inadequately performed or completely lacking owing to administrative burdens, insufficient training, or constrained resources. This has resulted in increasing concern among stakeholders over the declining quality of instructional delivery in public schools, especially at the senior secondary level.

Motivational tactics significantly influence teachers' perceptions of their profession. Educators, like to personnel in other industries, need motivation via rewards, acknowledgment, conducive working environments, and avenues for professional development. Principals who comprehend the motivating requirements of their instructors are more inclined to cultivate a school environment that promotes commitment, creativity, and perseverance. Recent research, like that conducted by Eze and Nwankwo (2018), underscores that intrinsic and extrinsic motivation considerably affect teachers' classroom performance and their propensity to exceed fundamental responsibilities. In Rivers State, challenges such as delayed wages, insufficient recognition, and inadequate advancement opportunities have diminished teacher morale, rendering motivating tactics used by school leaders essential for maintaining successful work performance.

Given these findings, it is essential to analyze the correlation between principals' strategic methodologies particularly in administration, supervision, and motivation—and teachers' job performance in public senior secondary schools in Rivers State. Although prior research has examined the general impact of leadership styles on school performance, there is a lack of empirical evidence about the particular strategic activities of principals and their direct effects on teachers' work within the Nigerian setting (Okorie & Okwuoha, 2022). Addressing this deficiency is crucial for influencing educational policy, directing principal training initiatives, and enhancing teaching and learning outcomes. This research examines the degree to which

administrators' administrative, supervisory, and motivational tactics affect the work performance of teachers in public senior secondary schools in Rivers State.

Statement of the Problem

The quality of education in public senior secondary schools in Rivers State continues to raise concerns among stakeholders, including government officials, school administrators, teachers, parents, and students. Despite various reforms and investments in the education sector, teacher performance in many public schools remains below expectations. This has been reflected in students' poor academic outcomes, lack of commitment among teachers, frequent absenteeism, and inadequate instructional delivery. One of the underlying factors often attributed to these challenges is the ineffective leadership and strategic approach of school principals. Principals, as the administrative and instructional leaders of schools, are expected to adopt strategies that foster a supportive and productive work environment for teachers. However, in practice, many principals struggle to employ effective administrative, supervisory, and motivational strategies that can enhance teachers' job performance.

In many cases, school administrators lack the strategic capacity to plan, coordinate, and manage both human and material resources efficiently. Administrative lapses such as poor communication, unclear delegation of duties, and lack of structured planning have been reported in several public senior secondary schools in the state. These issues not only disrupt the smooth functioning of schools but also negatively affect teacher morale and productivity. Supervision, which should serve as a tool for professional support and accountability, is often conducted superficially or ignored altogether. The absence of regular, constructive, and supportive supervision leaves teachers without proper feedback, guidance, or encouragement to improve their instructional techniques and classroom management.

Moreover, the motivational needs of teachers are frequently neglected. Factors such as recognition, career advancement, workload balance, and provision of teaching materials are essential motivators for teachers. Yet, in many public secondary schools in Rivers State, teachers are often left unmotivated due to delays in promotions, lack of incentives, and poor working conditions. When principals fail to adopt effective motivational strategies, teachers become disengaged and indifferent to their duties, which subsequently affects students' academic outcomes and the overall school performance.

Although various studies have examined leadership and teacher performance, few have focused specifically on the strategic approaches of principals particularly in the domains of administration, supervision, and motivation as they relate to teachers' job performance in the context of Rivers State. The gap in empirical research in this area creates a need for a study that will not only explore the nature of these strategies but also establish their relationship with how well teachers perform their roles. Understanding these dynamics is crucial for designing interventions and policies aimed at improving school leadership and enhancing teacher performance.

It is against this backdrop that this study seeks to investigate the relationship between principals' strategic approaches and teachers' job performance in public senior secondary schools in Rivers State, Nigeria.

Objectives of the Study

The main objective of this study is to examine the relationship between principals' strategic approaches and teachers' job performance in public senior secondary schools in Rivers State. Specifically, the study seeks to:

- Determine the relationship between principals' administrative strategies and teachers' job performance in public senior secondary schools in Rivers State.
- Examine the relationship between principals' supervisory strategies and teachers' job performance in public senior secondary schools in Rivers State.
- Assess the relationship between principals' motivational strategies and teachers' job performance in public senior secondary schools in Rivers State.

Research Questions

- What is the relationship between principals' administrative strategies and teachers' job performance in public senior secondary schools in Rivers State?
- What is the relationship between principals' supervisory strategies and teachers' job performance in public senior secondary schools in Rivers State?
- What is the relationship between principals' motivational strategies and teachers' job performance in public senior secondary schools in Rivers State?

Research Hypotheses

The following null hypotheses were formulated to guide the study:

- **HO_1**: There is no significant relationship between principals' administrative strategies and teachers' job performance in public senior secondary schools in Rivers State.
- **HO_2**: There is no significant relationship between principals' supervisory strategies and teachers' job performance in public senior secondary schools in Rivers State.
- **HO_3**: There is no significant relationship between principals' motivational strategies and teachers' job performance in public senior secondary schools in Rivers State.

CONCEPTUAL REVIEW

To ensure a comprehensive understanding of the key concepts explored in this study, it is essential to define and clarify the central terms and ideas. This section provides conceptual clarity on the major terms involved, such as principals' strategic approaches, teachers' job performance, and the relationship between these concepts.

Principals' Strategic Approaches

Principals' strategic approaches refer to the intentional and systematic methods that school leaders employ to manage and improve various aspects of school operations, including administration, supervision, and motivation. These strategies aim to create a positive school culture, enhance teaching quality, and achieve the school's educational objectives. Principals, as

the chief executive officers of schools, make decisions that directly influence the quality of education and the working environment for teachers.

Three key strategic approaches are often highlighted in the literature: administrative strategies, supervisory strategies, and motivational strategies:

- Administrative Strategies: These involve the planning, organizing, coordinating, and controlling of resources and activities in the school to ensure that educational goals are met. Administrative strategies include setting clear goals, delegating tasks effectively, managing school finances, and creating efficient workflows. The success of these strategies is often reflected in the overall school climate, teacher satisfaction, and student outcomes (Olatunji & Alade, 2020).
- Supervisory Strategies: Supervisory strategies focus on monitoring and evaluating teachers' work, providing guidance, and ensuring that instructional activities align with the school curriculum. Effective supervision promotes professional development, feedback, and accountability, helping teachers to enhance their instructional practices and performance. Research has shown that regular, constructive supervision positively influences teacher motivation and classroom effectiveness (Adekeye, 2021).
- Motivational Strategies: Motivational strategies refer to the techniques employed by principals to inspire and encourage teachers to perform their duties with dedication and enthusiasm. These strategies may involve both intrinsic and extrinsic incentives, such as recognition, rewards, career advancement opportunities, provision of resources, and creating a supportive work environment. Motivated teachers tend to exhibit greater commitment, innovative teaching practices, and higher levels of job satisfaction (Eze & Nwankwo, 2018).

Teachers' Job Performance

Teachers' job performance refers to the extent to which teachers fulfill their professional responsibilities, including delivering quality instruction, managing classroom behavior, and contributing to the overall academic success of students. Job performance encompasses a range of tasks, such as lesson planning, implementation of teaching methods, assessment of student progress, and engagement in professional development activities. A teacher's performance is often assessed through both observable outcomes (e.g., student achievement) and subjective measures (e.g., principal and peer evaluations).

The performance of teachers is influenced by multiple factors, including their personal motivation, the teaching environment, available resources, and the support they receive from school leadership. It is widely acknowledged that effective school leadership particularly in the form of strategic administrative, supervisory, and motivational approaches can significantly enhance teachers' job performance (Nwosu & Ugboma, 2019).

The Relationship between Principals' Strategic Approaches and Teachers' Job Performance

The relationship between principals' strategic approaches and teachers' job performance has gained increasing attention in the discourse on educational leadership and school effectiveness. Principals serve as the cornerstone of effective school management, and their leadership

strategies significantly shape the working conditions, motivation, and productivity of teachers. Strategic approaches such as administrative planning, instructional supervision, and staff motivation are central to fostering a supportive and high-performing school environment. When principals are strategic in organizing school operations, setting goals, communicating expectations, and ensuring resources are available, teachers are better positioned to meet instructional objectives and engage meaningfully in the teaching-learning process.

Administrative strategies adopted by principals often include setting clear goals, delegating tasks appropriately, ensuring regular communication, and enforcing discipline in ways that are fair and supportive. These strategies help to establish a stable, organized environment where teachers understand their roles, responsibilities, and the expectations of the school leadership. For instance, when a principal ensures that timetables are properly managed, teaching aids are provided, and conflicts are addressed promptly, teachers experience less stress and more satisfaction with their work conditions. This, in turn, enhances their job performance, as they are able to focus on instruction rather than on structural challenges. Moreover, a well-organized administrative system encourages teachers to adopt best practices in classroom management, assessment, and student engagement, thereby directly improving educational outcomes.

Supervision, another core area of principals' strategic intervention, plays a pivotal role in shaping teacher behavior and professional growth. Principals who engage in consistent, constructive, and supportive supervision provide teachers with timely feedback, identify areas for professional development, and encourage reflective teaching practices. Supervision goes beyond fault-finding; it involves mentorship, coaching, and the creation of opportunities for capacity building. Teachers under the guidance of proactive principals are more likely to feel empowered and competent, which boosts their confidence and job satisfaction. For example, lesson observation followed by a supportive discussion helps teachers to refine their pedagogical techniques, align their teaching with curriculum objectives, and adopt innovative instructional strategies. Effective supervision also fosters a sense of accountability, as teachers become more aware of their strengths and areas needing improvement.

Perhaps most significantly, motivational strategies employed by principals influence teachers' emotional well-being and commitment to duty. Motivation encompasses both intrinsic and extrinsic factors. Intrinsically, teachers need to feel respected, valued, and involved in school decisions. Extrinsically, they respond to incentives, recognition, opportunities for advancement, and favorable work conditions. Principals who implement motivational strategies such as acknowledging achievements, encouraging teacher participation in decision-making, supporting further training, and addressing teacher welfare issues often witness higher levels of teacher enthusiasm and productivity. Motivated teachers are more likely to go the extra mile in preparing their lessons, attending to students' diverse needs, and participating in co-curricular activities. Conversely, where motivation is lacking perhaps due to poor communication, neglect of teacher welfare, or authoritarian leadership styles teachers may become demoralized, disengaged, and less effective in the classroom (Olatunji & Alade, 2020).

In the context of public senior secondary schools in Rivers State, Nigeria, these strategic approaches are particularly crucial due to systemic challenges such as overcrowded classrooms, limited instructional resources, and teacher shortages. A principal's ability to navigate these challenges with strategic foresight can make a considerable difference in school performance. For example, where funding or infrastructure is limited, a resourceful principal may build partnerships with the community or non-governmental organizations to support school programs. Such strategic thinking not only helps in addressing material needs but also boosts teacher

morale by showing that leadership is responsive and proactive. Similarly, promoting a culture of collaboration, professional dialogue, and shared vision among teachers fosters unity and increases the collective capacity for high-quality instruction.

Ultimately, understanding and strengthening the link between principals' strategic approaches and teachers' job performance is essential for improving the overall quality of education. When educational leaders are intentional about their administrative, supervisory, and motivational roles, they create environments that support teacher effectiveness and student achievement. The goal should be to ensure that principals are trained, supported, and evaluated not only based on academic results but also on their leadership competence and the strategies they employ to support teaching and learning. In doing so, education stakeholders in Rivers State and beyond can build sustainable systems where both teachers and students thrive.

THEORETICAL REVIEW

A strong theoretical foundation is essential for understanding the relationship between principals' strategic approaches and teachers' job performance. Several theories of leadership and organizational behavior provide valuable insights into how school principals can influence teachers' performance. For this study, the **Contingency** Theory of Leadership and Herzberg's Two-Factor Theory of Motivation are particularly relevant, as they address the roles of leadership style and motivational strategies in improving teacher job performance.

Contingency Theory of Leadership

The Contingency Theory of Leadership, proposed by Fred Fiedler in 1964, posits that the effectiveness of a leader's behavior is contingent upon the situational context in which the leadership occurs. According to this theory, there is no single best way to lead; instead, the most effective leadership style depends on the specific circumstances and variables at play, such as the nature of the task, the work environment, and the characteristics of the followers.

In the context of school leadership, principals are required to adapt their leadership strategies based on the particular needs and challenges of their schools. For instance, in schools with low teacher motivation or where administrative challenges are prevalent, principals may need to adopt a more hands-on, directive leadership style. Conversely, in schools where teachers are motivated and the environment is stable, a more delegative or participative style might be more effective. Fiedler's theory emphasizes the importance of matching leadership styles to specific situations to maximize effectiveness (Fiedler, 1964).

Relevance of Contingency Theory to the Study

The Contingency Theory of Leadership is highly relevant to this study because it highlights the adaptive nature of leadership. It suggests that principals must assess their school's needs and the teachers' motivational and performance levels to adopt the appropriate strategic approaches in administration, supervision, and motivation. By applying this theory, the study acknowledges that principals cannot rely on a one-size-fits-all approach; instead, they must adjust their strategies to ensure that they meet the diverse needs of their teaching staff.

For example, in public senior secondary schools in Rivers State, principals may be dealing with different sets of challenges in terms of resources, teacher capacity, and the general

work environment. The study will explore how principals' administrative strategies, supervision, and motivational approaches can be modified according to these contingencies to enhance teacher performance. Understanding how principals align their leadership approaches with the unique circumstances of their schools will provide insights into the factors that contribute to teachers' job satisfaction and effectiveness.

Herzberg's Two-Factor Theory of Motivation

Herzberg's Two-Factor Theory, developed by Frederick Herzberg in the 1950s, is another significant framework that underpins this study. The theory proposes that there are two categories of factors that influence employees' job satisfaction and performance: hygiene factors and **motivators**. Hygiene factors are those elements that are necessary to avoid dissatisfaction but do not necessarily lead to satisfaction or motivation, such as working conditions, salary, and job security. Motivators, on the other hand, are factors that lead to job satisfaction and increased motivation, such as opportunities for achievement, recognition, responsibility, and personal growth.

In the educational context, hygiene factors could include adequate salaries, proper classroom resources, and a supportive work environment. Motivators could include professional development opportunities, recognition for teaching excellence, and the ability to participate in decision-making processes. According to Herzberg, job performance improves when principals ensure that both hygiene factors are adequately addressed and motivational factors are actively promoted.

Relevance of Herzberg's Theory to the Study

Herzberg's Two-Factor Theory is particularly relevant to understanding the motivational strategies of school principals and their impact on teachers' job performance. The study aims to examine how principals' strategic approaches especially in terms of motivation affect teachers' performance in public senior secondary schools in Rivers State. By focusing on the distinction between hygiene factors and motivators, the study will explore how principals can improve teacher performance not just by addressing basic needs but by actively engaging teachers with motivating factors.

For instance, principals who recognize and reward teachers for their accomplishments, provide opportunities for professional growth, and create a work environment conducive to learning and development are likely to enhance teacher performance. Conversely, neglecting to address basic job dissatisfaction factors, such as poor working conditions or insufficient remuneration, can lead to disengagement, which negatively impacts teachers' motivation and performance.

Application of Theories in the Study

The Contingency Theory of Leadership provides a useful framework for understanding the adaptive nature of leadership, while Herzberg's Two-Factor Theory of Motivation offers valuable insights into how principals can motivate teachers through a combination of hygiene factors and motivators. These theories, when combined, suggest that effective leadership in schools involves a dynamic approach to managing teacher performance, where principals need to

assess both the context and the specific needs of their teachers in order to adopt strategies that foster an environment of professional growth and motivation.

In Rivers State, where schools may be grappling with administrative and motivational challenges, principals must be able to adjust their leadership styles according to the specific needs of their teachers and the school environment. This theoretical approach underscores the importance of strategic leadership practices that can adapt to situational demands while also focusing on improving teachers' motivation, job satisfaction, and overall performance.

Review of Related Study

Okeke (2018) conducted a study titled "Principals' Administrative Strategies and Teachers' Job Performance in Public Senior Secondary Schools in Anambra State, Nigeria." The study aimed to examine how principals' use of administrative strategies such as instructional supervision, delegation of duties, and staff motivation influenced teachers' performance in delivering instructional services. The study adopted a descriptive survey design with a population comprising all principals and teachers in the state's public senior secondary schools. Using stratified random sampling, 300 teachers and 30 principals were selected. Data were collected through a structured questionnaire titled "Principals' Administrative Strategies and Teachers' Performance Questionnaire (PASTPQ)." Data were analyzed using mean scores, standard deviation, and Pearson Product Moment Correlation Coefficient (PPMCC) to test the hypotheses. Findings revealed that principals' use of instructional supervision and delegation significantly improved teachers' job performance. However, the study noted that lack of adequate motivation strategies hindered optimal teacher commitment and productivity. It was recommended that principals be trained in modern administrative approaches to enhance teacher efficiency.

Afolabi (2020) carried out a research titled "Effect of Principals' Administrative Styles on Teachers' Job Performance in Public Secondary Schools in Lagos State." This study investigated how different leadership and administrative styles adopted by principals affected teachers' classroom effectiveness, punctuality, and instructional delivery. The research employed a correlational survey design, targeting 150 public secondary school teachers across three education districts in Lagos. The instrument used was a self-developed questionnaire titled "Administrative Styles and Teachers' Performance Scale (ASTPS)." The data collected were analyzed using both descriptive statistics (mean and standard deviation) and inferential statistics, particularly multiple regression analysis. The results showed a significant positive correlation between transformational leadership style and teacher job performance. Conversely, autocratic leadership was found to have a negative impact on teacher morale and performance. The study concluded that the adoption of participatory and supportive administrative strategies by principals enhances teacher productivity.

Mohammed and Dantani (2021) undertook a study titled "Influence of Principals' Supervisory Strategies on Teachers' Work Effectiveness in Public Secondary Schools in Kaduna State." The study explored how supervisory practices such as classroom observation, feedback provision, and performance appraisal influence teachers' job effectiveness. A survey research design was used, involving 350 teachers randomly selected from 50 public secondary schools. The data collection instrument was a validated questionnaire tagged "Supervisory Strategies and Work Effectiveness Questionnaire (SSWEQ)." The study employed Analysis of Variance (ANOVA) and t-test statistics for data analysis. The findings showed that teachers whose principals regularly conducted classroom supervision and provided constructive feedback

demonstrated higher levels of preparedness, lesson delivery, and student engagement. However, the study found disparities in supervisory practices across urban and rural schools, with rural schools lagging in administrative efficiency. The researchers recommended uniform training programs for principals to standardize supervisory techniques across schools.

Uche (2017) undertook a study titled "Principals' Supervisory Strategies and Teachers' Job Performance in Public Senior Secondary Schools in Abia State, Nigeria." The study examined the extent to which principals' supervisory roles such as classroom observation, monitoring of lesson plans, and feedback impacted teachers' effectiveness. A descriptive survey design was adopted, and the population consisted of 1,200 teachers across public secondary schools in Abia State. A sample of 300 teachers was selected using stratified random sampling. The instrument for data collection was a structured questionnaire titled Supervisory Strategies and Job Performance Questionnaire (SSJPQ). Data analysis involved mean, standard deviation, and Pearson Product Moment Correlation Coefficient. The findings revealed a significant positive relationship between principals' supervisory practices and teachers' job performance, especially in areas of lesson delivery and punctuality. The study concluded that effective supervision boosts instructional quality and recommended regular supervision by trained principals to enhance teaching standards.

Olayemi and Ibrahim (2019) conducted a study titled "Principals' Supervisory Techniques and Their Influence on Teachers' Instructional Effectiveness in Public Senior Secondary Schools in Kwara State." The study sought to determine how techniques like classroom visitation, peer review facilitation, and professional development coordination influenced teacher performance. A correlational research design was employed, and the sample consisted of 250 teachers drawn from 25 senior secondary schools. The researchers developed and used a 25-item questionnaire called the Supervisory Techniques and Teachers' Effectiveness Scale (STTES) for data collection. The data were analyzed using multiple regression analysis to determine the influence of the independent variables on the dependent variable. Findings showed that classroom visitation and professional development were the most influential supervisory techniques. It was also found that when principals engaged regularly in supervisory activities, teachers displayed increased commitment and instructional quality. The authors recommended a structured supervisory schedule for principals to maintain consistent teacher performance.

Nwachukwu (2021) carried out a study titled "Effect of Principals' Instructional Supervision on Teachers' Job Performance in Public Senior Secondary Schools in Enugu State." The study aimed to explore how principals' instructional supervision roles, including checking of lesson notes, classroom observation, and post-observation conferences, influenced teachers' output. The study employed an ex-post facto design with a sample of 320 teachers selected through purposive sampling. The instrument used was a researcher-developed questionnaire named Instructional Supervision and Teachers' Performance Inventory (ISTPI). Data were analyzed using descriptive statistics for research questions and Analysis of Variance (ANOVA) to test hypotheses. The findings indicated that principals' regular involvement in instructional supervision significantly improved teachers' classroom delivery, punctuality, and evaluation practices. However, the study noted that some principals lacked the professional training necessary to carry out effective supervision. The study recommended capacity-building workshops for principals to strengthen their instructional leadership.

Eze (2018) undertook a study titled "Principals' Motivational Strategies and Teachers' Job Performance in Public Senior Secondary Schools in Ebonyi State." The study sought to determine the impact of principals' motivational techniques such as recognition, incentives,

promotion opportunities, and staff development on teachers' commitment and performance. A descriptive survey design was adopted for the study, and the population comprised all public senior secondary school teachers in Ebonyi State. Using stratified random sampling, 240 teachers from 24 schools were selected. The researcher developed a structured instrument titled Motivational Strategies and Teachers' Job Performance Questionnaire (MSTJPQ) for data collection. Data were analyzed using mean, standard deviation, and Pearson Product Moment Correlation Coefficient. The findings revealed that principals' use of recognition, timely promotion, and provision of in-service training significantly enhanced teacher job satisfaction and instructional performance. The study recommended that principals prioritize intrinsic and extrinsic motivation strategies to maintain high levels of teacher productivity.

Aliyu and Salami (2020) conducted a study titled "Effect of Principals' Motivation Techniques on Teachers' Productivity in Public Senior Secondary Schools in Niger State." The study focused on how motivation strategies such as monetary incentives, provision of teaching materials, and opportunities for professional development influenced teachers' job performance. The study employed a correlational survey design. A sample of 300 teachers was drawn from 30 public senior secondary schools using a simple random sampling method. The instrument used was a 30-item questionnaire named Teachers' Motivation and Performance Scale (TMPS). Descriptive statistics (mean and standard deviation) were used for research questions, while multiple regression analysis was employed for hypothesis testing. Results showed that the combination of both financial and non-financial motivational strategies significantly influenced teachers' punctuality, lesson delivery, and overall job performance. The study concluded that motivation plays a pivotal role in enhancing teacher effectiveness and urged government and school leaders to make it a consistent priority.

Okon and Udofia (2021) carried out a study titled "Principals' Use of Motivational Strategies and Their Influence on Teachers' Job Performance in Public Senior Secondary Schools in Akwa Ibom State." The study investigated the extent to which motivational strategies such as commendation, workload reduction, and participatory decision-making influenced teacher morale and classroom efficiency. The researchers employed a survey research design. A total of 280 teachers were selected using a multi-stage sampling technique. Data were collected using a validated questionnaire titled Motivational Strategies and Teachers' Work Effectiveness Questionnaire (MSTWEQ). Data were analyzed using descriptive statistics and Analysis of Variance (ANOVA). The findings indicated that teachers who were regularly motivated through appreciation, involvement in decision-making, and supportive leadership were more committed to their roles and performed better in instructional activities. The study recommended regular motivation seminars for school administrators and the institutionalization of motivational policies in secondary education.

METHODOLOGY

The study adopted a correlational research design to examine the relationship between principals' strategic approaches and teachers' job performance in public senior secondary schools in Rivers State. A correlational design is used when a researcher aims to explore the extent of the relationship between two or more variables, where data are typically measured on a ratio or interval scale, allowing for correlation analysis. The population of the study consisted of 6,893 teachers from 286 public senior secondary schools across 23 local government areas in Rivers

State, as provided by the Rivers State Senior Secondary Schools Board (RSSSSB) Planning, Research, and Statistics Department (2021).

A sample size of 500 teachers was selected using a simple random sampling technique, which represented 7% of the total population. This technique was chosen because it ensures that every teacher in the population had an equal chance of being included in the sample, thereby promoting fairness and representativeness. Data were collected using two self-designed questionnaires: the "Principals' Administrative Strategies Questionnaire (PASQ)" and the "Teachers' Job Performance Questionnaire Scale (TJPQS)." The questionnaires were developed based on the research questions and reviewed literature. The questionnaires were structured into two sections: Section A collected demographic information such as gender, while Section B contained items addressing the research questions. Items were scored on a four-point Likert scale, with Strongly Agree (SA) assigned 4 points, Agree (A) assigned 3 points, Disagree (D) assigned 2 points, and Strongly Disagree (SD) assigned 1 point.

To ensure the validity of the instrument, it was subjected to both content and face validation by the researcher's supervisor and two experts in measurement and evaluation from the Department of Educational Guidance and Counseling at Ignatius Ajuru University of Education. The experts reviewed the instrument for clarity, relevance, adequacy, and other qualities that make a good research tool. Based on their feedback, the instrument was modified, with certain items being revised, added, or deleted to improve its quality.

The reliability of the instrument was tested using the Pearson Product Moment Correlation (PPMC) method. Thirty copies of the questionnaire were administered to teachers outside the study area, who shared similar characteristics with the target population. After two weeks, the exercise was repeated, and the responses were collated and analyzed using PPMC through SPSS software. The reliability coefficients obtained were 0.85 and 0.76, indicating that the instrument was reliable for the study.

The data collection process involved the researcher and three trained assistants, who were familiar with the proper procedures for administering the questionnaires. The instruments were distributed to the respondents, who completed them immediately, and the completed questionnaires were retrieved on the spot. Out of the 500 distributed questionnaires, 455 were properly completed and returned, representing a 91% return rate.

For data analysis, the study employed Pearson Product Moment Correlation (PPMC) to answer research questions and test the null hypotheses at a 0.05 level of significance.

RESULTS

Test of Hypotheses: Decision Rule

If the Significant/Probability Value (PV) < 0.05 (level of Significance) = reject the null and conclude Significant Relationship

If the Significant/ Probability value (PV) > 0.05 (level of Significance) = Accept the null and Conclude Insignificant Relationship.

Research Question One: What is the relationship between principals' administrative strategies and teachers' job performance in public senior secondary schools in Rivers State?

H_{O1}: There is no significant relationship between principals' administrative strategies and teachers' job performance in public senior secondary schools in Rivers State.

Table 1: Correlation between principals' administrative strategies and teachers' job performance in public senior secondary schools in Rivers State

		Principals' Administrative Strategies	Teachers' Job Performance
Principals' Administrative Strategies	Pearson Correlation	1	.136
	Sig. (2-tailed)		.051
	N	455	455
Teachers' Job Performance	Pearson Correlation	.136	1
	Sig. (2-tailed)	.051	
	N	455	455

The table presents the Pearson correlation between principals' administrative strategies and teachers' job performance in public senior secondary schools in Rivers State. The correlation coefficient is 0.136, indicating a weak positive relationship between the two variables. The significance value (Sig. = 0.051) is just above the commonly used alpha level of 0.05, meaning the relationship is not statistically significant at the 5% level. Thus, based on this result, the null hypothesis (HO1) that there is no significant relationship between principals' administrative strategies and teachers' job performance cannot be rejected. The weak and statistically insignificant correlation suggests that principals' administrative strategies do not have a significant impact on teachers' job performance in the context of the schools studied.

Research Question Two: What is the relationship between principals' supervisory strategies and teachers' job performance in public senior secondary schools in Rivers State?

H_{O2}: There is no significant relationship between principals' supervisory strategies and teachers' job performance in public senior secondary schools in Rivers State.

Table 2: Correlation between principals' supervisory strategies and teachers' job performance in public senior secondary schools in Rivers State

		Principals' supervisory strategies	Teachers' Job Performance
Principals' Supervisory Strategies	Pearson Correlation	1	.079
	Sig. (2-tailed)		.263
	N	455	455
Teachers' Job Performance	Pearson Correlation	.079	1
	Sig. (2-tailed)	.263	
	N	455	455

The table shows the Pearson correlation between principals' supervisory strategies and teachers' job performance in public senior secondary schools in Rivers State. The correlation coefficient is .079, indicating a very weak positive relationship between the two variables. The significance value (Sig. = 0.263) is well above the 0.05 alpha level, suggesting that the relationship is not statistically significant. Therefore, based on this result, the null hypothesis (HO2) that there is no

significant relationship between principals' supervisory strategies and teachers' job performance cannot be rejected. The very weak and statistically insignificant correlation implies that principals' supervisory strategies do not significantly influence teachers' job performance in the studied schools.

Research Question Three: What is the relationship between principals' motivational strategies and teachers' job performance in public senior secondary schools in Rivers State?

H_{O3}: There is no significant relationship between principals' motivational strategies and teachers' job performance in public senior secondary schools in Rivers State.

Table 3: Correlation between principals' motivational strategies and teachers' job performance in public senior secondary schools in Rivers State

		Principals' Motivational Strategies	Teachers' Job Performance
Principals' Motivational Strategies	Pearson Correlation	1	.074
	Sig. (2-tailed)		.289
	N	455	455
Teachers' Job Performance	Pearson Correlation	.074	1
	Sig. (2-tailed)	.289	
	N	455	455

The table presents the Pearson correlation between principals' motivational strategies and teachers' job performance in public senior secondary schools in Rivers State. The correlation coefficient is 0.074, indicating a very weak positive relationship between the two variables. The significance value (Sig. = 0.289) is well above the 0.05 alpha level, suggesting that the relationship is not statistically significant. Therefore, based on this result, the null hypothesis (HO3) that there is no significant relationship between principals' motivational strategies and teachers' job performance cannot be rejected. The very weak and statistically insignificant correlation indicates that principals' motivational strategies do not significantly affect teachers' job performance in the studied schools.

DISCUSSION OF FINDINGS

The research aimed to investigate the relationship between principals' administrative, supervisory, and motivational strategies and teachers' job performance in public senior secondary schools in Rivers State. Each of the three research questions was tested through Pearson correlation analysis to understand the extent to which these strategies influenced teachers' performance. The findings, while revealing weak correlations in all three instances, provide significant insights when compared to existing literature.

Principals' Administrative Strategies and Teachers' Job Performance

The first research question sought to explore the relationship between principals' administrative strategies and teachers' job performance. The findings indicated a very weak positive correlation of 0.136, which was statistically insignificant (p = .051). This suggests that principals'

administrative strategies have a minimal, if any, impact on teachers' job performance in the public senior secondary schools in Rivers State.

These results are consistent with studies that have found administrative strategies can influence teachers' performance, though the relationship is often nuanced. For example, a study by Akinyele (2018) found that while administrative support, which includes strategic planning and resource allocation, is positively related to teachers' motivation, its impact on overall job performance was moderate. This suggests that factors such as the organizational culture and personal characteristics of teachers may play a more critical role in influencing performance than administrative strategies alone. Similarly, in the work of Oloruntegbe and Akinyemi (2020), administrative strategies were found to support teaching but not always significantly improve performance, indicating that the impact of administrative strategies can be indirect or mediated by other variables such as teacher autonomy or job satisfaction.

Principals' Supervisory Strategies and Teachers' Job Performance

The second research question investigated the relationship between principals' supervisory strategies and teachers' job performance. The correlation coefficient was 0.079, also reflecting a very weak positive relationship, with a significance value of 0.263, which is above the commonly used threshold of 0.05. This indicates that the supervisory strategies employed by principals do not significantly affect teachers' job performance in this context.

This finding aligns with previous research that indicates supervisory strategies, while important, often do not have a strong or direct effect on teachers' performance. For instance, Ogunyemi (2019) highlighted that while supervision plays an essential role in identifying areas where teachers need support, it often fails to directly influence their job performance if not coupled with other motivational or developmental strategies. Additionally, a study by Mustapha and Haruna (2020) found that supervisory strategies are often perceived by teachers as mere checks or controls, leading to disengagement rather than an improvement in job performance. This suggests that the quality of supervision, rather than its frequency or presence, is a key factor in enhancing teachers' effectiveness.

Principals' Motivational Strategies and Teachers' Job Performance

The third research question examined the relationship between principals' motivational strategies and teachers' job performance. The correlation coefficient was 0.074, indicating a very weak positive relationship, with a significance value of 0.289, suggesting no significant relationship. This implies that principals' motivational strategies, as implemented in the schools studied, have a minimal influence on teachers' job performance.

This result contradicts some literature that emphasizes the importance of motivation in improving teachers' performance. For instance, a study by Adeyemi (2019) found that principals' motivational strategies, such as recognition and reward systems, significantly improved teachers' job satisfaction and overall performance. However, other studies have noted that the impact of such strategies depends on the context in which they are applied. According to Okonkwo and Osuji (2021), motivational strategies that are not tailored to the specific needs of teachers or are poorly implemented may fail to produce significant results. This suggests that while motivational strategies may be essential for fostering a positive work environment, their impact on performance is not guaranteed unless they are aligned with teachers' intrinsic and extrinsic needs.

Theoretical Implications

The findings of this study align with Herzberg's Motivation-Hygiene Theory, which posits that factors such as recognition, responsibility, and personal growth (motivators) can lead to job satisfaction and better performance, while poor administrative strategies (hygiene factors) lead to dissatisfaction but do not directly affect performance unless they are addressed. The weak correlations found in this study suggest that the lack of effective administrative, supervisory, and motivational strategies could be seen as hygiene factors that prevent dissatisfaction but do not directly foster improved job performance unless properly managed.

Moreover, the findings are consistent with systems theory, which emphasizes the interaction of various components within an organization. Teachers' performance is influenced not just by principals' strategies but also by other factors such as work environment, student behavior, and the availability of resources (Lamb et al., 2020). This indicates that the educational system in Rivers State may require more holistic approaches that combine leadership strategies with other support systems to foster better outcomes for teachers.

CONCLUSION

Based on the findings of this study, it can be concluded that principals' administrative, supervisory, and motivational strategies have limited and statistically insignificant relationships with teachers' job performance in public senior secondary schools in Rivers State. The weak positive correlations observed in all three aspects administrative (.136), supervisory (.079), and motivational (.074) strategies suggest that these leadership approaches, as currently practiced, do not significantly enhance teachers' performance in the school system studied.

The implications of these findings point to a possible disconnect between principals' leadership practices and the actual needs or expectations of teachers in the educational context. This could be due to a lack of strategic alignment, ineffective implementation, or broader systemic challenges such as inadequate resources, teacher workload, or insufficient support for professional development. While leadership remains a crucial component of effective school management, the results indicate that mere presence or application of these strategies may not yield desired outcomes without attention to quality, relevance, and consistency.

Furthermore, the findings reinforce the importance of adopting a holistic approach to school leadership one that integrates administrative efficiency, meaningful supervision, and targeted motivation with participatory decision-making and teacher empowerment. School principals need to be trained not only in technical leadership skills but also in interpersonal and contextual competencies that allow them to connect more effectively with their staff and respond to their professional needs.

Recommendations

Based on the findings of this study, the following recommendations are made to relevant stakeholders to enhance teachers' job performance in public senior secondary schools in Rivers State:

- The Ministry should design and implement regular leadership training programs for school principals focused on modern, evidence-based administrative, supervisory, and motivational strategies that directly support teacher effectiveness.
- Principals should adopt a more inclusive and teacher-centered leadership style by involving teachers in decision-making processes and tailoring strategies to meet their professional and personal needs.
- The TSC should regularly monitor and evaluate principals' leadership practices and their impact on teachers' performance, using the data to inform promotions, postings, and capacity development.
- The PTA should collaborate with school leadership to provide additional support financial or otherwise that enhances the work environment and contributes to teacher motivation and satisfaction.
- NGOs focusing on education should partner with schools to provide mentorship programs, workshops, and motivational support initiatives aimed at boosting teachers' morale and professional commitment.
- Researchers should conduct further studies exploring additional factors such as school climate, teacher workload, and professional development that may better explain variations in teacher performance beyond principals' leadership strategies.
- Teachers are encouraged to engage in continuous professional development and maintain open communication with school leadership to ensure their challenges and needs are clearly understood and addressed.

ABSTRACT

The study examined principals' utilization of disciplinary measures for improved teachers' performance in public senior secondary schools in Rivers State. The study had four objectives, four research questions, and four corresponding null hypotheses. The design of the study was descriptive survey design. The study population was the 333 principals of the 333 public senior secondary schools in Rivers State. The sample size was 100 principals (65 males and 35 females) representing 30% of the population. The sample was purposively chosen by the researcher for ease of access to the respondents from public senior secondary schools in Port Harcourt City, Ikwerri, and Obio/Akpor Local Government Areas of Rivers State. The instrument for data collection was a structured questionnaire constructed by the researcher and titled: "Principals' Utilization of Administrative Disciplinary Measures for Teachers' Improved Performance Questionnaire (PUADMITPQ). The reliability index of the instrument was determined using Pearson's Product Moment Correlation statistics on test-retest data obtained from a pilot study of 20 principals from the study population who were not part of the main study. The analysis gave a reliability coefficient of .89. The response pattern of the instrument was the modified 4 points form of Likert scale. The research questions were answered using descriptive statistics of mean and standard deviation whereas the hypotheses were inferentially tested using independent samples t-test at a significance level of .05. The study concluded that the use of administrative disciplinary measures by principals ensures that teachers do the right thing, the right way, and at the right time in the school system. It suggested among others that principals should implement disciplining of teachers with the aim of helping them improve on their job performance for the attainment of goals and objectives of the school, and not as a witch-hunting or vindictive measure.

Keywords: Discipline, Administrative Disciplinary measures, Teachers' Performance, Attendance Monitoring, Warning, Lesson Plans/Notes.

INTRODUCTION

Indiscipline among teachers is eroding the quality and value of secondary education in Nigeria as a whole and in Rivers State in particular. Unethical behaviours like lateness to school, absenteeism from school or from classes, truancy, use of school hours for personal business, indecent dressing, quarreling, and various other forms of misconducts that undermine the dignity of the teaching profession have become the common sight when one visits a typical public secondary school in Rivers State. This becomes really worrisome given how critical secondary level of education is in the country. The objectives of this level of education as contained in the national Policy on Education are so critical that if duly achieved, would produce graduands who are sound in both character and in learning, and who possess the competence for self-reliance and for meaningful contribution to their societies. This is achieved through the collaborative effort of teachers, school administrators, parents, the schools board, and other well-meaning members of the society who are all stakeholders of the school system. Unfortunately, teachers have not been playing their roles as expected by the school system and by the society and this has become a cause of concern to stakeholders in the state.

Teachers are at the helm of affairs in the transformation process of the recipients of secondary education, and as such are expected to model good character in their job performance and in their relationship with the school system. It is through teachers that the stated goals and objectives of secondary education are achieved. It has however been found that majority of teachers in public senior secondary schools in Rivers State come short in character and in delivery of their jobs, leading to poor teaching and learning in these schools and consequent upon poor student outcomes. The place of enforcing discipline in the school system is therefore very paramount if teachers must work in accordance with job ethics. Principals, who are the administrators of the secondary schools, therefore need to stand up to their roles as custodians of discipline in the schools, to ensure that teachers deliver their jobs in accordance with stipulated guidelines for effective realization of instructional objectives. Hence, this study is on the administrative strategies that could be leveraged by principals in enforcing discipline among public senior secondary school teachers in Rivers State.

According to Kulbir cited in Ndung'u (2017), a teacher is any person that undertakes the great task of educating the child who looks to him for knowledge, wisdom, manners, morals, inspiration, and enlightenment and so on. Teacher's job performance therefore, is the execution of teaching tasks and rendering of school support services by teachers. It has to do with the ability of a teacher to carry out his / her duties as a teacher. The teacher's job performance is so critical to the success of the school system because it is what determines the students' outcome. The importance of the teacher to the school system rightly made Nwankwoala (2019) to describe the teacher as the most important person in the instructional process. The process of shaping the students' lives academically, mentally, morally, socially, and in many other aspects in line with the broad objectives of the school system is driven by the teachers, hence, the emphasis on their job performance.

The school is an organization with the principal as the administrator. The smooth operation of any organization largely depends on the level of discipline enshrined in the system. Nasibi (2023) argued that the creation and development of a healthy organization has discipline as an integral part, and discipline is central to the smooth operation of any learning institution. Teachers, like any other employees, are expected to act in a responsible manner and perform their duties as expected. Teachers cannot be able to fulfill the noble task of directing the children

towards adulthood and towards achievement of their potentials if the teacher frequently engages in professional misconduct. The principal as the sole administrator of the secondary school must thus ensure that all teachers carry out their duties dutifully in line with professional conducts in the school. The level to which the principal is able to enforce discipline among his staff determines to a great extent how effective and efficient the staff become on their jobs. The administrative disciplinary measures whose potentials at improving teachers' performance in senior secondary schools in Rivers State are being examined in this study include: compulsory signing of staff attendance register; compulsory weekly submission of lesson plans/notes; compulsory signing of teachers' classroom attendance register, and warning. Although literature (Ahiri et al., 2019; Owan & Ekpe, 2019) has established the existence of relationship between administrative disciplinary measures and teachers' performance, there is however the need to really examine the nature of the relationship and the ways principals could leverage these disciplinary measures to improve teachers' performance in their schools. This is thus the crux of this study.

Statement of the Problem

Disciplinary problems have been one of the strongest challenges bedeviling effective administration of public senior secondary schools in Rivers State in recent times. Many studies that have attempted to diagnose and proffer solutions to the problems have moreover focused mostly on student indiscipline with the assumption that teachers are already disciplined and committed to their work of assisting learners realize their goals in both academic work and their socialization process. Little attention has been focused on teachers' indiscipline and how the school administration handles inverted or infracting teachers who have departed or are departing from the course of improving the learner's achievement through displays of de-motivating behaviours.

Observations made during some visits to some public secondary schools in Rivers State have shown that there seems to be poor administrative disciplinary management, which is leading to poor job performance of teachers in these schools. It was clearly observed that some teachers displayed various deviant behaviors, such as frequent lateness to school, voluntary absenteeism from school and from classroom even when they are present in the school, leaving the school environment during work hours for their own personal engagements, refusal to prepare lesson plans and notes for teaching, among others, which grossly undermine instructional effectiveness of teachers and result to poor leaning outcomes and outright defeat of education objectives in these schools. Other negative impacts of such display of indiscipline by teachers have been found to include high drop-out rate, and high rate of examination malpractice, poor reading and writing cultures, indecent dressing, and truancy among students. The above situation is worrisome, hence the researcher decided to investigate administrative disciplinary measures to be adopted by principals to enhance teacher's job performances in public senior secondary schools in Rivers State.

Aim and Objectives of the Study

The aim of this study was to investigate principals' utilization of administrative disciplinary measures for improved teachers' performance. The specific objectives of the study include to:

- Ascertain the types of administrative disciplinary measures utilized by senior secondary school principals for improved teachers' performance in public senior secondary schools in Rivers State.
- Examine the extent principals' utilization of compulsory signing of staff attendance register as a disciplinary measure improves teachers' performance in public senior secondary schools in Rivers State.
- Determine the extent principals' demanding for weekly submission of lesson plan/notes as a disciplinary measure improves teachers' performance in public senior secondary schools in Rivers State.
- Evaluate the extent principals' utilization of warning as a disciplinary measure improves teachers' performance in public senior secondary schools in Rivers State.

Research Questions

The following research questions were posed to guide the study:

- What are the administrative disciplinary measures utilized by senior secondary school principals for improved teachers' performance in public senior secondary schools in Rivers State?
- To what extent does principals' utilization of compulsory signing of staff attendance register as a disciplinary measure improve teachers' performance in public senior secondary schools in Rivers State?
- To what extent does principals' demand for weekly submission of lesson plan/notes as a disciplinary measure improve teachers' performance in public senior secondary schools in Rivers State?
- To what extent does principals' utilization of warning as a disciplinary measure improve teachers' performance in public senior secondary schools in Rivers State?

Research Hypotheses

The following hypotheses were formulated and statically tested at 0.05 level of significance.

- There is no significant difference in the mean ratings of male and female principals on the types of administrative disciplinary measures utilized by senior secondary school principals for improved teachers' performance in public senior secondary schools in Rivers State.
- There is no significant difference in the mean ratings of male and female principals on the extent principals' utilization of compulsory signing of staff attendance register as a disciplinary measure improves teachers' performance in public senior secondary schools in Rivers State.
- There is no significant difference in the mean ratings of male and female principals on the extent principals' demanding for weekly submission of lesson plan/notes as a disciplinary measure improves teachers' performance in public senior secondary schools in Rivers State.

- There is no significant difference in the mean ratings of male and female principals on the extent principals' utilization of warning as a disciplinary measure improves teachers' job performance in public senior secondary schools in Rivers State.

Significance of the Study

The findings of this study will be practically significant to school administrators, principals, teachers, students, government, and future researchers. The findings of this study will acquaint school administrators on how best to manage the indiscipline challenges posed by teachers in their schools. Teachers will benefit immensely from the findings of this study. Their acquaintance with the various disciplinary measures examined in the study will help them in responding appropriately to principals when such strategies are applied in their schools. This will bring about improvement in teachers' performance, which will also translate to improved students' performance thereby profiting the students, too.

Furthermore, the findings of this study will be very beneficial to the government. They will uncover the academic and disciplinary problems which are as a result of negligence on the part of the school administration that has been obliterating various secondary schools in Rivers State in the recent time. This study will serve as an eye-opener to the state government and also give her an insight on how to tackle these problems. Having eliminated these problems, the educational system in the state will experience revival in all ramifications.

Finally, the findings of this study will be added to the existing literatures. Researchers in a similar field of study will also find the results of this study very interesting and useful. Moreso, the findings of this study may serve as a source of secondary data, thereby constituting a basis to identify research gaps, and for further research in this area or related areas.

THEORETICAL FRAMEWORK

The theory is anchored in the Theory X model of Douglas McGregor's Theory X and Y, propounded in his 1960 book, "The Human Side of Enterprise" as cited in (Keerthana & Babu, 2018). The theory X and Y acknowledged the existence of two categories of employees in every organization: the inherently deviant X employees, and the inherently compliant Y employees. The prevalent nature of the organization's employees thus informs the appropriate administrative style of the manager or administrator.

In McGregor's work, the theory X workers are a set of workers found in organizations, who are cold and introverted towards work. The theory X managers are therefore of the assumption that workers are lazy, indolent; unmotivated towards work; always shying away from responsibility; lack integrity; and prefer to just get by. These workers therefore need high control and strict disciplinary measure for them to be able to perform as expected.

Managers who adopt Theory-X assumptions have a tendency to structure, control and closely supervise their employees. These managers think that external control is clearly appropriate for dealing with unreliable, irresponsible and immature people. Such managers therefore appear to be more autocratic in approach and are seen as high disciplinarians (Kopelman et al., 2019).

The relevance of theory X to this present study is that the theory highlights the inherent nature of majority of teachers in public secondary schools in Rivers State—hating to work, shying away and avoiding responsibilities as much as possible, hating to be fully committed,

mostly coming late to work, often absent for the slightest reasons, seeing it as stressful to draw up lesson plans or appropriately form their lesson notes, and engaging in several other forms of unprofessional conducts, whilst always expecting pay at the end of every month. The theory therefore opines that such teachers would need principals to be highly structured, bureaucratic and authoritarian in his approach. It is only through the utilization of disciplinary measures that principals may be able to ensure that these teachers perform as expected in the school system.

CONCEPTUAL REVIEW

Discipline

According to the American Heritage Dictionary, the word discipline refers to training that is expected to produce a specified character or pattern of behaviour. At organizational level, it is the action(s) taken by the management to enforce organizational standards and the process of encouraging workers to move uniformly towards meeting the objectives of an organization (Okumbe cited in Ndung'u, 2017*).* In educational administration, it is the administrative action taken by education managers to encourage employees to follow the standards, rules and organizational (school) expectations enthusiastically (Gatababu, 2022; Okumbe cited in Ndung'u, 2017). It is arguably the most important component of running an educational institution and is manifested when the school becomes a harmonious, respectable and secure place where students behave responsibly, are aware of their actions and the consequences of these actions (Kibet et al. cited in Ndung'u, 2017).

As a matter of fact, discipline is a fundamental hallmark of the school system. The school itself is synonymous with discipline as discipline is always the first chord that strikes on parents' minds whenever they think about their children/wards and the school administrators or teachers. In the opinion of Shiundu and Umulando cited in Ndung'u (2017), discipline also refers to the values that students and teachers are to live by within the school, family, the neighbourhood, the village and all the social units up to the nation and the entire world community.

Okumbe in Ndung'u (2017) identified seven principles of discipline in the school system which principals must adopt when dealing with cases of indiscipline in staff or the learners. They include:

- Prior knowledge of rules and regulations in a school;
- Immediate application of disciplinary action just after the infraction;
- Consistency in application;
- Objectiveness;
- Impersonal in application;
- Avoiding entrapment;
- Allowing right of appeal.

However, strict adherence to these principles by secondary school principals is not always the case as some principals often find themselves entrapped after undertaking unprocedural disciplinary actions. In line with the shepherd's "rod and staff" analogy, there are two aspects of discipline exercised within the school system: the first aspect is concerned with administrative guidance given to subordinates so that they do not vie off the track of expected organizational conducts; and the second aspect is concerned with punishment meted out to errant staff or

students to get them back on track. According to Moles in Ndung'u (2017), school discipline has two main goals: (i) to ensure the safety of staff and students; and (ii) to create a conducive environment for teaching and learning. Thus, school discipline aims at making a school safe where learning can be conducted in a friendly environment free of violence, intimidation, or fear. Onyali (2024) therefore averred that discipline in the school system is the sum of educative efforts, including the teaching process, the process of character shaping, submission to rules and authority as well as the development of trust.

Administrative Disciplinary Measures

Administrative disciplinary measures in public senior secondary schools in River state in the context of this study refers to modalities or measures put in place by the school administration to ensure that teachers maintain disciplined conducts in the discharge of their duties. Disciplined conduct of teachers in instructional delivery, attitude towards work, and in general idiosyncrasies in the work place is, as a matter of fact, a prerequisite for effective job performance. These administrative disciplinary measures fall within the purview of teachers' disciplinary management.

As humans, erring is inevitable. This reality is amplified in scenarios where one serves as a subordinate, or is a follower, trying to work with rules laid down by someone else. Sometimes, even best intentions of the employee, when judged in the light of organizational modalities, end up becoming unacceptable. The organization's code of ethics/conduct therefore becomes the checklist by which all activities and performance of the employee are verified and vetted. Teachers, therefore, beyond just making efforts to be committed to the school and in the discharge of their instructional duties, must seek to abide by the school administrations' modus operandi. Since teachers are human, and every human is a complex being, there must be times when some of them (teachers) will exhibit some behavior that is not necessary for the smooth running of the school. Such behaviors which are unacceptable must be managed by those with the powers and those saddled with the responsibility. The administrative disciplinary measures are therefore used by the principals to minimize or eliminate such behaviours.

According to Bacal cited in Owan and Ekpe (2019), disciplinary measures which can be used by the head teachers or employers to control the discipline of teachers include: development of a code of conduct; warnings, reprimand, dismissal, suspension, deprivation of privileges, salary deductions, query, and demotion. For Ezeugbor and Eboatu (2018), the types of disciplinary measures adopted by principals on infracted teachers include warning, interdiction**, s**uspension, termination**, d**ismissal, compulsory Retirement, and demotion. However, all of these identified measures mainly apply in cases of confirmed infraction. This study takes a holistic look at disciplinary measures that both prevent infraction and as well as those that remedy infraction. Hence the study looks at the preventive and curative administrative disciplinary measures that enhance teachers' performance with focus on instructional delivery in public senior secondary schools. Hence, the administrative disciplinary measures considered in the study include compulsory signing of attendance register, weekly submission of lesson notes, compulsory signing of teachers' class attendance register, and warning.

Teachers' Performance

The success of an educational system depends largely on the performance of teachers, who can be considered as the backbone of the system (Amin et al., 2013; Khan et al., 2022). Job

performance according to Motowidlo and Van Scotter cited in Li et al. (2018) is the set of behaviours an individual performs toward achieving the goals of an organization. In the educational context, teachers' performance can be defined as the actions they perform in schools in order to achieve educational goals (Hwang et al., 2017; Limon & Sezgin-Nartgun, 2020). Teachers' performance entails (1) what they are to do (2) when they do it and (3) how they do it.

In broader terms, teachers' job performance is the contribution teachers make to the achievement of educational goals and objectives (Özdemir & Gören, 2017; Özdemir & Yirmibeş in Limon & Sezgin-Nartgun, 2020), while in some studies it is limited to teaching behaviour (Bashir et al,, 2017; Okeniyi cited in Amin et al., 2023), it however applies not only to the classroom or school, but to all settings where students are present (Shaikh et al., 2022). So, teachers' job performance can be regarded as multidimensional (Ali & Haider, 2017; Amin et al., 2023; Mehmood et al., 2023; Limon & Sezgin-Nartgun, 2020; Yusoff et al., 2024). Some of the significant dimensions within the context of this study include: scheme of work development and preparation for lessons; instructional delivery; student evaluation; extracurricular activities; effective leadership and classroom management; motivation and discipline; collaboration with school administrators; communication; administrative duties; and finding solutions to students' problems and guidance (Mehmood et al., 2023).

The various dimensions of teachers' performance were captured and summarized in three main dimensions by Bhat and Beri (2016) and Yusoff et al. (2024). These three dimensions include:

- Task performance;
- Contextual performance; and
- Adaptive performance

Table 1: The dimensions and their sub-dimensions as they pertain to this study

S/N	The major dimensions of teachers' performance	The Sub-dimensions of teachers' performance
1	Task performance	▪ Scheme of work development ▪ Instructional delivery ▪ Students' assessment and evaluation ▪ Classroom management
2	Contextual performance	▪ Relationship with staff ▪ Collaboration with administration ▪ Communication
3	Adaptive performance	▪ Administrative duties ▪ Guidance and counseling ▪ Use of new technology as instructional aid ▪ Extracurricular activities

Influence of Administrative Disciplinary Measures on Teachers' Performance

Several studies have established the existence of relationship between administrative disciplinary measures and staff performance in various organizations. Owan and Ekpe (2019) carried out a study to examine disciplinary management in public primary schools and teachers' job effectiveness in Yakurr Local Government Area, Cross River State. The study revealed that warning, suspension, and dismissal have significant relationships respectively, to primary school

teachers' job effectiveness. In the same vein, Ahiri et al. (2019) conducted a study which aimed at analyzing and describing the effect of teachers' work discipline on teachers' performance. The study results showed a positive and significant effect of teachers' work discipline on teachers' performance. From reviews of several other studies on the subject matter, it is deduced that administrative disciplinary measures influence teachers' performance in the following ways:

Positive Influences

- Improved classroom management: Administrative disciplinary measures can promote a well-managed classroom environment, leading to improved teacher performance.
- Increased accountability: Disciplinary measures can hold teachers accountable for their actions, promoting a sense of responsibility and improving performance.
- Enhanced professionalism: Administrative disciplinary measures can encourage teachers to maintain high levels of professionalism, leading to improved performance.
- Reduced teacher burnout: Fair and consistent disciplinary measures can reduce teacher burnout by promoting a sense of security and stability.

Negative Influences

- Decreased teacher morale: Overly harsh or unfair disciplinary measures can decrease teacher morale, leading to decreased performance.
- Increased stress: Administrative disciplinary measures can create stress and anxiety for teachers, negatively impacting performance.
- Decreased autonomy: Overly restrictive disciplinary measures can limit teacher autonomy, leading to decreased motivation and performance.
- Teacher turnover: Excessive or unfair disciplinary measures can lead to teacher turnover, resulting in decreased performance and institutional knowledge.

Principals' Utilization of Administrative Disciplinary Measures for Teachers' Improved Performance

This session examines four major administrative disciplinary measures, what they entail, how they are implemented by principals and how they may influence teachers' performance in public senior secondary schools in Rivers State. These strategies include compulsory signing of attendance register, compulsory submission of lesson plans/notes, compulsory signing of class attendance for teachers, and the use of warning.

Principals' Utilization of Compulsory Signing of Attendance Register for Teachers' Improved Job Performance

The adoption of an attendance register for teachers is one of the disciplinary measures adopted by principals of public senior secondary schools in Rivers State to regulate teachers' daily attendance to school and to monitor and minimize the challenge of teachers' absenteeism and lateness. This register also monitors teachers' movement in and out of schools in the state. This register shows the time of arrival and departure of the teachers on each day. The teachers sign the register regularly in the morning before resumption (on arrival) and afternoon (on departure)

every day. Time of arrival of the late comers is indicated. In most cases, once teachers' statutory arrival time to work is reached, a red line is rules immediately after the last entrant on the register, so that latecomers' names get to appear below the red line. From experience as a teacher, every teacher frantically makes concerted effort to beat the resumption time to ensure that their names get on the attendance register before the principals' red line. As such, the attendance register inculcates in the teachers the discipline of punctuality. Failure to write one's name on the attendance register becomes the teacher's own cross to bear, as it means automatic record of absenteeism for the day, which may attract some stringent measures from the school management.

The strength or power of the attendance register as a disciplinary measure employed by school principals is in the reinforcement that comes with the records therein. The attendance register's information is used by school principals to both punish defaulting teachers and to reward performing teachers at the end of the term or session. In some cases, the most punctual teachers for the session or the teachers with highest mark of presence are acknowledged and rewarded, while teachers with poor record either suffer penalties of varying degrees as may be deemed fit by the school administration. Bassey et al. (2020) rightly affirm that the attendance register has implication on the salary received at the end of the month by teachers in some schools.

The job performance of teachers begins with their availability on duty. Availability in this regard encompasses both attendance and punctuality. The attendance register as an administrative disciplinary measure serves as a form of extrinsic motivation to teachers, causing them to be on duty as and when due (Ndifon & Cornelius-Ukpepi, 2024). It must be stated that absenteeism is one the biggest challenge that public schools face nowadays in Rivers State. Its consequences are numerous on the school. Absent teachers are a burden on the school principal and the rest of the staff in the sense that the drop in productivity is counterproductive for the school system (Thierry, 2020). Lack of strict guidelines to guarantee attendance at work can result in open conflict between teachers. The tension may probably lead to an uncomfortable work environment, slow productivity and excessive turnover. The attendance register is therefore one of the tools adopted by Principals to ensure or motivate teachers to be present on duty.

Punctuality aims at ensuring that teachers attend school daily and also complete their working hours (Engle cited in Thierry, 2018). Punctual teachers are valuable assets to any school that wants to be performant. Teachers who do not respect punctuality constitute mere burdens on the system and do not contribute much to the overall productivity of the school. Some authors (White cited in Thierry, 2020; Edwards cited in Thierry, 2020) believe that a man's intellectual or moral character can be measured with his capacity to keep appointment. To this regard, Thierry (2020) sees punctuality as a key condition to succeed in life. The advantages of punctuality at work are numerous and include: respect of others; helps establish strong work ethics and enhance productivity, credibility and professionalism. Punctuality also help teachers to be better organized and better composed for the activities of the day. Punctual teachers are never in a hurry trying to catch up lost time. Hence, the attendance register has a way of boosting teacher performance with respect to punctuality.

Principals Utilization of Compulsory Submission of Lesson Plans/Notes for Improved teachers' Performance

The teacher's most fundamental duty in the school is classroom teaching. Effective teaching however requires high level of expertise premixed on good planning of the lesson to be taught, excellent lesson delivery and mastery of the tenets of students' evaluation on the lesson taught. Besides, there is the educational curriculum from which teachers' lessons must be drawn and every lesson has objectives which must be sufficiently achieved. It therefore becomes obvious that there are standards to be followed by teachers in the business of lesson delivery, and effective observance of every set standard in the school system always requires discipline. This discipline must verily be seen in the teacher's adoption of a lesson plan for every lesson, which has been found to be a veritable tool for effective instructional delivery (Hanane, 2016; Moradi, 2019).

Unfortunately however, most public secondary school teachers falter in the adoption of the lesson plan for their teaching. Some teach without any plan at all, while for others, the lesson plan and notes do not follow the institutional standard. Either of these situations is detrimental to the goal of classroom instruction. Given the criticality of the teacher's excellent performance in instructional delivery to effective school administration, one of the principal's most important tasks is to serve as an instructional supervisor to the teacher (Ekpenyong, 2017; Oyewole & Ehinola, 2024; Shuaibu, 2016) , and this comes with ensuring that discipline takes its root in the instructional activities of the teacher. One way through which principals achieve this is by demanding for weekly submission of the teachers' Lesson Plans and Notes.

The lesson plan has been defined by Wordu (2021) as a detailed account or description of a course of teaching or instruction by a teacher or an instructor, which is planned as a daily guide to direct the students' learning. According to him, the teacher's lesson plan is to include: (1) what the students are supposed to learn (goal of lesson); (2) Determining materials that will be used (Instructional materials); (3) How the goal will be achieved (Method or procedure); and (4) How to measure the achievement of this goal (Test, Assignment, Homework). The Lesson Note on the other hand is a detailed account of all the activities of the teacher and the students. It is the one that the teacher gives to the students. In public senior secondary schools in Rivers state, both the Lesson Plan and the Lesson Note are joined together. The lesson plan however precedes the note. The Note of Lesson is the development of the Lesson Plan. This contains the detailed development of all the lesson objectives communicated in the plan, examples, diagrams, and evaluations (assignment, homework or tests). Each teacher has a Long Note or Exercise book for each subject. This is where the Lesson Plan and Note for every week's work is written. This notebook is what is to be submitted to the principals on weekly basis for check – used as an administrative disciplinary measure.

Drawing up a lesson plan with the making of the lesson note is one of the most cumbersome, most difficult, and most tiring works of most teachers. A lot of teachers would rather teach directly from text books; and some would rather prefer to read/study the topic to be taught and then stand before the class and teach it off hand instead of sitting to first make a lesson note. This is because the making of a lesson note actually takes a lot of time and mental energy. As such, most public secondary school teachers do not have that self-discipline to sit down and make the lesson note, and especially when it is something that has to be repetitious every week. Majority of others who prepare the note may just do it shabbily without following the set educational and institutional standards for the making of lesson notes. This puts effective

lesson delivery at jeopardy – exposing the teacher and the students to a lot of unsavoury experiences in class during the instructional delivery process, such as missing out on important points; beating about the bush; vying off the lesson objectives; improper utilization of instructional time, etc. (Moradi, 2019).

The importance of the lesson plan to teachers' effectiveness in instructional delivery cannot be overemphasized. Some of its relevance, which makes principals take it very seriously with the teachers include:

- The lesson plan helps teachers to outline and articulate the objectives of the lesson. This helps in the organization of the lesson, which facilitates teachers and students activities and interaction in the lesson
- The lesson helps teachers to prepare, plan for the lesson and upgrade knowledge, and not just only the residual one Singh cited in Hanane (2016). One of the contents of the lesson plan is instructional materials. The instructional materials like textbooks and other information sources actually help in enhancing the teacher's knowledge bank. This is of high importance in the business of education.
- Through planning, the teacher organizes and structures instructional activities to stimulate the cognitive activation of students. Moradi (2019) argued that through planning teachers are expected to create both the visible structure of a lesson and the deep structure of learning.
- The lesson plan helps teachers to avoid digression.
- It promotes learner-centred teaching which allows feedback from the students (Wordu, 2021).
- It promotes effective coverage of the scheme of work.
- It encourages effective evaluation of the lesson in terms of stated objectives.
- It assists teachers in the management of the class (Hanane, 2016)
- The lesson plan also encourages a systematic and logical conclusion of the lesson.
- In a case of teacher's absenteeism, with a lesson plan on ground, it becomes easier for any teacher that is assigned to cover up for the absent teacher. This is also the case in situations where a new teacher is employed by a school on a subject. The lesson plans of previous teachers prove very handy for a start for the new teacher.

The importance of the lesson plan to the school system is simply inexhaustible. Ensuring that teachers are up to date with their lesson plans through weekly demand for submission to the principals' tables is thus an administrative disciplinary measure employed by principals of public senior secondary schools in Rivers State.

Principals' Utilization of Compulsory Signing Teachers' Class Attendance Registers for Improved Teachers' Performance

The teachers' class attendance register is a register that is kept in the classroom with each classroom prefect and is to be signed by every teacher at the end of their scheduled lesson period on the class timetable. This register contains entry time and exit time of the teacher. It is used to monitor and regulate teachers' classroom attendance. The necessity for this register is because teachers in public secondary schools are highly capable of absconding from classes. They may be present in school but miss their instructional sessions with students. Principals therefore use

this register to instill the discipline of classroom attendance on teachers. Not just that they must attend classes, but they must also ensure to cover their period, and through this register, principals keep track of teachers' performance with respect to class attendance and delivery of lessons.

Principals' Utilization of Warning for Improved Teachers' Performance

Warning is an administrative disciplinary measure of alerting teachers of some misconduct or act of indiscipline found in his action, found inappropriate by the head principal. It can be expressed in an oral or written form. Discipline is supposed to be constructive. Its goal is to guide teachers to improve the performance or correct inappropriate behaviors and not to punish the teachers (Ewah, 2017). According to Ground Report (2019), there are two types of warnings which include oral warning and written warnings. The oral warning is used when an offence is not that serious or when a teacher is offending for the first time. The principal invites him, talks to him, cautions him and warns him to desist from such actions in the future. Sometimes, the warning may also come when the principal has made efforts in the past at mildly correcting the teacher and the teacher has failed in effecting the desired changes in his/her conduct.

The principal may resort to verbal warning, and sometimes this is done with a firm or aggressive tone to show how seriously displeased the principal is with that conduct of the teacher. In some cases, this may come with some form of threat just to instill fear in the teacher to avoid future reoccurrence of the said misconduct. The warning could also be issued in the presence of some other teachers to serve as witness. All of these are done to ensure that the faulting teacher takes the warning seriously and make amends. Written warning on the other hand, is used when the offence committed by the teacher is not an offence that the principal can just warn him verbally and let him go. He is issued a query. He replies the query and explains reasons for his action. The query and his response are filed in the staff file for future references. After considering his response, a written warning also is issued to him and a copy of the warning letter also documented in the staff file.

A written warning should be clearly labeled so that the nature of the document is fully understood. A warning letter according to Owan and Ekpe (2019) generally describes: deficiencies, problems, or offenses, changes expected, immediate consequences, if applicable, future consequences if expected changes are not made and sustained, an evaluation date that allows the teacher a reasonable amount of time to demonstrate an acceptable level of substantial change for performance concerns. Immediate correction is expected for misconduct. Specifics concerning complaints from any source will be addressed only insofar as they are helpful in bringing about a change and will be balanced against the confidences and expectations of other persons.

Principals' use of warning as a disciplinary measure can help in improving teachers' performance in a number of ways, some of which include:

- Increased focus: A warning from the principal can help the teacher focus on areas that need improvement, leading to better performance.
- Enhanced professionalism: A principal's warning can encourage teachers to maintain high levels of professionalism, leading to improved performance.
- Reduced complacency: When teachers are warned by principals, it can help them avoid complacency and stay motivated to perform better.

- Warning sometimes acts as feedback to teachers, which helps them to better direct their ways of doing things in the school system. It shows to them that the principal is displeased with their performance, and could help them in reviewing their activities for better performance.

It is moreover very important that principals communicate clearly and specifically about the issues and expectations involved. Focus of warning must be on specific behaviours or actions that need improvement, rather than making personal attacks. Additionally, there is the need for principals to provide support and resources to help teachers improve their performance in areas where they have been warned.

Review of Related Empirical Studies

Owan and Ekpe (2019) carried out a study to examine disciplinary management in public primary schools and teachers' job effectiveness in Yakurr Local Government Area, Cross River State. Three null hypotheses were formulated accordingly to guide the study. The study adopted a descriptive survey research design. Census technique was adopted in selecting the entire population of 98 primary school managers which comprised of 49 head teachers and 49 deputy head teachers across 49 public primary schools available in the area. A questionnaire tagged: "Disciplinary Control in Public Primary Schools and Teachers' Job Effectiveness Questionnaire (DCPPSTJEQ)" designed and administered by the researcher was used as an instrument for data collection. The null hypotheses were all tested at .05 level of significance using Pearson Product Moment Correlation Analysis. Findings from the study revealed that warning, suspension, and dismissal have significant relationships respectively, to primary school teachers' job effectiveness. This study relates to the present study in focus and design, but differs in scope and method of data analysis.

Thierry (2018) carried out a study on the impact of punctuality and attendance policy on organizational performance. The purpose of the study was to fill the gap in literatures that only emphasized on the usefulness of punctuality and attendance in public institutions like secondary schools without addressing the impact of “African Time” on organizational performance. The study adopted a correlational design. The population of the study was 4,107 personnel of public institutions in that year. The sample for the study was 200 employees draw from the study population. A questionnaire instrument was used, which had a response of 80%. The study found that the overall regression model was significant. This means that punctuality and attendance at work have a significant impact on organizational performance. It appears that 75% of respondents believe that there is an inverse relationship between punctuality and performance. Thus, tardiness impacts negatively on performance. The above analysis also indicated that punctuality and performance have a positive correlation which means that as punctuality increases, employee performance also goes up. This presupposes again that disciplinary procedures should be tailored to enhance punctuality and performance-driven goal. This study relates with the present study in focus but differs in design and method of data analysis.

Moradi (2019) carried out a study to investigate the teacher’s attitudes towards the effects of lesson plan on classroom management. The study adopted a descriptive survey design. The study population comprised of 570 teachers of secondary schools, out of which a sample size of 160 respondents were randomly sampled. A questionnaire instrument was used for the study. The questionnaire had two parts, the first part had 6 items and the second part had 6 items too

and was applied randomly, too. Besides, the data analyzing was performed in SPSS (version, 21) and brought out the mean and standard division. Finally, the findings revealed the importance and role of lesson planning on classroom management numbered as follows: (1) Lesson planning is the most appropriate skill that the teacher needs to create a successful instructional exercise. (2) The effective teacher is the one who plans effective lessons. (3) Preparation is the most important thing a teacher does. The study relates with the present study in design, method of data collection, and method of data analysis. It however deviated in scope and focus.

METHODOLOGY

The study adopted the descriptive survey research design. The population of the study was the 333 principals of the 333 public senior secondary schools in Rivers State. The sample size was 100 principals (65 males and 35 females) representing 30% of the population. The sample was purposively chosen by the researcher for ease of access to the respondents from public senior secondary schools in Port Harcourt City, Ikwerri, and Obio/Akpor Local Government Areas of Rivers State. The instrument for data collection was a structured questionnaire constructed by the researcher and titled: "Principals' Utilization of Administrative Disciplinary Measures for Teachers' Improved Performance Questionnaire (PUADMITPQ). The instrument was validated by two lecturers of the department of Educational Management in Ignatius Ajuru University of Education, Port Harcourt. The reliability index of the instrument was determined using Pearson's Product Moment Correlation statistics on test-retest data obtained from a pilot study of 20 principals from the study population who were not part of the main study. The analysis gave a reliability coefficient of .89. The response pattern of the instrument was the modified 4 points form of Likert scale. The research questions were answered using descriptive statistics of mean and standard deviation whereas the hypotheses were inferentially tested using independent samples t-test at a significance level of .05.

RESULTS

Research Question 1: What are the administrative disciplinary measures utilized by senior secondary school principals for improved teachers' performance in public senior secondary schools in Rivers State?

Table 1: Mean ratings of male and female principals on the administrative disciplinary measures utilized by senior secondary school principals for improved teachers' performance

s/n	Items	Male Principals		Female Principals		Mean Set		Decision
		$\bar{X}_1$	SD_1	$\bar{X}_2$	SD_2	Mean	SD	
1	Compulsory daily signing of teachers' attendance register	3.53	.541	3.50	.541	3.52	.541	High Extent
2	Demanding for weekly lesson plan/notes	2.80	.529	2.82	.529	2.81	.528	High Extent
3	Compulsory signing of teachers' classroom attendance	2.69	.444	2.58	.445	2.64	.444	High Extent
4	Use of warning	2.70	.554	2.64	.556	2.67	.554	High Extent
5	Suspension of teachers	1.26	.638	1.30	.611	1.28	.624	High Extent
	Grand Mean	**2.54**	**.543**	**2.57**	**.536**	**2.56**	**.537**	**High Extent**

Hypothesis 1: There is no significant difference in the mean ratings of male and female principals on the types of administrative disciplinary measures utilized by senior secondary school principals for improved teachers' performance in public senior secondary schools in Rivers State.

Table 2: T-test of significant difference in the mean ratings of male and female principals on the types of administrative disciplinary measures utilized by senior secondary school principals for improved teachers' performance

Gender	N	Mean	SD	t	DF	Sig.	Decision
Male Principals	65	2.54	.543	.010	98	.992	H_{01} Upheld
Female Principals	35	2.57	.536				
Total	**100**						

Significance level of .05

The data in Table 1 reveals that the grand mean rating of the examined items was 2.54±.543. Since this value is greater than the criterion mean of 2.50, it means majority of the respondents agreed that the items were adopted by principals as administrative disciplinary measures for improved teachers' performance. The table shows that only Item 5 was not utilized by principals. Table 2 further revealed that there was no significant difference in mean ratings of male and female principals in that regard [t(98) =.010, p=.992>.05]. Since p is greater than the significance level value, H_{01} was upheld.

Research Question 2: To what extent does principals' utilization of compulsory signing of staff attendance register as a disciplinary measure improve teachers' performance in public senior secondary schools in Rivers State?

Table 3: Mean ratings of male and female principals on the extent principals' utilization of compulsory signing of staff attendance register as a disciplinary measure improves teachers' performance

s/n	Item	Male Teachers		Female Teachers		Mean set		Decision
		$\bar{X}_1$	SD_1	$\bar{X}_2$	SD_2	Mean	SD	
6	Compulsory signing of teachers' attendance registers compels teachers to be present in school.	3.54	.553	3.55	.554	3.55	.552	High Extent
7	Compulsory signing of the attendance registers boosts teachers' punctuality.	3.44	.551	3.48	.556	3.46	.553	High Extent
8	Compulsory signing of attendance register makes teachers have more respect for school time.	3.48	.515	3.51	.530	3.49	.522	High Extent
9	Compulsory signing of the attendance register boosts teachers' commitment to professional practice.	3.54	.553	3.55	.554	3.55	.552	High Extent
10	Compulsory signing of attendance registers gives principals' data on teachers that need help with managing their time.	3.48	.515	3.51	.530	3.49	.522	High Extent
	Grand Mean	**3.50**	**.537**	**3.52**	**.545**	**3.51**	**.540**	**High Extent**

Hypothesis Two: There is no significant difference in the mean ratings of male and female principals on the extent principals' utilization of compulsory signing of staff attendance register as a disciplinary measure improves teachers' performance in public senior secondary schools in Rivers State.

Table 4: T-test of significant difference in the mean ratings of male and female principals on the extent principals' utilization of compulsory signing of staff attendance register as a disciplinary measure improves teachers' performance

Respondent's Portfolio	N	Mean	SD	T	DF	Sig.	Decision
Male Principals	65	3.50	.421				
				-.385	98	.701	H_{02} Upheld
Female Principals	35	3.52	.424				
Total	**100**						

Significance level of .05

Data presented in Table 3 shows that the grand mean set of the 5 examined items was 3.50±.537, which is greater than the criterion mean of 2.50. As such, majority of the respondents agreed that principals' utilization of compulsory signing of staff attendance register as a disciplinary measure to a high extent improved teachers' performance. Table 4 data further revealed that there was no significant difference in the mean ratings of male and female principals in that regard [t(98) =-.385, p=.701>.05]. The p value being greater than the significance value of .05 implies that H_{02} was upheld.

Research Question 3: To what extent does principals' demand for weekly submission of lesson plan/notes as a disciplinary measure improve teachers' performance in public senior secondary schools in Rivers State?

Table 5: Mean ratings of male and female principals on the extent principals' demand for weekly submission of lesson plan/notes as a disciplinary measure improves teachers' performance

s/n	Items	Male Teachers		Female Teachers		Mean set		Decision
		$\bar{X}_1$	SD_1	$\bar{X}_2$	SD_2	Means	SD	
11	Principals' demand for weekly lesson plan/notes makes teachers to be up and doing in preparing them and this improves teachers' performance.	2.74	.553	2.80	.554	2.77	.552	High Extent
12	It helps teachers to stick to the syllabus in developing lesson content and this improves their performance.	3.44	.551	3.40	.556	3.42	.553	High Extent
13	It helps teachers in complying with best teaching practices for improved performance.	2.78	.515	2.70	.530	2.74	.522	High Extent
14	It helps teachers to make better use of their time for improved performance.	2.94	.553	3.32	.554	3.13	.552	High Extent
15	It helps teachers to avoid digression in lesson delivery.	3.48	.515	3.50	.530	3.49	.522	High Extent
	Grand Mean	**3.07**	**.537**	**3.14**	**.545**	**3.11**	**.540**	**High Extent**

Hypothesis Three: There is no significant difference in the mean ratings of male and female principals on the extent principals' demanding for weekly submission of lesson plan/notes as a disciplinary measure improves teachers' performance in public senior secondary schools in Rivers State.

Table 6: T-test of significant difference in the mean ratings of male and female principals on the extent principals' demanding for weekly submission of lesson plan/notes as a disciplinary measure improves teachers' performance

Respondent's Portfolio	N	Mean	SD	t	DF	Sig.	Decision
Male Principals	65	3.07	.537	1.96	98	.341	H_{03} Upheld
Female Principals	35	3.14	.544				
Total	**100**						

Significance level of .05

The data in Table 5 revealed that the grand mean set of the five examine items was 3.11±.540. Since this value is greater than the criterion mean, it implies that majority of the respondents agreed that principals' demand for weekly submission of lesson plan/notes as a disciplinary measure to a high extent improved teachers' performance. Table 6 further revealed there was no significant difference in the mean ratings of male and female principals in that respect, with the null hypotheses being upheld [t(98)=1.96, p=.341>.05].

Research Question 4: To what extent does principals' utilization of warning as a disciplinary measure improve teachers' performance in public senior secondary schools in Rivers State?

Table 7: Mean ratings of male and female principals on the extent principals' utilization of warning as a disciplinary measure improve teachers' performance

s/n	Items	Male Teachers		Female Teachers		Mean set		Decision
		$\bar{X}_1$	SD_1	$\bar{X}_2$	SD_2	Mean	SD	
16	Principals' use of warning helps teachers to retract their wrong steps and this improves their performance.	2.64	.553	2.65	.554	2.65	.552	High Extent
17	Warning serves as feedback to teachers for better performance.	3.04	.551	2.78	.556	2.91	.553	High Extent
18	Warning from principal helps teachers focus on areas that they need improvement, leading to better performance	2.60	.515	2.70	.530	2.65	.522	High Extent
18	Principals' warning helps teachers to maintain professionalism, leading to improved performance	2.76	.553	3.04	.554	2.90	.552	High Extent
20	Warning from principals helps teachers to avoid complacency and stay motivated for improved performance.	2.62	.515	2.80	.530	2.71	.522	High Extent
	Grand Mean	**2.73**	**.537**	**2.79**	**.545**	**2.76**	**.540**	**High Extent**

Hypothesis Four: There is no significant difference in the mean ratings of male and female principals on the extent principals' utilization of warning as a disciplinary measure improves teachers' job performance in public senior secondary schools in Rivers State.

Table 8: T-test of significant difference in the mean ratings of male and female principals on the extent principals' utilization of warning as a disciplinary measure improves teachers' performance

Respondent's Portfolio	N	Mean	SD.	t	DF	Sig.	Decision
Male Teachers	65	2.73	.421				
				-.185	98	.801	H_4 Upheld
Female Teachers	35	2.79	.424				
Total	**100**						

Significance level of .05

Data presented in Table 7 shows that the grand mean set of the 5 examined items was 2.76±.540, which is greater than the criterion mean of 2.50. As such, majority of the respondents agreed that principals' utilization of warning as a disciplinary measure to a high extent improved teachers' performance. Table 8 data further revealed that there was no significant difference in the mean ratings of male and female principals in that regard [t(98) =-.185, p=.801>.05]. The p value being greater than the significance value of .05 implies that H_{04} was upheld.

DISCUSSION OF FINDINGS

Administrative Disciplinary Measures Utilized by Principals for Improved Teachers' Performance

The first research question sought to ascertain the administrative disciplinary measures utilized by principals for improved teachers' performance in public senior secondary schools in Rivers State. The findings showed that principals utilized measures such as compulsory daily signing of teachers' attendance register, demanding for weekly lesson plan/notes, compulsory signing of teachers' classroom attendance, and use of warning. It was further found that majority of the male and female principals that made up the study subjects had similar view on principals' utilization of these measures. This finding is in line with that of Owan and Ekpe (2019), which revealed that principals' utilization of disciplinary practices such as warning, suspension, and dismissal had significant relationships respectively, to primary school teachers' job effectiveness. The present study moreover showed that principals did not really utilize suspension in disciplining teachers. This is because principals in public schools in Rivers State lack the power to suspend teachers. The most they could do is to report deviant teachers to the schools board, following laid down procedures.

Extent Principals' Utilization of Compulsory Signing of Staff Attendance Register as a Disciplinary Measure Improves Teachers' Performance

The study in this regard showed that principals' utilization of compulsory signing of staff attendance register as a disciplinary measure improved teachers' performance to a high extent. It further revealed that majority of the respondents shared the same opinion concerning this

position. By the finding of the study, compulsory signing of staff attendance registers as a disciplinary measure helped in improving teachers' performance through: raising teachers' attendance rate to school, boosting teacher punctuality, causing teachers to have more respect for school time, boosting teachers' commitment to professional practice, and furnishing principals with teachers' attendance data which could be used for informed decision making towards improving teachers' attendance performance. The findings of the study agree with Thierry (2018) who found that strong attendance policies at work places boosted staff attendance and punctuality and helped to address the impact of "African Time" on organizational performance.

Extent Principals' Demand for Weekly Submission of Lesson Plan/Notes as a Disciplinary Measure Improves Teachers' Performance

The study in this regard found' demanding for weekly submission of lesson plan/notes ensured that principals' demanding for weekly submission of lesson plan/notes as an administrative disciplinary measure improved teachers' performance to a high extent, and majority of the respondents were in agreement on this position. The findings of the study revealed that teachers' performance was improved in this regard because principals demanding for weekly submission of these records: made teachers to be up and doing; made them stick to the syllabus in developing lesson contents; made them comply with best instructional practices; enabled them to put their time to better use; and helped them to avoid digression. These findings are in tandem with Moradi (2019) who asserted that the lesson planning is the most important activity of the teacher as it determines a teachers' instructional effectiveness in the classroom.

Extent Principals' Utilization of Warning as a Disciplinary Measure Improves Teachers' Performance

The study in this respect found that principals' utilization of warning as a disciplinary measure improved teachers' performance to a high extent, and majority of the respondents were unanimous on this position. When principals use warning as disciplinary measure on teachers, the study reveals that it has the potential of helping teachers retract their steps for improved performance. Warning also serves as feedback to teachers and helps them to stay focused on areas that they need to improve. Additionally the study found that warning helps teachers to maintain professionalism and helps them to avoid complacency, all of which leads to improved performance. These findings are supported by that of Agesa (2015) who found that warning was effective when teachers' offences of deviances are still minor but have the potential of expanding to something deleterious to school mission and vision. As such warning helps to prevent bigger damages from being done by teachers.

CONCLUSION

Conclusively, teachers, like every other employee in public organizations are prone to indiscipline behaviour. If left without strong supervision and clear disciplinary provisions, the tendency of truancy and professional misconducts are high, all of which come to the detriment of effective job performance. Administrative disciplinary measures such as compulsory signing of attendance registers, compulsory submission of weekly lesson plans/notes, compulsory signing of teachers' class attendance registers and warning are needed to help them do the right thing, the right way, and at the right time.

Suggestions

Based on the discourse of the study, the following suggestions are made:

- Principals should effectively maintain disciplinary measures like compulsory signing of attendance registers, compulsory submission of weekly lesson plans/notes, compulsory signing of teachers' class attendance registers and warning to nip behaviour of teachers and enhance their job performance in public senior secondary schools in Rivers State.
- Principals should implement disciplining of teachers with the aim of helping them improve on their job performance for the attainment of goals and objectives of the school, and not as a witch-hunting or vindictive measure.
- School staff should periodically make teachers' indiscipline a point of discussion in their staff meetings with a view to suggesting solutions on how they could best be managed in the school system.
- School management boards should carry out a thorough diagnosis of the problem of teacher indiscipline, with the view to finding lasting solutions to them.
- Indiscipline teachers should be invited by school principals once in a while for one on one heartfelt discussion of their challenges which inform their behaviours. This could better help in solving the problem.

ABSTRACT

The paper looked into principals' leadership practices for quality education delivery in secondary schools in Rivers State. It takes the position that effective leadership which brings about quality education delivery in secondary schools is a product of administrative mechanisms and practices employed by principals; hence the paper is on instructional leadership practices of principals, such as vision and goal setting practices, decision0making practices, instructional supervisory practices, transformational leadership practices, and administrative disciplinary practices. The paper explored how these practices are carried out in schools by principals and how they impact on the quality of education delivery in public secondary schools in Rivers State. The paper concluded that the quality of education delivery in public secondary schools in Rivers State greatly depends on the leadership practices adopted by the school principals. In other words, leadership practices play significant role in principals' vision of seeing that quality education is delivered in Public secondary schools in Rivers state. The paper suggested among others that principals of public secondary schools should ensure the adoption of transformational leadership practices as to ensure quality educational delivery in public secondary schools in Rivers State.

Keywords: Leadership, Principals, Leadership Practices, Vision and Goal-Setting, Decision-Making, Instructional Leadership, Instructional Supervision, Disciplinary Practices.

INTRODUCTION

Secondary schools are established basically for effective and efficient teaching and learning which culminate in effective curricular and extracurricular achievements of students. All the processes that would make this possible are well articulated in relevant sections of Federal Republic of Nigeria (FRN, 2014) in the National Policy on Education, inclusive of the goals of education at the secondary level, curricular contents, and directives for teachers and Principals to enable them realize the goals effectively. The extent to which the programmes and policies are realized defines quality of education at this level. Knowing the importance of leadership to the realization of organizational goals and objectives, Principals have the responsibility of piloting

the affairs of secondary schools. From various literatures reviewed, it has been found that the leadership practices employed by Principals in the discharge of their duties have implications on performance of their schools with respect to goal attainment. Unfortunately however, situations in public secondary schools in Rivers State do not suggest that Principals have been effective in their leadership responsibilities.

The performance of teachers and students as shown by students' outcomes in both internal and external examinations clearly suggest that public secondary schools in Rivers State are not living up to instructional expectations. Most public schools in the state are apparently run without a clear vision and set goals for both teachers and students. Most teachers complain of not being carried along by their Principals in the making of important decisions that affect the school community, and as such, they do not feel motivated to give out their best. At some other quarters, Principals hardly show instructional leadership, and supervision of instruction appears passive, leading to poor instructional delivery. Besides all these, indiscipline appears to be the order of the day on the part of teachers. Absenteeism from school, lateness to work, checking in and out of the school premises during work hours and several other expressions of deviant behaviours which place question marks on teachers' commitment have become hallmarks of public secondary school teachers in the state. The situation indeed poses great threats to the quality of education dispensed in these schools.

In attempts to tackle such unwholesome situations, principals of public secondary schools in Rivers State thus employ various administrative strategies also referred to as leadership practices. Some prominent practices identified from literature and from interaction with some principals include having a clear vision setting instructional goals for the school; decision-making; providing instructional leadership; adoption of transformational leadership practices; and the adoption of some forms of administrative disciplinary strategies. These practices are hoped to bring about transformation in the system for the good of all stakeholders – teachers, students, parents, the immediate community and the nation at large. The researcher therefore embarks on this study to investigate the extent to which these leadership practices ensure and assure quality education delivery in public secondary schools in Rivers State.

It has become common knowledge that leadership plays critical role in the success or failure of the school organization. Leadership according to Stogdill in Abraham (2013:63) is a process that involves influencing the activities of an organized group of people towards goal setting and goal achievement. The school administrator as a leader is given the responsibility of coordinating and directing the activities of the school towards accomplishing set goals. This responsibility however defines more of management, but the icing on the management cake that turns it to leadership is "influence". The Principal's ability to influence the stakeholders of the school, thereby inspiring them to run with the school's vision is what makes him more than just a school administrator to a school leader. It would therefore not be out of place to say that the Principal is an administrator by position, and a leader by his influence. This influence comes by how he does what he does and how he relates with the people, in other words, through his leadership practices. As such, the paper examines principals' leadership practices.

Principals' leadership practices refer to what Principals do as instructional leaders and how they do them. According to Ebete and Ejims (2020), these leadership practices are directly related to how the Principals interact with and create interaction between teachers and students. They affect decision-making, teaching and learning, and the entire administration of the school and are instrumental to the realization of the aims and objectives of establishing the school as an institution. Some of the significant practices found which possess the potential of greatly

influencing school outcomes include: establishing a clear focus on student learning by having a vision, clear learning goals and high expectations for learning for all students; decision-making; instructional supervision; transformational leadership practices; administrative discipline; ensuring cordiality in school-community relationship; facility management; and every other behaviour that would inspire whole-hearted followership in the school community (Brewster & Klump, 2015; Ebete and Ejims, 2020; Nthakyo et al., 2016).

The whole essence of the various leadership practices of the school principal is to achieve quality education in the school. Quality is however a relative term which often needs a basis for assessment as what is considered quality to one party may not be considered quality to another. As such the Federal Republic of Nigeria (FRN, 2014) in the national policy on education becomes the basis for assessing quality in education delivery in Nigeria. It meticulously articulates the goals and objectives of every level of education and gives vivid outlines of the roles of Principals and every other stakeholder of the school system. The level to which secondary school outcomes align with the specifications therein is what defines quality of education, as quality is generally seen as the level of compliance with client's specification(s).

Quality in education delivery is an all-encompassing concept that includes quality of the inputs, the process and the outputs of the school system. The inputs may include standardized curriculum, high quality of teachers, efficient learners, appropriate resources, capable leaders and supportive parents, which are all essential for a quality delivery (Ekpo cited in Ebete & Ejims, 2020). The process on the other hand revolves round the administration of the school, which is where the Principal's leadership and leadership practices come in. The leadership practices are adopted to transform the educational resource inputs into desirable outputs, which include a conducive school environment and atmosphere that supports the process of instruction; a realized curriculum; and ultimately secondary school graduates found worthy in character and learning, with excellent academic outcomes. The leadership practices of Principals being considered in this paper for quality education delivery include: vision and goal-setting; decision-making; instructional leadership; transformational leadership practices; and administrative discipline. Although there exists a whole lot of them as found in literature, but the paper is delimited to these five practices.

THEORETICAL FRAMEWORK

The paper is anchored in Bass Transformational Leadership Model propounded by Bass in 1985 as cited in Osagie and Momoh (2016). This theoretical model came out of Bernard M. Bass' review of Burns theory of transforming leadership in 1985. Bass originally coined the word transformational leadership. In his work, he sought to analyze the psychological mechanisms that underlie Burns' transforming and transactional leaderships. His model thus came up with how transformational leadership could be measured and these measures specify how a leader influences his/her subordinates (Bass cited in Osagie & Momoh, 2016).

The Bass transformational leadership theory propounded in 1985 proposes that leaders can influence their subordinates by expanding their understandings of the importance of tasks; making them realize to keep organizational and team goals above the individual interest; and incorporating their development needs. In so doing the transformational leader is able to transform the subordinate to staff that are capable of securing the future of the organization.

Bass transformational leadership theory identified four components of a transformational leader. These include: (1) intellectual stimulation, (2) idealized influence, (3) inspirational

motivation, and (4) individualized consideration (Korejan & Shahbazi, 2016; Tengi et al., 2017). Intellectual stimulation refers to the degree to which the leader solicits ideas from his subordinates, challenges assumptions and takes risks. By this, he is able to simulate and encourage creativity in them, thereby nurturing and developing staff who are capable of independent thinking (Sanchez-Cardona et al., 2017). By idealized influence is meant the leader's ability to act as a role model for high ethical behavior to the subordinates, instilling pride in them, thereby gaining their respect and trust. Inspirational motivation in the same vein is the degree to which the leader articulates an appealing and inspiring vision to the subordinates, challenging them with high standards, communicating optimism about the future goals of the organization, and providing meaning for the task at hand (Korejan & Shahbazi, 2016). This is required to give followers a sense of purpose that motivates them to act appropriately. Individualized consideration according to Bass refers to the degree to which the leader attends to the needs of subordinates. Empathy and support, open communication, mentorship and coaching, listening and attentiveness, respect and acknowledgement of each follower's contributions are hallmarks of this transactional leadership component (Rafferty & Griffin, 2016).

The Bass model of the transformational leadership theory is applicable to this discourse in several ways:

Firstly, quality education delivery is a collaborative effort of the school Principal and the school staff (his subordinate). Transformational leadership ensures that both the Principal and the staff support, inspire and motivate each other towards reaching their reaching for their optimum potentials in task performance for the realization of school goals.

Secondly, a transformational Principal is one who stimulates the staff of the school intellectually. This raises staff who are objective, intuitive and innovative - capable of independent thinking, and who generate ideas and visions that help in realizing the goals and objectives of the school.

Thirdly, the idealized influence of a transformational Principal ensures that he act as a role model to his subordinates for high ethical behaviour. This is necessary for him to gain their respect and trust, which are required for quality education delivery.

Fourthly, a transformational Principal is an inspirational motivator who is able to sell his vision and goal to the subordinates, causing them to run with them like they were their own personal visions. The theory thus empowers the Principal with the know-how of how to raise an optimistic workforce capable of quality task delivery in the present and of securing the school's future.

Lastly, the individualized consideration component of the model stresses the need for cordial interpersonal relationship between the Principal and each and every staff of the school. It is popularly said that followers do not care how much a leader knows until they know that the leader cares about them. The transformational Principal is one who cares about the personal welfare, growth and interests of the staff, and as such, the staff get fully interested and committed to the goals and visions of the Principal with respect to delivering quality education in all aspects of the school life. In summary, the mechanisms for achieving the goals of transformational leadership as elucidated by Bass are fully in line with Principals' leadership practices for the delivery of quality education in public secondary schools in Rivers State.

CONCEPTUALIZATION REVIEW

Quality Education Delivery

Quality is variously conceptualized in literature by various authors, as the criteria by which it is judged seem to differ from one person to another. Different disciplines also seem to express peculiar conceptualizations of the term. As such, quality is seen as a subjective term which means different things to different persons, as what is considered to be of quality to one person may not be adjudged the same by another. To come up with a general stand on the concept therefore, various authors have suggested that quality can only be judged with respect to a set standard; hence, quality becomes a measure of the level of compliance of an output to a set standard (Eze, 2018).

Orim et al. (2018) described the term quality as the total measure of the features and performance of a process, product or service in comparison to the clients' or customers' expectation of that performance. According to them, quality is not just a feature of a finished product or service rather; it involves a focus on internal processes and outputs and includes the reduction of waste and the improvement of high standard products. Quality according to them could be either high or low. As to the high side of quality in education, Dike cited in Orim et al. (2018) opined that quality in education has major hallmarks such as content relevance, access, efficient utilization of ICT and outcome. According to them, quality education delivery in a school system will always yield the full development of students' potentials in life, which is the hope of every parent.

In the opinion of Nasiru and Kasimu (2018), quality is the measure to which a product or service meets criteria of client satisfaction, fit for use, meeting specifications and standards, and aesthetic appeal. To this regard, quality education delivery would mean the delivery of education services which meets the criteria of stakeholder satisfaction; is useful to the end users (the students and the society at large; meets specifications and standards stipulated in the national policy on education for the given level of education; and is delivered in such a way that is appealing to relevant stakeholders (parents, sponsors and the government).

For Ibara (2015), quality in education delivery is a measure of the extent to which educational services in the school and the products of education meet the goals of education at the given level under consideration. He sees quality education delivery as that which deals with issues of relevance of the administered education, its validity, functionalism and excellence, and the efficiency in the actualization of educational goals and priorities. For Ojekheta cited in Ibara (2015), quality of education is the summation of: the quality of the teachers in the school; the quality of the learners; the quality of the content of subjects being taught; the quality of infrastructure and resources in the school; the quality of management and planning in the school; and the quality of teaching and evaluation methods being adopted. In other words, quality of education encompasses the totality of the educational program and the physical and human resources of the school. Any lapses in any aspect of the school's operation would demean the wholeness of the school system.

For Coombs cited in Ibara (2015), the quality of an educational system must be viewed in relation to criteria that are both internal and external to the system. While the internal criteria would involve students' performance in standard external examinations like the Senior School Certificate of Examination (SSCE) and the likes, the external criteria would involve the

performance of the school system in relation to relevance to the society. This means that the delivery of quality education in senior secondary schools will result to exceptional products (graduates) who are useful to the society. For this to be possible therefore, the curriculum of senior secondary education must reflect the needs and aspirations of the society, and the Principals and teachers must put in due diligence in ensuring that the curriculum is excellently delivered as to raise students that the educational system would be proud of.

In the opinion of Achor (2013), quality refers to the worth of something; its goodness; its acceptability; its strength, taste and durability; and the desirability of its general attributes. This corroborates with the eight components of quality standards which form the concerns of the National Educational Quality Standard Assurance Policy as articulated in the National Policy on Education of FRN (2014). These include (i) learner achievement and standards; (ii) learners' welfare and participation; (iii) care guidance and support; (iv) leadership and management; (v) school community relationship; (vi) learning environment; (vii) teaching and learning; (viii) curriculum and other activities. Ensuring quality in all eight areas of concern becomes the responsibility of the Principal in the school, and he must necessarily employ leadership practices that gain the teachers buy in into his philosophies and visions for the school.

Elements of Quality Education

Although various authors seem to express different views on the concept of quality education, some common themes appear in the existing literature on the concept. These are referred to as elements of quality education, or simply features/attributes of quality education (Eze, 2018). Eze (2018) opined that one cannot claim to be administering quality education if certain conditions are not visibly in place. These conditions include:

- Healthy and well-nourished learners who have the full support of their families and communities and are willing and ready to participate in the instructional process;
- A healthy, safe, protective and gender-sensitive environment in which adequate instructional resources and facilities are provided;
- A rich curriculum with relevant contents and materials that support the acquisition of basic skills in numeracy and literacy, social and relational skills, health and life skills, and all such skills that support peaceful coexistence in the community.
- Processes that enable trained teachers to adopt teaching approaches that are learner-centred within classrooms that are well-managed and supportive of skillful assessment which facilitates learning; and
- Instructional outcomes encompassing knowledge, skills and attitudes that can be linked to the national goals of education and meaningful participation in and contribution to the society.

Principals' leadership practices

Principals' leadership practices are mechanisms employed by Principals in their administrative role of managing and administering schools for effective and efficient realization of the internal and external goals of the schools. They are the strategies adopted by Principals in leading the school community from a present position per time to where they are envisaged to be in the near and far future. They are modalities or things Principals do to realize their personal and collective

goals for their schools. The leadership practices are different from leadership styles in that while leadership styles relate to how leaders lead, leadership practices relate to what leaders do (Oshagbemi & Gill, 2014). Besides, different leadership styles can still adopt the same leadership practices.

The leadership practices of Principals are directly related to teachers-students interactions, decision making, instruction (teaching and learning), and the entire administration of the school (Ebete & Ejims, 2020) - all aimed at ensuring that the aim and objectives of the senior secondary level of education are achieved in the school. The attainment of school goals is fulcrum on the quality of education delivery in the school which is a function of the effectiveness of the leadership practices employed by the Principal who is the instructional leader of the school. To this end, Principals need to provide the appropriate leadership practices that can positively impact on quality education delivery in their schools. This necessitates the examination of and review of the leadership practices prominently adopted by public secondary school Principals in Rivers State and how they relate with quality education delivery in the state. From literature, the prominent and dominant leadership practices of Principals were identified, and include vision and goal-setting; decision-making; instructional leadership/supervision; transformational leadership; and administrative discipline (Owan & Ekpe, 2019). These are comprehensively reviewed below.

Principals' Leadership Practices and Quality Education Delivery

This section explores the relationship between the examined leadership practices of principals and quality education delivery in secondary schools in Rivers State, and by extension to Nigeria as a whole. The leadership practices of interest in the paper include vision and goal setting practices, decision-making practices, instructional supervision practices, transformational leadership practices, and administrative disciplinary practices. These are examined in the proceeding subheadings and paragraphs.

Principals' Vision and Goal-setting Practices and Quality Education Delivery

The leader who succeeds is the leader who is visionary. Successful Principals are known to be visionary leaders who are able to see into the future of where the school ought to be. They are never complacent with present position or performance of the school even when the school appears to be doing well, but are always thinking of continuous performance and improvement. It is this vision that the staff run with. It takes a Principal who has a clear vision for the school to command the trust, respect and followership of staff. So vision is about having a clear sight or foresight of a desirable future for the school: a future which benefits the staff, students and the entire school community. Kantabutra cited in Kantabutra (2015) argued that it is the leader's vision that guides his/her actions.

Certain empirical attributes of vision as characteristic of Principals' leadership are identified by various authors in Kantabutra (2015), and include brevity, clarity, abstractness, challenge, future orientation, stability, and desirability or ability to inspire. These attributes have been found to have direct relationship with staff satisfaction. It was also found by Kantabutra (2015) that such visions play critical roles in nurturing a shared vision which is of utmost importance to effective leadership.

The Principal's vision must also be clearly stated and sufficiently communicated to the school. It has to be visible, and something that everybody is aware of. As a matter of fact, people are only able to run with a vision that they are knowledgeable about. This is why most organizations often have their vision statement publicly displayed in strategic places in their organizations where everyone coming into the organization can see it. As such, Principals must also have their visions well-articulated and displayed or publicized around the school. All stakeholders of the school need to be fully aware of the Principal's or school's vision.

Kantabutra (2015) offered operational definitions for the seven attributes of vision for school improvement. These are as presented below:

- *Brevity* is the degree to which a vision statement contains approximately 11-22 words;
- *Clarity* is the degree to which a vision statement directly points at a prime goal it wants to achieve;
- *Abstractness* is the degree to which a vision statement is not a one-time goal that can be met, resulting in the vision then being discarded;
- *Challenge* is the degree to which a vision statement motivates teachers to try their best to achieve a desirable outcome;
- *Future orientation* is the degree to which a vision statement indicates the long-term perspective of the school and the environment in which it functions;
- *Stability* is the degree to which a vision statement is unlikely to be changed by any market or technology change; and
- *Desirability or ability to inspire* is the degree to which a vision statement specifies a goal and how the goal directly benefits teachers.

An example of a vision statement characterized by the seven vision attributes is as stated below:

> To be the leading public school in Rivers State by providing the most rewarding learning experience to students at an affordable price.

This vision statement is brief and clear since it points directly at a prime goal and contains 21 words. It is also abstract because the prime goal is not a one-time goal that can be met, and the vision is then discarded. Aiming *to be the leading public school in Rivers State* is also future-oriented as it indicates the long-term perspective of an organization and the future environment in which it functions. This vision is also stable. No matter how far it is projected into the future, the vision statement is unlikely to be affected by any market or technology change. This vision is also very challenging and desirable for organizational members.

Another aspect of the discourse on the Principal being a visionary leader is the aspect of goals and goal-setting. Goals are the concretized achievements that lead to the realization of the school visions. In a most simple term, Locke and Lotham cited in Sinnema and Robinson (2022) defined a goal as something we consciously want to attain. They buttressed that goals signal a gap between current and future accomplishments or states of being. Contrasting goals from visions, they described a goal as being a functional and more narrowly drawn target, whereas a vision is vaguer and abstracted as seen above.

For Hallinger & Heck (2012), goals in the context of education describe the state a school wishes to achieve by the end of the school year in relation to student learning, graduation rates,

school climate, or community satisfaction. In the same vein, Murin and Murdtadho (2020) defined education goals as statements that describe the skills, competencies and qualities that are to be possessed by learners upon completion of a course of program. Goal-setting according to Marzano et al. in Dotson (2016) is the process of establishing a direction for the school organization. Since school goals are not just about the learners alone, they could also be defined as statements of anticipated deliverables to be realized or accomplished in the school system within any definite set time. They cover every aspect of the school operation, inclusive of expectations for learners and educators, school-community relationship, etc. The Principal's goal-setting practices therefore entail defining objectives, selecting short-term targets that are feasible, and developing strategies that aid in realizing the goals.

A very strong link exists between goals and visions. It is the achievement of the goals that lead to the realization of the visions. School goals and missions, no matter how finely expressed, will remain ineffectual if they are not operationalized through relevant goals and action plans (Fullan cited in Sinnema & Robbinson, 2022; Hallinger & Heck, 2012). Goals help to give priority and scale of preference to activities to be performed in the school. They provide a critical mechanism for coordinating the work of school members and making decisions about how to allocate scarce resources (Goldring & Pasternak cited in Sinnema& Robinson, 2022).

Goal setting is not sufficient on its own. If the set goals eventually do not get realized, then it was all a waste of time setting them. The realization of the goals of the school greatly depends on the collaborative efforts of both the Principal and the school staff. This therefore calls for Principals to make their goal-setting practices collaborative. The extent to which teachers are involved in the setting of school goals has significant implication on their commitment to see to the realization of the goals. Empirical evidences suggest that Principals who succeed in the leadership practice of goal-setting are those who: set goals that offer clear direction to where the school is going; involve teachers in the goal-setting process; set high quality goals that focus on student achievement; and set goals with SMART attributes (Brewster & Klump, 2015; O'Neil, 2020; Sinnema& Robinson, 2022). SMART is an acronym that stands for Specific, Measurable, Achievable, Realistic and Time bound.

Principal's Decision-making Practices and Quality Education Delivery

The position of leadership in any institution is a decision-making position. The Principal is principally the chief decision maker or the chief preside over administrative decisions made in the school. The Principal as the head of the institution should ensure that his decision making leadership practice impacts positively in the students' academic performance and the entire administration process.

Successful Principals are known to be masters at sharing decision-making among their subordinates (Umar et al., 2021). Wahstron et al. in Gohlmann (2018) found that sharing decision-making and distributing leadership among staff raises the quality of education delivery thereby resulting in enhanced students' outcomes. This means that the more there is distribution of leadership and sharing of decision-making responsibilities among staff of the school, the greater the capacity of all individuals within the school, and the more goals and objectives will be effectively achieved. Decision-sharing and leadership distribution thus enhances administrative efficiency and productivity.

Heck and Hallinger in Gohlmann (2018, p.48) also found that shared decision-making had a positive impact on the quality of student outcomes and that the reverse was the case in

schools without shared decision making. Furthermore, Hitt and Tucker (2016) averred that when decision-making is shared, there is both the advantage of the principal benefiting from the varied perspectives of teachers and also the benefit of teachers' development. According to them, teachers who are involved in decision-making can see how their input is implemented and learn from the ultimate results of these shared decisions. This thus boosts such teachers' self-confidence and commitment to the vision of the Principal for the utmost good of the school.

Also, Abraham (2013:84) stated that "it has been found that participative decision–making stands out as the best way to achieve effectiveness and compliance in the school organization". He further noted that when teachers participate in decision-making, their satisfaction with the teaching profession is positively boosted. The opportunity to share in formulating policies according to Hoy and Miskel in cited in Abraham (2013) is an important factor in the morale of teachers and in their enthusiasm for the school organization. So, sharing decision-making or participative decision making not only results in better decisions, but also boosts the capacity of teachers and other leaders in the school organization, which in turns positively influences quality education delivery culminating in higher students' achievement.

Instructional Supervision Practices and Quality Education Delivery

Instructional supervision is arguably the most important function of Principals in senior secondary schools, accounting for why they are popularly referred to as instructional leaders in the school (Chiedozie & Victor, 2017; Gray, 2018). Unfortunately however, most Principals get carried away with other administrative responsibilities and activities, and also fail in delegating this duty to capable hands in the school, leading to decline in the quality of instruction in their schools (Ndubuisi et al., 2021; Ogunode et al., 2020; Suleiman et al., 2020). Successful Principals are known to place premium on instructional supervision practices as they realize the importance of this duty to their success as instructional heads in their schools.

The Principal as the instructional leader of secondary schools acts in four crucial areas – as a resource provider, as a teaching resource, as a communicator, and a visible presence at school who is always critical of whatever activities that are going on in the school (Andrews & Soder cited in Iqbal et al., 2021). His instructional leadership disposition includes behaviours that provide high expectations and outcomes and vivid policy objectives for the performance of students as well as the teachers. He supervises and provides feedbacks to the staff on the technicalities of the instructional (teaching and learning) process. He is also responsible for the provision and promotion of professional growth and development of the workers, all aimed at continuous improvement for sustained quality delivery of instruction in the school. Hoy and Hoy in Iqbal et al. (2021) are of the opinion that the Principal's vision of teaching and learning must be comprehensible and that he must have the professional development of his subordinates as a priority in mind if quality education really matters to him.

Supervision of instruction is variously conceptualized in literature. For Chiaha and Akubue (2013), supervision of instruction is the act of overseeing the teaching and learning processes in schools so that schools are administered in such an efficient and effective manner that they are able to attain world-class status. It has to do with the effort of the school administration at ensuring that teachers teach and behave in the manner that they are expected to behave (in tandem with ethical standards of the profession), and that students learn as they are expected to learn, so as to attain the standard and quality of instructional output that are in line with the expectations of all stakeholders of the given level of education.

Instructional leadership practices according to Onyali and Akinfolarin (2017) entail ensuring high quality teaching and learning by supervising instructional programme and ensuring effective use of instructional time to foster the attainment of educational goals and objectives. Similarly, Onuma (2016) that "Principal has the primary functions of exhibiting effective instructional leadership practices for the improvement of diversified curriculum and quality of instructional programme for effective attainment of educational goals".

Again, Nnebedum and Akinfolarin (2017) are of the view that instructional supervision is the actions taken to mentor and monitor subordinates or teachers and provide supportive and conducive atmosphere for improvement on the instructional process. Sule et al. (2015) stated that "Principals" supervision of instruction practices include; checking of teachers' lesson notes, scheme of work, students' notes, teachers' punctuality, teachers' regularity in class, classroom observation, moderation of examination papers and marketing schemes among others". According to them, instructional supervision practices help to ensure that instructional delivery is painstakingly planned, effectively executed and properly eradiated. The Principals ensure that instructional time is managed to ensure that instructional time is not interrupted by other school activities which are not related to the instructional process (Mohammed & Muhammad cited in Onyali & Akinfolarin, 2017).

It is therefore, the duty of school Principals to ensure quality and timely instructional delivery to facilitate school effectiveness through supervision and time management to foster coverage of scheme of work. The Principals' personal observation of teachers will help to eliminate cases of inadequate coverage of scheme of work, teachers' persistent lateness, missing of their class lessons, absenteeism and truancy among students in secondary schools. In this direction, Olele cited in Ebete & Ejims (2014)averred that it is the duty of the Principal to oversee the running of the school in terms of staff and student welfare, development and implementation of proper instruction, school-community relations, discipline and proper keeping of school records. Others include student admissions, proper documentation of school finances and the creation of a conducive learning atmosphere.

Techniques of Instructional Supervision

Peretomode cited in Archibong (2014) outlined practices of a skillful instructional supervisor (Principal) that can bring about an effective instructional process in the school. These include:

- Classroom observation: This involves the Principal visiting classroom sessions to observe and analyze teachers' classroom practices: the instructional process, the personality and self-carriage of the teacher, the teacher-students interaction, the lesson note and the teacher's presentation of the lesson. The Principal is present in the class to witness and make observations of the classroom session.
- Demonstration: This involves the supervisor's presentation of a pre-arranged series of events to a group of teachers for their view. This is used to initiate group discussions and stimulate teachers' growth.
- Teacher visitation: This activity also called "inter-visiting" or "reciprocal visitations". It involves one teacher visiting and observing another teacher in action in another class within the same school (inter-class visitation) or in another school (inter-school visitation). This method enhances proficiency especially if the beginning or inexperienced teacher watches experienced teacher in action. Principals make provisions

for this activity as a way of encouraging teachers' professional development for improved service delivery.

- Workshops: In workshops, the Principal initiates a temporary gathering of small groups of teachers to discuss a specific topic or work on a common project or problem together as a team to proffer solution to the problem.
- Micro-teaching: This is a modular teaching exercise scaled down in terms of duration, class size and complexity to allow the teacher focus on a selected strategy of teaching. The class size is usually between 5-10 pupils and the duration is usually not more than 10 minutes. While the teacher teaches, he is being observed by the Principal/supervisor. Immediate feedback is given, evaluating the teacher's performance. When corrections are made, the teacher either re-teaches the lesson to the same group or a different group of learners for improvement.
- Listening to tape, radio or recordings: This involves using sound recordings to present ideas to one or more listeners in such way as to help develop understanding or skills. Also the use of visual presentations through the media film, television, or video tape is increasingly important in the supervisory process.
- Guided Practice: This supervision technique involves individualized or small group manipulative activities. It is an approach in which doing is emphasized rather than talking with practice activities arranged out of context.
- Research: Research is the systematic and objective collection and analysis of data in order to find solutions to identified problems. Here the supervisor works with and through teachers to finding solutions to problems of teaching/learning that confronts them instead of dictating solutions to or autocratically setting educational problems relating to teaching and teachers.

Principals' Transformational leadership Practices and Quality Education Delivery

The word transformation is all about change; hence, principals who are transformational leaders are principals who bring about desirable change in their schools. Transformational leadership practices have been found to motivate and stimulate followers or team members into productivity and as such, principals who adopt these practices are able to effectively and efficiently drive their teachers into effectiveness and efficiency in the delivery of quality instruction in the school (Iroegbulam, 2021). The change that is brought about by transformational leadership is not just one that occurs in the system, but one that ultimately occurs in the people. The face of any school is a reflection of the staff in that school, and as such, transformational principals bring about the desired change in the teachers which consequently leads to desired change in every aspect of school performance. So transformational leadership involves a committed relationship between the leaders and the followers, one in which the leader and the followers raise each other's awareness of the goals and aspirations of the organization and inspire each other to optimize their potentials in the organization (Kalu et al., 2019). According to Harris-Boundy (2015), transformational leadership nurtures innovation and originality, and improve job performance. Krishnan cited in Iroegbulam (2021) opined that the main premise of transformational leadership practice is the leader's ability to motivate followers to exceed expectations. A transformational leader is able to inspire the subordinates to go beyond their own personal targets and to prioritize the goal of the organization over their own personal goals.

Transformational leadership is seen with principals of public secondary schools when they empower teachers to develop and grow on their jobs. Although the Principal's work is to oversee school activities and ensure that the process is going as expected, but the transformational leader pays keen attention to the personal wellbeing of the teachers on the job to see that each teacher becomes the best he or she can become. He understands that the best way to build a school is by building the builders—the teachers. He develops the teachers to become leaders, too, so that they are able to work collaboratively with him towards the attainment of school goals. he stimulates and inspires the teachers to reach beyond their perceived potentials, and produce extraordinary instructional outcomes. He is a "people person", a "process person" and a "product" person. For Charry (2012), such transformational Principals are able to exercise such a level of influence on their teachers because they possess high moral and ethical standard. As such, they become role models to teachers, making it easy for them to replicate themselves in the teachers. Transformational Principals thus do everything within their ability to ensure continuous improvement and continuous progress of stakeholders of the school, and to create a desirable instructional environment that favours quality delivery of education at all times.

Furthermore, a transformational instructional leader is a visionary leader who is future oriented. He has a strong personality that is able to inspire the school staff to change expectations, perceptions and work motivations which lead to instructional excellence cum quality education delivery (Aneke, 2015; Thompson & Akudo, 2020). In the opinion of Iroegbulam (2021), the transformational Principal adopts practices which stimulate the effort of their followers to be creative, innovative, problem solvers and people who can reframe problems and look at old situations with new perspectives. Bernard Bass in 1985 identified four basic elements that are hallmarks of transformational leadership, and these include idealized influence, inspirational motivation, intellectual stimulation and individualized consideration. These are reviewed below as practiced by transformational Principals.

Idealized influence of transformational principals

This is characterized by the principal's display of charismatic personality which serves as a role model to the staff, influencing them to be like him. It articulates high expectations and confidence in the subordinates. Transformational Principals practice idealized influence by role modeling and graciously granting unrestricted access to teachers. He displays high moral and ethical principles that are worthy of emulation. Through idealized influence, the Principal is able to build trust with his teachers, which is also reciprocated. Such Principals do not act like they know it all. They seek teachers' opinions and make teachers feel important as well. They are quick to admit when they are wrong and apologize appropriately, ensuring that a healthy and socially friendly working climate is always created in the school and promoting an atmosphere of respect and regard.

Inspirational motivation and ability to inspire confidence

This element of transformational leadership refers to the leader's ability to articulate a clear vision for the future, communicate expectations to his subordinates and demonstrate commitment to set goals through one-on-one coaching and mentoring of the subordinates (Iroegbulam, 2021). In the context of secondary schools, inspirational motivation refers to the ability of the Principal (instructional leader) to inspire confidence, motivation and a sense of purpose in his staff. Principals who demonstrate this attribute are known to be supportive of teachers' professional

development through in-service training, so that teachers grow and become fulfilled in their jobs. They understand that quality education delivery relies greatly on teachers' competence per time, and hence inspire and motivate teachers to reach for their optimum potentials at all times.

Intellectual stimulation and creativity

This element of transformational leadership refers to encouraging followers to challenge existing approaches, reframe problems, and think in new ways. The transformational leader is able to convey his vision in such a way that followers see the big picture and this helps them to succeed in their endeavours. Anjali and Anand (2015) averred that intellectual stimulation leads to the development of employee commitment to the organization. They further stated that this has implications for the ability of the organization to achieve goals based on the dedication and hard work of employees. The Principal's practice of transformational leadership achieves intellectual stimulation when staffs are made to be part of decision-making and are granted autonomy to demonstrate leadership within their own spheres of influence. By this, the teachers become innovative and creative in their task performance in school, which has implications for quality delivery of instruction.

Individualized consideration of group members

The transformational leader recognizes the personal needs and aspirations of his subordinates. He understands that meeting the personal needs of employees is one way to motivate them towards commitment and high level performance. He takes into account the differences in perspectives of followers and becomes a coach and mentor to them rather than acting as a boss. A Principal whose leadership approach is transformational is able to recognize what motivates each staff through meticulous observations and through eavesdropping. He seeks to see that their personal needs and desires are met, knowing that personal problems and burdens can affect teachers' job quality. Warrilow cited in Iroegbulam (2021) and Egbezor cited in Iroegbulam (2021) noted that satisfied workers are more effective and perform much better on their jobs than unsatisfied workers. They are also more committed to duty, which is predictive of quality task delivery. Satisfaction in this context refers to the extent to which workers' personal needs are met. As such, it becomes imperative for public secondary school Principals to practice personalized consideration in dealing with their teachers as this has been found to influence teachers' delivery of quality services to schools.

Principals' Administrative Discipline practices and Quality Education Delivery

Administrative disciplinary strategies of public secondary school Principals in River state in the context of this study refer to modalities or measures put in place by the school Principal to ensure that teachers maintain disciplined conducts in the discharge of their duties. Disciplined conduct of teachers in instructional delivery, attitude towards work, and in general idiosyncrasies in the work place is, as a matter of fact, a prerequisite for effective job performance (An, 2022; Buchtova et al., 2015; Khatun & Siddiqui, 2018; Rahimi &Karkami, 2013; Rohyani et al., 2021) and has implications for quality education delivery. These administrative disciplinary strategies fall within the purview of teachers' disciplinary management.

As humans, erring is inevitable and this happens either deliberately or unintentionally in the workplace. This reality is amplified in scenarios where one serves as a subordinate, or is a

follower, working by laid down rules or within a formal organization where certain professional way of life is expected. Sometimes, even best intentions of the employee when judged in the light of organizational modalities, end up becoming unacceptable. The organization's code of ethics/conduct therefore becomes the checklist by which all activities and performance of the employee are vetted. Teachers, therefore, beyond just making efforts to be committed to the school and in the discharge of their instructional duties, have professional conducts that are in tandem with the goals of the school, and ensuring that they do not deviate from the right track is the responsibility of the Principal. Principals thus employ disciplinary strategies to ensure that teachers continually act in manners that are in line with quality education delivery in the school.

Bacal cited in Owan and Ekpe (2019) averred that the disciplinary measures which can be used by the Principal to control the discipline of teachers include development of a code of conduct; warnings, reprimand, dismissal, suspension, deprivation of privileges, salary deductions, query, and demotion. For Ezeugbor and Eboatu (2018), the types of disciplinary strategies adopted by Principals on infracted teachers include warning, interdiction**, s**uspension, termination**, d**ismissal, compulsory Retirement, and demotion. However, all of these identified measures mainly apply in cases of confirmed infraction. Principals' administrative disciplinary strategies act both as preventive and corrective tools for teachers' acts of indiscipline. Prominent disciplinary practices identified in literature include: ensuring compulsory signing of attendance register; ensuring that teachers prepare and submit lesson plans/notes; use of warning; and the use of suspension. These are buttressed below.

Several studies have established the existence of relationship between administrative disciplinary measures and teachers' performance cum quality of education at various levels of education. Owan and Ekpe (2019) carried out a study to examine disciplinary management in public primary schools and teachers' job effectiveness in Yakurr Local Government Area, Cross River State. The study revealed that warning, suspension, and dismissal have significant relationships respectively, to primary school teachers' job effectiveness. In the same vein, Ahiri et al. (2019) conducted a study which aimed at analyzing and describing the effect of teachers' work discipline on teachers' performance. The study results showed a positive and significant effect of teachers' work discipline on teachers' performance. From reviews of several other studies on the subject matter, it is deduced that administrative disciplinary measures influence teachers' job performance in the following ways:

- Improved classroom management: Administrative disciplinary measures can promote a well-managed classroom environment, leading to improved teacher performance.
- Increased accountability: Disciplinary measures can hold teachers accountable for their actions, promoting a sense of responsibility and improving performance.
- Enhanced professionalism: Administrative disciplinary measures can encourage teachers to maintain high levels of professionalism, leading to improved performance.
- Reduced teacher burnout: Fair and consistent disciplinary measures can reduce teacher burnout by promoting a sense of security and stability.

Barriers to Principals' Effective Implementation of Leadership Practices for Quality Education Delivery in Public Schools in Rivers State

Various studies and authors express consensus on certain factors that have seriously constrained principals' administrative effective in public secondary schools in Rivers State (Adeniran, 2020; Chapi & Adio, 2020; Puyate, 2018; Usman, 2016). Some of these factors include:

- Financial Constraints: It is no more news that Nigerian public schools are grossly underfunded, and this is having serious limiting impact on administrators' ability to implement their plans, visions, and goals which would bring about quality delivery of education in their schools. Finance is acknowledge as the livewire of any school system (Usman, 2016) because the availability of finance within the principals' control ensures to a high extent his ability to purchase resources, and support teacher development programs which could boost the instructional process of the school. The common situation where principals hardly have money for spending on well-meaning intentions borne out of decision-making practices in the school will always be a serious barrier to principals' implementation of leadership practices. Even transformational leadership practices of the principal depend on the availability of finance to a high extent because it also involves meeting teachers' needs.
- Bureaucratic constraint: Principals' ability to elicit desired level of performance from teachers through the application of disciplinary practices is limited by reason of the fact that their power over teachers is highly limited. They cannot suspend nor fire deviant teachers. Because of this, there is the possibility that teachers take principals for granted, especially those teachers who have connections in the Schools Board.
- Infrastructural facilities constraints: The state of infrastructure is poor in some public schools, and as such, principals may be incapacitated in their efforts to lead schools effectively despite their application of leadership practices. For example, instructional supervision practices of principals become futile where the school physical environment does not support effective teaching and learning.
- Administrative competence constraints: Principals are effective in implementing leadership practices to the extent of their administrative skills, knowledge, and competence. Where principals lack the requisite knowledge and competence, it becomes a barrier to their effectiveness in school administration.
- Stakeholder participation constraints: In a school community where stakeholders like parents and community members are not lovers of education, their participation in school decision-making and in school activities may not be supportive of principals' administrative efforts.

CONCLUSION

Based on the foregone discourse, it is concluded that the quality of education delivery in public secondary schools in Rivers State greatly depends on the leadership practices adopted by the school Principals. In other words, leadership practices play significant role in Principals' vision of seeing that quality education is delivered in Public secondary schools in Rivers state. To ensure that quality education delivery is achieved in the schools, Principals adopt variety of leadership practices, the most significant ones being: vision and goal setting; engagement of

teachers in the decision-making process; supervision of instruction; transformational leadership practices; and the adoption of administrative disciplinary strategies. Irrespective of the style of leadership adopted by the Principal, these practices must necessarily be imbedded in their daily operations. Visions and goals must be set and properly communicated to the school community; teachers must be involved in the school's decision-making processes as this is the only thing that makes them to wholly commit to the realization of the outcomes of such decisions. Teaching and learning need the askance eyes of the Principal who by default is the instructional leader (the number one teacher and the number one learner) in the school; and the need for the Principal to always be futuristic in his approach, whilst ensuring that teachers' satisfaction, growth and development are enhanced can simply not be overemphasized. Finally are the disciplinary practices which ensure that all teachers do what they are supposed to do at the right place, in the right time, the right way and with the right attitude. All of these culminate in the delivery of education that meets standards, satisfies the stakeholders, and leads to improved students' performance.

Suggestions

The paper therefore makes the following suggestions:

- The government should increase funding of public secondary schools to be able to enable principals to work effectively towards ensuring quality education delivery in these schools.
- Greater autonomy and support should be granted to principals by the schools board in the area of exercising control over teachers for quality education delivery in public secondary schools in Rivers State.
- The government and well-meaning stakeholders of public secondary schools should partner in the provision of requisite physical facilities to compliment the efforts of principals towards ensuring quality education delivery in public secondary schools in Rivers State.
- The Ministry of Education should periodically organize leadership training and development programs for principals for regular up-skilling of their leadership competences and practices towards effective delivery of their administrative mandates in public secondary schools in Rivers State.
- The schools board and the Ministry of Education should create awareness through jingles on the necessity for stakeholder participation and support in school administration in other to compliment the administrative efforts of principals for quality education delivery in public secondary schools in Rivers State.

THE ROLE OF INFORMATION AND COMMUNICATION TECHNOLOGY (ICT) IN RECORD KEEPING IN NIGERIAN UNIVERSITIES

Grace Emmanuel EFFIONG
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

Information and Communication technology (ICT) has become an inseparable entity in all aspects of human life. The use of ICT has fundamentally changed the practices and procedures of nearly all forms of endeavor within business, governance and civil service. In Education, ICT has begun to have a presence hasn't been of much impact when compared to other fields of endeavor. The moving of the world to digital media and information has made the role of ICT in education to become more important and this importance will continue to grow and develop in the 21st century. The main aim of this paper was to investigate the role of ICT in record keeping in Nigerian universities. This paper aimed to analyze the effectiveness of ICT in record keeping, particularly in the computation and retrieval of students results, transcript; generation of e-payment receipt, student's bio-data, etc. In the cause of this study it was revealed that the use of ICT gadgets facilitate the preparation of students, results, transcripts, admission letters, among others. It therefore recommended that computer gadgets be provided in all departments to ease the stress involved in the preparation of students result and other data. Adequate funds must be provided to initiate develop, promote, review and implement ICT policies in the educational sector to bring about an improvement on ICT utilization, through computer courses taught in Nigerian Universities.

Keywords: Role, Information, Communication, Technology, Record-Keeping, University.

INTRODUCTION

University records constitute a fundamental aspect of higher education institutions, serving as the documented memory of their activities, decisions, and achievements. These records encompass a wide range of information and data, existing in various formats, including electronic documents, paper files, images, and more, that are created or received by university staff in the course of conducting their official duties. This broad definition underscores that the essence of a university record lies in its content and its connection to the institution's operations, rather than the physical or digital medium on which it is stored. There is no educational system, universities that exist without record keeping. Record keeping is one off the life wires of educational system. The

importance of record keeping in an organizational set-up like the school cannot be overemphasized, especially in ensuring that accurate and proper record of student's achievement and growth are kept. Records are the major administrative tools for the success of any educational system.

Records when not properly kept and managed disorganize the entire system and administrative effectiveness may not be achieved. Since staff and students presently live in information age, the keeping and control of information system in Nigerian universities should be sustained. Oftentimes, these records are not kept or managed effectively. The traditional methods of keeping records have been observed to be inefficient. The smooth running of any higher institution depends on effective and efficient records management as one of the student's personnel services. These records serve the purpose of referring to the past and serve as a sign post to the future. Records should be adequately stored and preserved for easy reference and retrieval. Records of most universities in Nigeria, either public or private are kept manually in paper form and with the passage of time, vital records and information are lost as the paper get defaced, mutilated, mixed-up and even misplaced. Imagine an applicant who applied for a program in the university, and her form was misplaced in the admission office, where the forms were kept. This could have been avoided, if the university was ICT compliant,

This problem, coupled with the difficulty in wading through a mountain of paperwork often result in wrong performance analysis, inaccurate planning and inefficient management of records. The few Nigerian universities that have adopted the electronic records keeping management system risen above these challenges as information and communication technology has enabled their administrative staff to have a total view of all the schools activities, including the preparation of students' transcripts, the corporate records, finance and staff records. One wonders why despite the rapid changes in technology that led to revolution in information and communication technology (ICT), the use of Information and Communication Technology gadgets is still posing a challenge to the university authority. It is against this backdrop that this paper sets to highlight the role of Information and Communication Technology in record keeping in Nigerian universities. In doing this, emphasis will be, on the concept of record keeping, classification of university records, methods of record keeping and retrieval, the purpose of record keeping, the concepts of ICT, the constraints, how to overcome them, conclusion and suggestions:

- Record: According to Oxford Language Dictionary, record refers to a piece of evidence about the past, especially an account kept in writing or some other permanent form. It can also be referred to as the past achievements or performance of a person, organization, or thing. Record can be defined as information created, received, and maintained as evidence and as an asset by an organization or person, in pursuit of legal obligations or in the transaction of business. Record is piece of information or description of an event that is written on paper or stored in a computer.
- Record keeping: Ndu, Ocho and Okeke in Wali (2007) defined record keeping as documented statements of facts about persons, proposals and activities in and about the school. Agi and Adiele (2009) opine that record keeping is the systematic documentation of information relating to school personnel, school facilities and sundry issues fundamental to effective administration of a school. Abraham (2003) saw record keeping as all the files, correspondences, documents, etc., that have information on persons, activities and facilities in the school. Record keeping therefore can be seen as the account

of transactions and all that happened to individuals and facilities in the school which can be retrieved when needed.

- Records Management (RM): also known as Information Management or (RIM) is the professional practice or discipline of controlling and governing what are considered to be the most important records life-cycle, which includes from the time such records are conceived, through to their eventual disposal. Records management can also be referred to as an organization's policies and procedures for managing file systems and disposing of records once they are no longer needed.

THEORETICAL FRAMEWORK

Several theories inform the use of Information and Communication Technology in record keeping, including the Technology Acceptance Model (TAM), the Diffusion of Innovation Theory, and the Adaptive Structuration Theory. These theories help explain how ICT is adapted, used, and implemented in the management of records. Record keeping theories provide frameworks for managing information throughout its lifecycle, ensuring authenticity, reliability, accessibility, and encompass concepts like the records lifecycle, accountability, and compliance.

- Technology Acceptance Model (TAM): This model suggests that people's acceptance and use of technology depend on perception of its usefulness and ease of use. In record keeping, this means understanding why users are willing to adopt and use ICT-based systems for record creation, storage, and retrieval.
- Diffusion of Innovation Theory: This theory explains how new technologies, like ICT-based recordkeeping systems spread within a population. It helps with understanding the factors that influence the rate of adoption and challenges faced during the process.
- Communication Theory: This theory helps understand how information is exchanged and shared through various communication channels, including electronic media. It is relevant to the use of ICT for record creation, dissemination, and retrieval. This theory examines how ICT facilitates communication and information sharing in record keeping, particularly in the context of electronic records. It explores how ICT influences the nature of communication, the creation of digital records, and the management of information flows.
- Records Management Theory: This theory provides a framework for understanding the principles and practices of managing records throughout their lifecycle, including use of ICT. It emphasizes the importance of ensuring the authenticity, reliability, and accessibility of records, both in physical and digital formats.
- Information System Theory: This theory provides a framework for understanding how information is created, stored, retrieved and used within an organization. It is particularly relevant to the design and implementation of ICT-based recordkeeping system, ensuring efficient and effective information management.
- Records Lifecycle: The records life cycle describes the stages a record goes through from creation to it eventual destruction. This theory views records as having a lifespan, from creation to eventual disposal or preservation, including stages of creation, maintenance, use, and disposal. The phases of the life cycle theory include;
- Creation: The initial stage where the record is contacted or received.
- Maintenance and Use: This is the period the record is actively used and maintained

- Disposition: This is the final stage where the records are disposed of in a secure and compliant manner, either through destruction or archival.
    - This theory recognizes that records go through different stages in their existence, including creation, classification, storage, retrieval, retention, and disposition. Understanding the lifecycle helps organizations develop strategies for managing records effectively at each stage. When combined provide a comprehensive of how ICT can be effectively integrated into record keeping, enabling efficient management and access to crucial information.
- Records Continuum Theory: This challenges the traditional life cycle model, which separates the creation, maintenance, and disposal of records. The continuum theory argues that records can be managed from their creation as archival materials, eliminating the need to wait until they are no longer actively used. This theoretical framework views records as a continuous process, from their creation to their eventual disposition. It emphasizes the interconnectedness of different stages of the records lifecycle. It also highlights the importance of understanding the context and purpose of records throughout their existence.
- DIRKS Methodology: DIRKS (Disposal Review and Knowledge System) is a methodology for developing and issuing records disposal authorities, which are used to determine how long records should be retained and how they should be disposed of. It provides a structured approach to managing records retention and disposal.

Contextual Approach

Recordkeeping theory must be contextual to the organization, as different organizations have different needs and requirements for managing records. The specific theories and practices used will vary depending on the nature of the organization, its activities, and the types of records it creates.

All these theories when combined provide a comprehensive understanding of how ICT can be effectively integrated into record keeping, enabling efficient management and access to crucial information.

Principles of Good Recordkeeping

Key principles or record keeping include the following:

- Accountability: Ensuring that records are managed responsibly and that those responsible for their management are accountable for their actions.
- Transparency: Making records accessible and understandable, promoting openness and trust.
- Integrity: Maintaining the authenticity and reliability of records.
- Protection: Safeguarding records from damage, loss, or unauthorized access.
- Compliance: Ensuring that recordkeeping practices meet legal, regulatory, and organizational requirements.
- Accessibility: Making records readily available to those who need them.

- Retention: Determining how long records need to be kept for business, legal, or historical purposes.
- Disposition: Deciding how records will be disposed of when they are no longer needed, whether through destruction or transfer to a repository.

Classification of University Records

University records encompass a wide range of documents vital for the administration, academic function, and historical preservation of institution. It involves a lot of information including; academic transcript, students files minutes of meeting, policy documents and research grant applications, all created or received by the university employees in their official capacity. These records can be categorized into academic, administrative, financial, and historical types, all important for effective university operation and decision making. University records are classified as follows

1. **Academic Records:** Academic records serve as the official documentation of a student's progress and achievements throughout their academic career at the university. These records include official transcripts, which provide a comprehensive history of courses taken, grades received, and credit hours earned, as well as verifications of enrollment and degrees conferred upon graduation. These records pertain to students' academic progress. Examples include:
   Register of admission/matriculation: this record shows the list of students each year for each course, department and faculty. It contains Admission/matriculation number, surname, and other relevant personal information on the students. It also contains the oath of allegiance and obedience to the university authority and the promise to refrain from any act of violence or any action aimed at disrupting the activities of university. Examples are Matriculation Pledge, course enrollment, examination results, and thesis or dissertation records. They also include attendance registers, and other academic documents related to student performance.
   *Cumulative Records***:** this contains the progress report of each student, the scholastic performance and conduct for each course for each session or semester. Transcripts and results are forms of the cumulative records.

2. **Administrative Records**: Administrative records encompass the wide range of documents and information that pertain to the university's origin, its ongoing development, the various activities it undertakes, and its overall accomplishments as an institution. These records are generally categorized into two main types: *Policy records*: which outlines the university's rules, regulations, and adopted procedures for carrying out its responsibilities.
   Operational records: are necessary for implementing these administrative policies and ensuring the smooth functioning of the university's day-to-day operations.
   A multitude of documents fall under the umbrella of administrative records, including the findings and reports of both financial audits (examining the university's financial systems) and programmatic audits (evaluating the effectiveness of specific programs or departments). Others include records related to university awards (including criteria, eligibility information, recipient correspondence, and lists of winners), calendars of

events and programs organized by various departments and centers; documentations of conferences, symposia, and workshops attended by university staff. Curriculum records that document the development of academic programs; departmental histories chronicling the evolution of university units; various planning documents all fall under administrative records.

Others are project or program reports; official policies and procedures governing different aspects of university operations; records related to the development and accreditation of academic programs; resource and reference materials used by administrative units in carrying out their functions; self-study reports completed by departments or offices; strategic plans outlining the university's goals and objectives; and general subject files that provide background information for office programs and activities. These records cover the general operations and management of the university, such as, policies, committee papers, minutes of meetings, staff files, and other administrative documents. They also include inventory records of facilities and equipment, as well as budgetary information.

3. **Financial Records**: Financial records are essential for the sound fiscal management of a university. They include documents related to the institution's accounting practices, the conduct of internal and external audits, all banking activities, the processes of budget development, approval, and execution, procurement of goods and services, the preparation and dissemination of financial reports, and compliance with all applicable tax regulations. This category of records is of paramount importance for ensuring the financial accountability, transparency, and sustainability of the university. These records pertain to the financial operations of the university, including budgetary information, financial statements, bursary receipts and other financial documents.
4. **Human Resources Records/Personnel Records:** These records provide a comprehensive documentation of an employee's relationship with the university, from the initial stages of recruitment and hiring through their active employment and eventual separation from the institution. They include a wide range of documents such as the employee's original application materials, records of their performance evaluations conducted throughout their tenure, documentation of any disciplinary actions taken, and letters or notices of commendation recognizing their contributions and achievements. Personnel records for all individuals employed by the university are typically maintained by both the central Human Resources department, which serves as the official custodian of employee information, and another department within the specific academic or administrative department where the employee works, reflecting a shared responsibility for managing employee-related documentation. This dual system necessitates clear communication and coordination between HR and departmental units to ensure accuracy and consistency in recordkeeping practices.

   Comprehensive personnel record serves various HR functions; including performance management, compensation administration, and legal compliance, while also providing a historical account of the employee's service to the university. Access to personnel records is generally restricted to protect the privacy and confidentiality of employee, access is granted only to the individual employee themselves, or to authorized university officials who have a legitimate professional need to access the information in order to perform their duties, and in response to legally mandated requests such as court orders. Strict

adherence to these access restrictions is paramount for maintaining employee's trust and complying with privacy regulations.

The specific contents of an employee's personnel file can vary but often include; their original resume or curriculum vitae submitted during the application process, the official offer letter detailing the terms and conditions of their employment, various hiring forms completed upon joining the university, signed notices of appointment and reappointment documenting their official employment status, personnel action forms that record any changes in their employment status or position, records of their performance evaluations conducted over time, documentation related to any supplemental compensation they may have received, and records of any written warnings or other disciplinary actions taken during their employment.

The length of time for which personnel records must be retained is typically governed by a combination of university policy and applicable federal, state, and local laws. Retention periods can vary depending on the specific type of document, with some records required to be kept for the entire duration of an employee's service plus a specified number of years following their termination, resignation, or retirement. Strict compliance with these established retention schedules are essential for meeting legal obligations and ensuring proper management of employee's records. Examples of such records include; personnel files, payroll information, staff performance evaluations, records related to faculty and staff appointment and other relevant documents and financial related data.

5. **Research Records:** Research records are essential for documenting the entirety of a university's research endeavors, encompassing a diverse array of materials that provide evidence of the research process, findings, and outcomes. These records include fundamental documentation such as laboratory notebooks (both handwritten and electronic), computer databases containing raw and processed research data, microscopic slides and other physical specimens, digital and analog images and videos capturing experimental setups and results. Other clinical records may include research data itself, records of data analysis, audio and video recordings of research subjects, images obtained from subjects, and any other type of record that could potentially identify individuals from whom data were collected. Finally, research records also encompass all documentation related to the funding of research projects, such as grant applications, financial records detailing the expenditure of grant funds, purchasing records for research materials and equipment, rendered, and all correspondence with granting agencies, collaborating institutions, and individual collaborators. This comprehensive collection of research-related documentation is critical for ensuring the integrity, reproducibility, and accountability of the university's scholarly activities.

   Effective records management for research teams necessitates a thorough understanding of what constitutes a research record within the specific context of their discipline and project, as well as familiarity with applicable retention schedules mandated by funding agencies, ethical guidelines, and legal regulations. Researchers must also be proficient in best practices for the storage of research data, both in physical and digital formats, the establishment of clear and logical file structures to facilitate organization and retrieval, and the appropriate procedures for the eventual disposition of research records, whether through long-term archiving or secure destruction in compliance with relevant policies.

University Records Management programs often play a vital role in supporting researchers in their recordkeeping responsibilities by providing a range of services tailored to the unique needs of research records. These services can include secure off-site storage facilities specifically designed for the preservation of research data, efficient retrieval services to allow researchers to access their stored records when needed, and expert consultation and guidance on navigating the complex landscape of research-related record retention requirements and compliance obligations.

METHODS OF RECORD KEEPING AND RETREIVAL

There are two basic methods of record keeping, storing and retrieving in schools. These methods are manual and electronic.

Manual Record Keeping System

These involve keeping records in written form the following formats; files, shelves/cup boards and cabinets/drawers. Information on students and other school personnel such as academic and non-academic staff, school facilities and programmes can be written or graphically presented on paper such as books, reports, ledgers, etc. and kept in files, on shelves or locked cabinets in the office.

Electronic Record Keeping System

This involves the use of electronic devices in storing/keeping records either in written or graphic form. They have very large memories for storing information. Such devices include: personal computers, hard discs, floppy discs, tape storage, microfilms, Compact discs, DVDs, flash drives, etc.:

- Personal computer: A personal computer (PC) is a mini computer designed for use by one person at a time. It can be desktop, laptop, net book, tablet or handheld pc palmtop).
- Hard Disks: or called a disk drive, this method of storage stores and provides relatively quick access to large amounts of data. The information is stored on electromagnetically charged surfaces called platters.
- Floppy Disks: A floppy disk is a type of magnetic coating. Almost all floppy disks for personal computers now have a capacity of 1.44 megabytes. Floppy disks are readable, portable, and are very popular for transferring software from one PC to another. They are however very slow compared to hard disks and lack good storage capacity. Increasingly, computer manufacturers are not including floppy disks drives in the products as a built-in storage option.
- Tape Storage: Tape is used as an external storage medium. It consists of a loop of flexible celluloid-like material that can store data in the form of electromagnetic charges. Recorded tapes can be viewed or projected using appropriate projectors.
- Microfilms: These are films on which printed materials are photographed at greatly reduced size for ease of storage. They are often used to store many documents in a small space.

- CD-R: Compact Disk Recordable (CD-R) disks have become a universal data storage medium worldwide. CD-Rs are becoming increasingly popular for music recording and for file transfer between personal computers, CD-R disks are write-once media. This means that once used they cannot be erased or re-recorded upon CD-R disks can be played back in any audio CD player or CD-ROM players and drives that are CD-RW playback-compatible. The capacity of such discs is usually in the region of 760MB (760 Megabytes.)
- CD-RW: Compact Disk Rewritable is rewritable and can be erased and re-recorded upon over and over again. CD-RW discs can only be used on CD players, CD-ROM drives and DVD players and drives that are CD-RW playback - compatible.
- DVD: A DVD (Digital Versatile Disk or Digital Video Disk) is a high density optical disk with large capacity for storage of data, pictures and sounds.
- Flash drive: A flash drive is a small piece of equipment used to store and transfer information from one computer to the other using the USB (universal serial bus). It varies in size and shape and can hold gigabytes of information.
- Telnet: This is a network protocol used on the internet or local area network to provide a bidirectional interaction facility using a virtual terminal connection.
- Usenet: This is a collection of newsgroups where the users can post messages and these posted messages are distributed via use net servers. Each server holds these posted messages for a certain period of time called retention time.

Benefits of Using ICT for Record keeping

The adoption of ICT in record keeping offers several benefits, particularly for Nigerian universities dealing with scale and resource constraints. These benefits include:

- Improved Efficiency: Information and Communication Technology reduces reliance on paper-based systems, streamlining processes such as record updates and retrieval. This is crucial for managing large student populations, as digital systems involve faster data processing and less manual labor.
- Enhanced Accessibility: This facilitates better communication and data sharing among staff and students.
- Cost Savings: By minimizing paper use and physical storage needs, ICT lowers operational costs. This is a significant advantage for universities with limited budgets, as it reduces expenses on materials and labor.
- Increased Productivity: Staff can quickly locate and manage documents using digital systems, improving administrative productivity. This is especially important for tasks like students' enrollment, grading, and financial management, where delays can impact operations.
- Superior Data Storage Capacity: Information and Communication Technology allows for the storage of large amounts of data efficiently, unlike traditional paper-based systems.
- Faster Data Retrieval: ICT enables quick and easy retrieval of information, especially when searching for specific records.
- Quicker Data Analysis: There is faster analysis of data, allowing for better decision-making and planning.

- Easy Amendment of Data: Information and Communication Technology allows for easy updating and modification of records, reducing the risk of errors and ensuring accuracy.
- Reduced Paperwork: Information and Communication Technology systems minimize the need for paper-based records, leading to a more efficient and environmentally friendly approach.
- Improved Efficiency: Information and Communication Technology streamlines administrative processes, leading to faster and more efficient record-keeping.
- Better Data Management: ICT enables better organization, storage, and retrieval of data, leading to improved data management practices.
- Streamlined Processes: Information and Communication Technology facilitates the automation of tasks like student enrollment, course registration, and grading, improving efficiency.
- Enhanced Security: There is better security for sensitive data, protecting it from loss or unauthorized access.
- Improved Communication: ICT can facilitate communication between staff, students, and administrators, ensuring that everyone has access to the information they need.
- Remote Access: Information and Communication Technology allows for remote access to records, making it easier for staff to access information from anywhere.
- Data Sharing: Information and Communication Technology enables the secure sharing of data between different departments and institutions, improving collaboration.
- Cost Reduction: Information and Communication Technology can lead to cost savings in the long run by reducing the need for physical storage space, paper, and manual labor.

Examples of ICT Applications in Record Keeping:

- Student Information Systems (SIS): These systems manage student data, including enrollment, course registration, grades, and transcripts.
- Human Resource Information Systems (HRIS): These systems manage employee records, payroll, and other HR functions.
- Electronic Document Management Systems (EDMS): These systems store and manage documents electronically, making it easier to access and retrieve them.
- Online Learning Platforms: These platforms facilitate online learning and allow for the storage of course materials and student work.
- Email and Communication Tools: These tools facilitate communication between staff, students, and administrators.
- Database Management Systems: These systems store and manage large amounts of data, making it easier to access and analyze.
- Cloud-Based Records Management System: Data can be shared and updated remotely rather than solely on-premises.

CONCEPT OF INFORMATION AND COMMUNICATION TECHNOLOGY

ICT stands for information and communication technology and it can be defined as a diverse set of technological tools and resources used to communicate, disseminate, store, and manage information. Examples of ICT include, radio, television, video, digital versatile device (DVD)

telephone, satellite systems management information systems, Computer and network, hard ware and software, etc. ICT is a composite term which embodies three important concepts:

- **Information** means many things to many people, depending on the context. According to De Walter Ville and Gilbert, (2000) information is any potentially useful fact, quantity or value that can be expressed uniquely with exactness. Information is data that has been processed in such a way that it is meaningful to the person who receives it.
- **Communication r**efers to the transfer or exchange of information from person to person or from one place to another. Communication is said to have taken place when an action produces a reaction, whether positive or negative. Other writers on the field of communication see it a process, a transfer of information, ideas thoughts and messages. It involves a sender and a receiver. A process involving the passing of messages through the use of symbols which all participants in the communication encounter understand. It involves the exchange of ideas facts opinions attitudes and beliefs between people. It is not a one - way affair. There must be a sender to transmit the message and receiver to make appropriate decision on how the rest of the exchange should continue (James et al, 2004).
- **Technology** refers to the use of scientific knowledge in inventing tools that assist human beings in their efforts to overcome environmental hazards and impediment to comfort. In this regard, technology refers to the things like the computer, telephone, cell phone, GSM handset, television, radio, etc. Vera and Goni (2007) described information technology as the mechanical and electronic device that is capable of producing, manipulating, transmitting, and storing words, numbers, and pictures as information. It includes the supply side, that is computer hard ware and software, and the demand or user side, which is information's application. ICT and information technology (IT) are similar concepts that can be used interchangeably. They both involve communications and are therefore synonymous.

The use of internet has revolutionized access to information for the business world, libraries, education and individuals. A few of the most popular include E-mail (electronic mail), World Wide Web, etc. The internet and its technology continues to have a profound effect in promoting the sharing of information especially in academic world, making possible rapid transactions among businesses, and supporting global collaborations. The World Wide Web (WWW/W3) can be described as a library of resources available to computer users. The W3 resources are organized so that users can easily move from one resource to another.

ICT is an acronym that stands for information and communication technology. There is no universally accepted definition of ICT because the concepts, methods and application involve are constantly evolving on daily basis. It covers any product that will store, manipulate, transmit, or receive information electronically in digital form. For example; personal computers, digital television, email, etc.

THE ROLE OF ICT IN RECORD KEEPING

Impact of ICT in Record Keeping

Historically, the system of governance is based on sound record keeping so that irrespective of the executive head, the records forms the basis for governance, control and decision making.

Billions of pages of information are being generated each year by various departments in the universities. Some of these are in duplicate and triplicate form. Even then the relevant information is difficult to locate from the existing records and sharing of information between departments is not-existent. In tertiary institutions, people receive, store, process, call up selectively, retrieve, and transmit a vast amount of potentially useful information that will facilitate administrative duties. In some of Nigerian's higher institutions today, students' academic records and transcripts are computed and processed using computer.

Using computer to process vast amounts of academic data has been made easier, faster and accurate. The need for technological innovation has led to a revolution in the development of technological facilities that are applicable to keeping and management of school records. Making use of Information and Communication Technology for record keeping and management will go a long way in raising the standard of school records anywhere in the world. Educators are fast realizing the need for using computer for the keeping and management of school records as it convenient to both administrators and academic/nonacademic staff in tertiary institutions. Records and record keeping constitute the life wire of organizations (Egwunyenga, 2006). It would be very difficult to plan and administer any organization such as the university effectively if records are not kept and managed properly.

Okoli (2007) classified university records into two broad categories, namely management and administrative records. Management records are generated at the top management level (vice chancellor, deputies, bursar, librarian, and registrar) in the form of meeting records, procedures, decisions and resolutions. On the other hand, administrative records take the form of admission records, personnel records (employment, leave and duty records), and physical resource records.

It seems that the growing complexities of universities in Nigeria and the challenges it poses to management makes the application of Hi-Tech information and ICT indispensable for quality assurance (Okorie et al., 2005). Record keeping and management ought to be taken as a vital responsibility by school authorities because of the indispensable role records play in the effective day-today running of the institution. In order to make decisions on both short and long term, school authorities rely on information that are on records.

However, in most institutions, authorities do not have a good culture of record keeping. The few records that are kept are usually not properly stored, thus creating the problem of retrieval to users when needed. The few tertiary institutions authorities that have adopted the electronic record-keeping practice in the record management system of their institutions have risen above such problems of storage and retrieval. This is because I.C.T affords the opportunity to have a quick and easy view of all the records on school activities. Hence, by means of modern data storage facilities like computers, microfilm, CD-ROM, cassettes, e-mail, collaboration software and hardware, technological advancement has contributed to the effective storage and management of school records.

The use of Information and Communication Technology for school record keeping and management gives an overview of the number of students that registered, accurate information on students' fees payment status, and a comprehensive database of staff, students and lecturers with just a click. Due to the expansion in tertiary institutions, it is essential that computerization takes place and a total overhauling of the existing Information and Communication Technology system be undertaken for easy record keeping and management. Information and Communication Technology has the potentials for easing the administrative duties of tertiary institutions' record keeping and management. Being aware of the significant role of information and communication technology in our lives, especially in our educational activities, management

of tertiary institutions should be wise enough to use Information and Communication Technology in supporting record keeping and management.

Presently, records of most tertiary institutions are kept manually and, with the passage of time, vital records and information are lost due to the rise in the number of activities. A lot of problems have been identified from manual record keeping and management practice. They include lack of skills in the interpretation of scores from assessment instruments, lack of skills in records and preparation of reports and shortage of experts in record keeping.

For any school system to engage in satisfactory record keeping and management activities, information and communication technology must be applied in its operational system. This is because human beings can make mistakes. However, with the help of these modern electronic devices, the mistakes will either be eliminated or reduced to the barest minimum.

Osakwe (2012) is of the view that records kept and managed in tertiary institutions are classified as management records, administrative records, reference records and student records. Management records are records of meetings, procedures, decisions and resolutions kept as important reference materials through which institutions keep track of changes in their procedures, practices and to know the state of transparency of their activities in the past and present. They also stand as the basis for determining what should be done in the future. *Administrative records* include admission records, personnel records and physical resource records. *Admission records* are permanent records showing students particulars from the first day of admission. They help to keep track of the student's enrolment. They are a source of reference on every matter relating to when a student came into the institution, course of study, possible date of graduation, etc.

Personnel records provide information about the employment and duty records of both academic and non-academic staff members. These records contain detailed personal information of staff (in terms of age, gender, qualification, previous experience, appraisal forms, certificates), detailed description of tasks to be performed by staff in accordance with the employment conditions of service as well as staff disciplinary committee files. *Physical resource records* are records of tangible assets 18 such as classrooms, offices, laboratories and workshops as well as the equipment and furniture in them (Salau, 2005; Oyedeji et al., 2008).

Reference records are policy records which must be possessed by the institutions. They include government policies, decisions of governing council and procedures on funding and moral codes Daramola,(1995 in Osakwe (2012)). *Student records* include the personal data of students as at the time of admission, matriculation number, date/year of admission, department/course of study, degree in view, mode of entry, letter of recommendation/attestation, name of course adviser, academic records (transcripts, examination scripts), social records, and students disciplinary committee file.

Impact of ICT in Communication in Tertiary Institutions

It is mentioned that ICT is used in administration to support the business strategies and processes of higher education institutions. This facilitated creation of large and complex institutions that could function with increased efficiency and user-friendliness. It is also mentioned that usage of ICT in higher education administration involves "harnessing technology for better planning, setting standards, effecting change and monitoring results of the core functions of universities. Okafor (2007) argues that the impact of ICT is becoming more and more pronounced worldwide such that most areas of human endeavor refer to this technology in some capacity. Olayemi

(2007) posits that information and communication and technology ICT is computer related technology used to process, store and transit data. The nature of records is slowly changing as more records are generated electronically.

According to Stewart and Westgate (2008), an electronic record is a record stored on electronic storage media that can be readily accessed or changed. It often referred to as a machine readable record that is digitized and coded. It helps to reduce paper storage by converting paper documents into electronic form. It improves record retrieval time.

The pervasive influence of ICT has brought about a rapid technological, social, political economical and educational transformation which has paved way to network society. It helps to create economic viability for tomorrow's workers, contributes to the total development of the institution, strengthens teaching and learning, and provides opportunities for connection between the university and the world.

Information and Communication Technology (1CT) has a vital role to play in record keeping in Nigerian universities. It is now recognized as an important utility. It advances knowledge and skills necessary for our Universities. It also enhances staff productivity, efficiency and effectiveness.

The use of internet has revolutionized access to information for the business world, libraries, education and individuals. A few of the most popular include E-mail (electronic mail), The World Wide Web (WWW/W3), FTP (File Transfer Protocol), use net and Tel net. The internet and its technology continues to have a profound effect in promoting the sharing of information especially in academic world making possible rapid transactions among business, and supporting global collaborations. FTP refers to File transfer protocol which is a standard internet protocol for transmitting files between computers on the internet through the global internet. It enables users to view a wide variety of information including magazines, archives, public/college library resources, and current world and business news. The W3 resources are organized so that users can easily move from one resource to another.

Roles of ICT in University Recordkeeping

Information and Communication Technology (ICT) has transformed record-keeping in Nigerian universities by improving efficiency, accuracy, and accessibility. The roles Information and Communication Technology plays in university record keeping can be further streamlined thus:

- Digital Storage and Accessibility: ICT enables universities to store records digitally, reducing reliance on physical files. Cloud computing and university databases allow easy retrieval and backup of student records, faculty information, and administrative documents.
- Automation of Administrative Processes: ICT streamlines processes such as student admissions, registration, fee payments, and result processing. Online portals and management systems help in reducing paperwork and delays.
- Enhanced Security of Records: With ICT, universities can implement data encryption, password protection, and access control measures to secure student and staff records from unauthorized access and cyber threats.
- Improved Accuracy and Reduction of Errors: Manual record-keeping is prone to human errors. ICT systems, such as Student Information Systems (SIS), ensure accuracy in grading, transcript generation, and other academic records.

- Efficient Communication and Data Sharing: Universities use ICT tools like email, Learning Management Systems (LMS), and student portals to share records efficiently between students, lecturers, and administrative staff.
- Easy Retrieval and Backup: Cloud-based and centralized databases allow quick retrieval of records, even in emergencies. Backup systems prevent data loss due to disasters like fire or theft.
- Cost Reduction: Digitizing records reduces costs related to printing, paper storage, and manual labor in administrative tasks.
- Transparency and Accountability: ICT enhances transparency by keeping audit trails of document modifications, making it easier to track changes and hold individuals accountable.
- Research and Data Analysis: ICT tools help universities analyze student performance, enrollment trends, and other academic metrics, aiding decision-making and policy formulation.
- Compliance with Regulatory Requirements: Many regulatory bodies, such as the National Universities Commission (NUC), require universities to maintain proper records. Information and Communication Technology ensures compliance by keeping accurate and updated records.

Constraints to Effective Utilization of Information and Communication Technology in record keeping

There have been a number of factors militating against the utilization of Information and Communication Technology in education across the nations. In Nigeria, the political situation in the past thirty years has been used to entrench mediocrity, corruption in high places, and poor consumer culture. This has affected the use of Information and Communication Technology in the education sector. The various constraints to Information and Communication Technology utilization as a change agent in record keeping in Nigerian universities include:

- Inadequate ICT Infrastructure/Non-availability of computer gadgets: As seen in many African universities for use by staff and students. These universities, especially in rural areas, lack sufficient computers, internet connectivity, and digital tools. This is particularly acute in Nigeria, where universities often struggle with limited hardware.
- Unreliable Electricity Supply: Frequent power outages disrupt ICT systems, making it difficult to maintain consistent record-keeping operations. This is a common issue across Nigeria.
- Lack of Trained Personnel: Poor computer literacy among staff and students, as well as inadequately computer-trained/certificated staff is another constraint. There is often a shortage of staff trained to manage digital records, which hinders effective implementation. Studies emphasize the need for continuous professional training to keep up with technological changes, a gap particularly evident in Nigerian universities.
- Funding Constraints: Absence of subsidies to facilitate the purchase of Computer gadgets by students and staff at affordable rates, limited budgets, etc. restrict the procurement of Information and Communication Technology equipment and maintenance, exacerbating the digital divide. Research on university education systems indicate high costs of e-

learning platforms and infrastructure as significant challenges, which extend to record-keeping

- Weak Legislative and Organizational Frameworks: Many universities lack clear Information and Communication Technology policies that outline how ICT will be used for record keeping, including the security and integrity of electronic records. In Nigerian universities, particularly federal and state ones, there is no legal or organizational readiness for electronic records management.
- High Cost and Instability of Internet Services: The universities may not have the financial resources to invest in Information and Communication Technology infrastructure, training and support. The cost of internet access and unreliable internet connectivity is a very serious problem.
- Lack of motivation by academic and non- academic staff: ICT equipments are expensive since they are produced in the developed world. Absence of subsidies to facilitate the purchase of computer gadgets by students and staff at subsidized rates; lack of technicians to service and software and hardware; etc. all reduce the interest of staff members in ICT.

OVERCOMING CONSTRAINTS TO THE USE OF ICT IN RECORDS KEEPING

Some factors have been identified as constraints for the effective use of ICT in managing school records. The following therefore are some of the ways such constraints can be overcome as to enhance efforts towards effective, management of school records with the use of ICT.

- Lecturers and administrative staff should be exposed to training workshops, seminars and conferences on the use of ICT.
- Computer literacy/ education should be made compulsory for all academic and non-academic staff.
- Nigerian Universities should be provided with computer infrastructure and gadgets so as to make the use of ICT functional and effective.
- Nigerian Universities should be connected to the internet and the World Wide Web cheaply and with ease.
- The various departments in the universities should be linked up together via Local Area Network in each campus or a Wide Area Network connecting all campuses. This will facilitate research and exchange of ideas freely.
- Computer equipment should be sold at subsidized prices to university staff and students as is done in the advanced countries.
- Administrative staffs who are assigned responsibilities of record keeping in tertiary institutions should be retrained to be able to service the computer hardware and software.
- Public and private sponsorship should be encouraged in the provision of ICT facilities in the universities.

CONCLUSION

It is obvious that record keeping in schools is an inevitable and indispensable tool that helps for effective school management. That being the case, proper management of those records should be done. The traditional method of piling up files in the name of record keeping has been found

to be cumbersome and therefore the need of anew innovation in the use of ICT being adopted to guarantee effective and efficient management of school records.

Though certain factors have also been identified as constraints to using ICT in managing school records, suggestions have been proffered on how to surmount them. If those suggestions are adhered to, hopefully effective management of school records for the overall achievement of school management will be achieved. The moving of the world to digital media and information age has made the role of ICT in education to become more important and this importance will continue to grow and develop in the 21st century. Information communication technology (ICT) is an indispensable part of the contemporary society and thus needs to be adopted to meet the challenges being encountered in the quality of teaching, learning and research in tertiary educational institutions in Nigeria. The various constraints to ICT utilization in higher education must receive prominent attention, for ICT to continue playing its lofty role as a change agent for Nigeria tertiary institutions.

This study has attempted to examine the usefulness of ICT as very vital tool in record keeping in the universities. It is concluded that ICT gadgets have helped a lot to prepare the students result right from the computation of the cumulative G.P.A, the preparation of the master marks sheet to the computation and preparation of the students transcripts. Based on these, every member of staff both academic and the non-academic, should be computer literate.

Suggestions

ICT should be fully integrated into capacity building of academic and non- academic staff of tertiary institutions. University owners must be ready and willing to fund the procurement, installation and replacement of substandard and outdated ICT equipment.

Adequate funds must be provided to initiate, develop, promote, review and implement Information and Communication Technology (ICT) policies in the educational sector to bring about an improvement on ICT utilization, through computer apprentices courses taught in Nigerian universities. Electronic record keepers must stay up-to-date with database applications, software and data security issues so as to safeguard the sanctity of records. Institutions should likewise secure database applications and record keeping software for their record keepers.

It is important that institutions also procure antivirus software and a constant internet supply (for updates) to protect students academics records against viruses. Constant supply of electricity should be guaranteed.

Generating sets should be provided to solve the problem of power failure. Alternative means of energy supply like solar, wind and other forms of cheap renewable energy can be incorporated as a backup to the main power supply.

Finally, institutions should encourage staff and student's to purchase personal computers and laptop by liaising with financial institutions, governmental and international education bodies for funding and assistance. They should create E-learning environments and facilitate the use of the internet. There should be government policy on records Management in our universities.

QUALITY ASSURANCE STRATEGIES AND EFFECTIVE INSTRUCTIONAL DELIVERY IN UNIVERSITIES IN RIVERS STATE

Nne EGWU
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

The study investigated quality assurance strategies and effective instructional delivery in universities in Rivers State. Three research questions and three corresponding null hypotheses guided the study. This study adopted a correlational survey design. The population of the study was 3525 academic staff of public Universities in Rivers State which consists of 1385 academic staff of University of Port Harcourt, 1705 academic staff of Rivers State University and 435 academic staff of Ignatius Ajuru University of Education. The sample for this study was 529 which was determined using 15% of the total population of the study. To ensure that the sample is representative of the entire population, stratified random sampling was employed. The instruments used for data collection was a questionnaire designed by the researcher titled 'Quality Assurance Strategies Questionnaire (QASQ) and Effective Instructional Delivery Questionnaire (EIDQ). The reliability of the instrument was determined through a test of internal consistency using Cronbach Alpha method. The reliability co-efficient obtained for each of the sections were 0.84, 0.86 and 0.88 respectively. The average reliability index was 0.86 which showed the instrument was reliable. A total of 529 copies of the questionnaire were administered to the academic staff from the three Universities. However, due to poor accessibility and availability on several visits to the respondents for collection, only 428 (81% rate) were retrieved and this proportion was used for the analysis. Pearson's Product Moment Correlation Coefficient (PPMCC) was used to answer the research questions and test the formulated research questions. The study concluded that curriculum review, accreditation compliance, provision of infrastructure, and effective instructional delivery in universities in Rivers State revealed a strong positive relationship between these variables and instructional delivery. The study recommended among others that Universities should periodically revise their curricula to align with contemporary educational trends, technological advancements, and industry needs and Institutions should adhere to accreditation standards by ensuring qualified faculty, up-to-date instructional materials, and effective quality assurance mechanisms.

INTRODUCTION

Effective instructional delivery deals with the systematic process of imparting knowledge, skills, and competencies in a manner that enhances students' understanding and academic performance. It involves the use of well-structured lesson plans, appropriate pedagogical approaches, adequate teaching resources, and continuous assessment to measure learning outcomes. In universities, effective instructional delivery ensures that students are not only exposed to theoretical knowledge but also acquire practical and analytical skills necessary for their professional and personal development. The quality of instructional delivery in universities significantly impacts the overall learning experience, research output, and the employability of graduates.

To achieve effective instructional delivery, universities must implement quality assurance strategies that uphold academic standards and improve teaching and learning conditions. Quality assurance in higher education involves policies, mechanisms, and practices designed to maintain and enhance the standard of education. In Rivers State, public universities face challenges such as outdated curricula, inadequate infrastructure, and non-compliance with accreditation requirements, which affect the quality of education. Implementing quality assurance strategies, such as curriculum review, accreditation compliance, and provision of infrastructure, is essential for fostering effective instructional delivery.

According to Sam-Kalagbor and Nwuke (2024), quality assurance has to do with policies, strategies and practices aimed at ensuring that secondary schools carryout programmes that meets high standards and deliver effective learning outcomes Quality education is a fundamental pillar for societal progress, and its significance at the secondary level cannot be overstated. In recent times, the need to enhance quality assurance mechanisms in secondary schools has gained prominence, particularly within specific regions such as Rivers State. Quality education is a fundamental pillar for societal progress, and its significance at the secondary level cannot be overstated. Efforts to improve the quality of education are crucial for national development Mishra in Nwuke and Okwu (2024)

Quality assurance strategies in universities are designed to maintain and improve academic standards, ensure regulatory compliance, and create an enabling learning environment for students and lecturers. These strategies help institutions to align their programs with global best practices while addressing challenges affecting the quality of education. Effective quality assurance strategies in universities include curriculum review, faculty development programs, accreditation compliance, provision of infrastructure, continuous assessment and feedback, institutional research, and internal quality assurance monitoring. These strategies collectively enhance instructional delivery by improving the teaching-learning process, updating academic programs, and ensuring that students have access to the necessary resources for learning.

Curriculum review is a fundamental quality assurance strategy that ensures university programs remain relevant, updated, and aligned with societal and industry needs. It involves the periodic assessment and restructuring of academic programs to integrate new knowledge, emerging trends, and technological advancements that enhance students' learning experiences (Okon, 2021). A well-structured curriculum promotes active learning, critical thinking, and problem-solving skills, which are essential for students' academic and professional success. In public universities in Rivers State, curriculum review is necessary to bridge the gap between theoretical knowledge and practical application. Many university programs operate with outdated curricula that do not align with current industry demands, leading to graduates who lack the required skills for the job market (Eze, 2022). Regular curriculum review ensures that courses

remain dynamic and incorporate contemporary developments in various fields. For instance, the introduction of courses in artificial intelligence, digital literacy, and entrepreneurship can better prepare students for the evolving global economy.

The process of curriculum review involves consultations with academic experts, industry professionals, and stakeholders to ensure that course content meets both academic and labor market expectations. Universities must also consider student feedback in curriculum design to enhance the relevance of learning materials and teaching methods (Adebayo, 2023). Furthermore, regulatory bodies such as the National Universities Commission (NUC) play a significant role in ensuring that curriculum updates comply with national academic standards. When properly implemented, curriculum review enhances instructional delivery by making learning more engaging, practical, and adaptable to societal needs.

Accreditation compliance is a crucial strategy for maintaining academic quality and ensuring that universities operate in line with established educational standards. Accreditation is the formal recognition granted to academic programs and institutions that meet the minimum requirements set by regulatory bodies (Oladipo, 2021). In Nigeria, the NUC is responsible for accrediting university programs to ensure they meet the required standards in curriculum content, faculty qualifications, research output, and teaching facilities. Public universities in Rivers State must comply with accreditation requirements to guarantee the validity of their academic programs and degrees. Non-compliance with accreditation standards leads to the withdrawal of program approvals, making graduates ineligible for employment and professional certifications (Obinna, 2022). Accreditation also ensures that universities maintain a minimum standard in instructional delivery, including the adoption of appropriate teaching methodologies, qualified lecturers, and adequate learning resources. One of the key aspects of accreditation compliance is faculty qualification. Universities must ensure that lecturers possess the necessary academic qualifications, teaching experience, and research credentials to effectively deliver lectures. Additionally, accreditation mandates that universities maintain an adequate staff-to-student ratio to enhance personalized instruction and effective mentorship (Uche, 2023). By adhering to accreditation requirements, universities foster a culture of academic excellence, improve instructional delivery, and enhance the credibility of their degrees.

The availability of adequate infrastructure is critical to ensuring effective instructional delivery in public universities. Infrastructure includes lecture halls, libraries, laboratories, ICT facilities, and student hostels, all of which contribute to the overall learning environment (Chukwu, 2022). Without proper infrastructure, instructional delivery is hindered, leading to overcrowded classrooms, limited access to learning resources, and reduced student engagement. In Rivers State, many public universities face challenges related to inadequate infrastructure, which negatively affects the quality of teaching and learning. Overcrowded lecture halls limit students' ability to interact with lecturers, while poorly equipped laboratories hinder practical learning in science and technology courses (Afolabi, 2023). Additionally, inadequate internet access and ICT facilities restrict the adoption of modern teaching methods such as e-learning and virtual classrooms. To address these challenges, universities must invest in expanding and upgrading their infrastructure to support quality education.

Several scholars have conducted research on quality assurance strategies and their impact on instructional delivery in universities. Their findings highlight the importance of maintaining academic standards, ensuring compliance with accreditation requirements, and providing necessary resources for effective teaching and learning. However, gaps still exist, particularly in the context of universities in Rivers State, necessitating further investigation.

One notable study by Ogunleye (2021) examined the role of accreditation compliance in enhancing instructional quality in Nigerian universities. The study assessed how adherence to accreditation guidelines set by the National Universities Commission (NUC) impacts the quality of teaching, faculty qualifications, and learning outcomes. The findings revealed that universities that strictly comply with accreditation requirements tend to have better instructional facilities, qualified lecturers, and improved student engagement. However, the study was conducted at a national level, with limited focus on public universities in Rivers State. There is a need for a localized investigation to assess how accreditation influences instructional delivery within the specific socio-economic and infrastructural context of Rivers State universities.

Another study by Eze and Chukwu (2022) explored the impact of curriculum review on students' learning experiences in public universities in South-South Nigeria. The study found that regular curriculum updates incorporating modern technological advancements and industry needs significantly improve students' understanding, engagement, and skill acquisition. Despite these findings, the study did not examine how curriculum review interacts with other quality assurance strategies such as infrastructure provision and accreditation compliance. Additionally, while it focused on South-South Nigeria, it did not specifically analyze the challenges faced by universities in Rivers State regarding curriculum adaptation and implementation.

While previous studies have highlighted the significance of accreditation compliance and curriculum review in improving instructional delivery, they have not comprehensively examined how these strategies, alongside infrastructure provision, influence instructional effectiveness in public universities in Rivers State. Additionally, existing studies have largely focused on general quality assurance practices at the national and regional levels, without a specific focus on the unique challenges of public universities in Rivers State, such as overcrowded lecture halls, outdated curricula, and inadequate infrastructure.

This study, therefore, seeks to fill these gaps by investigating the extent to which curriculum review, accreditation compliance, and infrastructure provision influence effective instructional delivery in public universities in Rivers State. By providing a localized analysis, the study will offer insights into specific challenges and recommend strategies tailored to improving instructional quality within the state's public university system.

Statement of the Problem

Effective instructional delivery is crucial in universities, ensuring that students acquire the necessary knowledge, skills, and competencies for academic excellence and professional success. Ideally, universities in Rivers State should provide high-quality education through well-structured curricula, adherence to accreditation standards, and adequate infrastructure to support teaching and learning. These measures are essential for fostering an environment where lecturers can effectively deliver content, and students can engage in meaningful learning experiences.

However, public universities in Rivers State are grappling with several challenges that hinder effective instructional delivery. There are reports of outdated curricula that do not align with industry demands, making it difficult for graduates to meet labor market expectations. Additionally, while accreditation compliance is a requirement set by the National Universities Commission (NUC), some universities struggle with meeting these standards due to poor implementation of quality assurance policies, inadequate funding, and administrative bottlenecks. Moreover, inadequate infrastructure, such as overcrowded lecture halls, poorly

equipped laboratories, and limited ICT resources, further constrains effective teaching and learning processes.

Various measures have been introduced to improve instructional quality, including periodic curriculum reviews, accreditation exercises, and infrastructure development initiatives. Despite these efforts, the challenges persist, as many universities still operate with outdated course content, substandard teaching facilities, and inconsistent adherence to accreditation guidelines. The continuous decline in instructional quality has resulted in low student engagement, poor academic performance, and reduced employability of graduates.

If these issues are not adequately addressed, the quality of higher education in Rivers State will continue to deteriorate, affecting not only students and lecturers but also the overall development of the region. Given the growing concerns over declining instructional quality, there is an urgent need to investigate the extent to which quality assurance strategies—specifically curriculum review, accreditation compliance, and infrastructure provision—enhance instructional delivery in public universities in Rivers State.

Although previous studies have examined quality assurance in Nigerian universities, most have focused on broader national or regional contexts without addressing the peculiar challenges faced by universities in Rivers State. There is a need for a localized study that provides empirical evidence on how these strategies influence instructional effectiveness within the state's public universities. Therefore, this study seeks to bridge this knowledge gap by exploring the effectiveness of quality assurance strategies in enhancing instructional delivery in public universities in Rivers State. The findings will provide insights for policymakers, university administrators, and stakeholders in strengthening quality assurance mechanisms to improve teaching and learning outcomes.

Aim and Objectives of the Study

The aim of this study was to investigate Quality assurance strategies and effective instructional delivery in universities in Rivers Stat**e**. Specifically, the study sought to:

- Examine the extent of relationship between curriculum review and effective instructional delivery in universities in Rivers Stat**e**.
- Investigate the extent of relationship between accreditation compliance and effective instructional delivery in universities in Rivers Stat**e**.
- Ascertain the extent of relationship between provision of infrastructure and effective instructional delivery in universities in Rivers Stat**e**.

Research Questions

The following research questions guided the study:

- What is the extent of relationship between curriculum review and effective instructional delivery in universities in Rivers Stat**e**?
- What is the extent of relationship between accreditation compliance and effective instructional delivery in universities in Rivers Stat**e**?
- What is the extent of relationship between provision of infrastructure and effective instructional delivery in universities in Rivers Stat**e**?

Hypotheses

The following null hypotheses were tested at 0.05 level of significance:

- HO_1: There is no significant relationship between curriculum review and effective instructional delivery in universities in Rivers Stat**e**
- HO_2: There is no significant relationship between accreditation compliance and effective instructional delivery in universities in Rivers Stat**e**
- HO_3: There is no significant relationship between provision of infrastructure and effective instructional delivery in universities in Rivers Stat**e**

THEORETICAL FRAMEWORK

Total Quality Management (TQM) Theory

This study is anchored on Total Quality Management (TQM) Theory, propounded by W. Edwards Deming in 1986. Deming, a renowned management expert, developed the TQM theory as a systematic approach to continuous improvement in organizational processes, emphasizing customer satisfaction, efficiency, and quality enhancement. The theory has been widely applied in education, where universities are expected to implement quality assurance mechanisms to enhance instructional delivery and overall academic performance.

The Total Quality Management (TQM) theory emphasizes a continuous improvement process in service delivery by focusing on quality assurance mechanisms, performance monitoring, and adherence to established standards. It advocates for an institutional culture that prioritizes excellence through strategic planning, stakeholder involvement, and resource optimization. In the educational context, TQM suggests that universities must consistently review curricula, comply with accreditation standards, and provide adequate infrastructure to enhance instructional quality. The theory outlines key principles such as:

- Continuous Improvement – Universities should regularly review and upgrade instructional strategies, ensuring that curricula remain relevant and aligned with societal and industry needs.
- Customer Focus – In education, students are considered the primary beneficiaries, and their learning needs should be prioritized by ensuring effective teaching methodologies and conducive learning environments.
- Process Optimization – Instructional delivery should be supported by structured teaching approaches, well-equipped classrooms, and adherence to academic policies that enhance knowledge transfer.
- Stakeholder Involvement – Effective instructional delivery requires active participation from university administrators, lecturers, students, accreditation bodies, and policymakers in ensuring quality assurance measures are upheld.

Okwu and Nwuke (2024) opined that the application of TQM principles in administrative functions of universities encompasses various facets such as strategic planning, resource allocation, communication channels, and service delivery mechanisms. By integrating TQM

principles into administrative practices, universities in Rivers State can streamline operations, optimize resource utilization, enhance service quality, and ultimately elevate their overall performance and reputation.

The TQM theory is highly relevant to this study as it provides a structured framework for understanding quality assurance strategies and their impact on instructional delivery in universities. Firstly, it highlights the importance of curriculum review as a continuous improvement process that ensures course content remains up-to-date and meets industry expectations. Secondly, the theory underscores the necessity of accreditation compliance, which guarantees that universities adhere to established quality standards, leading to improved teaching and learning outcomes. Finally, TQM stresses the significance of infrastructure provision, as quality instructional delivery requires well-equipped classrooms, laboratories, libraries, and ICT facilities. By applying the TQM theory, this study will assess how quality assurance strategies influence instructional delivery in public universities in Rivers State. It will provide insights into how universities can implement systematic improvements to enhance academic performance and meet global educational standards.

CONCEPTUAL REVIEW

Curriculum Review and Effective Instructional Delivery in Universities in Rivers State

Curriculum review plays a fundamental role in ensuring effective instructional delivery in universities, as it aligns academic programs with industry demands, societal needs, and global educational standards. In Rivers State, the extent of this relationship is evident in how regularly universities assess and modify their curricula to improve teaching and learning outcomes. According to Okpara and Nwosu (2021), frequent curriculum reviews help universities incorporate new knowledge, emerging technologies, and modern pedagogical approaches, thereby enhancing instructional delivery. When the curriculum remains static for extended periods, it becomes outdated and disconnected from contemporary realities, leading to a decline in student engagement and learning effectiveness.

One major way curriculum review influences instructional delivery is by updating course content to reflect current trends in various disciplines. For instance, in fields such as engineering, medicine, and information technology, frequent advancements require universities to revise their curricula to include the latest developments. Ekezie (2022) found that universities in Rivers State that conduct regular curriculum reviews record higher levels of student performance and employability, as graduates possess skills that meet industry expectations. Conversely, institutions that fail to update their curricula struggle with producing graduates who can compete in the job market due to a lack of relevant knowledge and competencies.

Furthermore, curriculum review enhances instructional delivery by promoting innovative teaching methodologies. When universities revise their curricula, they often integrate modern teaching techniques such as problem-based learning, case study analysis, and experiential learning. This shift moves instruction away from traditional rote memorization to a more interactive and student-centered approach. As noted by Obinna and Chukwu (2023), a well-structured curriculum fosters effective instructional delivery by ensuring that lecturers adopt teaching strategies that engage students, stimulate critical thinking, and improve knowledge retention.

The extent of the relationship between curriculum review and instructional delivery is also reflected in the relevance of assessment methods. A curriculum that incorporates diverse and up-to-date evaluation techniques—such as project-based assessments, continuous coursework evaluations, and technology-driven assessments—provides a more accurate measure of students' learning progress. According to Bamidele (2021), universities in Rivers State that revise their curricula frequently tend to employ more dynamic assessment methods, leading to better instructional outcomes and improved academic performance among students.

Despite the importance of curriculum review, its implementation in some public universities in Rivers State faces several challenges. Bureaucratic bottlenecks, inadequate funding, and resistance to change among lecturers often slow down the process of revising curricula. As a result, some universities continue to use outdated course content, which negatively affects instructional delivery and student learning experiences (Amadi & Uche, 2022). Addressing these challenges requires a more structured and periodic curriculum review process, backed by adequate funding and policy support.

The extent of the relationship between curriculum review and effective instructional delivery in universities in Rivers State is significant. A well-reviewed curriculum enhances student learning by ensuring content relevance, promoting innovative teaching methods, and improving assessment strategies. However, the effectiveness of curriculum review depends on its timely implementation and the commitment of universities to aligning their academic programs with evolving educational and industry standards.

Accreditation Compliance and Effective Instructional Delivery in Universities in Rivers State

Accreditation compliance plays a critical role in ensuring effective instructional delivery in universities, as it serves as a mechanism for maintaining academic standards and improving the quality of education. In Rivers State, the extent of the relationship between accreditation compliance and instructional delivery is evident in how universities align their academic programs with regulatory requirements to enhance teaching and learning outcomes. According to Okorie and Nwogu (2021), accreditation ensures that universities meet the minimum academic standards set by regulatory bodies such as the National Universities Commission (NUC), thereby guaranteeing that instructional delivery meets national and global benchmarks.

One of the major ways accreditation compliance influences instructional delivery is through standardized curriculum implementation. Universities that comply with accreditation requirements ensure that their curricula are regularly updated, structured, and aligned with contemporary academic and industry needs. In a study by Eke and Chukwu (2022), it was found that public universities in Rivers State that adhere strictly to accreditation guidelines tend to have well-structured curricula that enhance knowledge acquisition, skill development, and critical thinking among students. Without proper accreditation compliance, some universities may operate with outdated curricula, leading to ineffective instructional delivery and poor graduate employability.

Furthermore, accreditation compliance promotes the recruitment of qualified academic staff**,** which directly impacts instructional effectiveness. As a key accreditation requirement, universities are expected to hire lecturers with the requisite qualifications, experience, and expertise in their respective fields. According to Amadi and Uche (2023), universities in Rivers State that meet accreditation standards often have better student-teacher ratios, well-trained

lecturers, and more structured instructional methods. Conversely, institutions that do not strictly adhere to accreditation guidelines may employ unqualified or insufficient teaching staff, leading to ineffective instructional delivery and poor academic performance among students.

Another critical aspect of accreditation compliance that affects instructional delivery is the adequacy of teaching and learning resources**.** Accreditation bodies evaluate the availability of essential facilities such as lecture halls, laboratories, libraries, and ICT infrastructure to ensure that they meet required standards. Bamidele (2022) observed that universities in Rivers State that comply with accreditation requirements tend to provide well-equipped learning environments, which significantly enhance instructional delivery. On the other hand, institutions that do not meet accreditation standards often lack modern educational resources, making it difficult for lecturers to deliver quality instruction and for students to engage effectively in learning activities. Accreditation compliance also enhances effective assessment and quality assurance mechanisms.

Universities are required to establish robust assessment procedures that evaluate students' academic progress through standardized examinations, continuous assessments, and research-based projects. Okon and Nwachukwu (2021) found that accredited universities in Rivers State consistently maintain structured assessment policies, ensuring that students acquire relevant competencies before graduation. In contrast, universities that fail to comply with accreditation standards may have weak assessment frameworks, leading to inconsistencies in grading, inadequate feedback, and compromised academic integrity.

Despite the strong relationship between accreditation compliance and instructional delivery, some universities in Rivers State face challenges in meeting accreditation requirements. Issues such as inadequate funding, administrative inefficiencies, and lack of proper monitoring have hindered full compliance in some institutions (Eze & Obi, 2023). As a result, some universities struggle with maintaining the necessary standards for effective instructional delivery, leading to gaps in student learning and academic performance. Addressing these challenges requires continuous investment in educational infrastructure, periodic staff training, and strict adherence to accreditation guidelines.

The extent of the relationship between accreditation compliance and effective instructional delivery in universities in Rivers State is highly significant. Compliance ensures that universities maintain high academic standards through standardized curricula, recruitment of qualified lecturers, provision of adequate learning resources, and implementation of effective assessment methods. However, achieving full accreditation compliance requires continuous institutional commitment, adequate funding, and proactive policy enforcement to sustain quality instructional delivery.

Provision of Infrastructure and Effective Instructional Delivery in Universities in Rivers State

The provision of infrastructure plays a fundamental role in ensuring effective instructional delivery in universities, as it directly impacts the quality of teaching, learning, and research. In Rivers State, the extent of this relationship is evident in how the availability of adequate facilities enhances lecturers' ability to deliver lessons effectively while also improving students' learning experiences. According to Okonkwo and Nwafor (2021), universities with well-equipped infrastructure, including lecture halls, libraries, laboratories, and ICT centers, tend to have better instructional delivery compared to institutions with inadequate facilities. Without the necessary

infrastructure, the learning environment becomes unconducive, leading to poor knowledge retention, reduced student engagement, and lower academic performance.

One key aspect of infrastructure that influences instructional delivery is the availability of well-equipped lecture halls and classrooms**.** Universities with spacious, ventilated, and technology-enabled classrooms facilitate better student-teacher interaction and effective knowledge transfer. Ekezie (2022) observed that in some public universities in Rivers State, overcrowded and poorly maintained lecture halls negatively affect instructional delivery, as students struggle with distractions, discomfort, and poor audibility of lecturers. On the contrary, institutions with adequate classroom infrastructure provide a more engaging and productive learning environment, allowing for interactive teaching methods and improved academic outcomes.

The provision of functional libraries and digital learning resources also significantly impacts instructional delivery. Libraries serve as knowledge hubs where students and lecturers can access textbooks, research journals, and academic databases necessary for effective teaching and learning. According to Amadi and Obi (2023), universities in Rivers State that invest in well-stocked libraries and online learning platforms enhance students' research capabilities and improve instructional delivery. However, some public universities struggle with outdated books, limited study spaces, and inadequate internet access, making it difficult for students and lecturers to access relevant academic materials.

Another critical aspect of infrastructure that affects instructional delivery is the availability of modern laboratory facilities and practical learning environments. In science, engineering, and medical programs, hands-on experiments and practical sessions are essential for developing technical skills and reinforcing theoretical knowledge. Okoro and Nwachukwu (2021) found that universities with well-equipped laboratories tend to produce graduates with better problem-solving skills and industry-relevant competencies. However, in some universities in Rivers State, obsolete equipment, lack of reagents, and inadequate laboratory spaces hinder effective practical instruction, thereby reducing the quality of education in technical and scientific disciplines.

Additionally**,** ICT infrastructure and digital learning facilities have become increasingly vital for effective instructional delivery. The integration of technology in education, including smart classrooms, e-learning platforms, and virtual laboratories, enhances accessibility and flexibility in teaching and learning. According to Bamidele (2022), universities in Rivers State that have embraced ICT infrastructure have recorded improved student engagement and learning outcomes, as digital tools facilitate multimedia instruction, real-time assessments, and remote learning opportunities. Conversely, universities with poor ICT infrastructure face challenges in implementing blended learning approaches, limiting students' exposure to global academic resources.

Despite the clear relationship between infrastructure and instructional delivery, many universities in Rivers State face challenges related to poor funding, inadequate maintenance, and infrastructural deficits. Amadi and Uche (2023) noted that many public universities in the state experience frequent power outages, inadequate hostel accommodations, and limited transportation facilities, all of which indirectly affect instructional delivery. When students lack access to stable electricity, accommodation, and transportation, their ability to focus on academics is compromised, leading to reduced classroom attendance and engagement.

The extent of the relationship between the provision of infrastructure and effective instructional delivery in universities in Rivers State is significant. Adequate lecture halls, libraries,

laboratories, and ICT facilities enhance teaching and learning by creating a conducive academic environment. However, infrastructural deficits pose a major challenge to instructional effectiveness, making it necessary for universities and policymakers to prioritize investments in educational infrastructure to improve learning outcomes.

METHODS

This study adopted a correlational survey design. The population of the study was 3525 academic staff of public Universities in Rivers State which consists of 1385 academic staff of University of Port Harcourt, 1705 academic staff of Rivers State University and 435 academic staff of Ignatius Ajuru University of Education (Source: Establishment Desk of Public Universities in Rivers State 2024**).** The sample for this study was 529 which was determined using 15% of the total population of the study. To ensure that the sample is representative of the entire population, stratified random sampling was employed. This technique involves dividing the academic staff into three distinct strata based on the three universities involved: University of Port Harcourt, Rivers State University, and Ignatius Ajuru University of Education. For each university, the sample was proportionately allocated based on the number of academic staff in each institution. Specifically, University of Port Harcourt, which has 1,385 academic staff, the sample was 208, Rivers State University, with a total of 1,705 academic staff, the sample was 256 while Ignatius Ajuru University of Education, which has 435 academic staff, the sample was 65. By using stratified random sampling, the study ensured that each university is adequately represented in the sample.

The instruments used for data collection was a questionnaire designed by the researcher titled 'Quality Assurance Strategies Questionnaire (QASQ) and Effective Instructional Delivery Questionnaire (EIDQ). The instrument was divided into two sections: Section A was used to collect demographic data from the respondents, section B contained questionnaire items that assessed the raised research questions and the questionnaire was based on four-point modified Likert rating scale of Very High Extent (VHE)-4, High Extent (HE)-3, Low Extent (LE)-2, and Very Low Extent (VLE)-1.

The research instrument was given to the researcher's supervisor and two other experts from the Department of Psychology in Measurement and Evaluation in Ignatius Ajuru University of Education, to scrutinize and analyze both face and content validity in terms of clarity and appropriateness.

The reliability of the instrument was determined through a test of internal consistency using Cronbach Alpha method. Twenty (20) copies of the instrument were administered to 20 lecturers who are outside the sample of the study but were part of the population of the study. Their responses were analyzed using the Cronbach Alpha Statistics. The reliability co-efficient obtained for each of the sections were 0.84, 0.86 and 0.88 respectively. The average reliability index was 0.86 which showed the instrument was reliable.

A total of 529 copies of the questionnaire were administered to the academic staff from the three Universities used in the study by the researcher and two (2) trained research assistants who were post graduate students of Ignatius Ajuru University of Education. Completed copies of the questionnaire were retrieved by the researcher and the accredited trained assistants on the spot, while others were collected at later dates within the period of three weeks. However, due to poor accessibility and availability on several visits to the respondents for collection, only 428 (81% rate) were retrieved and this proportion was used for the analysis.

The data collected for the study were analyzed using Pearson's Product Moment Correlation Coefficient (PPMCC) formula. Research questions were answered based on the value and direction of the correlation coefficient, (positive and high, positive but low, or negative and high or negative but low or moderate). Hypotheses were tested for significance of relationship at 0.05 level of significance. This was further tested by transforming the coefficient of correlation (r) to t in order to establish the significance or the r–value.

RESULTS

Research Question 1: What is the extent of relationship between curriculum review and effective instructional delivery in universities in Rivers Stat**e**?

Table 1: Relationship between curriculum review and effective instructional delivery in universities in Rivers State

Variable	N	$\sum X \sum Y$	$\sum X^2 \sum Y^2$	$\sum X \sum Y$	r-cal	R-crit	Remarks
Curriculum Review (X)	428	767.13	2307.33	2753.07	0.83	0.195	**Positive Relationship**
Effective Instructional Delivery (Y)		1108.04	3228.06				

**. Correlation is significant at the 0.05 level (2-tailed)

Table 1 shows the relationship between curriculum review and effective instructional delivery in universities in Rivers State. The Pearson correlation statistic measured the strength and direction of the relationship between the two variables. In this case, the correlation coefficient between curriculum review and effective instructional delivery is 0.83**,** which indicates that there is a high positive relationship between curriculum review and effective instructional delivery in universities in Rivers State. Therefore, the answer to Research Question 1 states that there is a high positive relationship between curriculum review and effective instructional delivery in universities in Rivers State.

Research Question 2: What is the extent of relationship between accreditation compliance and effective instructional delivery in universities in Rivers Stat**e**?

Table 2: Relationship between accreditation compliance and effective instructional delivery in universities in Rivers State

Variable	N	$\sum X \sum Y$	$\sum X^2 \sum Y^2$	$\sum X \sum Y$	r-cal	R-crit	Remarks
Accreditation Compliance (X)	428	836.04	2741.08	2907.07	0.80	0.195	**Positive Relationship**
Effective Instructional Delivery (Y)		1108.04	3228.06				

Table 2 shows the relationship between accreditation compliance and effective instructional delivery in universities in Rivers State. The Pearson correlation statistic measured the strength and direction of the relationship between the two variables. In this case, the correlation coefficient between accreditation compliance and effective instructional delivery is 0.80**,** which indicates that there is a high positive relationship between accreditation compliance and effective

instructional delivery in universities in Rivers State. Therefore, the answer to Research Question 2 states that there is a high positive relationship between accreditation compliance and effective instructional delivery in universities in Rivers State.

Research Question 3: What is the extent of relationship between provision of infrastructure and effective instructional delivery in universities in Rivers Stat**e**?

Table 3: Relationship between provision of infrastructural facilities and effective instructional delivery in universities in Rivers State

Variable	N	$\sum X \sum Y$	$\sum X^2 \sum Y^2$	$\sum X \sum Y$	r-cal	R-crit	Remarks
Provision of Infrastructure (X)	428	760.11	2618.12	2573.12	0.86	0.195	**Positive Relationship**
Effective Instructional Delivery (Y)		1108.04	3228.06				

Table 3 shows the relationship between the provision of infrastructure and effective instructional delivery in universities in Rivers State. The Pearson correlation statistic measured the strength and direction of the relationship between the two variables. In this case, the correlation coefficient between the provision of infrastructure and effective instructional delivery is 0.86**,** which indicates that there is a strong positive relationship between the provision of infrastructure and effective instructional delivery in universities in Rivers State. Therefore, the answer to Research Question 3 states that there is a strong positive relationship between the provision of infrastructure and effective instructional delivery in universities in Rivers State.

Testing of Hypotheses

The following null hypotheses were formulated and tested at 0.05 level of significance.

Hypothesis 1: There is no significant relationship between curriculum review and effective instructional delivery in universities in Rivers Stat**e.**

Table 4: Pearson Correlation Summary Analysis between **curriculum review** and effective instructional delivery in universities in Rivers State

Variable	N	$\sum X \sum Y$	$\sum X^2 \sum Y^2$	$\sum X \sum Y$	Df	A	r_{cal}	r_{crit}	t_{cal}	t_{crit}	Rmk
Curriculum Review (X)	428	767.13	2307.33	2753.07	426	0.05	0.83	0.195	30.13	1.96	Rejected
Effective Instructional Delivery (Y)	428	1108.04	3228.06								

Table 4 presents the Pearson Product Moment Correlation Coefficient (PPMCC) analysis examining the relationship between curriculum review and effective instructional delivery in universities in Rivers State. The correlation coefficient (**r**) between curriculum review and effective instructional delivery is 0.83**,** indicating a strong positive relationship**.** The p-value (α = 0.05) is compared with the calculated correlation coefficient **(**r = 0.83**)** and the critical value **(**r = 0.195**).** Since rcal (0.83) is greater than rcrit (0.195)**,** and the calculated t-value **(**tcal = 30.13) is greater than the critical t-value **(**tcrit = 1.96**),** the result is statistically significant**.** This confirms

that the observed relationship is unlikely to have occurred by chance. Given that the p-value is less than 0.05, we reject the null hypothesis (H_{01})**.** This indicates that there is a significant relationship between curriculum review and effective instructional delivery in universities in Rivers State.

Hypothesis 2: There is no significant relationship between accreditation compliance and effective instructional delivery in universities in Rivers Stat**e**

Table 5: Pearson Correlation Summary Analysis between accreditation compliance and effective instructional delivery in universities in Rivers State

Variable	**N**	**∑X ∑Y**	**$\sum X^2\sum Y^2$**	**∑X∑Y**	**Df**	**A**	**r_{cal}**	**r_{crit}**	**t_{cal}**	**t_{crit}**	**RMKS**
Accreditation Compliance (X)	428	836.04	2741.08	2907.07	426	0.05	0.80	0.195	23.51	1.96	Rejected
Effective Instructional Delivery (Y)	428	1108.04	3228.06
