Government control in higher education plays a crucial role in maintaining educational standards, ensuring financial accountability, and implementing national policies. However, excessive governmental influence can undermine institutional autonomy, affecting academic decision-making, research freedom, and overall institutional governance. Universities and colleges require a certain level of independence to function effectively, promote intellectual inquiry, and develop sustainable policies that align with academic and societal needs. The balance between regulation and autonomy remains a challenge in Nigeria's education sector, as political influence continues to dictate many institutional decisions.

One major issue related to government control is funding dependency. Public universities in Nigeria rely significantly on government subventions to cover staff salaries, infrastructure development, and operational costs. This financial dependence allows the government to exert control over institutions by influencing budgetary decisions, resource allocation, and policy implementation. In cases where institutions demand increased funding or challenge government directives, financial support may be delayed or withheld, leaving universities in financial distress. This affects the ability of institutions to maintain infrastructure, invest in research, and provide quality education. Universities with greater financial autonomy are better positioned to implement long-term development strategies without external interference (Adamu, 2022).

Another aspect of government control is the regulation of academic policies and curricula. While oversight by regulatory agencies such as the National Universities Commission (NUC) is necessary to maintain quality assurance, excessive bureaucratic involvement often limits institutional innovation. Frequent government-imposed policy changes disrupt academic planning, making it difficult for universities to execute long-term educational strategies. In addition, institutions are sometimes required to adopt politically motivated policies that do not align with their academic objectives, leading to inefficiencies in curriculum implementation and institutional governance (Ogundele, 2021).

Government influence also extends to the appointment of university leadership. In many cases, vice-chancellors, provosts, and other top administrators are appointed based on political affiliations rather than merit. This compromises institutional integrity, as leadership decisions are often influenced by political interests rather than academic priorities. Universities that lack autonomy in leadership selection struggle with administrative instability, internal conflicts, and a decline in academic standards. Moreover, politically appointed leaders may be reluctant to challenge government policies, even when such policies negatively impact the institution. This limits the ability of universities to advocate for necessary reforms that enhance educational quality (Olatunji, 2023).

The impact of excessive government control is also evident in research activities. Universities are expected to be hubs of innovation and independent inquiry, but excessive government interference often discourages critical research, particularly on politically sensitive topics. Scholars who publish findings that contradict government narratives may face restrictions, limiting academic freedom. Autonomous institutions are better positioned to encourage objective research, contribute to policy development, and provide evidence-based solutions to national challenges (Egbewole, 2023).

To enhance institutional autonomy, universities must diversify their sources of funding. Encouraging private-sector partnerships, research grants, and alumni contributions can reduce financial dependency on government allocations. Furthermore, legal frameworks should be established to protect universities from undue political interference, allowing institutions to operate independently while maintaining accountability. Strengthening governance structures within universities, including transparent selection processes for leadership roles, will also enhance institutional autonomy.

Political Appointments in Universities and Colleges

The appointment of university administrators is a crucial aspect of institutional governance, affecting leadership stability, academic quality, and institutional credibility. However, political influence in the selection of key university officials, including vice-chancellors, provosts, and governing council members, has become a major issue in Nigeria's higher education sector. Instead of selecting candidates based on academic merit, experience, and institutional vision, many appointments are driven by political affiliations, undermining the effectiveness of university leadership and management.

One of the primary concerns with political appointments is the erosion of meritocracy. Universities are academic institutions that require competent and experienced administrators to drive educational policies, promote research, and ensure efficient governance. However, politically motivated appointments often result in the selection of individuals who lack the requisite academic and administrative expertise. This compromises institutional decision-making, as politically appointed leaders may prioritize personal or political interests over the educational needs of students and faculty members (Adeyemo, 2023).

Political appointments also contribute to administrative instability within universities. In many instances, the selection of vice-chancellors and other key administrators sparks conflicts between university staff, students, and government authorities. Academic unions, such as the Academic Staff Union of Universities (ASUU), have frequently opposed political appointments, arguing that they undermine institutional integrity. These disputes often lead to prolonged

strikes, legal battles, and disruptions in academic activities, affecting students' academic progression and institutional productivity (Ezeokoli, 2022).

Another major consequence of political appointments is their impact on resource allocation and institutional priorities. Politically appointed administrators are often expected to align with the interests of those who facilitated their appointment, which may lead to biased decision-making in the distribution of resources, faculty promotions, and student admissions. This creates an environment of favoritism, where individuals benefit based on political connections rather than competence. Additionally, politically appointed leaders may be reluctant to challenge inadequate government funding or advocate for policy changes that would benefit the institution, for fear of contradicting their political sponsors.

Furthermore, political appointments weaken institutional governance structures. Universities are meant to operate independently, with clearly defined procedures for leadership selection, policy development, and academic administration. However, when government officials directly influence appointments, it undermines the credibility of these processes. In some cases, university governing councils, which are supposed to oversee leadership selections, are sidelined, with decisions imposed by external political figures. This reduces transparency and weakens the effectiveness of internal governance mechanisms (Akinwale, 2023).

The long-term consequences of political appointments extend beyond governance challenges to academic performance and institutional reputation. Universities that lack strong leadership struggle with inefficiencies in policy implementation, delays in academic program accreditation, and poor research output. Moreover, international organizations and academic ranking bodies assess universities based on governance structures, research contributions, and leadership stability. Institutions that are perceived as being heavily influenced by political appointments may struggle to attract international partnerships, funding opportunities, and recognition on global platforms (Onyema, 2022).

The Role of Political Parties in Educational Reforms

Political parties play a decisive role in shaping educational policies and reforms in Nigeria. As the primary drivers of government policies, political parties influence decisions on curriculum changes, education funding, and institutional governance. However, the involvement of political parties in education has often led to inconsistencies, policy reversals, and ideological biases that hinder the long-term development of the sector (Afolabi, 2021). Political parties typically use education policies as tools to gain political advantage rather than as strategic efforts to improve learning outcomes. As a result, reforms introduced by one government are often abandoned when a new administration comes into power, creating instability in the education sector.

Furthermore, political parties influence the level of investment in education through budgetary allocations. The ruling party determines how much funding is allocated to education and how those resources are distributed. In some cases, educational spending is used as a political tool to gain favor from specific regions or demographics. This approach leads to unequal distribution of resources, where some states receive better funding than others based on political considerations rather than educational needs (Balogun, 2021). Political parties also determine priorities within the education sector, sometimes emphasizing infrastructure development over quality improvement, leading to an imbalanced approach to educational reform.

Moreover, the involvement of political parties in educational reforms has affected the recruitment and employment of teachers and administrators. In many instances, employment in public schools and universities is influenced by party loyalty rather than competence. This has resulted in the hiring of underqualified individuals, which negatively impacts teaching quality and learning outcomes. The practice of using educational appointments to reward political supporters has led to inefficiencies in school administration, as politically appointed individuals may lack the experience necessary to implement effective policies (Olumide, 2019).

Additionally, political parties have played a role in shaping the ideological direction of education policies in Nigeria. Some reforms are introduced to align with the political agenda of the ruling party rather than to improve educational standards. This has led to instances where education policies lack proper consultation with stakeholders such as teachers, parents, and students. For example, reforms in tertiary education financing, such as the introduction or removal of tuition fees, have often been driven by political motives rather than an assessment of their impact on access to education (Ugochukwu, 2022).

Political parties play a crucial role in educational reforms, but their involvement has often resulted in policy instability, resource misallocation, and favoritism in recruitment processes. To ensure that educational reforms are sustainable and beneficial to all, there is a need for policies that prioritize long-term educational goals over short-term political gains. Strengthening institutional frameworks and promoting evidence-based policymaking can help minimize the negative impact of political party influence on education in Nigeria.

CHALLENGES POSED BY POLITICIZATION IN EDUCATIONAL MANAGEMENT

The politicization of educational management in Nigeria presents several challenges.

Appointment of Unqualified Administrators

The appointment of unqualified administrators remains one of the most pressing challenges posed by the politicization of educational management in Nigeria. Political leaders often select individuals for key positions in universities, colleges, and secondary schools based on party loyalty rather than competence and experience. This practice compromises institutional leadership, as these politically appointed administrators may lack the skills needed for effective management. When educational institutions are led by individuals who do not understand academic policies, research development, or administrative efficiency, it results in poor decision-making and mismanagement of resources. Moreover, such appointments often create tension between management and staff, particularly when academic unions perceive leadership selection as politically motivated. This can lead to conflicts, resistance to policies, and disruptions in the education system. The long-term effect is a decline in academic standards and a weakening of institutional credibility, making it difficult for Nigeria's education system to compete globally (Olatunji, 2023).

Policy Inconsistency

Frequent policy changes due to political transitions pose another challenge to educational management in Nigeria. Each new government introduces its own set of policies, often disregarding those implemented by previous administrations, regardless of their effectiveness.

This lack of continuity affects curriculum development, teacher training programs, and long-term educational goals. The absence of a stable policy framework leads to confusion among educators, students, and institutional administrators. Additionally, frequent changes in policies hinder the development of long-term strategic plans, as education stakeholders struggle to adapt to shifting regulations. The constant alteration of policies without thorough evaluation disrupts learning processes and weakens institutional stability. The inconsistency in policies also affects funding allocation, with some projects abandoned midway because they were initiated by a previous administration. Without a well-structured and consistent policy framework, the education sector will continue to struggle with inefficiencies that hinder national development (Okafor, 2020).

Inadequate Funding and Resource Misallocation

Political influences have led to severe financial mismanagement and inadequate funding in the Nigerian education sector. Education is often not prioritized in budgetary allocations, and when funds are allocated, they are sometimes mismanaged or diverted for political purposes. Instead of channeling resources toward improving infrastructure, procuring learning materials, and enhancing staff welfare, some funds are used for political campaigns or personal enrichment by government officials. Moreover, resource distribution is often politically motivated, where some institutions receive higher funding than others based on political affiliations rather than actual needs. This leads to disparities in educational standards across regions, with some institutions operating in poor conditions due to insufficient financial support. As a result, many schools lack essential teaching aids, laboratories, and research facilities, which negatively impact the quality of education provided. A transparent and equitable funding system is necessary to ensure that all educational institutions receive the resources required to function effectively (Usman, 2021).

Frequent Industrial Actions

Industrial actions by academic and non-academic staff in Nigerian institutions have become a recurring issue due to the politicization of educational management. The government's failure to honor agreements with academic unions, particularly on issues related to funding, salaries, and working conditions, has led to frequent strikes. The Academic Staff Union of Universities (ASUU) and other educational unions have consistently embarked on industrial actions to demand better working conditions, improved funding, and policy implementation. These strikes disrupt academic calendars, delay student graduations, and lower the quality of education. Political leaders often use these negotiations as bargaining tools rather than genuinely addressing the sector's problems. Furthermore, political favoritism in fund allocation and the refusal to implement necessary reforms contribute to continuous conflicts between the government and educational unions. The resolution of these disputes requires a sincere commitment to honoring agreements and implementing long-term policies that enhance stability in the education sector (Ibekwe, 2021).

Loss of Institutional Autonomy

Excessive political interference in educational institutions has led to the loss of institutional autonomy, affecting decision-making processes and academic freedom. Political leaders often

exert influence over university admissions, staff recruitment, and policy implementation, prioritizing political interests over academic excellence. This undue interference affects the credibility of academic institutions and diminishes their ability to operate independently. Admission processes are sometimes manipulated to favor candidates with political connections, compromising merit-based selection. Additionally, employment opportunities within educational institutions are often granted to individuals based on political loyalty rather than qualifications. This practice undermines the quality of teaching and research, as underqualified individuals occupy key positions in academia. The suppression of institutional autonomy also restricts academic freedom, as scholars may face limitations in conducting research or expressing views that contradict government policies. Restoring autonomy in educational institutions is essential for fostering innovation, academic excellence, and institutional integrity.

THE WAY FORWARD: STRATEGIES FOR DEPOLITICIZING EDUCATIONAL MANAGEMENT

The politicization of educational management in Nigeria has led to inefficiencies, instability, and a decline in academic standards. Political interference influences the appointment of educational administrators, policy formulation, funding allocation, and labor relations, often prioritizing political interests over educational development. These challenges hinder institutional autonomy, disrupt academic activities, and contribute to poor resource management. To address these issues, there is a need for strategic reforms aimed at depoliticizing the education sector.

Merit-Based Appointment of Educational Administrators

Ensuring that educational administrators are appointed based on merit rather than political affiliations is essential for reducing political influence in the education sector. Many leadership positions in Nigerian educational institutions are awarded to individuals with political connections rather than those with the necessary expertise and experience. This weakens the management of institutions and reduces accountability. Implementing a transparent and competitive selection process overseen by an independent body can help ensure that only qualified individuals hold key leadership positions. Furthermore, recruitment policies should be reviewed to emphasize academic qualifications, leadership competence, and administrative experience, thereby eliminating favoritism in appointments. If appointments are based strictly on professional qualifications, educational institutions will experience improved management, better policy implementation, and increased efficiency in service delivery. A neutral and transparent recruitment system will also enhance public trust in educational institutions and foster national development.

Establishing Policy Continuity and Stability

A major challenge in Nigerian educational management is the frequent reversal of policies by successive administrations, leading to inconsistencies and inefficiencies. Every new government tends to introduce its own policies while discarding previous initiatives, regardless of their effectiveness. This instability disrupts long-term educational planning and affects students, teachers, and institutions negatively. To ensure stability, a legally binding framework should be established to protect long-term educational policies from abrupt changes. An independent

education policy commission should be tasked with evaluating and ensuring the continuity of effective policies while making necessary modifications based on research rather than political considerations. Moreover, engaging education experts in policy formulation will ensure that decisions are made based on the actual needs of the sector rather than short-term political goals. A structured and sustainable approach to policy implementation will minimize disruptions and enhance educational development.

Enhancing Financial Transparency and Accountability

The mismanagement of educational funds due to political interference has contributed to poor infrastructure, unpaid staff salaries, and inadequate teaching resources. Many institutions struggle with financial shortfalls because funds meant for education are often diverted for political purposes. To address this, an independent financial oversight body should be established to monitor and audit all education-related expenditures. Digital financial management systems, such as e-budgeting and expenditure tracking, should be introduced to prevent corruption and ensure that funds are used appropriately. Additionally, public reports on budget allocations and spending should be published regularly to enhance transparency and accountability. When financial resources are allocated based on need rather than political influence, institutions can function more effectively and provide better educational services. Proper financial management will also enable schools to invest in modern facilities, teacher development, and research, ultimately improving the quality of education.

Strengthening Institutional Autonomy

Political interference in the administration of educational institutions has significantly undermined their ability to function independently. Universities and other institutions should be granted full autonomy in decision-making regarding curriculum development, staff recruitment, and financial management. Excessive government interference often leads to inefficiencies, delays in decision-making, and restrictions on academic freedom. Laws that protect institutional independence should be strengthened, and any attempts by political actors to impose control over institutions should be resisted. Establishing a legal framework that limits government intervention to policy guidance rather than direct control can help institutions operate more efficiently. Additionally, academic unions and civil society organizations should advocate for policies that reinforce institutional independence. When educational institutions are free from undue political influence, they can focus on academic excellence, research, and innovation, ultimately contributing to national progress.

Promoting Stakeholder Involvement in Education Governance

Educational management should be a collaborative effort that includes input from multiple stakeholders, such as teachers, parents, students, and academic unions. Political leaders often make decisions without consulting those directly affected by them, leading to ineffective policies. Establishing education advisory councils at the national, state, and local levels can provide a platform for diverse voices to contribute to policy discussions. These councils should be composed of experienced educators, civil society organizations, and student representatives to ensure that policies reflect the needs of the educational sector rather than political interests.

Furthermore, public engagement through town halls, surveys, and feedback mechanisms should be encouraged to ensure inclusive decision-making. By involving key stakeholders in policy formulation and implementation, transparency and accountability will be enhanced, and education policies will be more responsive to the needs of society.

Depoliticizing Union-Government Relations

The frequent industrial actions in Nigerian educational institutions are often linked to political interference in labor relations. Many strikes occur because of the government's failure to honor agreements with academic unions, leading to disruptions in academic activities. Political interests sometimes delay the resolution of labor disputes, affecting students and institutional stability. Establishing an independent mediation body to handle disputes between the government and unions can help prevent prolonged strikes. Agreements should be legally binding, and sanctions should be imposed on parties that fail to uphold them. Additionally, labor negotiations should be conducted transparently, with clear timelines for the implementation of agreements. A professional approach to labor relations will reduce conflicts and ensure a stable academic environment. A well-structured dispute resolution mechanism will promote industrial harmony, improve productivity, and enhance the overall quality of education.

Ensuring Equitable Distribution of Resources

In Nigeria, political influence often determines the allocation of educational resources, resulting in disparities between institutions. Some schools and universities receive more funding due to their affiliation with ruling parties, while others suffer neglect. This imbalance has contributed to poor educational standards in certain regions, thereby widening the inequality gap. To address this issue, a standardized funding formula should be developed based on student population, institutional needs, and educational priorities. An independent agency should oversee resource distribution to ensure fairness and prevent favoritism. Equal access to resources will improve educational quality across all regions and eliminate the use of funding as a political tool. In addition, a monitoring system should be established to track the utilization of funds to ensure that they are used for the intended purposes. Fair resource allocation will create a more inclusive and balanced education system.

Encouraging Evidence-Based Educational Reforms

Many education policies in Nigeria are introduced without adequate research, leading to ineffective implementation. Policy decisions should be driven by empirical evidence, expert recommendations, and global best practices rather than political interests. Without sufficient research, policies may fail to address the core challenges in the education sector, resulting in wasted resources and inefficiencies. Universities and research institutions should be actively involved in conducting studies on educational challenges and proposing solutions. A national education research council should be established to evaluate policy proposals and provide recommendations based on data-driven analysis. Furthermore, the government should invest in research grants and partnerships to encourage the generation of knowledge that can inform educational reforms. Evidence-based policymaking will ensure that reforms are practical,

sustainable, and beneficial to the education sector, leading to long-term improvements in educational outcomes.

Legal Frameworks to Safeguard Educational Institutions

Implementing strong legal frameworks is essential in ensuring that educational institutions operate without undue political interference. The government should enact and enforce laws that clearly define the roles and limitations of political actors in the administration of educational institutions. Laws protecting universities and colleges from arbitrary government interventions should be strengthened to ensure stability in leadership and policy implementation. Additionally, legislative bodies should be actively involved in creating policies that promote educational excellence rather than advancing political interests. The judiciary should also play a role in upholding the autonomy of institutions by ensuring that legal disputes regarding university governance and administration are resolved in a fair and independent manner (Okonkwo, 2024).

Strengthening Academic Freedom

Academic freedom is a crucial component of effective educational management. Universities and other tertiary institutions should have the liberty to determine their academic programs, research priorities, and institutional policies without government interference. A strong and independent academic system allows universities to operate based on educational principles rather than political directives. Encouraging academic freedom fosters innovation, critical thinking, and research development, which are essential for national progress. University governing councils should be empowered to make independent decisions, and lecturers should be free to conduct research and publish findings without fear of political victimization. A national academic freedom policy should be developed to provide legal protection for scholars and institutions against undue political control (Ibrahim, 2024).

CONCLUSION

Depoliticizing educational management in Nigeria requires a comprehensive approach that includes reforms in leadership selection, policy continuity, financial accountability, institutional autonomy, and stakeholder engagement. Implementing merit-based appointments, ensuring transparent financial practices, and promoting inclusive decision-making can help reduce political interference in education. Additionally, strengthening laws that protect institutional independence and adopting evidence-based reforms will create a more stable and effective education system. Without these measures, the education sector will continue to suffer from inefficiencies, corruption, and instability. A commitment from policymakers, educators, and civil society organizations is essential to achieving a depoliticized education system. With proper implementation, Nigeria can build an education sector that prioritizes academic excellence and national development over political interests.

Suggestions

To ensure that Nigeria’s educational management system operates independently and efficiently, various stakeholders must take proactive measures to eliminate political interference. The following suggestions were made to achieve this goal:

- Government and relevant agencies should implement policies that ensure appointments in educational institutions are based on merit rather than political affiliations.
- Policy makers should develop strict guidelines that ensure the selection of educational administrators, including vice-chancellors, rectors, and provosts, is based on merit rather than political affiliations.
- Educational Administrators should maintain professionalism and uphold institutional independence by resisting external political pressures.
- Academic Unions and Educators should engage in constructive dialogue with the government to resolve labor disputes without excessive political involvement.

EFFECT OF TRANSFORMATIONAL LEADERSHIP PRACTICES ON TEACHER MOTIVATION AND ENGAGEMENT IN PUBLIC SECONDARY SCHOOLS

Obiajulu Helen NWOSA
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria
nwosaohelen@gmail.com

ABSTRACT

The paper investigated the effects of transformational leadership practices and teachers' job motivation and engagement. In the educational context, the school organizational commitment of teachers is very important for achieving school effectiveness which in turn influences students' learning outcomes. Additionally, teachers' organizational commitment plays an essential role in establishing a unified effort within a school organization. Thus, it is necessary for every individual in the school organization to build up efforts in supporting the augmentation of teachers' commitment towards the school organization. Herewith, this will allow the school organization to come across impending organizational challenges and concurrently maintain the organizational commitment of teachers. The paper concluded that a classroom teacher who derives the satisfaction of his job is expected to be punctual in school and perform his duties diligently in an adequate learning environment and instructional facilities. A satisfied teacher is invariably an effective and efficient teacher It was recommended that Education Ministries and Boards should establish and implement programmes such as seminars, workshops and so on to develop transformational leadership skills among school principals, among others.

Keywords: Leadership**,** Motivation, Engagement**,** Transformational leadership, Teacher motivation, Teacher Motivation.

INTRODUCTION

Leadership is a crucial element in organizational success, exerting significant influence over employee motivation and engagement. Nowhere is this influence more critical than in elementary and secondary schools, where effective leadership cultivates a positive learning environment. In recent years, scholarly interest has surged in transformational leadership, which is a style known for inspiring and empowering followers toward excellence. This growing interest is substantiated by empirical evidence demonstrating the positive correlation between transformational leadership and employee motivation and engagement across various organizational contexts, including educational institutions. Transformational leaders as described

by Litz and Blaik-Hourani (2020), and echoed by Roache (2023) possess the ability to transcend traditional hierarchical structures, fostering collaboration and a shared vision. Through inspirational motivation, intellectual stimulation, individualized consideration, and idealized influence, they cultivate trust and empowerment, encouraging followers to reach their full potential.

Numerous studies, such as those by Ahmad et al. (2023), and Aljumah (2023), support the notion that transformational leadership correlates with heightened levels of employee commitment, satisfaction, and performance. In educational settings, this leadership style not only enhances school performance but also elevates student outcomes (Roache, 2023). Anchored in established theories of transformational leadership by Tayal et al. (2022) and the managerial style of Kariuki et al. (2022), this research seeks to unravel the nuanced mechanisms through which leadership practices influence the motivational landscape of educators. By exploring these dynamics, this study aspires to offer actionable insights for educational leaders and policymakers to cultivate environments that prioritize the well-being and professional development of educators.

It is obvious that the duties of teachers' center around their classroom, a room, and a chalkboard. In the traditional school system, one person leads, the other follows and one person also makes the major decisions that affect the entire group. Input maybe asked for or given but the decision itself is left up to one individual and in most cases, this one person in the case of secondary school is always the principal. According to Saleh and Kalu (2017), the principal gives direction and lead to achieve objectives, ensure the implementation of school plants with its facilities. The principal is a leader, a thinker and a decision maker. He oversees all the teachers and is the person to whom they all answer to.

Uyanya, (2007) affirmed that the principal is the administrative head of secondary who perform management the actualization of educational objectives at this level of education. In the school system, the head of school has to share information, transfer ideas, and feelings through communication to enhance the collective cooperation of others within the school (Nakpodia, 2010). Ogbonnaya (2003) acknowledged that the principal is also expected to provide educational leadership as teachers look up to him/her for educational leadership and administrative guidance. Zembylas and Papanastasiou (2004) noted that teachers' dissatisfaction with work place has been seen to be one of the problems drawing these dreams away from reality.

Teachers' job satisfaction is the fulfillment, the attractiveness and happiness teachers find in their job that makes them to be highly committed to it. Commitment is when an individual experiences responsibility for the outcome of his/her work. Committed teachers complete their tasks diligently and are also willing to sacrifice their time and personal agenda whenever their attention is needed for the academic achievement of the school. However, Akpan (2015) observed that most teachers are not committed to their primary responsibilities. Teachers show laissez- faire attitude to school activities, some are involved in other businesses while some trade during official hours. Hence, school performance depends more on the principals' leadership than any other factor. Principals therefore are required to exhibit appropriate leadership skills to entice teachers to maximize input, which might be expressed in teachers' commitment to duty and students' academic achievements.

Leadership is a multifaceted moral relationship that exists between people as it is centred on trust, emotion, shared visions, commitments and obligation. Leadership is an act of motivating a group of people to act toward achieving a common goal. It occurs in any group or

organization, in all groups a leader must emerge. Leadership could be seen as a purposeful relationship which occurs periodically among participants who use their individual skills and influence to promote transforming change (Kearns, 2005). Leadership is the ability to get things done with the help and cooperation of other people within the institution (Grace & Kalu, 2016). Blackburn (2009) stated that leadership skill of school principals is often the key factor of difference between effective and ineffective schools. Leadership is a process in which there is an element of influence. One factor that influences teachers' commitment to their duties is the principal's leadership practices which is the most important determinant of school excellence.

Traditionally speaking, some secondary school principals place emphasis on hierarchical leadership models, where top-down decision-making reigns (Onyekwere, 2024). The system directly or indirectly tells them that they do not know anything about the school administration. Maybe that is the major reason why in developing countries such as Nigeria, there is a high rate of teacher attrition.

According to Ololube (2024a), transformational leadership practices stimulate followers into productivity and therefore there is need to accommodate transformational leadership practices in the secondary school system. Transformational leadership practices involve a change. Change cannot just happen in schools but it happens with people. So, in order to initiate change, one needs to know how to lead people.

This leadership style is what the present generation needs if the desired progress could be achieved in secondary schools. It is the type of leadership that will change, revolutionize and transform progressively the lives and developmental process of people, institution, organization or nation. Hence, it involves a committed relationship between the leader and followers. Educational leaders, administrators and researchers considered leadership as a necessary factor to attain institutional goals. Transformational leadership, according to Robbins (2013), is defined as a leader who pays attention to his followers' issues while motivating them to achieve their objectives. To Ololube (2024b), leaders who can persuade people to imagine and materialize the vision, as well as well-coordinated and lead coordination and collaboration between the leaders and their followers, are key to success. The leadership role of the educational institution is determined in all features of the over-all duties of the school management. Thus, leadership has to do with initiating, organizing, motivating and directing the followers' actions in particular situation towards the accomplishment of the common goal.

Transformational leadership, according to Akitunde (2013), focuses on changing the connection between leaders and subordinates. The transformational leader in this situation encourages and stimulates his or her followers to promote a happy attitude and complete responsibilities to the best of their capabilities. Through the approach of attitude, desire, and encouragement, the leader attempts to bring change to the organization and raise the individuals he or she leads. This style of leadership encourages subordinates to feel appreciated and cared for. It also encourages followers to feel inspired to give more, making them feel accomplished.

A transformational leadership style allows a leader to have a significant part in establishing an environment that is full of drive, enthusiasm, and passion to help his followers achieve their goals. Followers, however, are expected to maximize their performance in the institution without feeling pressured of the stated transformational leadership dimension: (1) Idealized Influence (Attributes)—Transformational leaders inspires admiration, respect, and belief in his followers. (2) Idealized Influence (Behavior)—Transformational leaders uses their vision for the organization to inspire and implant dynamics in their group. (3) Inspirational Motivation—Transformational leaders understand how to communicate with their people. They

can also inspire others to achieve their goals by sharing their passion and motivation. 4) Intellectual Stimulation - Not only transformational leaders do challenge the current situation, but they also embed their followers to think beyond the box. The leader encourages his followers to try innovative things and learn new things. 5) Individualized Consideration - Transformational leaders also help and encourage individual followers. Leaders invests into delivering clear lines of communication which results to followers to share their thoughts, identify each distinctive contributions, and create supportive bonds. Followers will build rapidly their trust, shows their strengths and confidence in the production of aimed output.

According to Sadeghi and Pihie (2012), leaders who employ inspiring motivation behavior motivate their followers by setting challenges and significance of their job. It signifies that school leaders encourage their subordinates to do their tasks. The study also discovered that school leaders' idealized influenced behavior is driven by their sense of worth and mission. This suggests that school leaders are leaders who openly discuss essential organizational ideals and place a premium on appealing and worthwhile visions as well as ethical considerations. Nevertheless, work motivation among teachers is an important determinant in classroom success and school progress. Teachers are motivated to engage in the educational process. The amount of participation is critical for achieving educational objectives. The willingness to work determines a teacher's motivation. If a teacher is passionate about the school, he/she will actively participate in both academic and non-academic activities. The conditions necessary for high motivation and involvement of school teachers must be improved.

According to a study by Yanti (2016), a connection between transformational leadership and teacher work motivation is determined. The characteristics of transformational leadership can be expected an affirmative evaluation on work motivation according to the theory (van Wart, 2012). It is an expectation from a transformational leader to develop a foundation of appreciation (idealized influence), deliver inspirational motivation and offer significance and purpose for what needs to be accomplished, stimulate their followers' minds (intellectual stimulation) to think of innovative ways and show individualized consideration by identifying and uplifting each follower's needs. The researcher aims to evaluate the process of transformational leadership style to inspire leaders and teachers to give their all in order to achieve the institution's goals and objectives. It is critical to find an explanation because low teacher motivation, as an outcome of ineffective transformational leadership in the institution, can lead to lower performance, and when teachers perform poorly, human resource investments fail, and the institution is unable to achieve its goals due to a lack of support from the administration.

METHODOLOGY

This paper employs a quantitative descriptive approach, focusing on a critical review of academic literature, policy and theoretical perspectives. It brings together existing knowledge to establish a comprehensive understanding of the factors that influences teaches' motivation and engagement in public senior secondary schools.

The paper sourced data from various reviewed articles from education, journals, public administration and agencies related to teachers' motivation and engagement as well as transformational leadership style. Books and relevant presentations on transformational leadership are practices on teachers' motivation and engagement. Data base such as Gemini, Google scholar were consulted.

A systematic literature review is conducted to identify key themes related to teachers' motivation and engagement, including; Transformation leadership, Elements of transformational leadership, Teacher motivation, Teachers' engagement, Application of transformational leadership style, Characteristics of transformational leadership style in secondary school, How transformational leadership style benefits secondary schools. These were enumerated under conceptual clarification.

A systematic analysis is used to categorize findings, compare perspectives and draw conclusions that contributed to the theoretical discussions. For validity sake only sources published from reputable journals and publishers are considered.

Theoretical framework is employed upon which the paper anchored/hinged. The reliability of this paper is enhanced by cross-referencing multiple sources to verify consistency in findings. In this paper, there is no direct engagement with human source it is a theoretical paper.

THEORETICAL FRAMEWORK

Transformational Leadership Theory

This study is deeply rooted in Transformational leadership theory, as advocated by Katsande (2021), which remains a central pillar in understanding leadership dynamics. This theory underscores the significance of leaders' ability to inspire and motivate followers through idealized influence, inspirational motivation, intellectual stimulation, and individualized consideration. Within educational settings, transformational leadership has emerged as a critical factor in shaping teacher motivation and engagement, aligning with the evolving demands of modern schooling (Jay, 2023).

Transformational leadership theory promotes a style of guidance that emphasizes motivating employees, and creating a vision and encouraging them to fulfill it. The fundamental skills of a transformational leader include being able to mobilize employees, inspire them and boost their morale. Nowadays, organizations need to increase their knowledge and awareness about the environment and to create wide organizational changes for survival and development. In this context, the role of leaders who move the organization toward the future, recognize the environmental need and facilitate appropriate changes, becomes more evident. Such leaders are called transformational leaders. These school leaders can strengthen the staff understanding and justice, and improve the quality of work life in the organization. Quality of work life includes any improvement in organizational culture which improves employees' satisfaction and human dignity and causes their development and growth in the organization. On the other hand, perception of discrimination and injustice demoralizes and demotivates employees and decreases productivity of their performances. In the very fast changing world, organizational management becomes important more than ever and is considered as critical success factor in organizations (Raman, et al., 2015).

Not only top-level managers need to show their capabilities, but all managers at all levels of the organization also feel the need to cooperate with others to achieve the desired results. Regardless of their job, they should know how to influence others, provoke them into working and also they must take responsibility for outcomes. Transformational leadership is a complex and dynamic process in which leaders influence their followers' values, beliefs and goals. These leaders move organizations toward the future, recognize environmental needs and facilitate appropriate changes. Leadership is emerged from the advent of social life. Some people are put

together and begin their social life and influence each other. Transformational leadership is achieved when leaders and followers motivate each other for higher motivation and morality. These leaders have better relationships with their supervisors. They help the organization more than leaders who act transactional and they create more value for the organization. Transformational leaders motivate their employees to do more than what is sited in their employment contract and they focus on the employees' higher level needs. These leaders act as mentors and advisors and pay attention to personal development, learning, and supplying the needs of the employees. They provide challenge, a sense of mission, broader perspectives, respect, and trust for the employees, and they act as role models for their employees. They create an atmosphere of trust and motivate employees to work for the organization beyond their self-interests (Khorshid & Pashazadeh, 2014, p. 7).

Transformational leadership refers to leaders who seek to create ideas and new perspectives to create a new path of growth and prosperity in front of the organization. By developing commitment, passion and loyalty among managers and staff, they mobilize organization's members to make fundamental changes in fundaments and basis of the organization in order to be prepared and to gain necessary capabilities for moving in new directions and reaching higher ideal performance peaks (Mirkamali et al., 2014, p.23). The transformational leader constantly looks for potential motives in followers and aims to draw followers' attention to superior needs and conversion of individual interests into collective interests. According to Bass and Avolio, transformational leadership is a conscious, moral and spiritual process that provides development patterns for organization through a reliable equal power leadership.

CONCEPTUAL CLARIFICATION

Transformation Leadership

The leaders who look for and generate new ideas in a new way of development and success of the organization is transformational leadership. They activate the organization's followers to make essential modification and basis of changes to reach the top higher performance in innovative instructions by increasing the level of commitment, desire and faithfulness of the leaders (Mirkamali et al., 2014, p.23). A transformational leader, according to Storey (2010), is a modern leadership theory that emphasizes on the transformation of the follower and teamwork toward the fulfillment of the organizational goal. Various leadership theories have recognized transformational leadership as a more effective leadership approach. The type of leadership technique used determines the success of any firm. According to the case studies undertaken, in order to achieve the intended organizational goal, a leader must be innovative, motivating, and transparent, as well as possess the capacity to operate as part of a team.

Leadership is a vital part of most educational systems, thus, any learning completed depends on the influence of leaders, as catalysts of change, with the help of the teachers, who are the central of the acquisition and instruction of the education process. Hence, all processes, inputs and outcomes in an educational setting are influenced by various theories of leadership styles and practices in terms of motivating staff and increasing their sense of belonging towards the institution. Through effectiveness and efficiency to attain the essential level of output, leadership involves the appropriate performance and conduct of leaders to influence the group to work as team (Tengi et al., 2017:792). Thus, transformational leadership constructs a new

viewpoint both the leaders and followers to encourage change in the whole institution (Arabiun et al., 2014, pp. 57-56).

Transformational leadership according to Yang (2014) is an important tool to enhance the improvement of the quality of education in the institutions. This confirmed with the evaluation of Raman, et al. (2015) which disclose that behavior of transformational leaders in the institution bring changes with proper management and administration. As such, practicing this style of leadership, reform and efficiency within the organization is reinvigorated (Sun & Leithwood, 2012). A transformational leadership style allows a leader to have a significant part in establishing an environment that is full of drive, enthusiasm, and passion to help his followers achieve their goals. Followers, on the other hand, are expected to maximize their performance in the institution without feeling pressured by the five dimensions of transformational leadership style. Transformational leaders combine imaginative and honest leadership to change the educational environment, which includes not only the school but also the teachers that work there (Waters, 2013).

The act of preparing and training followers, as well as offering direction on issues and resource allocation toward an organization's goals and objectives, is defined as leadership as stated by Daft (2015). Leadership is responsible for an organization's performance and long-term success. The transformational leader identifies needed change with subordinates or followers, sets a vision to motivate change, then implements the change in close relationship with committed team participants (Bell & Menguc, 2012). Beyond transformational leadership, encouragement and caring are essential. It's a new kind of leadership that reflects today's cultural trends and emphasizes the moral responsibilities of both the leader and the followers. To escalate follower’s commitment to institutional goals, the leader should change their values and beliefs.

The leader suggests that subordinates be motivated by a shared organizational vision. To stimulate intellectual progress, the leader must present the most recent developments and trends and enlighten members. Individual members' requirements should also be considered by the leader. Furthermore, transformational leadership allows a leader to delegate authority to members. Members can exceed expectations and fulfill their goals with this style of leadership. According to Bush (2017) explains that transformational leadership in educational institution is a model of leadership focused on the influence and management of school. The leader works to increase the human resource performance while also accepting and implementing the school's vision.

ELEMENTS OF TRANSFORMATIONAL LEADERSHIP

The four basic elements of transformational leadership identified by Bernard Bass in 1985 cited Bush (2017) are:

Idealized influence of leaders

This refers to role modelling, articulation of high expectations and confidence in followers .The transformational leader displays a charismatic personality that influences others to be like him. The principal should act as a role model and express willingness to take visits and follow a core set of values, convictions and ethical principles in the actions she takes. It is through this concept of idealized influence that the principal builds trust with his teachers and the teachers in turn develop confidence in her. The principal should also demonstrate the highest level of ethical

behaviour possible, admitting when she is wrong and acting in a socially respectable and appropriate way.

Inspirational motivation & ability to inspire confidence

The leader is expected to articulate a clear vision for the future, communicate expectations of the group, and demonstrate a commitment to the goal through one-on-one coaching and mentoring. Inspirational motivation refers to the principal's ability to inspire confidence, motivation, and a sense of purpose in her teachers. The principal should also provide opportunities for in-service training for her teachers for them to grow and become fulfilled in their job. She should also motivate and direct her teachers to use their energy towards maximizing the attainment of instructional goals and objectives.

Intellectual stimulation and creativity

This refers to encouraging followers to challenge existing approaches, reframe problems, and think in new ways. The vision of transformational leader is to helps followers see the big picture and succeed in their efforts. Anjali and Anand (2015) asserted that intellectual stimulation leads to the development of employee commitment to the organization. They further stated that this has implications for the ability of the organization to achieve goals based on dedication and hard-work. Transformational leader should support her teachers by involving them in decision making process and stimulate their efforts to be as creative and innovative as possible to identify solutions. She solicits ideas from her teachers without critics. She also helps to change the way the teachers thinks about and frame problems and obstacles.

Individualized consideration of group members

The transformational leader recognizes that each follower or group member has specific needs and desires. She should also take into account the differences and perspectives of the followers and be a coach and mentor to them. For instance, some are motivated by money while others by position and excitements. As a transformational leader, the principal should be able to recognize or determine through eaves dropping or observation what motivates each individual teacher so that they will perform well. A satisfied teacher is invariably an effective and efficient teacher. When a teacher is not satisfied, his/her classroom could be drastically and negatively affected. Satisfaction connotes happiness and a state of well-being as an outcome of a need fulfilled. When teachers are satisfied with their job, they carry out their duties in high spirit. Warrilow (2011) noted that when workers are satisfied in their jobs, they perform better and this is an indication of school effectiveness.

Egbezor (2005) observed that it can be argued that dedication to duty is a function of job satisfaction and job satisfaction here refers to the extent to which personal wants both materially and psychologically realized by the individual while performing a task. Job satisfaction offers explanation of what makes people want to come to work, what makes them happy about their jobs or what makes them decide to quit their job. Udoeke (2005) opined that if the school system is to succeed and if the huge investments and national hopes on education are to be fully achieved, the teacher must have enough job satisfaction. Teachers that have job satisfaction are committed to duties. It is the school principal who will effectively maximize the available human

and material resources by the commitment process to achieve the educational goals. Hence, when teachers are committed to their job, they are bond emotionally and intellectually to their duties.

TEACHER MOTIVATION

"Motivation" came from the Latin name "movere," meaning "to move" (Nguyen, 2017). Motivation is the social, biological, cognitive, and emotional understanding that stimulate conduct. It is the driving force of human behavior. Thus, motivation makes us feel as if something is happening and motivates us to act. According to Naile and Selesho (2014), the concept of leadership and work motivation has a close relationship since a leader's ability to persuade individuals to attain stated goals is highly influenced by their leadership style. Culture, social justice, and organization, as well as an individual's emotional and spiritual nature, influence the concepts and criteria that underpin the concept of motivation. Motivation is influenced by personal attributes, physical conditions, prior experiences, and environmental influences. If a job is to remain stimulating, both the employee and his or her leader must be involved.

Motivation is defined as factors that activate, direct, and sustain directed activity. The whys of performance and the demands or requirements that determine and clarify our actions (Nevid, 2013). Psychological influences that impact the direction of a person's conduct in an organization, as well as their degree of effort and perseverance according to another definition (Jones & George, 2008). According to McClelland's theory, motivation is the most important factor that impacts an individual's conduct. He went on to say that everyone wants to do things that are done or better than others, and that there are three motivating factors: 1) the requirement for success; 2) the requirement to attach; and 3) the requirement for strong point. These three requirements are critical factors in deciding one's success (Wahyuningdyah, 2015). When combined with appropriate work discipline, teachers with intrinsic and extrinsic motivation will be more successful.

According to Tecer (2011), a teacher's motivation has an impact on practically every aspect of the educational structure in which the teacher is involved. Occupational motivation is known to be linked to a variety of aspects that influence on one's professional life (Unsar, 2011). Other considers the drawbacks of giving the same reward to people who perform well in the institution and others realize how the importance of incentive (Gokay & Ozdemir, 2010). If teachers are more productive, they are more motivated to perform the task (Ayaydin & Tok, 2015). As opposed to this, some educators are motivated by the positive criticism they receive from their working environment (Firestone, 2014). Individual and institutional performance are dependent on motivation, and even skilled and well-educated employees if not motivated, will not work efficiently (Addison & Brundrett, 2008). Teachers showed the following characteristics as important to boost teacher motivation: economic stability, promotion, time management, remuneration, training and development, numerous responsibilities, and internal motivation were identified as the primary demotivating factors. As the most basic enhancing options, good working environment, recognition for special services, financial awards, providing assurance, acknowledgment from the institutional leaders, and support in decision-making processes were recommended (Shukr et al., 2016). Hence, individuals' inner energy is activated to guide them toward specific goals through motivation (Duren, 2002).

To attain the desired degree of achievement, school administrators must employ motivational techniques. This creates an effective, dynamic, efficient, and qualified classroom environment (Yilmaz & Ceylan, 2011). For educational institutions, motivation is a crucial topic. Education is concerned with teacher training programs at all levels, not only education administration. Constructive criticism offers teachers the necessary guidelines for enhancing their instructional abilities as long as their autonomy is not compromised, whereas positive feedback gives teachers the intrinsic motivation they need by clearly recognizing their accomplishments across appropriate platforms (Firestone, 2014).

TEACHER ENGAGEMENT

Currently, teacher engagement is emphasized in schools because of abrupt changes that may occur in the school environment. Becker and Riel (2000) defined professional engagement as teachers trying to help with what goes on in other classrooms. Schaufeli and Bakker (2004, 2010) also defined work engagement as the relationship of teachers with their work, and teacher engagement as the relationship with the schools. Clearly, there are various types of engagement and the present study is in line with Schaufeli and Bakker's (2010) widely used definition (Bakker & Xanthopoulou, 2013; Van der Heijden et al., 2015)

The concept of teacher engagement is helpful in describing the teaching methods and responsi- bilities of teachers (Borup et al., 2014). It is also valuable in illustrating effective teacher practices (Borup et al., 2014; Lewis, 2007). Since student learning can be affected by teacher engagement, it becomes a characteristic of quality teaching (Rossmiller, 1988). Furthermore, teachers can influence student success in both the academic and social environments. Since it is critical to their work, school administrators need to consider how to engage teachers in profes- sional development (Meister, 2010). Specifically, it is important to create school environments that encourage teachers to be involved in creative activities (Song et al., 2013).

In addition, Rossmiller (1988) noted that there is a perception gap between the perspectives of highly engaged and almost totally disengaged teachers. The perceptions of disengaged teachers improves when they conceptualize their duties and engagement as teachers (Becker & Riel, 2000). According to Van der Heijden et al. (2015), enhancing teacher engagement improves their performance, which then leads to higher student performance, and consequently elevates the pro- fession and attracts more high-quality teachers. Another characteristic of engaged teachers is that they know what to expect and have a sense of how to work with supervisors and coworkers (Bird, Wang, Watson, & Murray, 2009). Borup et al. (2014) states that teacher-teacher interaction is an essential component of engagement. Through this interaction, teachers gain more opportunities to profit from professional learning activities, improving their teaching practices, and the overall quality of instruction (Thoonen et al., 2011).

APPLICATION OF TRANSFORMATIONAL LEADERSHIP STYLE IN SECONDARY SCHOOLS

In secondary schools, transformational leadership can foster a positive and engaging learning environment by inspiring teachers and students, promoting shared vision, and encouraging innovation and collaboration, ultimately leading to improved student outcomes and a stronger school culture. Principals who exhibit transformational leadership behaviours inspire and challenge their students to reach their full potential (Anderson, 2017). These leaders set high

expectations for academic achievement, promote a culture of continuous learning and provide students with opportunities to develop leadership skills. By creating a stimulating and intellectually challenging environment, transformational leaders foster student success and overall school improvement (Allen et al., 2015). Furthermore, transformational leadership fosters effective communication and collaboration within the school community. Principals who adopt this leadership style actively listen to the concerns and ideas of their staff, students, and parents (Allie, 2014; Stronge & Xu, 2021). They create open channels of communication, encourage feedback, and engage in meaningful dialogue. By promoting a culture of trust and inclusivity, transformational leaders build strong relationships and foster a sense of collective responsibility for educational success.

Lastly, transformational leadership contributes to the overall development of a school's culture and climate (Demir, 2008; Allen, 2015). By promoting shared values, ethical behaviour, and a sense of social responsibility, transformational leaders establish a positive and nurturing school environment. They create a culture of respect, trust, and fairness, where diversity is celebrated, and differences are embraced. This inclusive and supportive climate enhances student well-being, fosters positive relationships, and facilitates effective teaching and learning. This paper examines the challenges and prospects of principals' transformational leadership style in public senior secondary schools in Oyo State. It also clarifies the rationale, difficulties, and possible advantages of principals in these schools implementing a transformational leadership strategy.

Leader who practices transformational leadership instils a feeling of purpose and enthusiasm in team members, inspiring and encouraging them to reach their greatest potential (Gillet & Vandenberghe, 2014; Pawar, 2016; Bojovic & Jovanovic, 2020). Several essential characteristics set this leadership method apart from other leadership philosophies. The capacity to express a clear vision is one of transformational leadership's key traits. Transformational leaders possess a compelling future vision and convey it to their followers (Anderson, 2017). By presenting a captivating vision of what could be and illustrating how their activities advance the greater good, they motivate others. The capacity for inspiration and motivation is a crucial aspect of transformational leadership. Transformational leaders are skilled at arousing passion and excitement in their followers by emotionally connecting with them (Shelton, 2012). They can inspire and involve their team members by motivating them to surpass expectations.

Characteristics of Transformational Leadership in Education:

- Inspiring a Shared Vision: Transformational leaders articulate a clear vision for the school, motivating teachers and students to work towards common goals.
- Empowering and Supporting Staff: They create a supportive environment where teachers feel valued and empowered to take initiative and innovate.
- Promoting Intellectual Stimulation: They encourage critical thinking, creativity, and problem-solving among both teachers and students.
- Individualized Consideration: They recognize the unique needs and talents of each student and teacher, providing personalized support and opportunities for growth.
- Fostering Collaboration and Teamwork: They promote a culture of collaboration and teamwork, where teachers and students work together to achieve common goals.

- Encouraging Continuous Improvement: They foster a culture of continuous improvement, where teachers and students are encouraged to reflect on their practices and make changes to improve outcomes.

How Transformational Leadership Benefits Secondary Schools

Transformational leadership has various benefits to secondary school. These are as follows:

- Improved Student Engagement and Motivation: By creating a positive and engaging learning environment, transformational leaders can help students become more engaged and motivated in their learning.
- Higher Student Achievement: When students are engaged and motivated, they are more likely to achieve academic success.
- Stronger School Culture: Transformational leaders can help create a strong and positive school culture, where everyone feels valued and respected.
- Increased Teacher Morale and Retention: By creating a supportive and empowering environment, transformational leaders can help improve teacher morale and retention.
- Innovation and Improvement: Transformational leaders can foster a culture of innovation and improvement, where teachers and students are encouraged to try new things and find better ways to learn and teach.
- Reduced Inequity: Transformational leaders can help design support systems that reduce inequity on multiple levels and create a more resilient educational infrastructure for the future.

RELATIONSHIP BETWEEN TRANSFORMATIONAL LEADERSHIP AND TEACHERS' JOB MOTIVATION AND ENGAGEMENT

The concept of motivation in this research is described in 3 (three) indicators, namely: need for achievement, need for cooperation, and need for power. Motivation is an individual's willingness to expend high effort to achieve organizational goals, Maslow's theory of needs is the earliest need and is already known to many (Maslow, 1943). Therefore, the term of motivation is often used interchangeably with the term of motive is the need, encouragement, and motion of the heart. Hoy and Miskel (1992) is stated that the motivation of the teacher's work is the willingness of the teacher to do his duties. Coupled with Wiles (1955), that the high and low a motivation of teachers work is greatly affect the performance in completing their tasks. In a number of the motivational theories, it is asserted that the motivation starts from unmet needs, and causing the tensions that drive a person to action. It is said that a teacher who is perform the certain activities is always driven by certain motives, that's in an effort to meet his needs (Wahyuningdyah, 2015: 92).

Basically, a teacher is also a human being, if they following the Maslow's hierarchy of needs theory, so every teacher have a need such as physiological, sense of security, self-esteem, and self-actualization. The needs what are encourage the teachers to work or whatever the teacher wants through his work. Wiles (1992) identifies eight the teacher needs, namely (1) security and decent living, (2) pleasant working conditions, (3) sense of belonging, (4) fair and reasonable treatment, (5) a sense of ability, (6) recognition and respect, (7) taking part in the formulation of school policy, and (8) the opportunity to develop self-respect (Wahyuningdyah,

2015: 93). Based on the theory of motivation as described above there are have some principles that applied by the headmaster into motivating the teachers to be willing and able to improve their performance so that will give birth a achievements or satisfactory results. Therefore, according with Mulyasa to motivate his employees, the brand is should be informed about the results of every job for those who achieve their efforts given the prize or praise (Mulyasa, 2012). Besides it the school leaders also try to meet the needs of the teachers by taking an attention with the physical condition, giving a sense of security, showing that the leaders pay attention to them, organizing the experience so the teachers will gain satisfaction and appreciation.

According to Mitchell, there are have some performance criteria in the performance area: (1) quality of work, (2) accuracy, (3) initiative, (4) ability, and (5) communication (Wahyuningdyah, 2015: 94). Motivation is also a habit that owned by each individual for example: (a) hard work habits, (b) habit of work to completion, (c) good work habits, (d) work habits on time. The motivation of work in this paper is either from the teacher themselves (intrinsic) such as work achievement, trying to improve the work and responsible for the tasks that undertaken, in addition, its also the affecting factors from outside (extrinsic) such as peer relationships, superiors and subordinate procedures that support each other, opportunities, family environment, income, position, and working. The indicators to know the motivation work of someone in an activity (Engkoswara and Komariah, 2010: 210), namely: (1) the duration of activity is how long the ability to use the time to perform the activities; (2) the frequency of activities is how often the activities is carried out within a certain period of time; (3) the persistence of the provision and attachment to the purpose of the activity; (4) the perseverance, tenacity and difficulty to achieve goals; (5) the devotion and sacrifice to achieve the goal; (6) the aspiration level is a intent, plan, aspiration, target or goal; (7) the level of achievement or product that's qualification achieved from the activities; (8) the direction of his attitude towards the objectives of the activity.

The low ability of teachers is influenced by the principal's leadership which is not optimal in producing empowerment of all stakeholders in the school, especially in empowering the teachers they guide. The principal is a reliable administrator in the school body who has a big impact on encouraging teacher activities. The principal, as the superior at the school, has an important position in efforts to improve the quality of alumni, who can demonstrate their fighting energy and competitive character in general competitions, in addition to teachers having an important role in encouraging teaching participants as the next generation in the future. The success of the organization today is determined by the principal's ability to transform himself to support the goals of the organization. In maintaining the continuity of life, the body must be able to increase the capacity of people's energy sources and strengthen habits, so that they can adapt to changes in habits in carrying out their function as a method of creating meaning and control which will later guide and shape the actions and attitudes of employees (Robbins, 2003).

Another aspect is activity encouragement, which is the urge to achieve a goal so that the strengths and weaknesses of the teacher's encouragement also determine a person's ability depending on his motive power in guiding. The motivation plan is expressed in 3 markers, namely: the desire for results, the desire for similar activities, and the desire for power. The drive is a person's desire to make great efforts to achieve body goals, there are 3 key parts to drive, namely; efforts, body goals, and desires. If a motivated person will try as hard as he can to achieve a goal, but it is not certain that great effort will produce great ability, then encouragement is an important aspect for increasing the ability of teachers, the source of energy for people who are ready and able to progress.

Transformational leadership is a leadership style allowing leaders to increase creativity by motivating individuals with a visionary, inspiring and innovative approach. Previous research suggested that transformational leadership enhanced employee creativity and this link was mediated by psychological empowerment, innovation support and the provision of learning opportunities (Al Harbi et al., 2019; Sui et al., 2012). On the other hand, Apiani et al. (2023) found that transformational leadership had a positive influence on teacher creativity which promoted the development of innovative teaching methods. Similarly, Zhang et al. (2019) demonstrated that transformational leadership contributed to teachers' information sharing and creative thinking and this improved teachers' creative skills. Azim et al. (2019) found that transformational leadership enhanced employees' engagement in creative processes with the mediating effect of creative self-confidence. In another study, Alarifi and Alharbi (2019) demonstrated that transformational leadership increased employees' perception of psychological empowerment which in turn improved their creativity and innovative thinking capacity (Bogler, 2001). Promoting individuals' self-confidence, psychological empowerment positively contributed to creative thinking and developing innovative approaches.

In literature there is convincing empirical evidence that using intellectual stimulation, individualized consideration, and inspirational motivation, transformational leaders promotes teachers' creativity and innovative thinking (Tse et al., 2018; Ripki et al., 2020). On the other hand, Mahmood et al. (2019) found that transformational leaders promoted teachers' creativity and the effect was further strengthened by complex tasks and innovation support. Based on these, it can be concluded that when teachers are supported in solving complex problems and adopting innovative teaching strategies, they become more creative.

IMPACT OF TRANSFORMATIONAL LEADERSHIP PRACTICES ON TEACHERS JOB ENGAGEMENT

Transformational leadership practices, characterized by inspiration, vision, and support, have a positive impact on teacher job engagement, leading to increased job satisfaction, motivation, and commitment, ultimately contributing to better school environments and student outcomes. According to Engkoswara and Komariah (2010), there are several ways transformational Leadership enhances teacher job engagement (1) Increased Job Satisfaction: Teachers who feel supported, valued, and empowered are more likely to be satisfied with their jobs. (2) Enhanced Motivation: Transformational leaders inspire teachers to be their best, leading to increased motivation and engagement. (3) Improved Commitment: Teachers who feel connected to the school's vision and mission are more likely to be committed to their roles. (4) Positive School Culture: Transformational leadership creates a positive and supportive school environment where teachers feel valued and respected. (6) Better Student Outcomes: When teachers are engaged and motivated, they are better able to support student learning and achievement.

Job engagement is closely tied to transformational leadership (Robbins & Judge, 2013). Josanov- Josanov-Vrgovic and Pavlovic (2014) noted that people-focused principals of the school have a favorable influence on teachers' engagement with their ability to work in teams and develop close bonds with their coworkers. A school principal's transformative leadership activity helps in raising teachers' job commitment (Hui et al., 2013; Nyenyembe et al., 2016; Tesfaw, 2014b). Bogler (2001) found out that leadership behavior of school principals, such as trying to support teacher development, recognizing teacher effort and advancing their careers can enhance teachers' job commitment. Therefore, the approach in which school leaders provide

guidance and inspiration has a higher influence on teachers' job engagement, particularly the transformational leadership dimension, is greatly connected to teachers' job engagement.

Teachers are crucial in facilitating secondary education, ensuring the attainment of educational goals. They help students acquire knowledge and values, and their commitment is essential for effective learning. Job commitment involves a strong sense of responsibility toward an organization's goals, leading to high performance and overall excellence. Teachers must be dedicated, professional, and diligent in their roles. Teacher job commitment, demonstrated through punctuality, well-organized lessons, and continuous improvement, is vital for effective teaching and learning. Leadership plays a key role in fostering this commitment.

Previous research findings show that there is a significant positive influence of transformational leadership towards employee engagement (Kopperud et al., 2014); (Ghadi et al., 2013). Through transformational leadership style, principals can grow and increase the optimism and work engagement of employee (Tims et al., 2011), one of them is by creating a conducive work environment. Transformational leadership can develop employees to become more engaged, especially if they can make them participate with organizational goals. In addition, the engagement of workers significantly affects loyalty and commitment when leaders succeed in adjusting transformational leadership (Mansor et al., 2017). The transformational leadership style makes the person have a positive outlook on himself and also uses the skills he has while working will strive to the fullest and feel engage and responsible for the success of the organization (Chaudari et al., 2012). The influence of transformational leadership style on employee engagement can be explained that workers who are bound to try will display brilliant performance. (Laura C. Bartista, 2009).

MEDIATING ROLE OF TEACHER SELF-EFFICACY AND INSTITUTIONAL COMMITMENT IN THE RELATIONSHIP BETWEEN TRANSFORMATIONAL LEADERSHIP AND TEACHER JOB MOTIVATION AND ENGAGEMENT

Teacher Self-Efficacy refers to a teacher's belief in their ability to effectively perform their job and positively impact student learning. On the other-hand, organizational Commitment refers to a teacher's sense of loyalty, identification, and dedication to their school or organization. Self-efficacy is a concept based on the social-cognitive theory. Self-efficacy is an individual's belief in oneself and his/her abilities to manage and realize prospective potential situations (Bandura, 1997). Teacher self-efficacy is a teacher's belief in one's abilities to unearth desired student behaviors (Tschannen-Moran & Hoy 2001). Bandura (1997) examined self-efficacy in four dimensions: mystery experiences, vicarious experiences, social persuasion, and physiological reflection. Tschannen-Moran and Hoy (2001) argued that teacher self-efficacy consists of the factors of instructional strategies, classroom management, and student engagement. Polatcan et al. (2021) clarified these factors as follows. Instructional strategies are about a teacher's belief in oneself regarding selecting and implementing appropriate and effective instructional strategies, methods and techniques. Classroom management includes a teacher's belief regarding organizing classroom setting and student behaviors in harmony in line with the instructional objectives. Student engagement is a teacher's belief in oneself regarding enhancing students' participation, attitudes towards lessons, and motivation.

Transformational leaders are mediators of change in schools. They transform teachers' behaviors in an attempt to ensure the change in schools. Effective teacher behaviors enhance the quality of instruction in schools. Transformational leaders support teachers' self-beliefs. The

literature has showed the relationship between transformational leadership behaviors and teacher self-efficacy (Gumah et al., 2016). The level of this relationship varies in different studies. On the other hand, some studies reported an insignificant relationship between transformational leadership and teacher selfefficacy (Groote et al., 2015; Valckx et al., 2020).

Organizational commitment of teachers poses more challenges to schools today. Employers are challenged to develop strategies to motivate teachers in order to be committed at work. Specifically, it is more challenging for millennials to stick to the school since they are more committed to their profession than to the school. Hence, in most cases, teachers exhibit a low level of organizational commitment (Guhao, 2019; Mahdi et al., 2017; Suryani, 2018). In conjunction, organizational commitment is vital for all schools. It is the primary factor that determines organizational competitiveness which enhances the motivation, and engagement of teachers (Caballero & Guhao, 2020; Hanaysha, 2016). In conjunction, organizational commitment has a huge impact on the school organization as a whole. The organizational commitment of teachers is very important since it is essential for school effectiveness and indirectly affects the learning outcome of the students. Teachers who are able to respond to challenges and give their full commitment can help their organization succeed. High teacher dedication and commitment enable school organizations to move successfully (Bernaldez & Gempes, 2016; Mustafa et al., 2020).

Further, transformational leadership has been highlighted as a significant influence in the development of affective organizational commitment (Sahu et al., 2018). When transformational leaders utilize individual consideration to address the needs of their followers, they transcend economic transactions, and contribute to lengthy organizational tenure and strong commitment (Nazir & Islam, 2017). According to previous research, transformational leadership is the best precursor of affective organizational commitment (Islam et al., 2018). Also, according to Coladarci (1992), general and personal self-efficacy are major predictors of teacher engagement, with instructors who have both higher general and personal efficacy preferring to have higher teacher engagement.

Tsai et al. (2011) discovered that self-efficacy has a strong beneficial influence on organizational commitment among banking personnel. Syabarrudin et al. (2020) confirmed that self-efficacy has a substantial influence on employees' organizational commitment. As a result, individuals who are confident in their ability to complete a task are more likely to remain with the firm. According to Liu and Huang (2019), occupational self-efficacy has a direct impact on organizational commitment. Teachers' self-efficacy has progressively gained an important role in school psychology research as a result of its implications for teaching effectiveness, instructional practices, and for students' academic achievement. Teachers' self-efficacy, namely teachers' beliefs in their ability to effectively handle the tasks, obligations, and challenges related to their professional activity, plays a key role in influencing important academic outcomes such as students' achievement and motivation and well-being in the working environment (Barni et al., 2019; Klassen & Tze, 2014).

Also, considerable research has shown that teachers with high levels of self-efficacy experience higher levels of job satisfaction, lower levels of job-related stress and face less difficulties in dealing with students' misbehaviors. Also, teachers with higher levels of openness to experience and conscientiousness reported a stronger sense of efficacy. Thus, understanding self-efficacy may have important payoffs in working for teachers' well-being and school effectiveness and improvement (Barni et al., 2019; Perera et al., 2018).

CONCLUSION

The quality of the leadership style of the principal makes the difference between the success and failure of the school. However, one of the major challenges to principals' leadership style adopted for the success of the school is teachers' job motivation and commitments to their duties. When teachers are not satisfied with their jobs as a result of non-payment of salaries and wages, not involving them in decision making, lack of professional development to enhance their knowledge and so on, they will not be committed to their duties. A classroom teacher who derives the satisfaction of his job is expected to be punctual in school and perform his duties diligently in an adequate learning environment and instructional facilities.

A satisfied teacher is invariably an effective and efficient teacher. It is imperative that the principals of public secondary schools in Rivers State adopt a transformational leadership style for the success of their schools. There is a very high level of transformational leadership of school heads, a very high level of organizational commitment in teachers and a high level of teacher's self-efficacy. Further, there is a significant relationship between transformational leadership and the organizational commitment of teachers. There is also a significant relationship between transformational leadership and the general self-efficacy of teachers, and a significant relationship between the general self-efficacy of teachers and organizational commitment of teachers. In addition, there is also a full mediation on the effect of the general self-efficacy of teachers on the relationship between transformational leadership and the organizational commitment of teachers.

Suggestions

Based on the findings of the study, the following recommendations were made:

- The state government should ensure that teachers' salaries and wages are paid when due.
- School principals should ensure there is quality instructional environment for effective teaching and learning in their schools.
- The state government should encourage development programmes such as seminars, workshops, conferences and so on for secondary
- School principals should allow clear communication with their teachers.
- Transformational leadership practices should be adopted in all secondary education systems.
- The state government should ensure that secondary school teachers' welfare should be considered adequately to enable them put in their best.

MANAGING STUDENTS' INVOLVEMENT IN CLASSROOM ACTIVITIES FOR IMPROVED ACADEMIC PERFORMANCE IN PUBLIC SENIOR SECONDARY SCHOOLS IN PORT HARCOURT METROPOLIS COUNCIL

Florence Nneka EMETUCHE
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

This study investigated managing students' involvement in classroom activities for improved academic performance of public senior secondary schools in Port-Harcourt Municipal Council. The study was guided by three research questions and three corresponding hypotheses. The study adopted a descriptive survey research design. The population of the study was 1,961 which comprised of 45 principals and 1,916 teachers drawn from the 45 public senior secondary schools in Port-Harcourt Municipal Council (OBALGA and PHALGA). A sample size of 42 principals and 290 teachers resulting a total of 332 was drawn from the total population of the study. The sample size represents 17% of the total population. The sampling technique employed was a combination of simple random sampling and stratified random sampling, ensuring equitable representation of the targeted population for the study. Data was collected through a self-designed questionnaire titled "Managing Students' Involvement in Classroom Activities for Improved Academic Performance Questionnaire (MSICAIAPQ). The instrument was validated by the researcher's supervisor and other two experts in the field of educational administration. The reliability of the Instrument was assessed using the Product Moment Correlation coefficient and a reliability of index of .85 was realized. The researcher, along with two trained research assistants helped in administering the questionnaire directly to the selected respondents. Both descriptive and inferential statistics was employed for data analysis. Descriptive statistics (mean and standard deviation) was used to answer the research questions, while the t-test statistics was used to test the hypotheses at .05 level of significance. The analysis was conducted using the Statistical Package for the Social Sciences (SPSS) version 28. The findings of the study revealed that interactive teaching methods, collaborative learning methods, and active learning techniques, all impact students' involvement in classroom activities for improved academic performance of public Senior Secondary Schools in Port-Harcourt Municipality of Rivers State. The study concluded that a holistic approach to managing classroom engagement centered on inclusivity, recognition, and consistency holds the key to unlocking students' potential and driving measurable improvements in academic outcomes. Among others, the study recommended that teachers should integrate interactive teaching methods, such as discussions, role-playing, and simulations, into their instructional practices to actively engage students and stimulate critical thinking.

Keyword: Managing Students, Student's Involvement, Classroom Activities, Improved Academic, Performance.

INTRODUCTION

In the contemporary educational system, the academic performance of students has become a primary concern for educators, policymakers, and stakeholders globally. In Nigeria particularly, the issue is even more pressing due to persistent under performance despite various interventions and reforms aimed at improving educational outcomes. Education is a fundamental pillar of development, and its quality significantly impacts the socio-economic progress of any nation. In Nigeria, the public education system, which caters for most of the population, faces numerous challenges that hinder the achievement of optimal student performance. Afolabi and Loto (2021) confirmed that these challenges include inadequate infrastructure, insufficient funding, poor teacher training, and outdated teaching methods. These factors contribute to the low academic achievement observed among students in public senior secondary schools. Consequently, there is a growing need to identify and implement effective strategies that can enhance student engagement and improve their academic outcomes.

Managing students' involvement in classroom activities emerges as a basic factor that can significantly enhance students' academic performance. Student involvement in classroom activities encompasses various forms of engagement, including participation in discussions, group work, hands-on activities, and interactive learning sessions. Educationist and scholars give greater attention to teachers' qualities and students' performance in estimating a quality school (Yusuf, 2017). Hence, teachers' job performance and students' learning outcomes are just variables that depend on many other factors, among which include individual school management structure and style, availability of educational resources and the quality of programs provided to students under conducive environment as well as the quality of support an individual school receives from stakeholders (Prince, 2024). Public secondary schools can attain good performance through the act of managing students' involvement in classroom activities by adopting simple classroom models like; the use of interactive teaching methods, collaborative learning method, use of active learning techniques, rewarding students' effort, enforcement of regularity to school for the teachers.

However, student involvement is a necessary aspect throughout the learning process. It is best understood as the relationship between the student and the school, teachers, peers, instruction and curriculum (Amadi, 2020). Student involvement has three dimensions which are behavioral, emotional, and cognitive. Behavioral involvement refers to student's participation in academic and extracurricular activities. Emotional involvement refers to student's positive and negative reaction to peers, teachers, and school, while cognitive involvement talks about student's thoughtfulness and willingness to master difficult skills (Obi & Nwankwo, 2022).

Classroom activities encompass a wide range of tasks and interactive engagements designed to facilitate learning and enhance student engagement during school lessons. These activities include group discussions, where students collaborate and share ideas on a particular topic, and hands-on projects that allow students to apply theoretical knowledge to practical scenarios (Edeh, 2019). Collaborative learning exercises, such as peer-to-peer teaching and group assignments, encourage teamwork and the sharing of diverse perspectives (Nwosu, 2020). Individual assignments and tasks are tailored to help students develop critical thinking and problem-solving skills independently. Technology-based activities, such as using educational software, online research, and multimedia presentations, integrate modern tools into the learning process, making lessons more dynamic and interactive. Also, classroom activities can involve role-playing, debates, and simulations that provide experiential learning opportunities, as well as

creative tasks like arts and crafts, writing exercises, and scientific experiments that cater to different learning styles (Dweck, 2016). These varied activities are strategically designed to engage students actively, promote a deeper understanding of the subject matter, and ultimately improve academic performance by making learning more enjoyable and effective (Nnamdi and Onuoha, 2022).

Statement of the Problem

The career of teaching come with a lot of excitement, personal reward, challenges, and chance to encourage and support others to achieve their dreams and aspirations. This is possible with an excellent teacher who knows how to work with stakeholders to inspire the students to perform better in their academic works. Through several rigorous process and training teachers acquire qualities that are essential in ensuring a long-lasting change in students' involvement in classroom activities (Alade, 2020). With such qualities, teachers are expected to motivate, guide, and encourage students to study hard to improve their academic performance.

Contrarily, academic performance of students in public senior secondary schools in Port-Harcourt Metropolis has been a concern for educators. Despite numerous efforts to enhance educational outcomes, many students continue to underperform, raising questions about the effectiveness of current teaching methods and classroom management strategies. This assertion was supported by Onuoha (2020) who opined that there have been public outcries that the academic performance of students in public secondary schools in Rivers State is below expectation. Many of the students perform woefully in both internal and external examinations, some cannot even boast of five credits in their West African Examination Certificate (WASSCE) and/or National Examination Council (NECO), while some can cannot read fluently nor even solve simple Mathematical problems.

These problems are not peculiar to only the students in public secondary school in Rivers State, but report from the public and external examinations outputs has it that there has been a decline in the standards of education in Nigeria. What could be responsible for this ugly trend, even when it is assumed that there are well trained and qualified teachers to teach effectively? Does it mean that the qualities teachers possess does not have a positive and significant link with students' academic performance? A closer look at the learning environment proof that something needs to be done to improve the academic performance of the students. It is on this background that the researcher sought to carry out thorough investigation to understand how managing students' involvement in the classroom through use of these various strategies can lead to improved academic performance.

Aim and Objectives of the Study

This study investigated managing students' involvement in classroom activities for improved academic performance of public senior secondary schools in Port-Harcourt Metropolis. The specific objectives sought to:

- Investigate the extent interactive teaching methods can be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State.

- Ascertain the extent collaborative learning methods can be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State.
- Determine the extent active learning techniques can be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State.

Research Questions

The following research questions were formulated to guide the study:

- To what extent can the use of interactive teaching methods be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State?
- To what extent can the use of collaborative learning methods be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State?
- To what extent can the use of active learning techniques be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State?

Hypotheses

The following hypotheses were formulated and tested at .05 level of significance:

- There is no significant difference between the mean ratings of principals and teachers on the extent interactive teaching methods can be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State.
- There is no significant difference between the mean ratings of principals and teachers on the extent collaborative learning methods can be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State.
- There is no significant difference between the mean ratings of principal and teachers on the extent active learning techniques can be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State.

The Study was Anchored on Engagement Theory

Engagement Theory, developed by Greg Kearsley and Ben Shneiderman in 1998, cited in Andrew Milne (2018). The theory posits that learning occurs most effectively when students are meaningfully engaged through collaboration, project-based tasks, and authentic learning. This theory underscores the importance of active involvement in the learning process, suggesting that engagement fosters deeper understanding, enhances motivation, and leads to improved academic outcomes. Engagement Theory is rooted in the principle that students must be actively involved in their learning experiences to achieve optimal educational outcomes. Kearsley and

Shneiderman (1998) propose three primary components that contribute to meaningful engagement: collaboration, project-based learning, and authentic learning. These components are designed to create a learning environment where students feel connected to the material, their peers, and the broader context of their studies. By incorporating these elements into the classroom, educators can foster a sense of ownership and investment in the learning process, leading to higher levels of student engagement and academic performance.

Collaboration is a cornerstone of Engagement Theory, emphasizing the social nature of learning. When students work together on tasks, they not only share knowledge and skills but also develop interpersonal relationships that enhance their learning experience. Collaborative learning encourages students to communicate, negotiate, and problem-solve collectively, which can lead to a deeper understanding of the material. According to Kearsley and Shneiderman (1998), collaboration helps students to develop critical thinking skills, as they are required to articulate their ideas and consider different perspectives. This process of social interaction and exchange of ideas fosters a supportive learning community, where students feel motivated to engage actively in their studies.

Project-based learning, another key component of Engagement Theory, involves students working on complex tasks that require sustained effort and critical thinking. Projects are typically interdisciplinary, allowing students to draw connections between different subject areas and apply their knowledge in practical, real-world contexts. This approach not only makes learning more relevant and interesting but also helps students to develop important skills such as time management, research, and self-regulation. The theory posit that project-based learning provides students with a sense of purpose and achievement, as they are able to see the tangible results of their efforts. By engaging in projects, students become more invested in their learning, which can lead to higher levels of motivation and academic success.

The relevance of Engagement Theory cannot be overstated. The theory focus on collaboration aligns perfectly with the study's goal of examining the impact of managing student involvement in classroom activities. According to Engagement Theory, such collaborative efforts are essential for meaningful learning, as they encourage students to share knowledge, support each other, and develop critical thinking skills. By incorporating interactive teaching methods that promote collaboration, educators can create a more engaging and dynamic classroom environment, leading to higher levels of student involvement and improved academic performance.

Students' Involvement in Classroom Activities

Student involvement in classroom activities is essential for promoting academic success and fostering a positive learning environment. This concept encompasses a variety of strategies and practices aimed at actively engaging students in their learning processes. This can range from interactive teaching methods to collaborative learning techniques, active learning strategies, and reward systems. Below, I will define the concept and elaborate on various approaches to enhance student involvement in classroom activities. Student involvement refers to the degree to which students participate in and are engaged with the academic and extracurricular activities within the classroom. This engagement is characterized by active participation, critical thinking, and collaborative efforts among students. Involvement is crucial as it directly impacts students' motivation, understanding of the material, and overall academic performance**.**

Student involvement in classroom activities is a fundamental aspect of the educational process, as it significantly contributes to students' academic success, social development, and overall learning experience. This concept encompasses various dimensions, including behavioral, emotional, and cognitive engagement, all of which play crucial roles in fostering a conducive learning environment. The active participation of students in classroom activities is vital for developing critical thinking skills, enhancing motivation, and promoting a deeper understanding of the subject matter. In Nigeria, the significance of student involvement has been widely recognized, and several scholars have explored its impact on educational outcomes. Managing students' involvement in classroom activities is a difficult task that significantly impacts academic performance. Effective management of student involvement requires the implementation of various strategies and techniques that encourage active participation, foster a conducive learning environment, and address the diverse needs of students. There is need to look into the importance of interactive teaching methods, collaborative learning, and active learning techniques, school attendance as means to enhance student engagement and academic outcomes.

Interactive Teaching Methods for Improved Academic Performance

Interactive teaching methods are essential for engaging students and fostering a deeper understanding of the subject matter. These methods include questioning, discussions, simulations, role-playing, and the use of multimedia resources. Involving students actively in the learning process, interactive teaching methods can transform traditional teacher-centered classrooms into dynamic, student-centered environments. This approach not only promotes active participation but also encourages critical thinking and collaborative learning.

Ogunleye (2021) emphasizes that interactive teaching methods are particularly effective in Nigerian classrooms where traditional rote learning methods often dominate. These methods can bridge gaps in resources and teacher training by making lessons more engaging and relevant to students' lives. For instance, integrating multimedia resources can cater to various learning styles, making the content more accessible and stimulating for all students.

Various factors can influence school attendance, including socio-economic conditions, health issues, and family responsibilities. Addressing these challenges requires a comprehensive approach that involves school policies, community support, and parental involvement. Ojo (2020) described the importance of creating a school environment that is welcoming and supportive, which can encourage regular attendance. Schools can implement strategies such as attendance monitoring, providing support services, and engaging with parents to promote regular attendance (Ogbonnaya, 2018). Ensuring that students attend school consistently, educators can enhance student involvement and support academic achievement.

Collaborative Learning Methods for Improved Academic Performance

Collaborative learning methods are essential for fostering teamwork, communication, and critical thinking among students. These methods involve students working together in small groups to achieve a common goal, which can significantly enhance their academic performance and social skills. Collaborative learning encompasses various techniques such as group projects, peer tutoring, cooperative learning structures, and collaborative problem-solving. These methods encourage students to engage with their peers, share ideas, and learn from one another. Abubakar (2020), states that collaborative learning methods lead to higher academic achievement and

greater student engagement compared to traditional teaching methods. The study highlights that students involved in collaborative learning activities demonstrate improved understanding of the subject matter and increased motivation to learn.

One of the primary benefits of collaborative learning is the development of social and interpersonal skills. Students learn to communicate effectively, resolve conflicts, and work as part of a team. Ajayi (2019) notes that these skills are crucial for success both in school and in future professional environments. Participating in collaborative learning activities, students gain valuable experience in teamwork and leadership, which can enhance their overall academic performance and personal development. Additionally, collaborative learning methods can help bridge the achievement gap among students with varying abilities.

According to Nwankwo (2019), this sense of community can lead to increased student engagement and a more positive attitude towards learning. Nwankwo's study found that students who feel connected to their peers and teachers are more likely to participate actively in class and achieve higher academic outcomes. Implementing collaborative learning methods requires careful planning and structuring by teachers. Teachers must create an environment where students feel comfortable sharing their ideas and working together. Akinyemi (2019) notes that effective collaborative learning involves clear instructions, well-defined roles, and consistent monitoring by the teacher to ensure that all students are participating and contributing to the group's success.

Moreover, collaborative learning methods align with contemporary educational theories that emphasize the social nature of learning. Collaborative learning provides opportunities for students to engage in meaningful social interactions that promote deeper understanding and knowledge construction. This theoretical framework supports the idea that learning is a social process, and collaborative methods create an optimal environment for students to learn from each other. Collaborative learning methods have shown promising results. These methods promote teamwork, communication, and critical thinking, while also fostering a sense of community and inclusivity in the classroom. Research by Nigerian scholars underscore the benefits of collaborative learning in addressing educational challenges and enhancing student engagement and academic outcomes. Implementing these methods requires careful planning and teacher facilitation, but the results demonstrate their potential to create a more dynamic and effective learning environment.

Active Learning Techniques for Improved Academic Performance

Active learning techniques involve engaging students in activities that promote analysis, synthesis, and evaluation of class content. These techniques are designed to foster deeper learning and greater student involvement in the learning process. In public senior secondary schools in Port-Harcourt Metropolis, Rivers State, active learning techniques can significantly enhance students' academic performance by making learning more interactive and participatory. Active learning techniques include a range of strategies such as problem-based learning, case studies, group discussions, and hands-on activities. In the word of Alade (2020), these techniques require students to actively participate in their learning process, rather than passively receiving information from the teacher. This active engagement helps students develop critical thinking skills, improve their understanding of the subject matter, and retain information more effectively.

One of the key benefits of active learning techniques is that they promote student-centered learning. Adeyemi (2017) asserted that student-centered learning shifts the focus from

the teacher to the students, allowing them to take responsibility for their own learning. This approach encourages students to become independent learners and develop a deeper understanding of the material. Students who engage in active learning techniques demonstrate higher academic performance and greater motivation to learn. Active learning techniques also foster a more engaging and dynamic classroom environment. Adeyemi asserted that these techniques create opportunities for students to interact with their peers and the teacher, making learning more enjoyable and meaningful. Additionally, students who participate in active learning activities are more likely to be engaged and attentive in class, leading to improved academic outcomes.

Moreover, active learning techniques can help address the diverse learning needs of students. Olaitan (2021) states that these techniques provide opportunities for students to learn in different ways, whether through visual, auditory, or kinesthetic activities. Active learning techniques also encourage collaboration and communication among students. Ajayi, and Ekundayo, (2020) opined that group activities and discussions provide opportunities for students to work together, share ideas, and learn from one another. This collaborative approach not only enhances students' understanding of the material but also helps them develop important social and interpersonal skills. Students who engage in collaborative active learning activities demonstrate improved academic performance and greater confidence in their abilities. Implementing active learning techniques requires careful planning and preparation by teachers.

Active learning techniques are highly effective in improving academic performance and developing essential skills among students. These techniques promote student-centered learning, foster a dynamic classroom environment, and address the diverse learning needs of students. Research by Nigerian scholars underscores the benefits of active learning techniques in enhancing student engagement, understanding, and academic outcomes. Implementing these techniques requires careful planning and teacher facilitation, but the results demonstrate their potential to create a more interactive and effective learning environment.

Review of Related Empirical Studies

Nwankwo (2019).examined the influence of collaborative learning on the academic performance of students at B.Ed. Levels focusing on social factors such as interaction with peers, interaction with teachers, and social media usage influence CL and collaborative learning to improve the student's academic performance. Social constructivism theory was used to observe student performance. Data have been collected through questionnaires from four private universities. Findings were evaluated through SPSS version 22; the composite reliability of the instrument was measured as α=0.954. The results of the regression analysis confirmed and accepted all three hypotheses. It can be concluded that all three independent variables - student interaction with peers, interaction with teachers, and social media use- positively impact collaborative learning and help students improve their academic performance and achieve their goals. The results of this study suggest that collaborative learning is an effective approach to enhancing academic Performance in higher education (B.Ed. Honors) and that social factors play an important role in promoting collaboration among students. The findings have implications for teaching and learning practices in higher education, where collaborative learning may be especially beneficial. Overall, this research highlights the importance of collaborative learning in promoting academic development in students.

Ogunleye (2021) conducted a study to examine the effects of instructional materials on students' academic performance in senior secondary schools in Kwara State, Nigeria. The study aimed to determine the role of instructional materials in enhancing learning and academic outcomes. The research question posed was: "What is the effect of instructional materials on students' academic performance?" The hypothesis was that the use of instructional materials improves students' academic performance. The study adopted an experimental design with a population of senior secondary school students in Kwara State. A sample of 150 students was selected through stratified random sampling. Data were collected using pre-test and post-test achievement tests, with a reliability coefficient of 0.83. The data were analyzed using ANCOVA. The study revealed that students who were taught using instructional materials performed better than those who were taught without them. It concluded that the use of instructional materials is essential for enhancing academic performance and recommended that schools should invest in adequate instructional resources to support effective teaching and learning.

Ogbonnaya (2018) investigated the impact of teacher qualification and experience on students' academic performance in secondary schools in Osun State, Nigeria. The study aimed to assess how teachers' qualifications and years of experience influence students' learning outcomes. The research question posed was: "How do teacher qualification and experience impact students' academic performance?" The hypothesis was that higher teacher qualifications and more teaching experience leads to better academic performance among students. The study employed a correlational research design, targeting a population of secondary school teachers and students in Osun State. A sample of 200 teachers and 400 students was selected through purposive sampling. Data were collected using structured questionnaires and academic performance records, with reliability coefficients of 0.84 for the teacher questionnaire and 0.81 for the student questionnaire. Pearson correlation and multiple regression analyses were used for data analysis. The study found that teacher qualifications and experience significantly influence students' academic performance, concluding that well-qualified and experienced teachers are vital for improving academic outcomes. It recommended that schools should prioritize the recruitment of qualified and experienced teachers to enhance student achievement.

In summary, the literature review underscores the importance of various strategies in managing students' involvement in classroom activities. Interactive teaching methods, collaborative learning approaches, active learning techniques, rewarding students' efforts, and enforcing regular school attendance all play critical roles in enhancing student engagement and academic performance. By implementing these strategies, educators can create a classroom environment that fosters active participation, promotes a deeper understanding of the subject matter, and ultimately leads to improved educational outcomes for students in public senior secondary schools.

METHODOLOGY

The study adopted a descriptive survey research design. This is because it involved the collection of data directly from a population at a particular time (Thakur, 2021). The descriptive survey design was characterized as to determine, describe, or identify the various phenomenon, characteristics and or behavior of sample population. The population of the study was 1,961 which comprised 45 principals and 1,916 teachers drawn from the 45 public senior secondary schools in Port-Harcourt Metropolis (OBALGA and PHALGA). This is based on data sourced from the Rivers State Senior Secondary Schools Board showing the statistic of teaching staff and

principals as of August 2024. A sample size of 42 principals and 290 teachers resulting a total of 332 representing 17% of the total population was drawn from the total population of the study, using Taro Yamane formula.

A combination of simple random sampling and stratified random sampling, ensuring equitable representation of the targeted population for the study. Data was collected through a self-designed questionnaire titled "Managing Students' Involvement in Classroom Activities for Improved Academic Performance Questionnaire (MSICAIAPQ). The study used four-point scale having Very High Extent (VHE), High Extent (HE), Low Extent (LE), and Very Low Extent (VLE) weighted in scores of 4, 3, 2, and 1 point respectively. The instrument was presented to the researcher's supervisor for scrutiny thereafter the instrument was validated by two experts in the Department of Educational Management and Educational Psychology, Measurement and Evaluation option, all from the Faculty of Education, Ignatius Ajuru University of Education, Port Harcourt. The validators were requested to vet the instrument in terms of relevance, clarity, usability, and appropriateness. Their observations, comments and corrections were strictly adhered to, and corrections effected before final copy were made. This improved the quality of the instrument. The instrument reliability was assessed using test-retest method. A subset of 20 respondents from the population, distinct from the study sample participated.

The Pearson Product Moment Correlation coefficient analysis was used to ascertain reliability indices demonstrating internal consistency of the instrument that were used for the study and reliability indices of .85 was realized. The trained research assistants administered the questionnaire directly to the selected respondents. Adequate guidance on completing the questionnaire was provided to ensure the instruments distributed are properly field out and collected. 306 out of 332 questionnaires retrieved representing 92% return rate was achieved. In analyzing the data collected for the study, mean and standard deviation statistics were used to answer the research questions while t-test was used to test the null hypotheses at .05 level of significance.

RESULTS AND DISCUSSIONS

Research Question 1: To what extent can the use of interactive teaching methods be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State?

Table 1: Mean and Standard Deviation showing the extent interactive teaching methods be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State

S/N	Items	Mean	Remark
1	Classroom discussions, facilitated by the teacher, significantly enhance students' understanding of the subject matter and promote active participation.	2.52	High Extent
2.	Teachers provide regular and constructive feedback on students' participation in class, which helps students improve their engagement and performance	2.53	High Extent
3	Well-constructed classrooms help maintain discipline by reducing overcrowding and promoting a sense of order.	2.61	High Extent
4	Interactive lessons, characterized by active student involvement, are perceived as more engaging compared to traditional lecture-based teaching methods	2.75	High Extent
5	When Teachers employ questioning techniques during lessons, it encourages students to think critically and engage with the material.	2.76	High Extent
	Grand mean	**2.63**	**High Extent**

The table 1 above shows the mean and standard deviation of principals and teachers' responses on the extent the use of interactive teaching methods was managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State. The mean values of all the items from the table above are greater than 2.5 criterion mean which indicates that majority of the respondents agreed to all the items presented. Having a grand mean set of 2.63, the respondents agreed to a high extent that, interactive teaching methods was effectively managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt.

Research question 2: To what extent can the use of collaborative learning methods be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State?

Table 2: Mean and Standard Deviation showing the extent collaborative learning methods be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State

S/N	Items	Mean	Remark
6.	When Students are assigned group projects and collaborative assignments that require teamwork and cooperation to achieve academic goals.	2.64	High Extent
7.	Participation in group activities and collaborative tasks enhances students' motivation and interest in the subject matter compared to individual tasks.	2.52	High Extent
8.	Collaborative work with peers is a common feature of classroom activities, promoting interaction and shared learning experiences.	3.31	High Extent
9.	Group discussions and collaborative problem-solving tasks help students better understand complex concepts and improve their academic performance.	2.7	High Extent
10.	Teachers regularly organize peer tutoring sessions where students assist each other, contributing to a supportive learning environment.	2.55	High Extent
	Grand mean	**2.74**	**High Extent**

The table 2 above shows the mean and standard deviation of principals and teachers' responses on the extent the use of collaborative learning methods was managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in of Rivers State. The mean values of all the items from the table above are greater than 2.5 criterion mean which indicates that majority of the respondents agreed to all the items presented. Having a grand mean set of 2.74, the respondents agreed to a high extent that, collaborative learning methods was effectively managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State.

Research question 3: To what extent can the use of active learning techniques be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State?

Table 3: Mean and standard deviation showing the extent active learning techniques be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State

S/N	Items	Mean	Remark
11.	Hands-on activities, such as experiments and practical exercises, are regularly incorporated into lessons to enhance students' learning experiences.	2.60	High Extent
12.	Problem-based learning activities, which involve real-world problems and case studies, are more engaging for students than traditional lecture-based instruction.	2.61	High Extent
13	Simulations and role-playing exercises are frequently used in class to provide interactive and experiential learning opportunities.	2.53	High Extent
14	Active learning techniques, such as group projects and interactive simulations, significantly aid in students' retention and understanding of the material.	2.54	High Extent
15.	Projects that require critical thinking, creativity, and problem-solving skills are commonly assigned, promoting deeper learning and student engagement.	2.55	High Extent
	Grand mean	**2.56**	**High Extent**

The table 3 table above shows the mean and standard deviation of principals and teachers' responses on the extent active learning techniques was managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State. The mean values of all the items from the table above are greater than 2.5 criterion mean which indicates that majority of the respondents agreed to all the items presented. Having a grand mean set of 2.56, the respondents agreed to a high extent that, active learning techniques was properly utilized for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State.

Test of Hypotheses

Ho_1: There is no significant difference between the mean ratings of principals and teachers on the extent the use of interactive teaching methods can be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State.

Table 4: t-test summary showing significant difference in the mean scores of principals and teachers on the extent interactive teaching methods can be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State

Category	N	Mean	SD	Df	t-cal	p-value	Decision
Principal	40	2.55	1.08	304	1.67	.601*	H_o Accepted
Teacher	266	2.57	1.10				

*Not Significant; p>0.05

Table 4 showed the t-test summary of the significant difference in the mean rating of principals and teachers on the extent use of interactive teaching methods can be managed for students' involvement in classroom activities for improved academic performance of public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State. The result of the study showed

that there was no significant difference at (t-cal = 1.67, df = 304, p = .601) as the p>.05. Therefore, the null hypothesis which stated that there is no significant difference between the mean ratings of principal and teachers on the extent the use of interactive teaching methods impacts students' involvement in classroom activities for improved academic performance of public Senior Secondary Schools in Port-Harcourt Metropolis in of Rivers State was accepted.

Ho_2: There is no significant difference between the mean ratings of principal and teachers on the extent use of collaborative learning methods can be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State.

Table 5: t-test summary showing significant difference in the mean rating of principals and teachers on the extent collaborative learning methods can be managed for students' involvement in classroom activities for improved academic performance of public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State

Category	N	Mean	SD	Df	t-cal	p-value	Decision
Principal	40	2.82	1.12	304	4.05	.890*	H_o Accepted
Teacher	266	2.00	.96				

***Not* Significant; p<0.05**

Table 5 showed the t-test summary of the significant difference in the mean rating of principals and teachers on the extent use of collaborative learning methods can be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State. The result of the study showed that there was no significant difference at (t-cal = 4.50, df = 304, p = .890) as the p<.05. Therefore, the null hypothesis which stated that there is no significant difference between the mean ratings of principals and teachers on the extent use of collaborative learning methods can be manage for students' involvement in classroom activities for improved academic performance of public Senior Secondary Schools in Port-Harcourt Metropolis in of Rivers State was accepted.

Ho_3: There is no significant difference between the mean ratings of principal and teachers on the extent use of active learning techniques can be managed for students' involvement in classroom activities for improved academic performance of public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State.

Table 6: T-test summary showing significant difference in the mean man rating of principals and teachers on the extent use of active learning techniques can be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State

Category	N	Mean	SD	Df	t-cal	p-value	Decision
Principal	40	2.65	1.23	304	2.26	.740*	H_o Accepted
Teacher	266	2.42	1.00				

*Not Significant; p<0.05

Table 6 showed the t-test summary of the significant difference in the mean rating of principals and teachers on the extent use of active learning techniques can be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State. The result of the study showed that there was no significant difference at (t-cal = 2.26, df = 304, p = .740) as the p<.05. Therefore, the null hypothesis which stated that there is no significant difference between the mean ratings of principals and teachers on the extent use of active learning techniques influence students' involvement in classroom activities for improved academic performance of public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State was accepted.

DISCUSSION OF FINDINGS

Use of Interactive Teaching Methods for Improved Academic Performance

The finding of research question one showed that to a high extent, interactive teaching methods can be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis y of Rivers State. The result showed that, the null hypothesis which stated that there is no significant difference between the mean ratings of principals and teachers on the extent the use of interactive teaching methods can be managed for students' involvement in classroom activities for improved academic performance of public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State was accepted. In supporting this finding, Onuoha (2020) added significant insight to the discussion of this current research, providing further insights into how interactive teaching methods impacts students' involvement in classroom activities for improved academic performance. Interactive teaching strategies significantly improve students' academic performance by promoting critical thinking and problem-solving skills. This shift from passive to active learning enables students to take ownership of their learning process, making education a more meaningful and impactful experience. Furthermore, Eze (2020) demonstrated that these methods can lead to substantial improvements in students' academic performance, particularly in challenging subjects like mathematics and science.

Adeyemo (2021) noted that integrating multimedia resources such as videos, interactive simulations, and digital games can accommodate visual, auditory, and kinesthetic learners. This approach ensures that all students, regardless of their preferred learning style, can engage with the material in a way that suits them best. Adeyemo's research highlights the importance of using a diverse range of interactive techniques to maximize student involvement and improve academic performance. Okoro (2018) emphasized those activities such as case studies, project-based learning, and role-playing challenge students to apply their knowledge in real-world scenarios. This approach not only enhances academic performance but also prepares students for future academic and professional challenges by developing essential skills needed in higher education and the workforce. Interactive teaching methods also play a crucial role in developing essential soft skills, such as communication, teamwork, and leadership.

Use of Collaborative Learning Methods for Improved Academic Performance

The finding of research question two showed that to a high extent, collaborative learning methods can be managed for students' involvement in classroom activities for improved

academic performance of public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State. The result showed that there was no significant difference. Therefore, the null hypothesis which stated that There is no significant difference between the mean ratings of principals and teachers on the extent the use of collaborative learning methods can be managed for students' involvement in classroom activities for improved academic performance of public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State was accepted. In supporting this finding on collaborative learning methods impact students' involvement in classroom activities for improved academic performance of public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State. Akinyemi (2019) noted the importance of teacher facilitation in maintaining a productive and collaborative classroom environment.

However, Adeoye (2020) asserted that students who participate in group projects and peer tutoring sessions demonstrate significant improvements in their academic performance, particularly in subjects such as mathematics and science. Collaborative learning can help address some of the systemic challenges in the Nigerian educational system, Musa (2019) opined that adaptability makes collaborative learning a versatile and effective teaching strategy that can be tailored to meet the specific needs of different subjects and students. Collaborative learning activities, such as group discussions and peer reviews, encourage students to take an active role in their education, leading to increased motivation and academic success.

Use of Active Learning Techniques for Improved Academic Performance

The finding of research question three showed that to a high extent, active learning techniques can be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State. This study showed that there was no significant difference. Therefore, the null hypothesis which stated that there is no significant difference between the mean ratings of principals and teachers on the extent use of active learning techniques can be managed for students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in Rivers State was accepted.

In line with this study, active learning techniques influence students' involvement in classroom activities for improved academic performance in public Senior Secondary Schools in Port-Harcourt Metropolis in of Rivers State, in supporting this study, Adeyemi (2017) noted that techniques create opportunities for students to interact with their peers and the teacher, making learning more enjoyable and meaningful. Additionally, students who participate in active learning activities are more likely to be engaged and attentive in class, leading to improved academic outcomes. Furthermore, Okoye (2019) opined that student-centered learning shifts the focus from the teacher to the students, allowing them to take responsibility for their own learning.

CONCLUSION

Managing students' involvement in classroom activities as a strategic pathway to improving academic performance. The transformative potential of interactive teaching methods, collaborative learning strategies, and active learning techniques in fostering student engagement. These methods only inspire intellectual curiosity, also create a dynamic learning environment where students are empowered to actively participate and excel. The rewarding students' efforts

emerged as a vital motivational tool, reinforcing positive behaviors, and encouraging sustained commitment to learning. Collectively, these strategies reveal that a holistic approach to managing classroom engagement centered on inclusivity, recognition, and consistency holds the key to unlocking students' potential and driving measurable improvements in academic outcomes.

Recommendations

Based on the findings of the study, the researcher recommended as follows:

- Teachers should integrate interactive teaching methods, such as discussions, role-playing, and simulations, into their instructional practices to actively engage students and stimulate critical thinking.
- Administrators should encourage group activities and peer learning sessions to promote teamwork and enhance students' collaborative problem-solving skills, which significantly boost engagement and academic performance.
- Educators should incorporate active learning approaches, such as case studies, project-based assignments, and hands-on experiments, to make lessons more engaging and participatory.

EFFECTIVE EDUCATIONAL MANAGEMENT AND ITS IMPACT ON NIGERIA'S ECONOMIC GROWTH

Margaret Dickson JUSTIN
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

The paper examined Effective Educational Management and its Impact on Nigeria's Economic Growth, focusing on how effective management of the education sector contributes to national development. Educational management plays a crucial role in ensuring the smooth administration of institutions, human capital development, and workforce productivity, which are essential for economic progress. However, various challenges, including inadequate funding, poor infrastructure, policy inconsistencies, corruption, and security threats, have hindered the sector's effectiveness in driving sustainable economic growth. Furthermore, education serves as a catalyst for innovation, entrepreneurship, and poverty reduction, significantly influencing national development. Higher education institutions contribute to research, technological advancements, and industrial growth, further strengthening economic productivity. Addressing the challenges in educational management requires strategic interventions such as increased investment, curriculum reforms, teacher training, technology integration, and industry-academia collaboration. The paper concluded that a well-managed education system enhances innovation, entrepreneurship, and industrial growth, contributing to sustainable economic advancement.. Amongst others the paper suggested that Government should increase budgetary allocation to education to meet international standards and ensure proper funding of schools, teacher salaries, and infrastructure.

Keywords: Educational Management, Economic Growth, Human Capital Development, Workforce Productivity, Innovation.

INTRODUCTION

Education serves as a foundational pillar for economic development, equipping individuals with the knowledge and skills necessary to drive innovation, productivity, and sustainable growth. In Nigeria, the management of the educational sector plays a pivotal role in shaping the nation's economic trajectory. Educational management encompasses the strategic planning, organization, coordination, and evaluation of resources and processes within the educational system to achieve optimal learning outcomes and societal advancement. Effective management in education ensures that policies are well-formulated, resources are efficiently allocated, and educational objectives align with national economic goals.

Moreover, the relationship between education and economic growth has been extensively studied, with numerous scholars highlighting the positive impact of education on a nation's economy. For instance, Abiodun and Iyiola (2011) emphasized that investments in education significantly contribute to sustainable economic development by enhancing human capital. Similarly, Ehiogu et al. (2013) argued that a well-managed educational system fosters innovation and technological advancement, which are critical drivers of economic growth. These perspectives underscore the importance of not only investing in education but also ensuring its effective management to realize its full economic benefits.

Additionally, the Nigerian context presents unique challenges and opportunities in the realm of educational management. Studies such as those by Ifionu and Nteegah (2013) have assessed the impact of education on economic growth in Nigeria, revealing that while education has the potential to drive economic development, inefficiencies and mismanagement within the educational sector can hinder this progress. Jaiyeoba (2015) further highlighted that addressing issues such as inadequate funding, poor infrastructure, and lack of qualified personnel is essential for the educational sector to effectively contribute to Nigeria's economic growth. These insights call for a comprehensive examination of the strategies and policies governing educational management in Nigeria.

Furthermore, understanding the dynamics of educational management and its impact on economic growth requires a multifaceted approach. It involves analyzing the roles of various stakeholders, including government agencies, educational institutions, and the private sector, in shaping educational policies and practices. Furthermore, it necessitates an exploration of the systemic challenges that impede effective educational management and the development of innovative solutions to overcome these obstacles. The relationship between educational management and economic growth in Nigeria is a critical area of study that holds significant implications for the nation's development. Effective educational management has the potential to transform the educational sector into a catalyst for economic prosperity, while mismanagement can stifle progress and perpetuate cycles of poverty and underdevelopment. Through a thorough examination of existing literature and empirical evidence, this study seeks to shed light on the key components of effective educational management and propose strategies to enhance its role in driving Nigeria's economic growth.

THEORETICAL FRAMEWORK

Classical Economic Growth Theory

Adam Smith’s Classical Economic Growth Theory, first introduced in *The Wealth of Nations* (1776), remains one of the most enduring frameworks for understanding the relationship between human productivity and national economic expansion. Smith argued that economic growth is driven by labor specialization, efficient resource allocation, and a free-market system that allows individuals to maximize their potential. Daron Acemoglu, Johnson, and Robinson (2024) reaffirmed Smith’s ideas by emphasizing the role of inclusive institutions in fostering sustainable development, highlighting that economies thrive when governments create policies that enhance productivity and human capital formation. In the context of educational management and economic growth in Nigeria, Smith’s principles provide a relevant foundation for analyzing how proper administration of the education sector can enhance workforce efficiency, reduce unemployment, and stimulate national development.

Furthermore, Smith's concept of the division of labor is directly applicable to the structure of Nigeria's education system. Specialization in various academic disciplines, vocational training, and research institutions aligns with Smith's argument that productivity improves when individuals focus on specific tasks in which they have expertise. In Nigeria, effective educational management should prioritize curriculum development that aligns with market demands, ensuring that graduates possess the necessary skills to contribute meaningfully to different sectors of the economy. Poor management, however, leads to a skills mismatch, where graduates are trained in areas that lack economic relevance, thereby contributing to high unemployment rates and underemployment. This inefficiency stagnates economic growth, as the workforce remains unproductive despite increased educational enrollment.

Moreover, Smith's advocacy for a self-regulating market through the "invisible hand" of competition can be linked to the role of private and public educational institutions in Nigeria. A well-managed education sector encourages both private and government institutions to compete in providing quality education, thereby improving learning outcomes. Acemoglu et al. (2024) expanded on this idea by asserting that economies that allow competition within structured institutional frameworks tend to experience more sustainable growth. In Nigeria, ensuring quality assurance mechanisms within the education sector will enhance efficiency, making education more responsive to labor market demands. When properly managed, the education system can serve as a driving force for industrial growth, technological advancement, and increased labor productivity, which are fundamental to Smith's economic principles.

Additionally, Smith emphasized the importance of capital accumulation as a driver of economic progress, which aligns with the role of investment in education. Nations that allocate sufficient resources to education experience long-term economic benefits through improved human capital. Acemoglu et al. (2024) further argued that economies with strong institutional support for education tend to outperform those that neglect investment in learning. In Nigeria, underfunding in the education sector has hindered infrastructural development, teacher training, and research activities, ultimately affecting the quality of graduates produced. Effective educational management must prioritize increased funding, efficient resource distribution, and policies that enhance accessibility and quality of education to strengthen economic growth.

The Classical Economic Growth Theory highlights the role of government policies in shaping economic prosperity. Smith asserted that while free markets drive growth, governments must establish frameworks that ensure stability and fairness. Acemoglu et al. (2024) reaffirmed this by arguing that institutions that enforce transparency, accountability, and long-term planning tend to foster economic resilience. In Nigeria, weak governance and inconsistent educational policies have led to instability in the education sector, affecting its contribution to national development. Strengthening educational management through strategic policies, improved institutional oversight, and long-term planning will ensure that education plays its rightful role in economic transformation.

CONCEPTUAL CLARIFICATION

Concept of Educational Management

Educational management refers to the systematic planning, organizing, directing, and controlling of educational institutions and resources to achieve predetermined objectives. It encompasses administrative and leadership functions aimed at ensuring that educational policies are

effectively implemented to enhance learning outcomes and societal development (Ofojebe & Ezugoh, 2019). The primary goal of educational management is to create an efficient system where teaching and learning processes operate seamlessly, fostering productivity within schools and higher institutions. This involves various components, including curriculum development, teacher training, financial administration, and student support services (Okeke, 2021).

Furthermore, effective educational management plays a fundamental role in maintaining discipline and order within educational institutions. It ensures that students, teachers, and administrators adhere to set guidelines that promote academic excellence. According to Aina (2020), well-structured educational management leads to improved instructional delivery, better student performance, and the overall efficiency of the education system. Additionally, educational management incorporates strategic planning, which involves setting goals and objectives that align with national and global educational policies. It also includes resource allocation to ensure that schools are adequately funded, teachers are well-remunerated, and students have access to quality learning materials (Onwuagboke & Osakwe, 2022).

Moreover, leadership in educational management is a critical factor that determines the success of educational institutions. The role of administrators, such as principals, rectors, and vice-chancellors, is to provide direction and implement policies that enhance the quality of education (Eze, 2020). Effective leaders within the education sector must possess skills in decision-making, problem-solving, and human resource management to address the challenges that arise within the system. Research has shown that institutions with strong leadership and management structures tend to produce better academic outcomes compared to those with weak administrative systems (Obi & Olaniyi, 2018).

Additionally, educational management is essential in maintaining accountability and transparency within the education sector. Educational institutions must ensure that funds allocated for learning purposes are utilized effectively to achieve the intended goals. According to Nwogu and Ekwe (2019), corruption and mismanagement of educational resources hinder the growth and development of the sector, leading to poor infrastructure, inadequate instructional materials, and a decline in educational standards. Therefore, implementing policies that promote accountability in financial and administrative matters is necessary for enhancing educational outcomes.

In addition, technology integration has become a crucial aspect of educational management in the modern era. The adoption of digital learning tools, online education platforms, and administrative software has transformed the way education is managed (Okonkwo, 2023). These technological advancements have improved efficiency in record-keeping, student assessment, and teacher training, making education more accessible and inclusive. Effective educational management must embrace innovations that enhance teaching and learning experiences while ensuring that technological resources are adequately provided in schools and higher institutions.

Educational management is a fundamental aspect of ensuring that the education system functions effectively. It involves various administrative and leadership functions that enhance the quality of education and contribute to national development. Proper planning, accountability, leadership, and technology integration are essential components of successful educational management. When well-implemented, educational management can improve learning outcomes, enhance institutional efficiency, and contribute to overall economic growth and societal advancement.

Economic Growth

Economic growth refers to the sustained increase in the productive capacity of an economy, leading to higher levels of output, employment, and income generation. It is measured through indicators such as Gross Domestic Product (GDP), per capita income, and industrial expansion (Adebayo, 2021). A growing economy signifies an improvement in the standard of living, increased job opportunities, and enhanced infrastructural development. According to Osakwe (2020), economic growth occurs when a country effectively utilizes its human and natural resources to create wealth and improve the well-being of its citizens.

Furthermore, economic growth is influenced by several factors, including capital accumulation, technological advancements, labor productivity, and government policies. The accumulation of physical and human capital plays a crucial role in driving economic expansion. Investment in infrastructure, industries, and human capital development enhances productivity, leading to long-term economic sustainability (Eze, 2021). Additionally, technological innovation is a significant driver of economic growth. Countries that embrace advanced technologies in industrial production, agriculture, and service delivery experience higher economic progress compared to those that rely on traditional methods of production (Okafor, 2019).

Moreover, labor productivity is a key determinant of economic growth. A skilled and educated workforce contributes significantly to national productivity by improving efficiency and innovation across various sectors. According to Adegbite (2022), nations that invest in education and vocational training witness improved labor efficiency, leading to higher economic output. Policies that promote workforce training, research, and development enhance economic competitiveness and create a sustainable growth environment.

Additionally, government policies play a vital role in shaping economic growth. Fiscal policies such as taxation, public expenditure, and monetary policies influence the level of investment and consumption within an economy. According to Obi and Nwachukwu (2020), stable economic policies attract both local and foreign investments, which boost production, create employment, and generate revenue for national development. Conversely, inconsistent policies, poor governance, and corruption hinder economic progress, leading to stagnation and financial crises.

Economic growth is linked to the expansion of industries and entrepreneurship. A vibrant industrial sector contributes to wealth creation, job opportunities, and increased export revenues. Industrialization allows economies to transition from agrarian-based production to manufacturing and service-oriented activities that generate higher incomes (Onyema, 2023). Supporting small and medium enterprises (SMEs) also plays a crucial role in boosting economic growth by fostering innovation, reducing unemployment, and increasing national revenue generation.

Furthermore, globalization has influenced economic growth in modern economies. International trade, foreign direct investment, and cross-border collaborations have provided opportunities for economic expansion. Countries that integrate into the global economy through trade agreements and foreign partnerships experience faster growth due to increased market access and technological transfer (Umeh, 2022). However, economic growth must be inclusive to ensure that benefits are distributed equitably among all social classes to avoid income disparities and poverty.

Economic growth is a critical component of national development that enhances income levels, employment opportunities, and infrastructural advancements. It is driven by factors such

as capital accumulation, technological advancements, labor productivity, and effective government policies. Sustainable economic growth requires strategic planning, investment in human capital, and the adoption of innovative technologies to ensure long-term national prosperity.

EDUCATIONAL MANAGEMENT AND ECONOMIC GROWTH IN NIGERIA

Educational management plays a fundamental role in the economic growth of Nigeria by ensuring the effective administration of educational institutions and the development of a skilled workforce. A well-managed education system produces graduates with the knowledge and skills necessary to contribute to national productivity, technological advancement, and industrial development (Ogunleye, 2020). The link between education and economic growth is evident in how nations that invest in education experience higher levels of innovation, improved labor efficiency, and sustainable economic expansion.

Furthermore, the education sector in Nigeria faces several challenges that affect its ability to contribute effectively to economic growth. Poor funding, inadequate infrastructure, and policy inconsistencies have hindered the proper management of educational institutions, leading to a decline in the quality of graduates produced (Obi & Okeke, 2021). The lack of investment in research and development has also affected the nation's ability to compete in the global knowledge economy. According to Eze (2019), countries that prioritize research and innovation through well-managed educational systems experience faster economic progress compared to those that neglect knowledge-driven development.

Moreover, educational management is essential for addressing unemployment in Nigeria. A structured education system that aligns with labor market demands ensures that graduates acquire relevant skills for employment and entrepreneurship (Oladipo, 2022). When educational institutions are effectively managed, students receive training that enhances their employability and productivity in various sectors of the economy. In addition, vocational education and skills acquisition programs contribute to workforce efficiency, leading to higher economic output and reduced poverty levels.

Additionally, Nigeria’s economic growth is dependent on the ability of the education sector to produce human capital that drives industrialization and technological advancements. Countries with well-managed education systems have a higher capacity to transition from resource-based economies to knowledge-based economies (Adebayo, 2023). Improving educational management through policy reforms, funding, and infrastructural development will enhance Nigeria’s economic competitiveness in the global market.

The role of educational management in Nigeria’s economic growth cannot be overlooked. A well-structured education system produces a skilled workforce, enhances industrialization, and fosters technological innovation. Addressing challenges such as poor funding, policy inconsistencies, and skills mismatch will enable the education sector to contribute effectively to national development.

KEY COMPONENTS OF EFFECTIVE EDUCATIONAL MANAGEMENT

Effective educational management ensures that schools, colleges, and universities operate efficiently to produce skilled graduates who contribute to economic growth. Key components such as leadership, resource allocation, curriculum planning, teacher development, and

stakeholder engagement play vital roles in achieving educational excellence. Below are essential components, each discussed in detail.

Strong Leadership and Governance

Leadership is fundamental to the success of any educational institution. Effective leaders create policies, set academic goals, and ensure the smooth operation of institutions. In Nigeria, weak leadership has contributed to inefficiencies in the education sector, including mismanagement of funds, poor teacher motivation, and inadequate infrastructure. School administrators must be well-trained in management practices to ensure transparency, accountability, and efficient decision-making. Moreover, leadership should encourage participatory governance, where teachers, students, and other stakeholders contribute to decision-making processes. A well-structured leadership framework fosters an environment where academic institutions can thrive, leading to better student outcomes and economic growth (Adelakun & Ogunyemi, 2024).

Efficient Resource Allocation and Funding

Proper resource allocation ensures that schools have the necessary infrastructure, teaching materials, and trained personnel to deliver quality education. Many Nigerian institutions suffer from underfunding, leading to overcrowded classrooms, outdated curricula, and poor learning conditions. A well-managed education system requires adequate government funding, supplemented by private sector investments and alternative financing mechanisms such as grants, donations, and international partnerships. Ensuring that funds are allocated transparently and used efficiently for school development, teacher salaries, and student support programs will enhance education quality. Proper financial management practices, including regular audits and oversight committees, can prevent mismanagement and corruption in education financing (Eze & Chukwu, 2023).

Comprehensive Curriculum Planning and Development

A well-structured curriculum ensures that students receive relevant knowledge and skills for both academic and professional success. In Nigeria, outdated curricula have resulted in a skills gap between graduates and labor market needs. Effective educational management requires periodic curriculum reviews to incorporate emerging technologies, economic trends, and global best practices. Curriculum development should also involve collaboration with industry experts to ensure alignment with job market demands. Additionally, integrating critical thinking, problem-solving, and entrepreneurship into the curriculum will equip students with skills necessary for innovation and self-employment. A dynamic and industry-relevant curriculum strengthens national competitiveness and enhances workforce productivity (Okafor & Nnaji, 2024).

Teacher Training and Professional Development

Teachers play a crucial role in shaping student learning outcomes. Without well-trained educators, even the best policies and curricula will fail. Many Nigerian teachers lack access to professional development opportunities, leading to outdated teaching methods and reduced student engagement. Effective educational management prioritizes continuous teacher training

programs to enhance instructional skills, digital literacy, and subject expertise. Government agencies, universities, and private institutions should collaborate to provide certification courses, workshops, and mentorship programs for educators. Incentives such as salary increments, promotion opportunities, and research grants will motivate teachers to pursue professional growth. A skilled and motivated teaching workforce improves the quality of education and contributes to national development (Eze, 2023).

Stakeholder Engagement and Community Involvement

Education is a shared responsibility among governments, educators, parents, industries, and the community. Effective educational management fosters collaboration among all stakeholders to enhance learning outcomes. In Nigeria, weak engagement between schools and local communities has contributed to low parental involvement and limited support for educational programs. Strengthening partnerships between schools and industries ensures that students gain practical experience and job placements. Additionally, involving parents in school governance through parent-teacher associations (PTAs) enhances accountability and improves student performance. Community support, including donations, volunteer teaching, and mentorship programs, can further strengthen the education system. A participatory approach to education management enhances institutional effectiveness and ensures that learning institutions meet societal needs (Balogun & Hassan, 2024).

Integration of Technology in Education Management

Digital transformation is crucial for modern education systems. Technology enhances teaching methods, improves administrative efficiency, and expands access to learning resources. Nigerian schools face challenges such as limited internet access, inadequate digital infrastructure, and low digital literacy among educators. Effective educational management requires investment in e-learning platforms, smart classrooms, and automated school management systems. Training teachers and administrators in technology use will ensure the successful integration of digital tools in education. Government support in providing affordable internet services, digital devices, and software solutions will further enhance learning. A technology-driven education system improves knowledge dissemination and prepares students for the digital economy (Ajayi & Okonkwo, 2023).

Quality Assurance and Performance Evaluation

Monitoring and evaluation are critical to maintaining education standards. In Nigeria, poor quality control mechanisms have led to inconsistent academic performance across institutions. Effective educational management involves setting clear performance indicators for schools, teachers, and students. Regular assessments, accreditation processes, and external evaluations ensure that institutions maintain high educational standards. Establishing independent quality assurance agencies will enhance accountability and promote adherence to global education benchmarks. Additionally, incorporating student feedback, teacher appraisals, and institutional rankings will help identify areas for improvement. A strong quality assurance system strengthens education outcomes and enhances the credibility of academic qualifications (Adeboye & Yusuf, 2024).

Inclusive Education and Equal Access to Learning

Education must be accessible to all individuals, regardless of socio-economic background, gender, or disability. Many Nigerian children, particularly in rural areas, face challenges such as lack of schools, high tuition fees, and cultural barriers. Effective educational management prioritizes inclusive policies that ensure equal learning opportunities for all students. Expanding school infrastructure in underserved regions, providing scholarships for disadvantaged students, and implementing flexible learning programs can improve access. Special education programs for individuals with disabilities should also be strengthened to ensure their full participation in academic activities. An inclusive education system maximizes human capital development and contributes to long-term economic growth (Ogundele & Balogun, 2023).

CHALLENGES IN EDUCATIONAL MANAGEMENT IN NIGERIA

Educational management in Nigeria encounters numerous obstacles that hinder the effectiveness of the education system. These challenges affect school administration, teacher performance, student learning outcomes, and overall national development. Issues such as inadequate funding, poor infrastructure, shortage of qualified teachers, policy inconsistencies, corruption, and security threats have contributed to the decline in education quality. Addressing these challenges is essential for improving the education system and ensuring its contribution to economic growth.

Inadequate Funding and Resource Allocation

One of the major challenges in educational management in Nigeria is the persistent lack of adequate funding. Many schools, colleges, and universities struggle with financial constraints, leading to dilapidated infrastructure, lack of instructional materials, and poor remuneration for teachers. The budgetary allocation to education often falls below international recommendations, making it difficult for institutions to expand and upgrade facilities. Misallocation of resources and embezzlement of educational funds further worsen the financial crisis in the sector. Without adequate investment, it is difficult to provide quality education that meets global standards.

Poor Infrastructure and Learning Facilities

Many educational institutions in Nigeria lack basic infrastructure such as classrooms, libraries, laboratories, and technological equipment. Rural schools, in particular, face severe infrastructure deficits, with students often learning in overcrowded and poorly ventilated classrooms. Inadequate laboratory facilities in science-based institutions hinder practical learning, while the absence of electricity and internet connectivity limits access to digital resources. Poor learning environments discourage student engagement and contribute to low academic performance. Improving infrastructure is critical to ensuring a conducive atmosphere for learning and skill acquisition.

Shortage of Qualified Teachers and Poor Teacher Welfare

The shortage of trained and experienced teachers poses a major threat to educational quality in Nigeria. Many schools, especially in rural areas, rely on unqualified or undertrained teachers who lack the necessary skills to deliver quality instruction. The teaching profession in Nigeria is often undervalued, leading to poor remuneration, delayed salary payments, and lack of incentives for professional development. These factors result in low teacher motivation, frequent industrial actions, and high attrition rates. Ensuring adequate teacher training, fair wages, and continuous professional development is essential for enhancing educational quality.

Policy Inconsistencies and Poor Implementation

Frequent changes in education policies without proper implementation strategies create instability in the sector. Over the years, Nigeria has introduced various educational reforms, but weak enforcement mechanisms, lack of political commitment, and insufficient funding have prevented these policies from yielding the desired results. Many reforms are initiated without thorough research, leading to policies that do not address the core challenges of the education system. Effective policy formulation and consistent implementation are necessary to ensure long-term improvements in educational management.

Corruption and Mismanagement of Educational Funds

Corruption remains a significant challenge in Nigeria's education sector. Funds allocated for school projects, teacher salaries, and student support programs are often misappropriated. Bribery in admissions, examinations, and employment within educational institutions further undermines the credibility of the system. Fraudulent practices in accreditation processes result in the proliferation of substandard institutions, lowering the value of educational qualifications. Strengthening transparency, accountability, and governance structures in education management is necessary to curb corruption and ensure resources are used effectively.

Human Capital Development and Workforce Productivity

Human capital development refers to the process of improving individuals' knowledge, skills, and health to enhance their productivity and economic contribution. Education, vocational training, and healthcare investments are critical components of human capital development, directly impacting workforce productivity (Afolayan, 2022). A well-educated workforce increases a country's economic output by improving efficiency, fostering innovation, and reducing dependency on low-productivity sectors. In Nigeria, limited investment in human capital has contributed to low labor productivity, high unemployment rates, and slow economic growth. Strengthening human capital development through quality education, skill acquisition, and healthcare improvements is essential for national development (Eboh, 2021).

Furthermore, education plays a critical role in equipping individuals with technical and cognitive skills that enhance workplace efficiency. Workers with higher educational attainment are more likely to secure well-paying jobs, contribute effectively to industries, and adapt to evolving economic conditions (Balogun & Adeyemi, 2023). Nigeria's education system must emphasize both theoretical and practical knowledge to bridge the gap between academic learning

and labor market requirements. The country must also invest in vocational and technical education to produce skilled artisans and professionals needed for economic diversification. Without structured human capital policies, Nigeria risks maintaining a workforce that lacks the competencies required for industrial and technological advancement.

Moreover, continuous professional training and skill upgrading are necessary to keep workers competitive in a rapidly changing global economy. Many developed countries have successfully implemented lifelong learning programs that allow employees to acquire new skills relevant to emerging industries (Udeh, 2023). Nigeria must adopt similar policies by encouraging companies to invest in employee training and retraining programs. These efforts will ensure that the workforce remains adaptable, reducing job redundancy caused by technological disruptions. Additionally, improved healthcare systems contribute to workforce productivity by ensuring that employees remain healthy and active, minimizing absenteeism and workplace inefficiencies.

Human capital development is essential for boosting workforce productivity and driving economic progress in Nigeria. A well-educated, skilled, and healthy labor force enhances efficiency, fosters innovation, and contributes to long-term economic stability. Nigeria must strengthen its education, vocational training, and healthcare sectors to build a resilient workforce capable of meeting the demands of the modern economy. By prioritizing human capital investments, the country can enhance labor productivity, create more employment opportunities, and achieve sustainable economic growth.

EDUCATION AS A CATALYST FOR INNOVATION AND ENTREPRENEURSHIP

Education serves as a powerful tool for fostering innovation and entrepreneurship by equipping individuals with essential knowledge, critical thinking skills, and business acumen. A well-structured education system supports creativity and technological advancement, both of which are fundamental to economic transformation (Ajibola, 2021). In Nigeria, education can play a pivotal role in developing an entrepreneurial culture that reduces unemployment and promotes wealth creation. Many developed nations have successfully integrated entrepreneurship education into their school curricula, leading to the establishment of thriving startup ecosystems and innovative industries. Nigeria must adopt similar strategies to empower students with entrepreneurial skills that drive economic progress.

Furthermore, research-driven education fosters innovation by exposing students to new ideas, technologies, and problem-solving techniques. According to Ekanem (2020), countries that prioritize science, technology, engineering, and mathematics (STEM) education witness rapid economic development due to increased technological breakthroughs. Nigeria's higher institutions must invest more in research and development, particularly in STEM fields, to produce graduates capable of driving industrial and technological advancements. Additionally, collaboration between universities and industries is crucial for ensuring that academic research translates into practical innovations that benefit society.

Moreover, entrepreneurship education reduces dependency on traditional employment by encouraging self-employment and business creation. Entrepreneurs contribute significantly to economic development by generating employment opportunities and driving economic diversification. According to Ogunyemi (2023), small and medium enterprises (SMEs) are critical engines of economic growth, particularly in developing economies like Nigeria. Providing young entrepreneurs with access to business training, financial resources, and

mentorship programs will enhance their ability to establish successful enterprises. This, in turn, will help in addressing youth unemployment and promoting economic stability.

In addition, education fosters resilience and adaptability, two essential qualities for entrepreneurial success. A strong educational foundation enables entrepreneurs to navigate business challenges, leverage opportunities, and sustain long-term growth (Okorie, 2022). To maximize the benefits of education in entrepreneurship development, Nigeria must integrate entrepreneurship courses into all levels of schooling, provide startup funding for student-led businesses, and establish innovation hubs within universities. These measures will help create an environment conducive to business growth and economic sustainability.

Education is a key driver of innovation and entrepreneurship. A well-designed education system that emphasizes research, business training, and technological advancements will foster a culture of entrepreneurship in Nigeria. Strengthening policies that support business education, startup financing, and industry collaborations will enhance entrepreneurial success, reduce unemployment, and drive national economic growth.

REDUCTION IN UNEMPLOYMENT AND POVERTY

Education plays a fundamental role in reducing unemployment and poverty by equipping individuals with relevant skills for economic participation. A well-managed education system aligns academic programs with labor market demands, ensuring that graduates possess employable skills (Bamidele, 2020). In Nigeria, unemployment remains a pressing challenge due to skill mismatches and inadequate vocational training. Reforming the education sector to focus more on practical skills will improve job creation and economic self-sufficiency (Olawale & Ibrahim, 2023).

Furthermore, expanding vocational and technical education programs can provide alternative employment pathways for young people. According to Oseni (2019), nations that invest in skill-based education experience lower unemployment rates and improved job security. In Nigeria, technical training institutes must be strengthened to equip students with market-relevant skills. Additionally, policies that provide free or subsidized education to marginalized groups can help in breaking the cycle of poverty and increasing social mobility.

Moreover, entrepreneurship education enables individuals to create self-sustaining businesses, reducing dependence on government jobs. According to Falade and Olorunfemi (2023), small and medium-sized enterprises contribute significantly to poverty alleviation and economic stability. Strengthening business education, access to microfinance, and mentorship programs will enhance the success rates of entrepreneurial ventures in Nigeria.

In addition, poverty reduction efforts must include initiatives that integrate education with social welfare programs. Ensuring that every child has access to quality education, regardless of socioeconomic background, will enhance long-term national prosperity. Nigeria must prioritize investment in educational infrastructure, teacher training, and policy frameworks that promote inclusive learning. A well-educated workforce contributes to higher national productivity, increased wages, and reduced income disparities.

Education is an essential tool for reducing unemployment and poverty. Strengthening Nigeria's vocational training system, entrepreneurship education, and policy reforms will enhance workforce readiness and improve economic stability. Prioritizing education investments will create opportunities for individuals to achieve financial security and contribute to national prosperity.

STRENGTHENING INDUSTRIAL AND TECHNOLOGICAL DEVELOPMENT

Industrial and technological developments are fundamental drivers of economic progress, as they enhance productivity, promote innovation, and create employment opportunities. A well-managed education system plays a vital role in strengthening these sectors by equipping individuals with the technical knowledge and skills necessary for industrial advancement (Adebayo & Okonkwo, 2023). Nigeria's industrial sector has long suffered from a lack of adequately trained personnel, which has limited the country's ability to compete in the global market. Strengthening technical and vocational education can bridge this gap by producing a workforce capable of supporting industrial growth and technological innovation.

Furthermore, investment in research and development (R&D) is crucial for technological progress. Advanced economies prioritize R&D funding to foster new technologies and enhance industrial efficiency (Eze, 2022). Nigeria, however, has historically underfunded research institutions, limiting the country's ability to develop homegrown technologies. A strong linkage between universities, research centers, and industries is essential for fostering innovation. Encouraging collaborations between academia and the private sector can lead to technological breakthroughs that drive industrial expansion. Moreover, establishing policies that support industrial apprenticeships and internships will ensure that students gain practical experience, making them more valuable to employers (Nwosu, 2021).

Additionally, digital transformation plays a crucial role in industrial growth. Many developing economies have leveraged digital technologies to enhance productivity, streamline manufacturing processes, and expand market reach (Obi & Lawal, 2023). Nigeria must embrace technological advancements by integrating digital literacy and information technology training into its educational curriculum. Encouraging the use of automation, artificial intelligence, and data analytics in industries will significantly improve efficiency and global competitiveness. Moreover, developing industrial hubs that specialize in emerging technologies, such as renewable energy and biotechnology, can position Nigeria as a leader in Africa's industrial transformation.

Strengthening industrial and technological development requires targeted investments in education, research, and digital transformation. Nigeria must enhance technical and vocational training, support R&D initiatives, and foster collaboration between academia and industry. By prioritizing industrial policies that encourage innovation and technological advancements, the country can achieve sustainable economic growth and global competitiveness.

THE ROLE OF HIGHER EDUCATION IN NATIONAL ECONOMIC GROWTH

Higher education is a critical component of national economic growth, as it enhances human capital development, fosters innovation, and supports research that drives industrial progress. Universities and other higher learning institutions produce highly skilled professionals who contribute to economic productivity across various sectors (Adegbite, 2022). A well-educated population attracts foreign investments, strengthens institutions, and enhances governance, all of which are essential for sustainable development. In Nigeria, higher education has the potential to address economic challenges by producing graduates with expertise in fields such as science, technology, engineering, and mathematics (STEM), which are crucial for economic diversification.

Furthermore, higher education institutions play a pivotal role in research and technological advancements. Many developed nations have invested significantly in university-led research, leading to groundbreaking discoveries that have transformed industries (Ogunleye, 2020). In Nigeria, however, underfunding of research and poor university-industry collaboration have limited the country's capacity for innovation. To maximize the economic benefits of higher education, the government must increase funding for research programs, establish technology incubation centers, and create incentives for private sector investment in university research. Additionally, partnerships between universities and global institutions can expose students and faculty members to cutting-edge knowledge and practices that enhance national development.

Moreover, higher education fosters entrepreneurship by equipping graduates with business management skills and financial literacy. According to Bello (2021), universities that integrate entrepreneurship education into their curricula produce graduates who are more likely to establish successful businesses. In Nigeria, where unemployment remains a major challenge, strengthening entrepreneurship training within higher education institutions can help graduates create jobs rather than rely solely on traditional employment. Supporting university-based business incubators and providing access to startup funding can further enhance this impact.

In addition, higher education institutions contribute to workforce adaptability by offering professional training and certification programs that enable workers to remain competitive in an evolving labor market. The rise of automation and artificial intelligence necessitates continuous skill upgrading, and universities must play a central role in lifelong learning initiatives (Chukwuma, 2020). Investing in flexible learning programs, such as online courses and part-time education, can ensure that Nigeria's workforce remains globally competitive.

Higher education plays an indispensable role in national economic growth. Enhancing research funding, fostering industry collaborations, and integrating entrepreneurship training will ensure that universities contribute effectively to Nigeria's economic transformation. A strong higher education system will not only produce skilled professionals but also drive technological advancements and economic resilience.

STRATEGIES FOR ENHANCING EDUCATIONAL MANAGEMENT FOR ECONOMIC GROWTH

Educational management is central to fostering national economic growth, as it ensures that educational institutions operate efficiently and produce a skilled workforce. Strengthening governance, improving teacher quality, increasing funding, integrating technology, and enhancing research initiatives are crucial for aligning education with economic development goals. Below are key strategies:

Strengthening Education Policy Formulation and Implementation

A well-defined and efficiently implemented policy framework ensures that education remains relevant to national economic needs. Nigeria must develop and enforce policies that promote equitable access, quality assurance, and industry-driven curriculum development. Policies should be data-driven, addressing inefficiencies such as poor teacher quality, inadequate funding, and weak governance structures. Establishing independent monitoring agencies to oversee policy implementation will enhance accountability and compliance. Furthermore, stakeholder engagement in policy formulation, including input from educators, industry leaders, and

policymakers, ensures that policies align with labor market demands. Regular policy reviews and reforms will maintain the relevance of the education sector, positioning it as a driver of economic growth (Ogunyemi & Falade, 2024).

Improving Teacher Training and Professional Development

The quality of education depends largely on the competence of teachers. In Nigeria, many educators lack access to modern teaching methodologies, limiting their ability to deliver quality instruction. To address this, continuous professional development programs should be established, focusing on innovative pedagogy, digital literacy, and subject-matter expertise. Government and private institutions should provide funding for teacher training workshops, certification programs, and postgraduate studies. Additionally, exchange programs with international educational institutions can facilitate knowledge transfer and enhance teaching standards. Providing incentives such as promotions, salary increments, and research grants will encourage teachers to engage in lifelong learning. A well-trained teaching workforce improves student learning outcomes, equipping graduates with the skills necessary for economic productivity (Adebisi & Lawal, 2023).

Expanding Technical and Vocational Education and Training (TVET)

Nigeria's economy requires a workforce skilled in various sectors, including manufacturing, technology, and agriculture. However, the traditional education system emphasizes theoretical knowledge, resulting in a mismatch between graduates' skills and labor market requirements. Expanding technical and vocational education (TVET) programs will help bridge this gap by providing students with practical, hands-on experience. Establishing partnerships between technical institutions and industries will facilitate internship opportunities, apprenticeships, and job placements. Additionally, integrating entrepreneurship education into TVET curricula will equip students with business management skills, enabling them to create self-employment opportunities. Increasing investment in vocational training centers, particularly in rural areas, will further enhance access to skill-based education, reducing youth unemployment and fostering economic diversification (Eze & Nwachukwu, 2023).

Increasing Education Funding and Infrastructure Development

Inadequate funding has contributed to poor educational infrastructure, lack of learning materials, and underpaid teachers in Nigeria. Increasing financial investment in education is crucial for improving the sector's quality and efficiency. The government should allocate a higher percentage of the national budget to education, ensuring sufficient resources for classroom expansion, laboratory upgrades, and digital learning facilities. Additionally, public-private partnerships can provide supplementary funding, supporting scholarship programs, research grants, and school renovations. Alternative financing mechanisms, such as education bonds and endowment funds, can also enhance resource availability. A well-funded education sector produces graduates equipped with the necessary skills to contribute effectively to economic development (Bamidele & Yusuf, 2024).

Integrating Digital Technology in Education

Technology-driven education enhances accessibility, efficiency, and learning outcomes. Nigeria must integrate e-learning platforms, virtual classrooms, and smart management systems to modernize its education sector. Providing digital literacy training for both students and teachers will ensure effective technology adoption. Expanding internet access and providing digital devices to underprivileged students will bridge the digital divide, enabling more individuals to access quality education. Additionally, adopting artificial intelligence (AI) and data analytics in educational management can improve administrative efficiency and student performance tracking. Investing in digital education will equip students with technological skills relevant to the modern workforce, increasing national competitiveness in the global economy (Eze, 2023).

Strengthening University-Industry Collaboration

A strong link between universities and industries is essential for aligning education with economic demands. Many Nigerian graduates struggle with unemployment due to a disconnect between academic training and labor market needs. Strengthening university-industry collaboration will facilitate curriculum adjustments to match emerging job market trends. Internship programs, industry-sponsored research projects, and joint training initiatives will provide students with real-world experience, improving their employability. Additionally, establishing innovation hubs within universities will encourage research-driven entrepreneurship, fostering job creation and technological advancements. Encouraging private-sector investment in higher education will further enhance industry-academia linkages, ensuring that graduates are adequately prepared for the workforce (Okonkwo & Ajayi, 2024).

Promoting Research and Development (R&D) in Education

Investment in research and development (R&D) fosters innovation, technological progress, and economic growth. Nigerian universities should prioritize R&D by increasing funding for research projects and promoting interdisciplinary collaborations. Establishing research centers focused on solving national challenges in areas such as energy, agriculture, and healthcare will generate solutions that drive economic advancement. Government incentives, such as tax reductions for companies investing in university research, can encourage private-sector participation in knowledge creation. Additionally, integrating research training into undergraduate and postgraduate programs will cultivate a research-oriented mindset among students, enhancing innovation and problem-solving capabilities in the workforce (Adeboye & Chukwu, 2023).

Addressing Educational Disparities and Expanding Access to Learning

Equitable access to education ensures that all individuals, regardless of socio-economic background, can contribute to national development. Expanding scholarship opportunities, implementing tuition subsidies, and developing community learning centers will improve access to education for disadvantaged populations. Special programs should also be introduced for marginalized groups, including individuals with disabilities and women in rural areas, ensuring inclusive education. Additionally, lifelong learning initiatives, such as adult education and skills

development programs, will enhance workforce adaptability and productivity. Closing educational disparities will maximize human capital development, promoting a more inclusive and sustainable economy (Ogundele & Hassan, 2023).

Reforming Curriculum to Align with Economic Trends

A curriculum that fails to reflect current economic realities limits students' ability to succeed in the job market. Regular curriculum revisions, incorporating global economic trends, digital transformation, and emerging industries, will enhance graduate employability. Modern education should emphasize problem-solving, entrepreneurship, and critical thinking, equipping students with skills applicable in various industries. Collaboration with industry experts in curriculum design will ensure that educational programs meet labor market demands. Additionally, introducing courses in artificial intelligence, cybersecurity, renewable energy, and financial technology will prepare students for future economic opportunities, enhancing national development (Okafor & Nnaji, 2023).

Strengthening Governance and Accountability in Educational Institutions

Weak governance structures and corruption have hindered the efficiency of Nigeria's education system. Strengthening transparency and accountability measures will improve institutional performance and resource utilization. Implementing merit-based recruitment, transparent financial management, and independent oversight mechanisms will enhance governance in educational institutions. Encouraging participatory decision-making, where teachers, students, and parents contribute to educational policies, will foster a more inclusive and responsive management system. Establishing an independent accreditation body to monitor compliance with educational standards will further ensure quality assurance. Strong governance structures will create a more efficient and result-oriented education sector, supporting national economic growth.

CONCLUSION

The study examined educational management and economic growth in Nigeria, emphasizing the role of effective administration in fostering human capital development, workforce productivity, and national progress. A well-managed education system enhances innovation, entrepreneurship, and industrial growth, contributing to sustainable economic advancement. However, challenges such as inadequate funding, poor infrastructure, policy inconsistencies, corruption, and security threats continue to hinder the sector's full potential. Addressing these challenges requires strategic reforms, including increased investment, curriculum improvements, teacher training, technology integration, and stronger industry-academia collaboration. Strengthening governance and accountability within the education system will ensure that educational institutions operate efficiently, producing graduates equipped with the necessary skills for economic development. Prioritizing education management reforms is essential for Nigeria's long-term economic prosperity, as a well-educated and highly skilled workforce remains the foundation of national growth and global competitiveness.

Suggestions

To enhance educational management for economic growth in Nigeria, various stakeholders must take proactive measures to address existing challenges and improve the efficiency of the education system.

- Government should increase budgetary allocation to education to meet international standards and ensure proper funding of schools, teacher salaries, and infrastructure.
- The ministry of Education should ensure transparent and accountable disbursement of funds to prevent mismanagement and corruption
- Government should develop and implement consistent education policies that align with national economic goals.
- Educational Institutions should adopt modern management practices to improve administrative efficiency and service delivery.

ABSTRACT

The study examined the relationship between parental support and principals' administrative effectiveness among secondary schools in Bayelsa State. Correlational survey design was used for the study. The population of the study comprised of 2,350 participants from 189 secondary schools in Bayelsa State. This was made up of 189 public secondary school principals and 2,161 teachers. The sample for the study was 235 participants which is 10% of 2,350. From the 235, 48 were principals while 187 were teachers. The researcher used stratified random sampling technique in selecting the principals and teachers in the public secondary schools in Bayelsa State. A questionnaire titled "Parental Support Questionnaire (PSQ)" and "Principals' Administrative Effectiveness Questionnaire (PAEQ)" were used as the research instrument. Pearson's Product Moment Correlation Coefficient statistical tool was applied to test the two (2) hypotheses at .05 level of significance. The study revealed that when parents are involved in developing school policies and collaborating with the principals in the decision-making process, it promotes accountability and transparency in school administration and helps the principals maintain a positive and supportive school environment. It was recommended that principals should actively promote and support the formation and functioning of Parent-Teacher Associations (PTAs). By involving parents in school governance and decision-making processes, schools can benefit from their insights and contributions, which can enhance the effectiveness of school administration.

Keywords: Parental Support, Principal, Administrative Effectiveness, Secondary Schools, Principal's Administrative Effectiveness.

INTRODUCTION

Parental support is widely regarded as a cornerstone for academic achievement and effective school administration. In secondary schools, the involvement and support of parents not only enhance student outcomes but also significantly influence the administrative effectiveness of school principals. This is particularly relevant in Bayelsa State, where principals face numerous challenges, including limited resources, diverse student needs, and socio-cultural factors that may affect school operations. According to Akinfolarin et al. (2016), parental support can lead to improved academic performance and discipline, both of which are critical for school management. Parental support comes in different forms, such as participating in school meetings, volunteering, and providing resources for extracurricular activities, all of which contribute to an organized and efficient school system (Adeyemo & Babajide, 2021).

The effectiveness of a principal's administration is closely tied to the level of support they receive from parents. Principals who enjoy strong support from the community and parents can better implement policies, manage resources, and foster a positive school climate. Ejiogu et al. (2018) observed that principals who had high levels of parental support reported fewer issues with student discipline and higher teacher morale, leading to an overall improvement in administrative effectiveness. Parental support can also reduce the administrative burden on principals by providing supplementary resources, thereby allowing them to focus on instructional leadership and other critical administrative tasks (Owolabi & Ogunlade, 2020).

Moreover, parental support often translates into increased resource availability and community backing for the school. Principals who enjoy consistent support from parents are more empowered to execute developmental projects, address students' needs, and ensure a safe and conducive learning environment. This collaboration not only enhances student academic performance but also boosts staff morale, as the school community works together toward common goals. Ultimately, when parents are actively engaged, it solidifies the principal's authority and amplifies their ability to lead with impact and efficiency. As I always affirm, "The strength of a school's leadership is deeply rooted in the support it receives from its parents (Obi, 2024).

Studies by Ige (2019) and Alade and Babalola (2023) strongly maintained that when parents actively support school initiatives, principals can lead with greater authority and confidence, knowing they have the backing of the school community. This collaboration is crucial in addressing complex issues such as attendance, discipline, and academic excellence, which require a united front from both school and home environments. Parental support also contributes to principals' emotional and psychological well-being, enabling them to perform their duties more effectively. When principals feel supported by parents, they are less likely to experience burnout and more likely to exhibit resilience and commitment to school improvement efforts (Ajayi et al., 2022). This support is especially beneficial in schools with limited resources, where parental contributions can offset shortages and enable principals to allocate resources more effectively.

The influence of parental support on school administration extends beyond resource provision; it also fosters accountability and transparency. According to studies by Bello and Fagbamila (2020), parents who are engaged and invested in the school are more likely to advocate for transparent practices and support principals in their administrative duties, creating a stable and effective administrative structure. By establishing clear communication channels and fostering trust between parents and the school administration, principals can lead with a shared

vision for student success. It is based on this background that this study seeks to examine how parental support relate to principals' administrative effectiveness among secondary schools in Bayelsa State.

Statement of the Problem

Parent lack of cooperation between principals of secondary schools in Bayelsa State and most parents has led to crises of various dimensions, negatively impacting the effective administration of these schools. These challenges are evident in areas such as poor communication networks, indiscipline, and poor parental resource support. This lack of collaboration fosters mistrust between principals, parents, and other stakeholders, undermining the school climate and creating organizational disharmony. Consequently, these issues contribute to inefficiencies in the administration of secondary schools, affecting their ability to achieve set objectives and deliver quality education.

A harmonious relationship between parents and school administrators is critical to fostering a positive school climate, enhancing stakeholder trust, and ensuring the smooth functioning of secondary schools. However, in Bayelsa State, the persistent lack of parental support for administrative processes has exacerbated challenges such as inadequate discipline enforcement, resource constraints, and ineffective communication. These factors not only hinder the ability of principals to carry out their administrative roles effectively but also diminish the quality of education provided.

This study, therefore, seeks to investigate the impact of parental support on principals' administrative effectiveness, aiming to provide actionable insights for improving school administration and fostering a more collaborative environment among stakeholders in secondary schools in Bayelsa State.

Aim and Objectives of the Study

The aim of this study is to examine the relationship between parental support and principals' administrative effectiveness among secondary schools in Bayelsa State. The specific objectives of the study are to:

- Examine how parental support in decision-making relates to principals' administrative effectiveness among secondary schools in Bayelsa State.
- Examine how parental evaluation of principals relate to principals' administrative effectiveness among secondary schools in Bayelsa State.

Research Questions

To achieve the objectives of this study, the following research questions will be addressed:

- How does parental support in decision-making relate to principals' administrative effectiveness among secondary schools in Bayelsa State?
- How does parental evaluation of principals relate to principals' administrative effectiveness among secondary schools in Bayelsa State?

Hypotheses

Based on the research questions, the following hypotheses will be tested at .05 level of significance:

- There is no significant relationship between parental support in decision-making and principals' administrative effectiveness among secondary schools in Bayelsa State.
- There is no significant relationship between parental evaluation of principals and principals' administrative effectiveness among secondary schools in Bayelsa State.

Significance of the Study

The significance of studying the relationship between parental support and principals' administrative effectiveness in secondary schools lies in its potential to improve educational outcomes and school management. Understanding how parental involvement impacts administrative effectiveness provides valuable insights for school leaders, educators, and policymakers aiming to foster a supportive and productive school environment. This study highlights the importance of parental support as a vital component in effective school administration, showing that when parents are actively engaged, principals can better manage resources, enforce discipline, and achieve academic goals.

This research also underscores the need for schools to implement strategies that encourage parental involvement, recognizing that strong partnerships between parents and school administration can lead to improved student behavior, attendance, and academic performance. By shedding light on the specific ways in which parental support benefits school leadership, the study offers practical recommendations for developing policies that promote parental engagement, thus enhancing the overall effectiveness of school governance.

For policymakers, this study emphasizes the necessity of creating frameworks that facilitate parental participation in school affairs, regardless of socio-economic barriers. Such frameworks can lead to greater equity in education by ensuring that all parents have opportunities to contribute to their children's education, which can, in turn, empower principals to carry out their administrative roles more effectively. This research ultimately demonstrates that fostering collaborative relationships between parents and school administrators is integral to building resilient and high-performing secondary schools, benefitting students, families, and communities alike.

For school administrators, the study provides insights into the practical benefits of fostering parental involvement. By understanding the role that parents play in the educational process and how their participation can support school management, principals can develop more effective strategies for engaging parents and strengthening school-community partnerships. This, in turn, can lead to more effective decision-making, resource management, and policy implementation, all of which are critical for the success of secondary schools.

The study is also significant for teachers, as it underscores the importance of collaboration with parents in supporting students' academic and social development. Teachers, as key stakeholders in the educational process, can use the findings to work more closely with parents, creating a united front that enhances student learning experiences and outcomes. Additionally, the study highlights how teacher-parent partnerships can contribute to a more positive school climate, which supports the overall effectiveness of school administration.

Finally, this study will be of immense benefits to parents and students by emphasizing the value of active parental participation in education. It provides parents with evidence of the positive impact they can have on their children's academic success and the school environment as a whole. For students, increased parental involvement can translate to better academic support, enhanced motivation, and a more supportive learning environment. Overall, the study contributes to building a more collaborative educational system that promotes the well-being and success of all stakeholders involved.

LITERATURE REVIEW

Theoretical Framework

Parental Involvement Theory (Henderson & Berla, 1994)

This theory provides a framework for understanding the crucial role parents play in the academic and personal development of their children, particularly in school settings. Rooted in educational psychology, this theory emphasizes that active parental engagement in children's education has positive outcomes on student achievement, motivation, and behavior. According to Epstein's (2011) model, parental involvement encompasses various dimensions, including parenting, communicating, volunteering, learning at home, decision-making, and collaborating with the community. These activities strengthen the relationship between home and school, creating a supportive environment that facilitates learning. Research consistently highlights that children with involved parents tend to perform better academically, show positive attitudes toward school, and exhibit stronger social skills than those with less engaged parents (Fan & Williams, 2018). Studies have shown that parental involvement is beneficial at all stages of education, from early childhood through adolescence. Jeynes (2016) found that children whose parents are engaged in school activities and provide educational support at home achieve better grades and have higher graduation rates. For students in secondary schools, parental engagement has been associated with improved self-discipline, motivation, and emotional well-being, as parents serve as role models and advocates for their children's academic success (Hill and Tyson, 2019). Moreover, parental involvement supports teachers and school administrators by creating a collaborative atmosphere where parents and educators can share goals for student success (Smith & Wohlstetter, 2021).

Parental Involvement Theory is central to understanding the impact of parental support on principals' administrative effectiveness in secondary schools. This theory highlights the crucial role of active parent participation in enhancing students' educational experience and overall school administration. When parents are engaged, they contribute to a supportive school environment, enabling principals to implement policies more effectively and address students' needs holistically. Increased parental involvement fosters a partnership between home and school, enhancing communication, reducing conflict, and promoting shared goals. This collaboration positively influences administrative decisions, creating a stable, cooperative environment that benefits both academic performance and school management efficiency.

The strength of this theory is that, it is backed by research showing a strong correlation between parental involvement and improved student achievement, attendance, behavior, and attitudes. It recognizes that learning doesn't only happen in schools families and communities are vital components of a child's education. It encourages schools to engage all parents, including

those from disadvantaged backgrounds, helping bridge the achievement gap. The theory promotes partnerships between schools and families, enhancing communication and trust. It provides a framework for recognizing parents as stakeholders in their children's education, not just passive observers.

While its weakness is traced to the fact that not all parents have the time, education, or resources to be involved especially those from low-income or single-parent households. The model may not fully account for cultural differences in parenting styles or attitudes toward school involvement. It may understate the responsibility of schools to create inclusive, high-quality learning environments, regardless of parental input. Schools may lack clear strategies or resources to effectively engage parents, leading to tokenistic efforts rather than meaningful involvement. The impact of parental involvement can be hard to quantify, and there is often variability in how "involvement" is defined and assessed.

Transformational Leadership Theory (James MacGregor Burns, 1978)

This is a prominent framework in organizational studies, focusing on how leaders inspire, motivate, and create positive changes within their teams. Originating from the work of Burns (1978) and expanded by Bass (1985), this theory identifies four main components of transformational leadership: idealized influence, inspirational motivation, intellectual stimulation, and individualized consideration. Leaders with idealized influence act as role models, building trust and respect among followers. Through inspirational motivation, transformational leaders communicate a clear vision, fostering a shared sense of purpose. Intellectual stimulation encourages creativity and problem-solving, while individualized consideration involves recognizing each team member's unique needs, thus promoting development and growth (Northouse, 2018). Recent studies underscore the theory's impact on organizational performance and employee satisfaction. For instance, Wu and Wang (2021) found that transformational leadership significantly enhances team innovation by promoting psychological safety and encouraging open communication. In educational settings, transformational leadership has been shown to improve teacher motivation and student outcomes by cultivating a supportive and empowering atmosphere (Sun & Leithwood, 2015). Additionally, transformational leadership fosters adaptability, which is increasingly important in rapidly changing environments (Li et al., 2022). Overall, Transformational Leadership Theory emphasizes the role of visionary, supportive leaders in driving organizational success and individual growth.

Transformational Leadership Theory is highly relevant to studying parental support and principals' administrative effectiveness in secondary schools. This theory emphasizes leaders who inspire and motivate others to achieve more than what is typically expected. In the school context, principals applying transformational leadership can foster collaborative environments that encourage greater parental involvement, leading to more robust support structures for student success. By building trust and fostering a shared vision, transformational leaders can engage parents as partners in education, which ultimately enhances the administrative effectiveness of the school. This leadership approach strengthens community ties, improves student outcomes, and supports a cohesive school culture.

The strength of this theory encourages parents to go beyond basic involvement, actively participating in school programs, decision-making, and creating a positive learning environment at home. Through idealized influence and individualized consideration, transformational

leadership fosters mutual respect and trust between parents and school leaders/teachers. Encourages parents to value and model learning, which can inspire children to develop a strong commitment to education. Aligns parental goals with school goals, improving consistency in support and discipline at home and school. Helps parents develop leadership capacity within the family setting, empowering them to guide, mentor, and support their children's educational journey. The weakness of this theory is that, not all parents may have the time, resources, or interest to engage at the level transformational leadership assumes, leading to a disconnect. Constantly inspiring and motivating parents can be challenging for school leaders or teachers, especially with limited staff or high parental apathy. Focus on big-picture goals might overlook practical, immediate needs like helping with homework or providing basic learning materials. The model may not consider deeply rooted issues like poverty, illiteracy, or cultural norms that limit active parental involvement. Some parents may resist change or be skeptical of school-led initiatives, reducing the effectiveness of transformational strategies.

CONCEPTUAL FRAMEWORK

Parental Support

According to Ceka and Murati (2016) a parent is defined as any adult who is charged with a responsibility of rearing a child, taking care and contributing towards raising their children whether biological or adopted. Parental support plays a critical role in the educational experience and achievement of students in secondary schools. When parents are actively engaged in their children's education, it positively impacts students' motivation, behavior, and academic performance. Parental support can take various forms, including providing financial resources, encouraging academic efforts, monitoring homework, attending school functions, and maintaining effective communication with teachers and administrators. These actions create a supportive learning environment that enhances students' sense of responsibility and commitment to their studies.

The presence of parental support significantly contributes to students' academic success by fostering a sense of belonging and a positive outlook on schoolwork. According to Osei-Akoto (2012), students whose parents provide both emotional and academic support are more likely to exhibit a positive attitude towards school, which in turn enhances their learning outcomes. This support is essential during adolescence a period marked by developmental changes and increased peer influence. Students with engaged parents tend to have higher self-esteem and better social skills, which can lead to improved academic performance and lower rates of behavioral problems. In their study, Epstein and Sanders (2014) highlighted that parental involvement strengthens the relationship between home and school, encouraging an environment where both institutions collaboratively support student development. They found that parental engagement also equips students to face academic challenges with greater resilience.

Financial support from parents is another critical factor in secondary education, especially in regions where schools rely on family contributions to fund learning materials and extracurricular activities. Parental support in this aspect ensures that students have access to the necessary tools for effective learning. Amponsah et al. (2015) observed that students with adequate financial support for their educational needs had a clear advantage in terms of academic achievement. They argued that when parents invest in their children's education, students are

less likely to be absent and more likely to participate actively in school activities, which enhances their learning experiences.

Another dimension of parental support involves monitoring and supervision, which has been shown to influence students' academic outcomes positively. Parents who set clear expectations for academic performance and discipline create a structured environment conducive to academic success. Adebayo and Olatunji (2016) observed that students with parents who monitored their academic progress and held them accountable for their performance were more likely to excel in their studies. This kind of support fosters a sense of accountability and encourages students to maintain a high level of effort in their schoolwork.

Communication between parents and the school is also an essential component of parental support. Regular interaction between parents and teachers allows both parties to discuss students' progress, address potential issues, and create individualized strategies to support student learning. According to Obi and Anazodo (2017), schools with strong parent-teacher communication tend to experience fewer disciplinary issues and report higher academic performance among students. This collaboration provides teachers with valuable insights into the challenges students may face at home, allowing them to tailor their teaching approaches to meet individual needs.

However, while the positive impact of parental support on student outcomes is well-documented, some studies have shown that excessive parental involvement may lead to unintended consequences. Heavy parental control can sometimes limit students' autonomy and reduce their intrinsic motivation for learning. Adeyemo (2019) noted that while supportive parenting is essential, overbearing parental involvement can cause anxiety and reduce students' ability to take responsibility for their learning. Parents need to strike a balance between guiding their children and allowing them to make independent decisions, which is crucial for the development of self-regulation and academic resilience.

The shift toward digital education has also transformed the ways in which parents can support their children academically. With the integration of technology in education, parents now have more opportunities to engage with their children's learning through online platforms, where they can monitor assignments, track academic progress, and communicate with teachers. Idowu and Ogunniyi (2022) emphasized that parents who adapt to these digital tools are better equipped to support their children's education, particularly as digital literacy becomes increasingly important in the modern economy. They suggested that digital engagement could help parents foster better learning environments at home, especially during periods of remote or hybrid learning.

Principals' administrative effectiveness

Bello (2019) believed that a principal is the chief executive of the secondary school, saddled with the responsibility of improving teaching and learning conditions within the classrooms, maintaining school-community, ensure an adequate supply of educational resources to motivate teachers, non-teachers, and students so that effectiveness and efficiency are attainable in the system. Bello also stated that for any school principal to achieve administrative effectiveness; the school environment should be made favorable.

Yahya (2019) defined school administration as a careful and systematic arrangement and use of human and material resources, situations and opportunities for the achievement of the specific objectives of a given organization. However, achieving the specific objectives of an

organization calls for the emergence of a leader/administrator. The effectiveness of school administration is however dependent on personal qualities, interaction with subordinates and the situation as well as their ability to inspire all members of the school community to work together toward the goal of excellent education of all students. Hussein (2018) stated that administrative effectiveness is the extent to which a school manager is able to lead the school to the realization of desired goals. However, effectiveness of a school is not only limited to how appreciable students' academic performance obtained in both internal and external examinations are, rather it also includes the level of adherence of both the students and the staff to the rules and regulations of the school, the level of judicious utilization of the school facilities, the level of teachers' dedication to their duties, ability of the school principal to provide a sense of direction as the head, the level of internal supervision carried out by the school manager and a host of others.

Parental support and principals' administrative effectiveness among secondary schools in Nigeria

Parental support, which encompasses active involvement in school activities, regular communication with school authorities, and providing resources for students, significantly enhances a principal's capacity to administer effectively. When parents actively participate in the educational process, they reinforce the school's objectives and values, thereby creating a stronger foundation for student achievement and well-disciplined environments.

On the other hand, principals' administrative effectiveness refers to their ability to manage school operations efficiently, ensure academic excellence, and foster a conducive learning environment. Parental support plays a vital role in enhancing principals' administrative effectiveness in secondary schools across Nigeria. In educational administration, the involvement of parents in school activities has been shown to contribute positively to the school environment, improving both student outcomes and administrative practices. Principals, who bear the responsibility of managing schools and ensuring effective operations, benefit from engaged parents who assist in reinforcing school policies, supporting educational initiatives, and creating a sense of community. Effective collaboration between parents and school principals often results in a more conducive learning environment, as principals can better focus on strategic goals, educational quality, and student well-being. According to Nwankwo (2012), parental involvement not only supports academic achievement but also strengthens school leadership by providing principals with additional resources, insights, and community support, which are essential for implementing administrative policies effectively.

Research by Adeyemi and Adu (2013) indicated that parental engagement facilitates administrative effectiveness by fostering communication and collaboration between the home and the school. This partnership allows principals to address challenges more effectively, as parents contribute valuable feedback on student progress, behavioral concerns, and resource needs. Through consistent involvement, parents can assist principals in understanding the community's educational expectations and values, enabling them to make more informed decisions. This alignment between home and school objectives supports principals in implementing policies that resonate with the community, which is particularly valuable in culturally diverse regions of Nigeria where parental expectations may vary widely.

The presence of active parent-teacher associations (PTAs) is a common manifestation of parental support in Nigerian secondary schools, where PTAs often provide both financial and moral support for school activities. As noted by Olatunji (2014), when parents actively

participate in PTAs, they enhance the principal's ability to manage school resources effectively. Parents can help fund extracurricular activities, infrastructure improvements, and other educational resources, thereby reducing financial strain on school administrators. This support allows principals to allocate resources more effectively and concentrate on other critical administrative tasks, such as curriculum development, staff management, and student welfare programs.

Parental support also helps to ensure that principals' administrative actions are well received and respected within the school community. Studies by Odu and Ekejiuba (2016) suggest that when parents are involved in school affairs, principals experience fewer challenges in enforcing school rules and policies. Parents who understand and support school regulations tend to reinforce these expectations at home, contributing to a positive school culture where students are more likely to adhere to behavioral guidelines. This collaboration eases the burden on principals and reduces disciplinary issues, thereby enhancing the overall administrative effectiveness of the school.

Moreover, the role of parental support in academic accountability cannot be underestimated. Principals rely on parental involvement to encourage students' academic engagement, attendance, and participation in school programs. Research conducted by Abayomi and Babatunde (2017) highlights that principals who actively engage with parents observe higher rates of student success and retention. When parents are aware of school policies, academic goals, and performance standards, they are better positioned to motivate their children to meet these expectations. This support provides principals with a foundation to enforce academic standards more consistently, knowing that parents will reinforce these standards at home.

The use of digital tools has increasingly facilitated parental involvement in recent years, providing new avenues for communication between parents and school administrators. Uche and Ugochukwu (2021) argued that digital communication platforms allow principals to update parents more frequently on school events, academic progress, and student conduct. By establishing online portals, principals can foster a transparent relationship with parents, which strengthen trust and reduce misunderstandings. This use of technology enhances principals' administrative effectiveness by streamlining communication, ensuring that parents are informed, and enabling faster responses to student needs.

In conclusion, parental support is an invaluable asset to principals' administrative effectiveness among secondary schools in Bayelsa State and Nigeria at large. Active engagement from parents, through financial assistance, communication, and reinforcement of school policies, provides principals with the resources and support needed to manage schools more efficiently. While challenges may arise from over-involvement, a balanced approach to parental engagement fosters a collaborative atmosphere that enhances both school administration and student outcomes. As educational dynamics evolve with the integration of digital tools, the relationship between parents and principals will likely continue to grow, providing further opportunities for collaborative administration in secondary schools across Nigeria.

REVIEW OF EMPIRICAL STUDIES

Duze (2011) investigated the relationship between parents' involvement in secondary school administration and school effectiveness in Nigeria adopting descriptive survey research. The population was all the teachers, principals and parents of students in all public and private secondary schools in the South-East Zone of Nigeria. The sample size of 3,198 comprised 2,460

teachers, 615 parents and 123 principals from 123 secondary schools selected through multi-stage, stratified, and simple random sampling techniques. Two sets of questionnaires were used for data collection, which were analyzed along with students' performance records using percentage, mean, t-test, and Pearson's r. Two research questions and three hypotheses were formulated. Results revealed that parents were moderately involved in school administration, with private schools indicating greater involvement than public schools and there was a significant relationship between involvement in school administration and school effectiveness. Also revealed was that secondary schools in the South-East Zone were moderately effective with the private schools being more effective, but not significantly, than the public schools. Recommendations required school administrators to endeavour to sustain parents' involvement in school administration in order to enhance school effectiveness and maintain the necessary cordial relationship between the home and the school tapping the accrued benefits.

Ajayi et al. (2009) examined the relationship between parents' involvement in school administration and effectiveness of secondary schools in Nigeria. The descriptive survey design was used for the study. The population consisted of all the teachers, principals and parents of the students in public secondary schools in South-West Nigeria. The sample comprised 1200 teachers, 300 parents and 60 principals from 60 secondary schools. Multi-stage, simple and stratified random sampling techniques were used to select the states, schools, teachers and parents used for the study. Two sets of questionnaires were used to collect the data for the study.

The Data were analysed using frequency counts, percentage scores and Pearson product movement correlation. The only hypothesis formulated in the study was tested at 0.05 level of significance. The study revealed that parents were much involved in the administration of secondary schools in Nigeria. The study also revealed that secondary schools in the area covered were moderately effective. However, the study showed that there was no significant relationship between parents' involvement in school administration and effectiveness in schools. It was recommended that the school administrators should sustain the high level of parents' involvement in school administration in order to maintain cordial relationship between the parents and the school authorities. Since parents' involvement in school administration was not significantly related to the effectiveness of the schools, the government and other stakeholders should make the teaching and learning environment of the schools more conducive in order to improve their effectiveness.

Yusuf and Olasupo (2023) examined parental involvement in the secondary school administration in Osun State: teacher perspective. Descriptive survey research design was used for this study; the target population for the study comprised 601 public secondary schools in Osun State. The sample for this study consisted of 36 teachers using simple random sampling technique. A self-designed questionnaire was used as research instrument for this study. Namely: Assessment of Parental Involvement in Secondary School Administration Questionnaire (APISSAQ). The APISSAQ was administered on teachers of the selected schools to elicit information. The data collected were analyzed using percentage scores to answer research questions. The findings indicated that Parents in Osun State secondary schools demonstrated their involvement in area of: school administration (75%), school decision making (63.9%), school project (66.6%), school development programmes (80.6%), and provision of school materials (75%). The study also indicated that level of parental involvement across the school types in Osun State secondary school is moderate (41.7%). Equally, the study showed that parents were facing financial challenges (69.5%), communication challenge (52.8%), community relation challenges (63.9%) and challenges of infrastructural provision (52.7%). The study

concluded that parental involved in the administration of administration of Osun State secondary school.

METHODOLOGY

The study employed a correlational research design. The population of the study comprise of 2,350 participants from 189 secondary schools in Bayelsa State. This is made up of 189 public secondary school principals and 2,161 teachers. The sample for the study was 235 participants which is 10% of 2,350. From the 235, 48 were principals while 187 were teachers. The researcher used stratified random sampling technique in selecting the principals and teachers in the public secondary schools in Bayelsa States. A self-developed questionnaire titled "Parental Support Questionnaire (PSQ)" and "Principals' Administrative Effectiveness Questionnaire (PAEQ)" was used as the research instrument after being submitted and modified by the supervisor. Face and content validity of the instrument was established by subjecting the instrument to an expert in educational administration for screening and another who is a specialist in measurement and evaluation in the Department of Guidance and Counseling in Ignatius Ajuru University of Education, Port Harcourt. To ensure that the instrument measured considerably and consistently what it is intended to measure, it was subjected to a split-half reliability test. The result gotten was correlated with the Pearson's Product Moment Correlation (r). The scores were computed using Pearson Product Moment Correlation Statistics. The researcher analysed the demographic variables with the statistics of simple percentage while Pearson Product Moment Correlation was used in answering the research questions and hypotheses at .05 level of significance.

RESULTS

Research Question 1: How does parental support in decision-making relate to principals' administrative effectiveness among secondary schools in Bayelsa State?

Table 1 - Mean and standard deviation showing parental support in secondary schools

S/N	Items	Mean	SD.	Remark
1	Parents regularly attend school events and PTA meetings as a way of showing their unalloyed support to the school.	3.11	0.32	Agreed
2	Parents encourage and monitor their children's academic progress at home.	2.90	0.40	Agreed
3	Parents reinforce the school's rules and discipline policies at home.	2.35	0.85	Disagreed
4	Parents actively participate in decisions related to school policies that affect their children.	3.02	0.29	Agreed
5	Parents volunteer their time and resources to support school activities and programs.	2.93	0.36	Agreed
6	Parents communicate frequently with teachers about their child's performance and behavior.	3.13	0.60	Agreed
	Grand mean	**2.90**	**0.47**	**Agreed**

From the data presented and analysed in table 1, majority of respondents agreed with the statements made in item 1, 2, 4, 5 and 6 because their respective arithmetic mean was 3.11, 2.90, 3.02, 2.93 and 3.13. This clearly indicates that parents demonstrate their unalloyed support by

regularly attending school events and PTA meetings and also volunteer their time and resources to support school activities and programs. On the other hand, majority of respondents disagreed with the statement made in item 3 because its mean was 2.35 (this is below the criterion mean of 2.50). This also shows that majority of parents do not reinforce the school's rules and discipline policies at home.

Research Question 2: How does parental evaluation of principals relate to principals' administrative effectiveness among secondary schools in Bayelsa State?

Table 2: Mean and standard deviation showing principals' administrative effectiveness in secondary schools

S/N	Items	Mean	SD.	Remark
7	The principal effectively manages school resources (e.g., finances, facilities, staff) to enhance the learning environment.	3.26	0.94	Agreed
8	The principal fosters a positive school culture by promoting respect and collaboration among students and staff.	2.97	0.95	Agreed
9	The principal regularly communicates with staff, students, and parents about school activities and academic performance.	2.88	0.80	Agreed
10	The principal actively involves parents and the community in school activities and decision-making processes.	2.01	0.51	Disagreed
11	The principal effectively implements school policies and ensures adherence by all members of the school community.	2.63	0.72	Agreed
12	The principal ensures that the school curriculum is effectively delivered and aligned with national standards.	3.46	0.54	Agreed
	Grand mean	**2.86**	**0.74**	**Agreed**

Item 7, 8, 9, 11 and 12 had mean values of 3.26, 2.97, 2.88, 2.63 and 3.346 respectively from the data presented in table 2. This invariably means that majority of respondents agreed that the principal effectively manages human, material and financial resources which helps him in effective administration. It also indicates that the principal regularly communicates with staff, students, and parents about school activities and academic performance. The statement made in item 10 had its mean value as 2.01 and shows that majority of the respondents disagreed with the statement that the principal actively involves parents and the community in school activities and decision-making processes. This is also because the mean value (2.01) is below the criterion mean of 2.50.

Test of Hypotheses

Hypothesis 1: There is no significant relationship between parental support in decision-making and principals' administrative effectiveness among secondary schools in Bayelsa State

Table 3: Correlation analysis of the relationship between parental support in decision-making and principals' administrative effectiveness among secondary schools in Bayelsa State

Variables	Mean	SD	r	P-value	Remark
Parents' support in school decision-making	2.31	.414	0.16	0.66	Not Significant
Principals' administrative effectiveness	2.73	.419			

$\alpha = 0.05$

Table 3 shows that there is significant relationship between parental support in school decision-making and principals' administrative effectiveness among secondary schools in Bayelsa State (r = 0.16, ρ > 0.05). The null hypothesis is hereby rejected.

Hypothesis 2: There is no significant relationship between parents' evaluation and principals' administrative effectiveness among secondary schools in Bayelsa State.

Table 4: Correlation analysis of the relationship between parental evaluation and principals' administrative effectiveness among secondary schools in Bayelsa State

Variables	Mean	SD.	r	P-value	Remark
Parental evaluation	3.19	2.419	0.04	0.92	Not Significant
Principals' administrative effectiveness	2.73	0.419			

α = 0.05

Table 4 shows that there is significant relationship between parental evaluation and principals' administrative effectiveness among secondary schools in Bayelsa State (r = 0.04, ρ > 0.05). The null hypothesis is hereby rejected.

DISCUSSIONS

Parental Participation in School Events and Policies

Parents' frequent attendance at school events and PTA meetings demonstrates commitment, aligning with Osei-Akoto's (2012) assertion that parental support enhances students' learning outcomes and attitudes toward education. According to him, students whose parents provide both emotional and academic support are more likely to exhibit a positive attitude towards school, which in turn enhances their learning outcomes. This support is essential during adolescence, a period marked by developmental changes and increased peer influence. Students with engaged parents tend to have higher self-esteem and better social skills, which can lead to improved academic performance and lower rates of behavioral problems.

Parental Communication with Teachers

Regular communication between parents and teachers about students' performance fosters accountability and positive attitudes, as noted by Adebayo and Olatunji (2016), who posited that, students with parents who monitored their academic progress and held them accountable for their performance were more likely to excel in their studies. According to them, this kind of support fosters a sense of accountability and encourages students to maintain a high level of effort in their schoolwork.

Principal-Parent Communication

Effective communication and collaboration between principals and parents, this is in line with the study of Adeyemi and Adu (2013), who indicated that parental engagement facilitates administrative effectiveness by fostering communication and collaboration between the home

and the school. To them, this type of partnership allows principals to address challenges more effectively, as parents contribute valuable feedback on student progress, behavioral concerns, and resource needs. Through consistent involvement, parents can assist principals in understanding the community's educational expectations and values, enabling them to make more informed decisions.

PTA Contributions

PTAs significantly support school management by providing financial resources for extracurricular activities and infrastructure, reducing principals' financial burdens and enhancing their focus on essential tasks, as stated by Olatunji (2014). To him, when parents actively participate in PTAs, they enhance the principal's ability to manage school resources effectively. Parents can help fund extracurricular activities, infrastructure improvements, and other educational resources, thereby reducing financial strain on school administrators. This support allows principals to allocate resources more effectively and concentrate on other critical administrative tasks, such as curriculum development, staff management, and student welfare programs.

CONCLUSION

Parental support plays a crucial role in enhancing principals' administrative effectiveness in secondary schools. The active involvement of parents contributes not only to a positive school environment but also supports principals in maintaining discipline, managing resources, and fostering student achievement. When parents engage in school activities, communicate openly with administrators, and collaborate on school initiatives, they provide principals with essential backing that strengthens school governance and enhances educational outcomes. However, achieving consistent parental involvement remains a challenge, especially in diverse socio-economic settings where resources and time may be limited. Schools that can bridge these gaps through open communication and inclusive practices are better positioned to harness the benefits of parental support, ultimately leading to more effective and resilient school leadership. By fostering strong partnerships between parents and school leaders, secondary schools can create an environment where both educational goals and administrative effectiveness are more readily achieved.

Recommendations

Based on the aim and objectives of the study and the findings drawn, the following recommendations are made:

- Schools should create effective communication systems such as digital platforms, newsletters, and regular meetings to keep parents informed and engaged. This will help build trust, encourage parents to participate in school activities, and provide principals with valuable feedback for effective decision-making.
- Principals should actively promote and support the formation and functioning of Parent-Teacher Associations (PTAs). By involving parents in school governance and decision-

making processes, schools can benefit from their insights and contributions, which can enhance the effectiveness of school administration.

- Schools should organize workshops and training sessions for parents to educate them about the importance of their involvement in school activities and how it impacts their children's education. This will help parents understand their roles and encourage their active participation, leading to a more collaborative school environment.
- To accommodate parents with busy work schedules or other commitments, schools should offer flexible ways for parents to participate in school activities, such as virtual meetings, weekend events, or volunteering opportunities that align with their availability. This approach will ensure that more parents can engage and contribute effectively.
- Principals should involve parents in the development and review of school policies to create a sense of ownership and collaboration. This will not only make policies more effective but also ensure that they reflect the needs and expectations of the community, enhancing the school's overall administrative effectiveness.
- During scheduled PTA meetings, school should conduct orientation sessions to educate parents about school regulations and how they can easily contribute actively.
- School Principals should gather inputs from students, teachers, and parents to improve effectiveness in the administration of the school system.

MANAGING WELFARE AND SUPPORT SYSTEMS FOR IMPROVED TEACHER JOB PERFORMANCE IN PUBLIC SENIOR SECONDARY SCHOOLS IN RIVERS STATE

Jane Ihuoma CLIFFORD
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

This paper discussed managing welfare and support systems for improved teacher job performance in public senior secondary schools in Rivers State. Education is key to societal progress, with teachers playing a crucial role in shaping future generations. However, teachers in public senior secondary schools in Rivers State face challenges such as low pay, lack of motivation, limited professional development opportunities, and inadequate welfare support. These issues negatively impact their job satisfaction and performance. Therefore, it is essential to establish effective welfare and support systems to improve their working conditions, eventually enhancing both teacher performance and the quality of education. Managing welfare and support systems involves the processes and strategies used to provide services that improve the well-being of individuals, families, or communities. The paper was supported by the Herzberg's Two-Factor Theory of Motivation, which was proposed by Frederick Herzberg**,** which suggests that there are two factors influencing job satisfaction: hygiene factors and motivators. Hygiene factors, like salary and job security, prevent dissatisfaction if addressed. Motivators, such as recognition and personal growth, enhance job satisfaction and performance. The paper identified strategies for managing welfare and support systems for improved teacher job performance to include; adequate compensation and benefits, professional development programs, health and well-being support, work-life balance initiatives, job security and career advancement opportunities, recognition and reward systems, mentorship and peer support networks, provision of teaching resources, effective communication channels and creating a positive work environment. It therefore concluded that managing welfare and support systems effectively is essential for improving teacher job performance in public senior secondary schools in Rivers State. The paper therefore suggested that Government officials should invest in continuous professional development programs for teachers, ensuring that they have access to the latest teaching techniques and resources.

Keywords: Managing, Welfare and Support Systems, Improved, Teacher Job Performance, Public Senior Secondary Schools, Rivers State.

INTRODUCTION

Education is the cornerstone of societal development, with teachers playing a pivotal role in shaping future generations. Teachers in public senior secondary schools are often subjected to various challenges that can hinder their performance. These challenges range from inadequate remuneration, lack of motivation, insufficient professional development opportunities, and inadequate welfare provisions, all of which affect their job satisfaction and overall performance. It is thus crucial to establish robust welfare and support systems that aim to improve the working conditions of teachers, which, in turn, would enhance their job performance and the quality of education provided (Wilson, 2022, Anderson, 2023; Pius, 2023).

In Rivers State, a significant issue persists concerning the management of welfare and support systems for teachers in public senior secondary schools. Agi (2017) emphasized that teachers in Rivers State face significant difficulties such as poor remuneration, lack of career advancement opportunities, and the unavailability of professional development programs. These factors directly impact the job performance of teachers, resulting in high turnover rates, reduced enthusiasm for teaching, and negative impacts on students' learning outcomes. Furthermore, inadequate infrastructure and insufficient teaching resources worsen the situation, leaving teachers ill-equipped to deliver high-quality education. Hence, addressing these welfare concerns through structured management systems has become a priority to improve teacher performance and contribute to the overall quality of education in the region. This position paper examines the various strategies that can be implemented to manage welfare and support systems to improve teacher job performance in Rivers State.

THEORETICAL FRAMEWORK

The theory that support this paper is the Herzberg's Two-Factor Theory of Motivation, which was proposed by Frederick Herzberg in 1959 cited in Harrison (2023). This theory posits that there are two types of factors that influence job satisfaction: hygiene factors and motivators. Hygiene factors include aspects such as working conditions, salary, job security, and relationships with colleagues, which, if not addressed, can lead to job dissatisfaction. Motivators, on the other hand, include factors such as recognition, achievement, and personal growth, which contribute to job satisfaction and improved performance.

Herzberg's theory is highly relevant to the paper because it highlights the importance of both addressing basic needs (hygiene factors) and providing growth opportunities (motivators). Teachers in Rivers State face challenges such as inadequate teaching resources, low salary, and poor working conditions, all of which are considered hygiene factors. These factors can lead to job dissatisfaction and poor performance. On the other hand, motivators like career advancement opportunities, professional development, and recognition for excellent teaching can significantly improve teacher motivation and job performance (Fredrick, 2023). Herzberg's theory emphasizes the importance of addressing both hygiene factors and motivators to enhance job satisfaction and performance. Therefore, it suggests that a balanced approach is needed to manage the welfare and support systems for teachers, ensuring that both their basic needs (hygiene factors) and their desire for personal growth and recognition (motivators) are met. In this paper, applying Herzberg's theory would involve improving the physical working environment, ensuring adequate remuneration, and providing opportunities for career advancement, which would, in turn, enhance teacher motivation and job performance. This theoretical framework provides a

solid foundation for understanding the relationship between welfare management and teacher job performance in public senior secondary schools in Rivers State.

Welfare and Support Systems

Welfare and Support Systems refer to the policies, programs, and services put in place to ensure the well-being of individuals, particularly in the workplace, by addressing both their personal and professional needs. These systems aim to provide essential resources and support that help individuals manage their work-life balance, personal challenges, and career development. For teachers, welfare and support systems are particularly crucial as they directly impact their job satisfaction, mental health, and overall performance. Osei and Amoah (2017) defined welfare and support systems as structured and deliberate initiatives designed to ensure the physical, emotional, and financial well-being of employees. These systems include policies and practices related to compensation, health, job security, and professional development. Musa (2018) described welfare and support systems as essential components of organizational management that are intended to improve employee satisfaction, retention, and performance by addressing both tangible (salary, benefits) and intangible (recognition, growth opportunities) needs.

Johnson (2020) conceptualized welfare and support systems as the provision of resources and services that help employees manage their job-related stress, enhance their work-life balance, and develop professionally. For teachers, this would include training programs, counseling services, and a supportive work environment. Chinonso and Okwudili (2019) viewed welfare and support systems as comprehensive packages that not only provide financial incentives but also include training, mentorship, job security, and opportunities for career advancement, which directly influence job satisfaction and performance. Thomas (2021) argued that managing welfare involves not only ensuring fair compensation but also creating a supportive environment where employees feel respected, valued, and motivated to perform their best.

Managing Welfare and Support Systems

Managing Welfare and Support Systems refers to the processes, policies, and strategies involved in overseeing and delivering various support services that aim to improve the well-being of individuals, families, or communities. These systems typically involve both public and private organizations that provide services to ensure that people can meet their basic needs and access resources for health, safety, education, employment, and housing. Gusmano et al. (2017) viewed management of welfare and support systems encompasses the administration and oversight of public policies and services designed to protect individuals from socio-economic risks and vulnerabilities. Effective management requires not only the efficient delivery of services such as healthcare, housing, and education but also the continuous evaluation of these systems to ensure their responsiveness and effectiveness in meeting the needs of diverse populations.

The above definitions highlight the need for a multifaceted approach to managing teacher welfare. In Rivers State, effective welfare systems must address both the immediate concerns of teachers (e.g., compensation, health) and their longer-term professional development needs (e.g., career advancement, recognition). Without such systems, teachers may experience burnout and their motivation and effectiveness in the classroom could decline, leading to lower quality

education. In the context of Rivers State, managing welfare and support systems should include the following:

- **Adequate Compensation and Benefits:** Teachers should be provided with competitive salaries and benefits that align with the cost of living and reflect the importance of their role. Okwudili (2018) emphasized that adequate financial compensation is a fundamental aspect of teacher welfare that directly impacts job satisfaction. For teachers in Rivers State, ensuring that salaries meet basic living standards can prevent burnout and foster motivation to excel in their roles.
- **Professional Development Programs:** Continuous professional development (CPD) ensures that teachers remain updated with modern pedagogical techniques and educational technologies. Osei and Amoah (2017) argued that investment in professional development is crucial for enhancing teaching quality. In Rivers State, offering teachers access to training programs and workshops can improve their teaching effectiveness, leading to improved job performance.
- **Health and Well-being Support:** Teachers' health is a critical factor influencing their performance in the classroom. Johnson (2020) asserted that schools should implement health and wellness programs, including access to medical services and psychological counseling, to ensure teachers are physically and mentally healthy. In Rivers State, establishing regular health check-ups and stress-relief programs can reduce absenteeism and enhance teacher productivity.
- **Work-life Balance Initiatives:** Ensuring that teachers have time to balance their professional and personal lives is essential for preventing burnout. Musa (2018) highlighted that work-life balance initiatives, such as flexible working hours and sufficient vacation time, contribute to improved job satisfaction. In Rivers State, introducing policies that allow teachers to manage their time effectively can help them maintain a healthy work-life balance, improving their overall performance.
- **Job Security and Career Advancement Opportunities:** Providing teachers with job security and clear opportunities for advancement within the educational system can significantly enhance their motivation. Pius (2019) argued that career advancement opportunities are essential for maintaining teacher engagement and job satisfaction. In Rivers State, creating clear pathways for career progression and providing long-term job security would ensure that teachers feel valued and committed to their profession.
- **Recognition and Reward Systems:** Recognizing and rewarding teachers for their achievements is crucial for boosting morale and motivation. Martins (2021) emphasized that recognition can take various forms, including awards, promotions, and public acknowledgment. In Rivers State, establishing a system for recognizing outstanding teachers can motivate others to improve their performance and foster a culture of excellence.
- **Mentorship and Peer Support Networks:** Providing mentorship and peer support networks helps teachers share best practices, resources, and strategies, improving their teaching effectiveness. Elvis (2018) suggested that mentorship programs contribute to the professional growth of teachers, particularly those who are new to the profession. In Rivers State, establishing a formal mentorship program can support new teachers and provide ongoing support to experienced ones.

- **Provision of Teaching Resources:** Access to adequate teaching resources is essential for effective teaching. Jackson (2017) highlighted that well-equipped classrooms contribute to better learning outcomes. In Rivers State, providing teachers with the necessary textbooks, digital tools, and other resources would enable them to deliver high-quality education.
- **Effective Communication Channels:** Open and transparent communication between school leadership and teachers fosters trust and collaboration. Anderson (2020) argued that regular feedback and consultations with teachers can improve decision-making and teacher satisfaction. In Rivers State, establishing regular meetings and feedback sessions would allow teachers to voice their concerns and contribute to the decision-making process.
- **Creating a Positive Work Environment:** A positive and supportive work environment is essential for enhancing teacher job performance. Harry (2019) suggested that school leadership should foster a collaborative and respectful atmosphere where teachers feel valued. In Rivers State, creating such an environment would encourage teachers to perform at their best and reduce turnover rates.

Teacher Job Performance

Teacher job performance refers to the effectiveness with which a teacher performs their duties and responsibilities in the classroom. Smith (2018) defined teacher job performance as the ability to meet educational standards, deliver quality instruction, and manage the classroom effectively. This includes both the academic performance of students and the teacher's professional conduct. Williams (2019) argued that teacher job performance involves the execution of duties to the highest standards, including lesson planning, student engagement, and fostering a positive learning environment. Duran (2020) defined teacher job performance as the outcome of a teacher's motivation, commitment, and ability to adapt to changing educational needs, including the use of technology in the classroom.

Hernandez (2021) viewed teacher job performance as the extent to which teachers can positively influence student learning, maintain discipline, and contribute to the overall development of the educational institution. Patrick (2022) highlighted that teacher job performance also includes the professional development and collaboration that teachers engage in with colleagues to enhance school-wide outcomes. In the context in Rivers State, teacher job performance can be significantly enhanced through the implementation of the strategies outlined above. For example, when teachers are provided with adequate compensation, career advancement opportunities, and a supportive work environment, they are more likely to be motivated to perform their duties effectively. Conversely, when these welfare factors are lacking, teachers may struggle to maintain high levels of performance, leading to poor student outcomes and higher teacher turnover rates.

Strategies for Managing Welfare and Support Systems for Improved Teacher Job Performance

The implementation of well-structured welfare and support systems can dramatically enhance teacher job performance in Rivers State. These systems address both intrinsic and extrinsic needs of teachers, ensuring that they feel valued, supported, and motivated. Below are ten effective

strategies for managing welfare and support systems for improved teacher job performance in public senior secondary schools in Rivers State:

Adequate Compensation/Benefits and Teacher Job Performance

Adequate compensation and benefits are fundamental to any profession, especially teaching, which is often perceived as a demanding yet underpaid occupation. Teachers' compensation is not just about salaries but also about the broader spectrum of benefits that support their personal and professional lives. A fair compensation package recognizes the critical role that teachers play in shaping the future of societies, motivating them to dedicate themselves to the profession (Wilson, 2022). Teachers who feel undervalued in terms of salary and benefits may exhibit lower levels of motivation and commitment to their job. This is particularly important in public schools, where budget constraints often limit the ability to provide adequate compensation. Huang et al. (2019) emphasized that teachers who perceive their salaries and benefits as fair are more likely to remain in the profession, contribute positively to the learning environment, and engage more actively with students.

Adequate compensation and benefits are essential to fostering a positive and productive work environment for teachers. Teachers who feel that their financial and personal needs are being met are more likely to invest their time and energy into creating effective learning experiences for their students. In addition to salaries, benefits such as health insurance, retirement plans, and paid leave further contribute to their overall job satisfaction and performance. Johnson and Heffernan (2017) highlighted that teachers who received competitive salaries and attractive benefit packages reported higher job satisfaction and better engagement in classroom activities, indicating that proper compensation is directly linked to teacher effectiveness. Adequate compensation is a fundamental factor in retaining qualified teachers, especially in challenging or resource-limited environments. Lee and Chen (2020) found that fair compensation was positively correlated with teacher retention rates in schools, particularly in low-income districts. This emphasizes the importance of competitive pay in ensuring that teachers remain committed to their roles, thereby contributing to greater stability and consistency in the education system.

Furthermore, proper compensation is necessary to help teachers meet their personal financial obligations, which in turn reduces stress and allows them to focus on their primary role in education (Grissom et al., 2017). The provision of benefits plays a crucial role in supporting teachers' long-term commitment to their profession. Benefits like health insurance, pension plans, and paid leave not only provide teachers with financial security but also contribute to their overall well-being, reducing stress and burnout. When teachers feel that their health and future are adequately supported, they are more likely to stay in the profession and focus on delivering high-quality education. Feng and Sass (2017) revealed that benefits such as health insurance, pension plans, and paid leave are significant motivators for teachers to remain in the profession. This highlights how comprehensive benefits packages can enhance teacher retention and overall job satisfaction. In the context of Rivers State, ensuring that teachers receive adequate compensation and benefits will help improve job satisfaction, which can lead to better teacher performance and improved student outcomes. However, the challenge remains for Rivers State to overcome its financial limitations and budgetary constraints that hinder the provision of competitive salaries and benefits to teachers. Implementing strategies to enhance teachers'

compensation packages is vital for enhancing job performance in the public senior secondary schools.

Professional Development Programs and Teacher Job Performance

Professional development is an essential part of any teacher's career progression. Teachers are lifelong learners, and their ability to adapt to new teaching methods, technologies, and educational standards is paramount to delivering quality education. Professional development programs aim to provide teachers with the necessary skills and knowledge to stay abreast of new developments in pedagogy and subject matter expertise. These programs can take various forms, including workshops, seminars, conferences, and in-service training. Darling-Hammond et al. (2017) showed that teachers who participated in professional development programs that were ongoing, content-focused, and collaborative tended to show higher levels of teaching effectiveness. This underscores the importance of such programs in enhancing both teacher performance and student outcomes.

Professional learning communities (PLCs) are key structures for fostering collaboration among teachers and improving instructional practices. When teachers come together to share experiences, discuss strategies, and reflect on their teaching, they are able to learn from one another and adopt more effective approaches in the classroom. Desimone (2019) indicated that when teachers were given opportunities to engage in professional learning communities, their instructional practices improved significantly, which ultimately led to higher student achievement. This highlights how collaborative professional development opportunities can have a direct and positive impact on both teachers' growth and student outcomes. Moreover, professional development programs contribute to teacher job satisfaction. Teachers who feel that their professional growth is supported by their school system are more likely to remain in the profession and demonstrate high performance.

McCaffrey et al. (2020) found that teachers who had access to well-structured professional development programs reported higher job satisfaction and were more effective in the classroom. This demonstrates the strong link between professional development and both teacher morale and performance, which directly benefits student learning outcomes. Programs that are designed with teacher input are more likely to meet the specific needs of educators and effectively address the challenges they face in the classroom. When teachers are actively involved in shaping their own professional development, the programs are more tailored to their teaching contexts and learning preferences, which can significantly improve their teaching practices.

Zhang et al. (2018) emphasized that programs designed with teacher input were more successful in fostering the skills needed for effective teaching. This highlights the importance of considering teachers' perspectives when developing professional development initiatives, ensuring that these programs are both relevant and impactful in enhancing teachers' skills and ultimately improving student outcomes. In Rivers State, developing and supporting professional development initiatives can significantly improve teacher job performance. However, the challenge remains in providing sufficient funding and infrastructure to ensure that all teachers, especially those in rural or remote areas, have access to these vital opportunities. Adopting professional development programs in Rivers State is essential to ensure that teachers are continuously equipped with the latest pedagogical tools and skills, leading to enhanced job performance and student success.

Health/Well-being Support and Teacher Job Performance

Teachers' health and well-being are integral to their ability to perform at their highest potential. The physical, mental, and emotional well-being of educators directly influences their capacity to deliver high-quality instruction. Health and well-being support encompasses various measures, including health insurance, mental health resources, stress management programs, and initiatives aimed at improving overall physical health. Bryk et al. (2019) showed that teachers who had access to comprehensive health and well-being programs were more likely to experience lower levels of burnout and fatigue, which are common issues among educators. Mental health resources are particularly important, as teachers often face significant stress due to the demands of their profession, including classroom management, administrative tasks, and interactions with parents and students (Billingsley et al., 2016).

Teacher well-being is a crucial aspect of job performance, as teachers who experience high levels of stress may struggle to perform effectively in the classroom. Stress management programs are essential in helping teachers cope with the emotional and mental demands of their profession, which can significantly enhance their overall job satisfaction and performance. When teachers are provided with the tools to manage stress, their mental health improves, leading to a more positive and productive work environment. Forlin et al. (2018) found that when teachers were provided with stress management programs, their mental well-being improved, leading to better performance in the classroom. This highlights the importance of supporting teachers' mental health, as it directly influences their effectiveness in teaching and contributes to a more supportive learning environment for students. Access to health care and preventive health services is also crucial. Teachers who are provided with health insurance and wellness programs can attend to their health needs without worrying about financial burdens, which directly contributes to their productivity and effectiveness in the classroom (Chang & Lee, 2017).

Health benefits play a critical role in supporting teachers' well-being and ensuring their consistent presence in the classroom. Teachers who have access to health-related benefits, such as medical insurance, wellness programs, and mental health support, are better equipped to manage personal health issues and reduce the likelihood of absenteeism. When teachers are healthy and have the resources to maintain their well-being, they are more likely to be present and actively engaged in their teaching duties. Bradley and Greene (2019) revealed that health benefits significantly reduced absenteeism among teachers, which in turn improved overall school performance. This demonstrates that providing health benefits not only supports teachers' personal well-being but also positively impacts their job performance and the academic success of their students.

In Rivers State, where healthcare access can be limited, particularly in rural areas, providing teachers with robust health and well-being support is essential. The challenge lies in creating and sustaining such programs amid limited resources. Nevertheless, investing in teachers' health and well-being is an investment in their professional effectiveness, which will ultimately lead to improved educational outcomes for students.

Work-life Balance Initiatives and Teacher Job Performance

Achieving a healthy work-life balance is a significant challenge for many teachers, especially those working in public schools where workloads can be overwhelming. Work-life balance initiatives are designed to help teachers manage the competing demands of their professional and

personal lives. These initiatives can include flexible working hours, the ability to take leave when needed, and support systems that allow teachers to reduce stress and avoid burnout. Kraft and Papay (2016) showed that when teachers are able to maintain a good work-life balance, they experience greater job satisfaction and are less likely to leave the profession. This underscores the importance of creating policies and practices that help teachers strike a balance between their professional responsibilities and personal well-being, which ultimately contributes to improved teacher retention and effectiveness.

Flexible work arrangements are a significant factor in promoting teacher well-being and job satisfaction. When teachers are given the flexibility to manage their schedules, whether through flexible hours or the ability to take time off when needed, they are better able to balance the demands of their profession with their personal lives. Encouraging teachers to take time off to recharge helps prevent burnout and allows them to return to the classroom with renewed energy and focus. Taris et al. (2017) found that teachers who had access to flexible work arrangements and were encouraged to take time off to recharge had higher levels of job satisfaction and engagement. This highlights the importance of offering flexibility in the workplace, as it not only boosts teachers' morale but also leads to greater involvement and effectiveness in their teaching roles.

Creating a work environment that supports balance is essential for teacher retention. When teachers feel that their work-life balance is respected and supported, they are more likely to remain in the profession for the long term, reducing turnover and ensuring consistency in student learning. Roza et al. (2019) emphasized that when schools foster a work environment that promotes balance, teachers are more likely to stay in the profession long-term. This demonstrates the importance of a balanced work environment in not only enhancing teacher satisfaction but also contributing to a stable and effective educational system. The importance of work-life balance also extends to teacher performance. Teachers who have time to rest, pursue personal interests, and care for their families are more likely to return to their teaching responsibilities with renewed energy and enthusiasm. Vega et al. (2018) found that teachers who were able to balance work and personal life were better equipped to handle classroom challenges and deliver effective instruction. This highlights the direct link between work-life balance and teacher performance, emphasizing that well-supported teachers are more capable of fostering positive learning environments for their students. In Rivers State, work-life balance initiatives are particularly crucial given the demands placed on teachers in public schools. However, limited resources and a lack of supportive infrastructure may hinder the implementation of such initiatives. Therefore, adopting strategies to improve work-life balance for teachers can directly enhance their job performance and retention in the profession.

Job Security/Career Advancement Opportunities and Teacher Job Performance

Job security is a key factor influencing teacher job performance. Teachers who feel secure in their employment are more likely to be motivated, engaged, and committed to their roles. Conversely, job insecurity can lead to stress, burnout, and reduced performance. Alongside job security, career advancement opportunities also play a vital role in enhancing teacher performance. Teachers who have clear pathways for career progression are more likely to invest in their professional development and remain committed to their schools. Ingersoll et al. (2018) demonstrated that job security and career advancement opportunities were positively correlated with teacher retention and job satisfaction.

Teachers who felt that they had opportunities for growth, whether through promotions, leadership roles, or advanced professional training, were more likely to remain in the profession for longer periods. Career advancement programs are vital for the professional growth and motivation of teachers. These programs, which include mentoring, leadership training, and other development opportunities, provide teachers with the tools to enhance their teaching effectiveness while also preparing them for higher roles within the educational system. Borman and Dowling (2019) highlighted that career advancement programs, such as mentoring and leadership training, not only helped improve teacher performance but also contributed to creating a positive school culture. This underscores the importance of fostering a culture of continuous growth and opportunity within schools, where teachers are empowered to take on leadership roles and improve both their own professional capabilities and the overall school environment. The availability of job security and career advancement opportunities has a direct impact on teacher motivation. Teachers who are uncertain about their job future are less likely to invest in their professional growth (Liu, 2022).

Career progression opportunities are essential for boosting teacher motivation and fostering a sense of accomplishment. When teachers have clear pathways for advancement, such as opportunities for leadership roles, additional responsibilities, or specialized positions, they are more likely to feel that their hard work is valued and appreciated. This sense of recognition not only enhances their job satisfaction but also drives them to perform better in their teaching roles. Milanowski (2019) found that career progression opportunities allow teachers to feel that their efforts are recognized and rewarded, leading to improved morale and job performance. Providing these opportunities, schools can cultivate a more motivated and engaged teaching workforce, eventually contributing to better educational outcomes. In Rivers State, providing teachers with job security and clear career advancement pathways will foster greater job satisfaction and retention, thereby improving their job performance. However, challenges such as funding and the absence of structured advancement systems may impede the realization of these goals. Therefore, creating policies that ensure job security and provide opportunities for career advancement is key to improving teacher performance in public senior secondary schools.

Recognition/Reward Systems and Teacher Job Performance

Recognition and reward systems are fundamental to maintaining high levels of motivation and job satisfaction among teachers. A well-structured recognition system involves not only acknowledging teachers for their hard work but also rewarding them for exceptional performance. This can take the form of financial incentives, awards, public recognition, career advancement opportunities, or non-monetary rewards such as additional professional development opportunities. Cheng and Tsui (2016) highlighted that teachers who feel appreciated are more likely to remain motivated and committed to their work. This demonstrates the crucial role that recognition plays in maintaining a dedicated and effective teaching workforce, thereby enhancing both teacher well-being and student achievement. Acknowledging teachers for their contributions is a powerful motivator that can significantly enhance their performance in the classroom. When teachers feel that their efforts are recognized, particularly in relation to student success, they are more likely to be inspired to continue improving their teaching methods and invest further in their students' development.

Recognition reinforces a sense of purpose and validates the teacher's role in shaping students' academic journeys. Popham (2017) found that teachers who were acknowledged for

their contributions to student success were more likely to demonstrate improved classroom performance. This emphasizes the importance of recognizing and celebrating teachers' achievements, as it fosters a positive cycle of motivation, engagement, and continued excellence in teaching.

Formal recognition programs are essential for creating a positive and motivating work environment for teachers. When schools implement structured systems to acknowledge and celebrate the accomplishments and hard work of their teachers, it fosters a sense of belonging and appreciation. Kim (2018) found that teachers in schools with formal recognition programs reported higher levels of job satisfaction, which directly contributed to increased performance. This highlights the significant impact that formal acknowledgment can have on teacher engagement and effectiveness, ultimately benefiting both educators and students. Recognition not only motivates individual teachers but also fosters a collaborative and supportive teaching culture within schools. Lopez et al. (2020) showed that when teachers are recognized for their efforts in the classroom, they are more likely to engage in collaborative practices with their peers, thereby improving the overall teaching environment. This underscores the importance of recognition as a catalyst for creating a dynamic and cooperative atmosphere in schools, where teachers can learn from one another and continuously improve their instructional practices. Recognition and rewards are powerful tools in creating a culture of excellence within schools, especially in environments where teachers are constantly faced with challenges and pressure.

Hargreaves and Fullan (2018) demonstrated that recognition and rewards play a significant role in fostering a culture of excellence in schools, particularly in environments where teachers face challenges and work under pressure. This highlights how essential it is to implement recognition strategies that not only motivate teachers but also cultivate a positive, resilient, and high-performing school culture. The adoption of recognition and reward systems in Rivers State can play a key role in improving teacher performance and job satisfaction, which are directly linked to better educational outcomes for students. However, the challenge remains in Rivers State, where financial constraints and a lack of structured recognition systems often prevent teachers from feeling adequately appreciated. Adopting recognition and reward strategies, Rivers State can't only enhance teacher motivation but also improve job performance, thereby benefiting both teachers and students.

Mentorship/Peer Support Networks and Teacher Job Performance

Mentorship and peer support networks are essential components of professional growth for teachers. These networks provide teachers with the opportunity to learn from one another, share best practices, and receive guidance from more experienced colleagues. Effective mentorship programs can significantly enhance teachers' skills, confidence, and overall performance in the classroom. Mentors serve as role models and offer advice on classroom management, instructional strategies, and career development, which is crucial in an ever-evolving educational landscape (Wilkins, 2016).

Mentorship programs are essential in providing teachers with guidance and support, particularly in the early stages of their careers or when facing specific classroom challenges. Taylor (2017) found that teachers who participated in mentorship programs were better equipped to handle classroom challenges and exhibited improved teaching strategies. Peer support networks, on the other hand, allow teachers to collaborate with colleagues who may be facing similar challenges, thus reducing feelings of isolation and fostering a sense of community.

Darling-Hammond (2018) emphasized that peer collaboration is one of the most effective ways to improve teaching practices, as teachers learn from one another's experiences and expertise. This collaborative learning fosters a culture of continuous improvement, where teachers are encouraged to reflect on their own practices and grow professionally by benefiting from the diverse perspectives of their peers. Furthermore, mentorship programs provide crucial support to teachers, particularly those who are new to the profession or working in challenging environments.

Newton (2022) found that mentorship programs have been shown to reduce teacher turnover by providing emotional and professional support, which is particularly important in schools with high levels of teacher attrition. This support not only helps teachers cope with the challenges they face but also enhances their job satisfaction, eventually leading to greater teacher retention and stability within the school community. Similarly, Zhao and Li (2020) found that mentorship programs tailored to meet the specific needs of teachers, such as individualized coaching or specialized workshops, led to improved teacher efficacy and job satisfaction. Peer support networks also contribute to the development of a collaborative school culture, which can significantly enhance the overall teaching and learning environment. Fostering a culture of mentorship and peer support, Rivers State can create a sustainable system for teacher development that enhances job performance and improves educational outcomes for students.

While mentorship and peer support networks have proven to be effective in many educational systems, Rivers State faces challenges in terms of limited resources and the absence of a formalized mentorship structure. However, investing in mentorship and peer support initiatives will foster a supportive environment that promotes continuous professional development, leading to improved teacher performance.

Provision of Teaching Resources and Teacher Job Performance

The provision of adequate teaching resources is a critical factor in supporting teachers' performance. Resources such as textbooks, teaching aids, technological tools, and other instructional materials are essential for creating a conducive learning environment. Inadequate resources not only hinder teachers' ability to deliver effective lessons but also contribute to job dissatisfaction and increased stress. The availability of teaching resources has a direct impact on teacher performance and student learning outcomes (Adegoke & Adekola, 2018).

Access to sufficient teaching materials is essential for teachers to create dynamic and engaging lessons that capture the attention and interest of their students. When teachers are provided with the resources they need, such as textbooks, digital tools, manipulatives, and other instructional materials, they are better equipped to innovate and implement creative teaching strategies. This, in turn, enhances their ability to foster a more interactive and effective learning environment. Asrar-ul-Haq and Anwar (2019) found that teachers who had access to sufficient teaching materials were more likely to demonstrate creativity and innovation in their lesson plans, which led to more engaging and effective teaching. This underscores the importance of ensuring that teachers have the resources they need to deliver high-quality instruction and meet the diverse needs of their students. Technology has become an integral part of modern education, offering a wide range of tools that can significantly enhance both teaching and learning.

Luo et al. (2017) emphasized the importance of technology in modern education, noting that when teachers are equipped with the necessary technological tools, they can enhance the learning experience for students and improve their own teaching practices. Access to well-

equipped classrooms and learning resources significantly contributes to both teacher satisfaction and student success. Mameli (2020) found that teachers in schools with well-stocked libraries, classroom materials, and access to modern technology showed higher levels of job satisfaction and better student outcomes. This underscores the importance of investing in adequate teaching resources to support both teachers and students in achieving educational success.

Moreover, teaching resources are essential for addressing the diverse needs of students in the classroom. Griffiths (2016) highlighted that teachers who had access to resources tailored to the needs of students with disabilities or learning challenges were more effective in providing inclusive education. Therefore, ensuring that teachers have the necessary resources is crucial not only for their job satisfaction but also for the academic success of their students. In Rivers State, many public senior secondary schools suffer from a lack of basic teaching resources, including textbooks, computers, and classroom materials. This shortage often limits teachers' ability to provide high-quality instruction and support their students effectively. Addressing this issue by ensuring the provision of adequate teaching resources will significantly enhance teachers' job performance, leading to improved educational outcomes.

Effective Communication Channels and Teacher Job Performance

Effective communication is a cornerstone of any successful organization, and schools are no exception. In the context of teaching, effective communication involves clear, open, and consistent exchanges between teachers, school administrators, parents, and students. Establishing effective communication channels ensures that teachers are well-informed about policies, expectations, and changes, and allows them to voice concerns or provide feedback regarding their work environment (Wood & Aitken, 2019). Effective communication between teachers and school leaders is essential for building a positive school culture based on trust and collaboration. When school leaders actively listen to teachers, value their input, and involve them in decision-making processes, it creates a sense of partnership and respect.

Day and Gu (2018) emphasized that communication between teachers and school leaders is key to fostering trust and collaboration within schools. When teachers feel that they are heard and that their opinions are valued, they are more likely to be engaged and motivated in their work. This collaborative environment not only enhances teacher morale but also positively impacts the overall learning environment and student success. Similarly, Meyer et al. (2020) found that schools with strong communication systems reported higher levels of teacher satisfaction and better job performance.

Effective communication also contributes to a positive school culture, where teachers work collaboratively and share ideas and resources. Furthermore, effective communication with parents and students is essential for creating a transparent and accountable learning environment. Glickman et al. (2017) highlighted that when teachers maintain open communication with parents, they are better able to support students' academic and social development. In Rivers State, establishing effective communication channels will help foster collaboration among all stakeholders and improve teachers' ability to meet the diverse needs of students. The challenge in Rivers State lies in the lack of well-structured communication systems in many public schools. Without clear communication channels, teachers may feel isolated and unsupported, which can negatively affect their job performance. However, adopting effective communication strategies will improve teacher morale, collaboration, and overall performance.

Creating a Positive Work Environment and Teacher Job Performance

A positive work environment is critical for the well-being and performance of teachers. Such an environment is characterized by mutual respect, support, and a culture of collaboration. Teachers who work in positive environments are more likely to be motivated, satisfied with their jobs, and engaged in their work. Conversely, a toxic work environment, characterized by conflict, poor leadership, and lack of support, can lead to burnout, low morale, and high turnover rates (Kraft, 2017). A positive school climate is fundamental to fostering teacher well-being and job satisfaction. When teachers work in supportive, collaborative environments, where they feel respected, valued, and connected to their colleagues and school leaders, they are more likely to experience higher levels of job satisfaction. Johnson and Birkeland (2016) showed that teachers who worked in schools with positive climates reported higher levels of job satisfaction and were less likely to experience stress or burnout. This highlights the critical role that school culture plays in promoting teacher retention, well-being, and overall performance, benefiting both educators and students.

Similarly, Reeve (2019) found that teachers in positive work environments were more likely to engage in professional development activities and collaborate with their colleagues, leading to enhanced teaching practices. Creating a positive work environment involves not only fostering supportive relationships among staff but also ensuring that teachers feel valued and respected. Furthermore, positive work environments contribute to teacher retention. Schaefer et al. (2018) found that teachers who feel that they are working in a supportive and inclusive school culture are more likely to remain in the profession for longer periods. This is especially important in regions like Rivers State, where teacher turnover can be high due to various challenges such as inadequate working conditions and low pay.

In Rivers State, many teachers face difficulties in their work environments, including a lack of resources, high student-to-teacher ratios, and insufficient support from school leadership. Creating a positive work environment will address these issues and improve teacher performance, leading to better educational outcomes for students.

CONCLUSION

Managing welfare and support systems effectively is essential for improving teacher job performance in public senior secondary schools in Rivers State. As the educational system faces challenges such as low teacher morale, inadequate resources, and poor working conditions, it is crucial to implement strategies that address both the basic needs (hygiene factors) and the motivational needs (motivators) of teachers. Focusing on improving compensation, professional development, health and well-being support, work-life balance, career advancement, recognition, and the provision of teaching resources, Rivers State can create an environment where teachers feel valued, supported, and motivated to perform at their best. These strategies, rooted in Herzberg's Two-Factor Theory of Motivation, will foster a more productive and positive teaching environment, leading to improved student outcomes and overall educational quality.

Suggestions

The following suggestions, based on the strategies outlined above, can help improve teacher job performance through effective management of welfare and support systems in Rivers State:

- School administrators should prioritize adequate teacher compensation to ensure that salaries meet the cost of living and reflect the value of teachers' work.
- Government officials should invest in continuous professional development programs for teachers, ensuring that they have access to the latest teaching techniques and resources.
- Educational leaders should introduce comprehensive health and wellness programs to support teachers' physical and mental health.
- School management teams should create policies that promote work-life balance for teachers, including flexible work hours and adequate time-off.
- Policy makers should provide job security and career advancement opportunities for teachers, ensuring long-term commitment and job satisfaction.
- School principals should implement recognition and reward systems that celebrate teachers' achievements, fostering a sense of accomplishment and motivation.
- Experienced teachers should take on mentorship roles, guiding new teachers and creating a supportive learning environment.
- Government education bodies should ensure the provision of sufficient teaching resources, including textbooks and digital tools, to enhance teaching effectiveness.
- School administrators should establish regular communication channels between teachers and management, enabling teachers to voice their concerns and contribute ideas for school improvement.
- School leadership should strive to foster a positive, inclusive, and respectful work environment where teachers feel valued and supported.

ADDRESSING BULLYING THROUGH SCHOOL ADMINISTRATION POLICIES FOR IMPROVED STUDENT ACADEMIC PERFORMANCE IN PRIVATE SECONDARY SCHOOLS IN PORT HARCOURT METROPOLIS, RIVERS STATE

Lilian Chizaekpere CHIM-CHINDA
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

Bullying remains a significant issue affecting students' academic performance in Private Secondary Schools in Port Harcourt Metropolis. This study examines the impact of bullying on students' academic achievements and explores strategies for addressing bullying to create a safer learning environment. Through a review of literature, findings indicate that bullying leads to decreased concentration, low self-esteem, absenteeism, and poor academic outcomes among victims. Additionally, ineffective implementation of anti-bullying policies, parental attitudes, and inadequate teacher training contribute to the persistence of bullying in private schools. The study highlights the importance of strict policy enforcement, comprehensive teacher training, student counseling, and parental involvement in reducing bullying incidents. A holistic approach involving school authorities, parents, and policymakers is recommended to foster a positive school climate that enhances students' well-being and academic success. Implementing these measures will improve student engagement, boost confidence, and ultimately lead to better academic performance in private secondary schools in Port Harcourt.

Keywords: Bullying, Academic Performance, Private Secondary Schools, Port Harcourt, Policy Implementation, Student Well-Being.

INTRODUCTION

Bullying remains a persistent issue in educational institutions worldwide, affecting students' psychological, emotional, and academic well-being. Defined as repeated aggressive behavior intended to cause harm, bullying takes multiple forms, including physical, verbal, relational, and cyberbullying (Olweus, 1993). Despite increased awareness and interventions, school administrators continue to struggle with effectively addressing bullying, creating a safe learning environment, and implementing sustainable policies. The challenge is exacerbated by the

evolving nature of bullying, particularly with the rise of digital platforms where cyberbullying transcends school boundaries and infiltrates students' personal lives (Patchin & Hinduja, 2015).

A well-structured administrative response is crucial in mitigating bullying and fostering a culture of inclusivity and respect in schools. However, research indicates that many school policies either lack comprehensive implementation or fail to address the root causes of bullying. Schools with inconsistent anti-bullying policies often witness increased incidents, as students perceive weak enforcement as an opportunity for continued harassment. Additionally, some administrative policies focus primarily on punitive measures rather than preventive strategies, leaving gaps in long-term behavioral change (Smith, 2016).

Bullying in schools is a global problem worldwide, a high percentage of students are involved in bullying every school day, either as bullies, victims, or both. Similarly, Alagbu et al.(2018) found a high prevalence rate of bullying (81.7%) in six secondary schools in Anambra and Enugu States in Southeast Nigeria. In another related survey involving 300 JSS3 students from three public and three private secondary schools in Benin City, Edo State, Egbochukwu observed that 78% of the students reported being bullied to some degree, while 85% admitted bullying other students at least once.

Olweus (1993) defined bullying as a situation in which a student is exposed, repeatedly or over time, to negative actions on the part of one or more other students. These negative actions take place when an imbalance of power exists between the bully and the victim. These actions could be physical or verbal or may come in the form of social manipulation or attack on property.

Physical bullying could be in the form of kicking, punching, and slapping, whereas verbal bullying is any slanderous statement or accusation that causes the victim undue emotional distress. It includes using foul language on the victim, using derogatory terms, constant teasing, issuing verbal threats, and name calling.

Social or emotional bullying is any form of bullying that causes damage to a victim's psychic and emotional well-being. This includes spreading malicious rumors about people, keeping certain people out of a group, making fun of someone, ignoring people on purpose, and getting certain people to "gang up" on others.

A bully is the aggressive student who picks on another student with the intent to inflict harm. A victim is the student who is the target of bullying, while a bully-victim is a bully who is also bullied. Various studies highlighted the adverse effects of bullying behaviors in school-aged children. Bullying has been associated with psychosomatic symptoms and smoking, poor academic achievements, poor school bonding and absenteeism, health problems among adolescents, poor emotional adjustment, increased tendencies to alcohol abuse, and potential suicide risk. The US National Threat Assessment Center found that many attackers in more than two thirds of 37 mass school shootings felt bullied, persecuted, threatened, attacked, and injured by others prior to the attack. Therefore, there is need to make the school environment safe for learners by tackling the issue of bullying in secondary schools.

There is scarcity of literature on the prevalence and types of bullying in secondary schools in Port Harcourt. Thus, the present study aimed to establish figures on the incidence of bullying and factors associated with bullying in secondary schools in Port Harcourt. Despite various efforts to combat bullying through school policies and national legislation, bullying remains a pervasive issue. Studies suggest that approximately one in three students globally experience bullying at some point during their schooling (UNESCO, 2019). The inadequacy of school administrative policies in addressing bullying stems from multiple factors, including poor

policy implementation, insufficient teacher training, lack of student engagement in policy formulation, and the challenges of addressing cyberbullying beyond school grounds (Bradshaw, 2017). The absence of clear reporting mechanisms and inconsistent enforcement further undermine anti-bullying initiatives (Rigby, 2020).

In light of these concerns, this study examines the effectiveness of school administration policies in addressing bullying. It explores the strengths and weaknesses of existing strategies and proposes recommendations for policy improvement. By assessing how school leadership influences bullying prevention and response mechanisms, this research seeks to contribute to the development of holistic, proactive, and sustainable policies aimed at creating safer educational environments.

CONCEPTUAL REVIEW

Categories of Bullying

Bullying in secondary schools is a serious issue that affects students' academic performance, mental health, and social development. Adolescents in this stage experience significant physical, emotional, and psychological changes, making them vulnerable to different forms of bullying. The most common types of bullying in secondary schools include physical bullying, verbal bullying, social (relational) bullying, cyberbullying, and sexual bullying.

Physical Bullying

Physical bullying involves direct bodily harm or aggressive physical actions toward a student. This can include hitting, kicking, shoving, tripping, and stealing or damaging personal belongings. Physical bullying is often more common among boys than girls and is typically observed in areas with less supervision, such as hallways, restrooms, and playgrounds (Olweus, 1993). Victims of physical bullying may suffer from injuries, anxiety, and a loss of self-confidence, which can affect their ability to focus on their studies. Furthermore, repeated physical bullying can lead to school avoidance, where students skip classes or drop out to escape their tormentors (Smith et al., 2004).

Verbal Bullying

Verbal bullying is one of the most common forms of bullying in secondary schools. It includes name-calling, insults, teasing, racist or sexist remarks, and verbal threats. Unlike physical bullying, verbal bullying does not leave visible marks, making it harder to detect and intervene (Rigby, 2003). Many students engage in verbal bullying to assert dominance or gain social status among peers. Victims of verbal bullying often develop low self-esteem, depression, and social withdrawal, affecting their overall well-being and academic performance. In some cases, the continuous verbal abuse can lead to suicidal thoughts or self-harm (Hinduja & Patchin, 2010).

Social (Relational) Bullying

Social or relational bullying involves deliberately harming a student's social status, reputation, or friendships. This type of bullying includes spreading false rumors, social exclusion, public

humiliation, and manipulation of peer relationships. Girls are more likely to engage in relational bullying compared to boys, and it often occurs in friendship groups where social hierarchies are formed (Crick & Grotpeter, 1995). The impact of social bullying can be long-lasting, leading to trust issues, loneliness, and emotional distress. Victims may struggle to make friends, experience difficulty in group activities, and develop social anxiety. Since relational bullying is often subtle, teachers and school administrators may find it challenging to intervene effectively.

Cyberbullying

With the widespread use of smartphones and social media, cyberbullying has become a growing concern in secondary schools. Cyberbullying involves using digital platforms such as social media, messaging apps, and emails to harass, intimidate, or embarrass another student. Examples include sending threatening messages, sharing inappropriate photos or videos, creating fake accounts to spread false information, and public shaming (Patchin & Hinduja, 2006). Cyberbullying is particularly harmful because it can occur at any time, even outside school hours, making it difficult for victims to escape. The anonymity of online interactions also encourages bullies to act more aggressively than they would in person. Victims of cyberbullying often experience anxiety, depression, and a decline in academic performance, and in severe cases, some students resort to self-harm or suicide (Tokunaga, 2010).

Sexual Bullying

Sexual bullying involves unwanted and inappropriate sexual behavior directed at a student. This can include making sexual jokes, inappropriate touching, spreading sexual rumors, sharing explicit images without consent (sexting), and sexual harassment (Shute et al., 2008). Teenage girls are more likely to be victims of sexual bullying, but boys can also be targeted. Sexual bullying can cause severe emotional trauma, shame, embarrassment, and fear. In some cases, it leads to self-hatred and body image issues, negatively affecting students' confidence and emotional well-being. Schools must take serious measures to address sexual bullying, as it can have long-term psychological effects on students.

SOME CASES OF BULLYING IN NIGERIAN SCHOOLS

There have been several tragic cases of bullying in Nigerian schools that resulted in the death of students. Some notable incidents include:

- Sylvester Oromoni (2021) – A 12-year-old student of Dowen College, Lagos, was allegedly bullied and tortured by senior students for refusing to join a cult. His death sparked national outrage, with his family insisting he was beaten and poisoned, though the school denied the allegations.
- Keren-Happuch Aondodoo Akpagher (2021) – A 14-year-old student of Premiere Academy, Abuja, died from complications allegedly caused by sexual abuse. Her mother claimed she was bullied and abused in school, leading to infections that contributed to her death.
- Nathanael Samuel (2023) – A student of Christ Ambassador College, Kaduna, was reportedly bullied by classmates, which led to severe injuries and ultimately his death.

- Mordecai Daniel (2024) – A 14-year-old student of Command Secondary School in Jos reportedly died from internal injuries sustained after being bullied and beaten by senior students. His parents alleged that the school failed to take proper action in time to save him.
- Oluwadamilola Akinlami (2023) – A student of a private secondary school in Ondo State, Oluwadamilola allegedly died by suicide after persistent bullying from peers. Reports suggested that she was constantly ridiculed, leading to severe emotional distress.
- Amarachi Nwodo (2022) – A 16-year-old student in Enugu was allegedly tortured by classmates over a dispute. She sustained internal injuries and later died in the hospital. Her parents claimed the school attempted to cover up the incident.
- David Imoh (2020) – A boarding student in a Benin City secondary school was reportedly beaten by a group of senior students after a disagreement. His health deteriorated due to untreated internal injuries, leading to his death.
- Chidiebere Eze (2019) – A student in Anambra State was severely bullied for weeks by classmates. He eventually collapsed and died, with reports suggesting he suffered from malnutrition and physical abuse.

These cases highlight the deep-rooted problem of bullying in Nigerian schools, often exacerbated by poor enforcement of anti-bullying policies, school negligence, and a culture of silence. There is urgent need for stricter anti-bullying policies and better enforcement of child protection laws in Nigerian schools.

INCIDENCE/ PREVALENCE OF BULLYING

Bullying is a major problem around the globe. Bullying is observed across race, gender, ethnicity, and socioeconomic status. It is prevalent in all grades and all schools in Cameroonand can be mild, moderate, or even severe (Smith et al., 1999). Bullying has been the focus of recent international research, policy development, and student's performance (Smith et al., 1999). The estimated prevalence of bullying usually depends on how bullying is perceived and who reports the incidence. For example, teachers and parents frequently report fewer cases of bullying behaviors than children and young people (Lodge & Baxter, 2014).

In Australia, many incidences of bullying have been obtained from questionnaire data. In a large study conducted, 1 in 6 students (aged between 7 and 17 years) reported being bullied at least once a week, with greater numbers from primary and secondary schools than university students (Rigby, 1997). The example of primary and secondary school students being more bullied than university students is a similar example of the incident that occurred in schools in the north and southwest regions of Cameroon (Smith et al., 1999).

An investigation by Juvonen (2011) showed that the incidences of bullying in schools result from victimization, which leads to school adjustment problems of academic achievement, school avoidance, and loneliness. Peer victimization and academic difficulty are also caused by elevated levels of depression due to bullying (Schwartz et al., 2011). Elevated levels of bullying have been witnessed, which is associated with Academic disengagement and poor grades in school.

Students who are more bullied fall in the range of rank order that receives low grades and engaging less in the academic task than others that are not bullied. Students usually stop classroom participation due to victimization by peers and fear of ridicule (Juvenon, 2011). Even

a very small manipulation of social exclusion negatively affects a student's school performance. Two multi-level models examined the direct link between peer victimization and academic performance to extend past research on peer victimization and academic outcome. Data drawn from a long-term Australian study of bullying showed that 1 in 3 students between the ages of 10-11 years of age reported being bullied by peers with name-calling far more common than physical bullying (Lodge & Baxter, 2013).

But name-calling in the Cameroon setting in schools is not regarded as bullying. Most students see more of physical bullying, and this is what really plays negative feedback with their academic performance (UNESCO, 2017). Many young people who bully others have been bullied in the past (Solberg & Olweus, 2003). This is one of the origins of bullying in most areas in the world. Research has shown that children who bully are self-focused, highly competitive, exhibitionistic, and aggressive (Salmivalli, Kaukianiemi, & Lagerspetz, 1999). Other studies propose that children who bully lack empathy and tend to be manipulative and self-seeking in their interpersonal relationships (Baumeister, Smart, & Boden, 1996).

In a study carried out by Salmivali et al. (1996), children who engage in bullying can be grouped by their level of involvement as follows; Ringleaders- Organising a group of bullies and initiating bullying Followers- who join in the bullying once it is started Reinforcers or Bystanders - who do not actively join in but reinforce more passively by watching and laughing or encouraging the bullying. Bullying is a significant problem with an impact on the physical and psychological health of those who are bullied (Moon et al., 2011). The students who bully their peers at an early age may gain undue boldness and confidence to engage in more anti-social acts (Moon et al., 2011).

In the world, there exist diverse ways of bullying, including verbal harassment, physical assault, and maybe directed repeatedly towards victims, on the grounds of race, religion, gender, sexuality, or ability, which have negative effects on the victim (Olweus 2007). The rate of bullying depends on who reports the present incident and how it occurred, but various researchers have come up with diverse ways of classifying bullying in the world. Given some of the problems associated with data collection, including access to data collection tools, the fact remains that bullying is taking place at unacceptable levels and is making school very unpleasant for many individuals

THE IMPACT OF BULLYING ON STUDENTS' ACADEMIC PERFORMANCE

Bullying in secondary schools, particularly in private institutions in Port Harcourt, can take various forms, including physical bullying, verbal bullying, social exclusion, and cyberbullying. According to a study conducted in Nigerian schools, bullying behaviors have been found to be common among students, with victims often suffering in silence due to the stigma surrounding the issue (Afolabi & Animasahun, 2024). The private schools in Port Harcourt, like their counterparts worldwide, are not immune to this issue. These institutions, which are often perceived as offering superior educational experiences, may face additional challenges in managing bullying due to the pressure to maintain their reputation and the focus on academic performance.

In these schools, bullying can be exacerbated by factors such as academic competition, class division, and peer pressure. Students may engage in bullying behaviors to assert dominance, gain social status, or navigate the rigid hierarchies that often exist within school environments. The diverse socio-economic backgrounds of students in private schools in Port

Harcourt may further contribute to bullying, as differences in wealth, culture, and personality may be targeted. As a result, students who are perceived as "different" or weaker may become frequent targets of bullying, negatively affecting their mental and emotional well-being.

Psychological and Emotional Impact of Bullying on Students

The psychological and emotional effects of bullying are often immediate and long-lasting, with significant consequences for a student's academic performance. Victims of bullying frequently experience heightened levels of anxiety, depression, and low self-esteem. These emotional disturbances can make it difficult for students to concentrate in class, participate in group activities, and retain information. Studies have shown that bullying can lead to a decline in mental health, which in turn affects academic engagement. According to Olweus (1993), students who experience bullying are more likely to feel anxious and fearful about going to school, leading to avoidance behaviors such as absenteeism.

In Port Harcourt, research indicates that students who are victims of bullying exhibit signs of emotional distress, which impact their cognitive abilities. For example, a study conducted in Ibadan, Nigeria, found that bullied students often experience poor concentration, lack of interest in learning, and a decrease in academic motivation (Afolabi & Animasahun, 2024). These psychological challenges create barriers to academic success, as students become more focused on their emotional struggles rather than on their studies. The heightened anxiety and feelings of isolation associated with bullying can make it difficult for students to engage in the learning process, leading to a decline in academic performance.

Moreover, the emotional toll of bullying can cause a significant decrease in self-esteem. Students who are bullied often internalize negative beliefs about themselves, feeling worthless or incapable. This diminished self-confidence can result in a lack of effort in schoolwork and a negative attitude toward academic achievement. As noted by Boulton (1997), students who are bullied are less likely to participate in classroom discussions, seek help when needed, or perform at their best academically. The sense of hopelessness that often accompanies bullying can cause students to disengage from their studies altogether, further exacerbating the academic decline.

Impact on School Attendance and Engagement

Bullying often leads to decreased school attendance, which directly impacts students' academic performance. Students who are bullied may avoid school to escape the harassment and emotional distress associated with it. In a study on bullying in Nigerian secondary schools, it was found that students who were victims of bullying were more likely to skip school or exhibit a reluctance to attend (Fareo & Habila, 2018). This absenteeism contributes to a lack of continuity in learning, leading to gaps in knowledge and understanding. Students who miss school frequently may struggle to catch up with their peers, which can lead to falling behind academically.

In addition to absenteeism, bullying can result in decreased participation in class activities. Students who are bullied may feel isolated and disengaged from their peers, leading to a lack of collaboration in group projects or reluctance to participate in classroom discussions. This disengagement from the school environment can further undermine a student's academic performance. A study by Smith et al. (2004) highlighted that students who experience bullying often have lower levels of school engagement, which can negatively affect their academic

achievement. The lack of social and academic involvement in school activities contributes to an overall decline in academic performance.

Social and Behavioral Consequences

Beyond the direct impact on academic engagement, bullying also has significant social and behavioral consequences for students. Victims of bullying may develop social anxiety, difficulty trusting others, and challenges in forming meaningful peer relationships. These social difficulties can affect students' ability to work effectively in groups, communicate with teachers and peers, and develop the social skills necessary for success in the classroom. In private secondary schools in Port Harcourt, where academic achievement is often emphasized, the lack of social integration can hinder students' overall academic performance.

Furthermore, the stress and trauma associated with bullying can lead to behavioral issues. Some students may respond to bullying by acting out in class, exhibiting aggression, or withdrawing entirely from school activities. These behavioral problems can create disruptions in the learning environment, affecting not only the bullied student but also their classmates and teachers. In schools where academic performance is prioritized, behavioral disruptions can lead to disciplinary action, further alienating students and contributing to their academic struggles.

WAYS IN WHICH BULLYING CAN BE ADDRESSED IN PRIVATE SECONDARY SCHOOLS

Addressing Bullying through Setting up School Administration Policies

Bullying in schools is a pervasive issue that can lead to severe psychological, emotional, and academic consequences for students. Effective school administration policies are crucial in mitigating bullying by establishing clear guidelines, fostering a safe environment, and ensuring accountability. According to Olewus (1993) he was of the view that schools that implement comprehensive anti-bullying policies can significantly reduce incidents of bullying and create a culture of respect and inclusion. These school policies can be stated thus;

Establishing Clear Anti-Bullying Guidelines

A well-defined policy is the foundation for addressing bullying in schools. School administrations should develop a comprehensive anti-bullying policy that clearly defines bullying, including physical, verbal, social, and cyberbullying. These policies should specify unacceptable behaviors, disciplinary measures, and reporting procedures. Clearly articulating the expectations helps students, teachers, and parents understand the seriousness of bullying and the consequences of engaging in such behavior. Furthermore, policies should emphasize that bullying is not a normal part of growing up and must be addressed proactively (Smith, 2016).

Implementing Reporting and Investigation Procedures

A critical component of an anti-bullying policy is establishing accessible and confidential reporting mechanisms. Many victims of bullying remain silent due to fear of retaliation or disbelief from adults (Hymel & Swearer, 2015). Schools should provide multiple avenues for

reporting, including anonymous tip lines, online reporting systems, and direct communication with school counselors or administrators. Also, the policy should outline a structured process for investigating reports of bullying, ensuring that all cases are handled promptly and fairly. A study by Cornell and Limber (2015) found that schools with formal reporting and response procedures had a significant reduction in bullying incidents.

Enforcing Consistent Consequences and Interventions

For anti-bullying policies to be effective, consistent enforcement is essential. Policies should outline clear consequences for bullying, ranging from warnings and counseling for minor infractions to suspensions or expulsions for severe or repeated offenses. However, punitive measures alone are insufficient. Effective policies incorporate restorative justice practices, where bullies are encouraged to understand the impact of their actions and make amends (Kokkinos & Kipritsi, 2012). Schools that implement both disciplinary actions and rehabilitative programs experience lower rates of recurring bullying (Espelage & Hong, 2017).

Promoting Preventative Educational Programs

In addition to disciplinary measures, school policies should emphasize preventive strategies, such as educational programs and awareness campaigns. Research indicates that schools that integrate anti-bullying education into their curriculum experience fewer bullying incidents (Farrington & Ttofi, 2009). These programs should teach students about empathy, conflict resolution, and digital citizenship to prevent cyberbullying. Moreover, training sessions for teachers and staff help them recognize signs of bullying and intervene effectively (Bradshaw et al., 2013). School-wide initiatives, such as peer mentoring and student-led anti-bullying committees, further reinforce a culture of kindness and accountability.

Engaging Parents and the Wider Community

Addressing bullying requires collaboration between schools, parents, and the broader community. Effective school policies should include parental involvement through workshops, regular communication, and participation in anti-bullying initiatives. According to Mishna et al. (2011), schools that engage parents in bullying prevention efforts see more success in curbing aggressive behaviors. Additionally, partnerships with local organizations and mental health professionals can provide resources and support for both victims and perpetrators of bullying.

Addressing Bullying Through Students' Education and Awareness

Bullying is a persistent issue in schools that negatively impacts students' mental health, academic performance, and overall well-being. One of the most effective ways to combat bullying is through education and awareness programs that empower students with knowledge, skills, and the confidence to prevent and respond to bullying. Research suggests that educating students about bullying can significantly reduce incidents and foster a culture of respect, empathy, and inclusion (Farrington & Ttofi, 2009). Schools that implement structured educational programs can help students recognize, report, and stand against bullying in all its forms.

Teaching Students about the forms and impact of Bullying, Educating students about the different types of bullying, physical, verbal, social, and cyberbullying is a crucial first step in raising awareness. Many students do not fully understand what constitutes bullying, leading them to either unknowingly participate in harmful behaviors or fail to recognize when they are victims (Smith, 2016). Schools should incorporate discussions about bullying into the curriculum, helping students identify bullying behaviors, their consequences, and ways to respond effectively. Research by Olweus (2013) highlights that when students are educated about the emotional and psychological harm caused by bullying, they become less likely to engage in such behaviors.

Moreover, teaching students about the consequences of bullying both for victims and perpetrators can deter aggressive behavior. Victims of bullying often experience anxiety, depression, and lower self-esteem, while perpetrators may face long-term difficulties such as increased aggression and difficulties in forming healthy relationships (Hymel & Swearer, 2015). Providing real-life examples and testimonials from individuals who have experienced bullying can help students empathize with victims and understand the serious implications of their actions.

Promoting Empathy and Social-Emotional Learning

Empathy is a key factor in reducing bullying, as students who understand and care about others' feelings are less likely to bully their peers. Social-emotional learning (SEL) programs, which focus on self-awareness, self-regulation, and interpersonal skills, have been shown to significantly decrease bullying behaviors (Durlak et al., 2011). Schools should integrate Social Emotional Learning (SEL) activities that encourage students to put themselves in others' shoes and develop emotional intelligence.

Role-playing exercises, literature discussions, and group activities that emphasize kindness and inclusivity can enhance students' understanding of different perspectives. According to a study by Espelage and Hong (2017), students who participated in empathy-based education programs demonstrated lower levels of aggression and were more likely to intervene when witnessing bullying. When schools prioritize emotional education, they create an environment where students feel valued and supported, reducing the likelihood of bullying incidents.

Encouraging Bystander Intervention and Peer Support

Bystanders play a crucial role in either perpetuating or preventing bullying. Many students witness bullying but choose to remain passive due to fear or uncertainty about how to intervene (Hawkins et al., 2001). Educational programs should focus on empowering students to become active bystanders who stand up against bullying rather than silently witnessing it. Teaching students strategies such as speaking up, reporting incidents, and offering support to victims can significantly reduce bullying rates.

Programs like the "KiVa" anti-bullying initiative in Finland have successfully encouraged bystander intervention by educating students on how their actions can either reinforce or stop bullying (Salmivalli, 2010). When students are aware that their voices can make a difference, they are more likely to take action against bullying and create a supportive peer environment.

Schools can also implement peer mentoring and buddy systems to ensure that vulnerable students have a network of support.

Addressing Cyberbullying through Digital Literacy

With the rise of social media and digital communication, cyberbullying has become a major concern for students. Many students do not fully understand the implications of their online behavior or the long-lasting effects of digital harassment (Patchin & Hinduja, 2012). Schools must educate students on responsible online behavior, the impact of cyberbullying, and strategies to protect themselves and others in digital spaces.

Digital literacy programs should teach students about privacy settings, recognizing online harassment, and the importance of ethical internet use. According to Hinduja and Patchin (2018), students who receive digital citizenship education are less likely to engage in cyberbullying and more likely to use the internet responsibly. Encouraging students to report online bullying and providing clear guidelines on how to respond to cyberbullying incidents can help create a safer digital environment for all students.

Implementing School-Wide Awareness Campaigns

Raising awareness about bullying requires ongoing school-wide initiatives that engage students, teachers, and parents. Schools can organize anti-bullying awareness campaigns, such as themed weeks, poster competitions, and student-led assemblies, to keep the conversation about bullying prevention active (Bradshaw et al., 2013). These initiatives should focus on positive messaging, emphasizing kindness, inclusivity, and the power of student voices in creating a bully-free environment.

School-wide efforts such as "Pink Shirt Day," an international anti-bullying movement, demonstrate the effectiveness of collective action in spreading awareness and promoting anti-bullying values (Craig & Pepler, 2014). When students actively participate in campaigns and awareness events, they internalize the message and become advocates for a respectful school culture.

Engaging Parents and the Community in Education Efforts

Bullying prevention extends beyond the classroom, requiring collaboration between schools, parents, and the broader community. Educating parents about bullying signs, communication strategies, and ways to support their children is essential in creating a holistic approach to bullying prevention (Mishna et al., 2011). Schools should host workshops, send informational materials home, and encourage parental involvement in anti-bullying initiatives.

Community partnerships with mental health organizations, law enforcement, and local advocacy groups can provide additional resources and expertise to strengthen school-based education efforts. According to Cross et al. (2011), schools that integrate community support into their anti-bullying programs experience greater success in reducing bullying incidents. By fostering a community-wide commitment to anti-bullying education, schools create a more comprehensive and sustainable approach to addressing the issue.

Addressing bullying through students' education and awareness is a proactive and effective strategy for creating a safer and more inclusive school environment. By teaching

students about the different forms and consequences of bullying, promoting empathy, encouraging bystander intervention, addressing cyberbullying, implementing awareness campaigns, and engaging parents and the community, schools can significantly reduce bullying incidents. Education empowers students to take a stand against bullying and fosters a culture of respect, kindness, and accountability. A well-informed student body is essential in the fight against bullying, ensuring that schools remain safe and welcoming spaces for all.

Addressing Bullying Through Teachers' Training and Support

Teachers play a crucial role in preventing and addressing bullying in schools. As frontline figures in students' lives, they are often the first to witness bullying incidents and have the power to intervene effectively. However, without adequate training and support, many teachers feel unprepared to handle bullying situations appropriately (Bradshaw et al., 2013). Providing educators with the necessary skills, strategies, and emotional support is essential for creating a safe and inclusive school environment. Training programs, continuous professional development, and institutional support systems can empower teachers to prevent, identify, and manage bullying effectively.

Enhancing Teachers' Understanding of Bullying

One of the primary components of teacher training is increasing awareness of the different forms and impacts of bullying. Many teachers may not recognize subtle forms of bullying, such as relational aggression or online harassment, which often go unnoticed (Smith, 2016). Professional development programs should educate teachers on the signs of bullying, the psychological consequences for victims, and the motivations behind aggressive behavior. According to Swearer et al. (2010), when teachers are trained to recognize bullying early, they can intervene more effectively and prevent escalation. Workshops and seminars can provide case studies, role-playing exercises, and real-world scenarios to help teachers practice identifying and addressing bullying situations.

Equipping Teachers with Intervention Strategies

Beyond awareness, teachers need concrete strategies to intervene effectively in bullying situations. Research suggests that untrained teachers may either underreact, ignoring or downplaying incidents or overreact with punitive measures that fail to address the root causes of bullying (Rigby, 2014). Proper training should focus on balanced, evidence-based interventions that prioritize student well-being and conflict resolution.

For example, the use of restorative justice practices, where teachers mediate discussions between the bully and the victim, has been shown to reduce repeat incidents (Kokkinos & Kipritsi, 2012). Teachers should also be trained in de-escalation techniques, ensuring they can address bullying in a calm and constructive manner. Additionally, bystander intervention training can help educators encourage students to step in and support their peers when they witness bullying (Hawkins et al., 2001).

Creating a Supportive Classroom Environment

Teachers' training should also emphasize the importance of fostering a positive classroom culture that discourages bullying. Classroom management strategies that promote inclusivity, respect, and cooperation can significantly reduce bullying behaviors (Espelage & Hong, 2017). Teachers should be trained to implement social-emotional learning (SEL) programs that teach empathy, conflict resolution, and positive peer interactions. Studies have shown that classrooms with clear behavior expectations, consistent discipline policies, and open communication between teachers and students experience lower levels of bullying (Bradshaw et al., 2013).

Challenges in Implementing Anti-Bullying Policies

Despite the existence of anti-bullying policies, bullying remains a significant issue in schools worldwide, including private schools in Port Harcourt, Nigeria. Despite efforts to curb this menace through the implementation of anti-bullying policies, many schools struggle with enforcement due to various challenges. These challenges include inadequate policy enforcement, parental attitudes, lack of awareness and training, cultural factors, and underreporting of bullying incidents. Addressing these barriers is crucial to creating a safe and conducive learning environment.

Inadequate Policy Enforcement

One of the major challenges private schools in Port Harcourt face in implementing bullying policies is the inadequate enforcement of existing rules. While many schools have policies in place, the lack of strict implementation leads to continued bullying incidents. According to Okafor and Nwankwo (2020), schools often have anti-bullying policies that are not actively enforced due to administrative bottlenecks or reluctance from school authorities to take strict disciplinary actions against offenders. This reluctance is sometimes influenced by fear of losing students, as private schools operate as business entities and may not want to expel fee-paying students. When schools fail to enforce disciplinary measures effectively, bullying persists, making policies ineffective.

Parental Attitudes and Influence

Parental attitudes significantly impact the implementation of bullying policies in private schools. Some parents, particularly those of students who engage in bullying, often defend their children rather than support disciplinary actions. Studies by Adiele and Ugochukwu (2019) indicate that some parents use their financial influence to pressure school authorities into overlooking their children's misconduct. This makes it difficult for schools to implement fair disciplinary measures, as administrators fear backlash from influential parents. Moreover, some parents fail to acknowledge that their child may be a bully, dismissing complaints from victims or blaming the school for not "controlling" their children properly. This lack of parental cooperation weakens the enforcement of bullying policies and emboldens bullies.

Lack of Awareness and Teacher Training

Another major obstacle to the successful implementation of anti-bullying policies is the lack of awareness and inadequate training for teachers and school staff. Many educators are not adequately trained to identify and handle bullying cases effectively. A study by Eze and Amadi (2021) found that many private school teachers in Port Harcourt lack formal training on bullying intervention strategies, making it difficult for them to address bullying incidents properly. Some teachers may perceive bullying as mere "child's play" or harmless teasing, failing to recognize the psychological impact on victims. Without adequate training, school staff may be unable to provide the necessary support to victims or enforce policies effectively.

Cultural and Societal Norms

Cultural factors also play a role in the challenges private schools face in combating bullying. In some Nigerian societies, aggressive behavior among children is seen as a sign of strength, while reporting bullying is often discouraged. Nwachukwu (2022) notes that many children who experience bullying fear being labeled as weak or cowardly, which prevents them from speaking up. Additionally, some cultures normalize hazing or initiation practices in schools, which further complicates anti-bullying efforts. When bullying is deeply ingrained in societal norms, it becomes harder for private schools to implement policies that challenge these beliefs.

Underreporting of Bullying Incidents

Many bullying incidents in private schools go unreported due to fear of retaliation or lack of trust in the school's disciplinary system. Victims may feel intimidated or believe that reporting the incident will not lead to any meaningful action. According to a report by the Nigerian Educational Research and Development Council (NERDC) (2020), a significant percentage of students in private schools do not report bullying because they think the school authorities will ignore their complaints. The lack of an anonymous and effective reporting system discourages students from coming forward, making it difficult for schools to address bullying cases. Additionally, some school authorities downplay bullying incidents to maintain the school's reputation, further silencing victims and enabling bullying behavior to continue.

Inconsistent Government Regulations and Oversight

The absence of strict government regulations and enforcement mechanisms also contributes to the difficulty in implementing bullying policies in private schools. While Nigeria has national policies on child protection and school safety, enforcement remains weak. Studies by Udeh (2021) suggest that private schools often operate with minimal oversight from educational authorities, allowing inconsistencies in the implementation of anti-bullying policies. Some schools adopt their own internal measures, which may not align with national guidelines, resulting in ineffective or selective enforcement. Without proper regulatory oversight, private schools may fail to prioritize bullying prevention and intervention strategies.

Peer Pressure and Group Dynamics

The influence of peer groups also presents a challenge in combating bullying in private schools. Peer pressure can encourage students to engage in bullying behaviors to fit in with a dominant social group. According to a study by Chukwuma and Okorie (2023), students who witness bullying may hesitate to intervene due to fear of social exclusion or becoming targets themselves. In environments where bullying is normalized within certain peer groups, it becomes difficult for schools to enforce policies that contradict group behaviors. Addressing peer pressure requires comprehensive education and sensitization programs, which many private schools may lack the resources to Private schools in Port Harcourt face multiple challenges in implementing effective bullying policies, including inadequate policy enforcement, parental interference, lack of teacher training, cultural influences, underreporting of incidents, weak government oversight, and peer pressure. Overcoming these challenges requires a collaborative effort between school authorities, parents, educators, students, and policymakers. Schools must prioritize strict enforcement of anti-bullying policies, provide training for teachers, establish safe reporting mechanisms, and engage parents in bullying prevention efforts. By addressing these barriers, private schools can create a safer learning environment that fosters student well-being and academic success.

CONCLUSION

The impact of bullying on students extends beyond the school environment and can have long-term effects on their mental health, academic success, social relationships, and physical well-being. Schools must implement anti-bullying policies, provide mental health support, and encourage a positive school culture to reduce bullying incidents. By addressing the harmful consequences of bullying, educators, parents, and policymakers can help create a safer and more supportive learning environment for all students.

Suggestions

Bullying in private secondary schools, remains a significant challenge affecting students' academic performance, mental health, and overall well-being. While private schools often have more resources and structured environments, they are not immune to bullying incidents. Addressing bullying effectively requires a comprehensive approach that includes policy enforcement, awareness programs, counseling services, parental involvement, and the use of technology. The following recommendations provide strategies for curbing bullying in private secondary schools.

- A clear and well-enforced anti-bullying policy is essential for preventing bullying in schools. Policies should define bullying, outline strict consequences for offenders, and establish a structured reporting system (Olweus, 1993). Private schools should regularly review and update their policies to address emerging forms of bullying, such as cyberbullying. According to Smith et al. (2008), schools that enforce strict anti-bullying policies experience fewer bullying incidents. Additionally, school administrators should ensure that policies are consistently applied to all students without favoritism.

- Educating students about bullying and its consequences can help prevent aggressive behaviors. Private schools should integrate anti-bullying education into their curriculum through workshops, discussions, and role-playing activities (Espelage & Swearer, 2003). Social-emotional learning (SEL) programs have been found to be effective in promoting empathy and positive peer relationships (Durlak et al., 2011). Schools can also conduct annual anti-bullying campaigns to reinforce the importance of respect and inclusion among students.
- Many victims of bullying hesitate to report incidents due to fear of retaliation or embarrassment. Private secondary schools should establish a confidential reporting system that allows students to report bullying without fear (Bauman et al., 2008). Anonymous tip lines, suggestion boxes, and online reporting platforms can encourage students to speak up. Additionally, schools should have designated counselors or trusted staff members whom students can approach for support and guidance.
- Counseling services play a crucial role in helping both victims and perpetrators of bullying. Victims of bullying often experience anxiety, depression, and low self-esteem, while bullies may have underlying behavioral or emotional issues (Holt et al., 2009). Private schools should employ trained counselors who can provide therapy and coping strategies for affected students. Support groups and peer mentoring programs can also help victims build confidence and resilience.
- Parental involvement is key to addressing bullying in private schools. Schools should regularly communicate with parents through newsletters, workshops, and meetings to educate them on bullying prevention and intervention strategies (Hymel & Swearer, 2015). Parents should be encouraged to discuss bullying with their children, recognize warning signs, and collaborate with schools in resolving bullying cases. A study by Rigby (2017) found that schools with strong parent-school partnerships experience lower rates of bullying.
- Teachers and school staff are the first line of defense against bullying. Private secondary schools should provide regular training for educators to help them identify, prevent, and address bullying effectively (Bradshaw et al., 2010). Training should include recognizing different forms of bullying, intervention strategies, and de-escalation techniques. Schools should also create a supportive environment where teachers feel empowered to take immediate action against bullying.
- With the rise of technology, cyberbullying has become a major concern in private schools. Schools should implement guidelines for appropriate online behavior and monitor students' use of digital platforms (Patchin & Hinduja, 2010). Educating students on responsible social media use and the consequences of cyberbullying can help prevent online harassment. Schools may also collaborate with parents to ensure that students use the internet safely at home.
- Promoting a positive school culture can help reduce bullying. Private schools should encourage students to participate in extracurricular activities such as sports, clubs, and leadership programs, which help foster teamwork and inclusivity (Thapa et al., 2013). Schools can also introduce peer mentorship programs where older students support and guide younger students, creating a sense of belonging and reducing the likelihood of bullying.

ABSTRACT

In a world increasingly threatened by climate change, biodiversity loss, and environmental degradation, the need for transformative leadership in education has never been more urgent. This paper explores the dynamic role of educational leaders in promoting environmental education as a cornerstone of sustainability. It argues that the future of our planet hinges not just on scientific innovation or policy reform, but on how effectively educational institutions nurture a generation of environmentally conscious citizens. Educational leaders are portrayed not only as administrators but as visionaries, culture shapers, and eco-activists that can embed sustainability principles into the fabric of school life. They act as catalysts for lasting ecological change by reimagining curricula, modeling green behaviors, empowering teachers, and forging partnerships with local and global environmental initiatives. The paper draws inspiration from global and local success stories, demonstrating that sustainable leadership is both feasible and impactful when driven by passion, policy, and purpose. However, the journey is not without challenges - funding constraints, policy gaps, and resistance to change often hinder progress. Yet, with innovative thinking and resilient leadership, these obstacles can be transformed into opportunities for growth. The paper also issues a call to action for educational leaders to rise beyond routine administration and champion sustainability as a moral and professional obligation. It is only through such bold, intentional leadership that environmental education can flourish and sustainability can become not just a concept, but a lived reality in schools and beyond.

Keywords: Educational Leaders, Environmental Education, Sustainability, Green Leadership, Curriculum Transformation, School Culture, Eco-Consciousness.

INTRODUCTION

The escalating environmental crises of the 21st century - climate change, biodiversity loss, pollution, and resource depletion demand urgent and transformative action across all sectors of society. The Intergovernmental Panel on Climate Change (IPCC, 2023) has underscored that human activities are the primary drivers of global warming, with catastrophic consequences for ecosystems and human livelihoods. In response, global initiatives such as the United Nations'

Sustainable Development Goals (SDGs) have called for integrating sustainability into education to cultivate environmentally conscious citizens (UNESCO, 2020). Despite this pressing need, environmental education (EE) remains marginalized in many school systems, often treated as an elective rather than a foundational component of learning. This gap highlights the pivotal role of educational leaders - principals, policymakers, curriculum designers, and teacher-leaders in reorienting education toward sustainability. Their decisions shape institutional priorities, pedagogical approaches, and the extent to which schools prepare students to address ecological challenges.

Educational leadership for sustainability is not merely about adding environmental topics to the curriculum but fostering a whole-school approach that embeds ecological consciousness into policies, practices, and community engagement. Schools with strong leadership commitment to sustainability are more likely to implement effective EE programs, reduce institutional carbon footprints, and empower students as change agents (Henderson & Tilbury, 2019). However, many leaders face barriers, including limited training in sustainability, competing academic priorities, and insufficient funding (Mogren & Gericke, 2017). Without intentional leadership, efforts to mainstream environmental education risk remaining fragmented and ineffective.

The concept of sustainability leadership in education has evolved significantly over the past decade. Earlier models often focused on compliance with green school certifications, but contemporary frameworks emphasize transformative leadership that challenges unsustainable norms and inspires collective action (Hargreaves & Fink, 2013). Leaders must navigate complex systems, balancing institutional constraints with the moral imperative to address environmental justice. For instance, schools in low-income communities may face greater challenges in adopting sustainability initiatives due to resource limitations, yet these communities often bear the brunt of environmental degradation (Martinez, 2021). Thus, equitable leadership is essential to ensure that environmental education does not become a privilege of affluent schools but a universal priority.

Internationally, several education systems have pioneered successful models of sustainability leadership. Finland, for example, integrates EE across subjects, supported by national policies that prioritize teacher training and student-led environmental projects (Borg et al., 2022). Similarly, in Costa Rica, educational leaders have partnered with environmental organizations to create experiential learning programs that connect classroom knowledge with real-world conservation efforts (Solís et al., 2023). These examples demonstrate that systemic change is possible when leaders adopt a visionary, collaborative, and action-oriented approach. However, in many regions, progress remains slow due to bureaucratic inertia, lack of political will, or insufficient professional development for educators (Stevenson et al., 2020).

The COVID-19 pandemic further exposed vulnerabilities in global education systems, but it also presented an opportunity to reimagine schooling with sustainability at its core. As schools worldwide adapted to remote and hybrid learning, some leaders seized the moment to introduce innovative environmental projects, such as virtual climate labs or community-based sustainability challenges (McKenzie, 2021). These adaptations suggest that crises can catalyze educational transformation when leaders are prepared to think creatively. Moving forward, the role of educational leaders will be critical in ensuring that post-pandemic recovery aligns with long-term ecological resilience.

Given these challenges and opportunities, this paper argues that educational leaders must be at the forefront of advancing environmental education. They can institutionalize sustainability

in curricula, operations, and school culture, ultimately shaping a generation capable of addressing the defining issue of our time, by leveraging their influence.

CONCEPTUAL UNDERPINNING

Sustainability

Sustainability has emerged as one of the most critical concepts of the 21st century, addressing the urgent need to balance human development with environmental protection and social equity. Defined as meeting present needs without compromising future generations' ability to meet theirs, sustainability encompasses ecological, economic, and social dimensions (Brundtland Commission, 1987, as cited in Purvis et al., 2019). The growing climate crisis, biodiversity loss, and resource depletion underscore the necessity for immediate and sustained action across all sectors of society (IPCC, 2023). Environmental sustainability focuses on preserving natural ecosystems and reducing humanity's ecological footprint. The overexploitation of resources, pollution, and deforestation have pushed planetary boundaries to dangerous limits, necessitating a shift toward renewable energy, circular economies, and conservation efforts (Rockström et al., 2023). Countries and corporations are increasingly adopting green policies, such as carbon neutrality pledges and sustainable supply chains, yet progress remains uneven (UNEP, 2022). Individual actions, from reducing waste to supporting eco-friendly products, also play a crucial role in mitigating environmental degradation (Whitmarsh et al., 2021).

Economic sustainability challenges the traditional growth-centric model by advocating for long-term stability that benefits both people and the planet. The rise of sustainable business practices, including corporate social responsibility (CSR) and impact investing, demonstrates a shift toward ethical capitalism (Eccles & Serafeim, 2013). However, critics argue that true sustainability requires systemic changes, such as degrowth strategies and alternative economic models that prioritize well-being over GDP (Hickel, 2020). Social sustainability ensures equitable access to resources, healthcare, and education while promoting justice and inclusion. Marginalized communities often bear the brunt of environmental harm, making environmental justice a key component of sustainability (Bullard, 2020). Movements advocating for fair wages, gender equality, and indigenous rights highlight the interconnectedness of social and environmental well-being (Whyte, 2017).

Education serves as a cornerstone for fostering sustainable mindsets. Schools, universities, and public awareness campaigns are essential in equipping individuals with the knowledge and skills needed to drive change (UNESCO, 2020). Youth-led initiatives, such as climate strikes and sustainability advocacy, demonstrate the power of informed and engaged citizens (Thunberg, 2019). The path to sustainability is complex, requiring collaboration among governments, businesses, and communities. While challenges persist, the growing global commitment to sustainability offers hope for a resilient and equitable future.

Educational Leaders: Architects of Transformative Learning

Educational leaders serve as the driving force behind institutional growth, pedagogical innovation, and equitable learning environments. Principals, superintendents, curriculum specialists, and teacher-leaders shape the policies, cultures, and practices that determine educational quality and accessibility (Leithwood et al., 2020). Their influence extends beyond

administrative duties, as they navigate complex challenges such as technological disruption, societal inequities, and evolving workforce demands (Fullan, 2014). Effective leadership in education requires vision, adaptability, and a commitment to fostering inclusive, student-centered learning experiences (Hargreaves & Shirley, 2020).

One of the primary responsibilities of educational leaders is cultivating a collaborative school culture that empowers teachers and engages students. Distributed leadership models, where decision-making is shared among stakeholders, enhance teacher morale and student outcomes (Harris & Jones, 2017). For example, schools that prioritize professional learning communities (PLCs) demonstrate higher levels of instructional innovation and academic achievement (DuFour & Reeves, 2016). Leaders who actively listen to educators, students, and families create environments where diverse perspectives are valued and collective goals are pursued (Khalifa, 2018).

Equity-centered leadership is critical in addressing systemic disparities in education. Achievement gaps persist along racial, socioeconomic, and geographic lines, demanding leaders who advocate for resource redistribution, culturally responsive teaching, and anti-bias policies (Theoharis, 2018). Successful leaders employ data-driven strategies to identify inequities and implement targeted interventions, such as mentoring programs or expanded access to advanced coursework (Datnow & Park, 2019). They also challenge institutional biases by promoting diverse curricula and inclusive school policies (Sensoy & DiAngelo, 2017). The digital age has further expanded the role of educational leaders, requiring them to integrate technology meaningfully while safeguarding student well-being. The COVID-19 pandemic accelerated the adoption of remote and hybrid learning, exposing disparities in digital access and pedagogical readiness (Darling-Hammond et al., 2020). Forward-thinking leaders have since prioritized digital literacy training, infrastructure upgrades, and responsible AI use to prepare students for a technology-driven future (Selwyn, 2023).

Environmental Education: Cultivating Stewards for a Sustainable Future

Environmental education has emerged as a critical pedagogical approach to addressing the complex ecological challenges of the 21st century. As climate change accelerates and biodiversity declines, equipping learners of all ages with environmental literacy has become an educational imperative (UNESCO, 2020). Environmental education transcends traditional science instruction by fostering systems thinking, ethical reasoning, and active citizenship (Ardoin et al., 2020). This holistic approach empowers individuals to understand the interconnectedness of ecological, social, and economic systems while developing the skills needed to create sustainable solutions (Wiek et al., 2015).

Contemporary environmental education emphasizes experiential, place-based learning that connects theoretical knowledge with real-world applications (Gruenewald & Smith, 2014). Schools implementing garden-based learning programs, for instance, have demonstrated improved student outcomes in both academic performance and environmental attitudes (Williams & Dixon, 2013). Similarly, outdoor education initiatives that incorporate indigenous ecological knowledge help bridge Western science with traditional sustainability practices (Bang et al., 2014). These approaches not only enhance content mastery but also nurture emotional connections to nature that are essential for long-term environmental stewardship (Chawla, 2020).
The role of educators in facilitating effective environmental education cannot be overstated. Teachers who employ inquiry-based methods and critical pedagogy create spaces for students to

examine environmental justice issues and explore their own agency as change-makers (Bencze & Carter, 2015). Professional development programs that build educators' confidence in teaching controversial topics like climate change are particularly valuable, as many teachers report discomfort addressing these subjects (Herman et al., 2023). When supported with proper training and resources, educators can transform classrooms into hubs of environmental innovation where students design and implement sustainability projects (Krasny & DuBois, 2019).

Digital technologies have expanded the reach and impact of environmental education, though not without challenges. While virtual platforms enable global collaboration on sustainability initiatives, they also risk reinforcing nature-deficit disorder if overused (Louv, 2019). Balanced programs that combine technology with direct nature experiences prove most effective in developing both digital and ecological literacies (Gough, 2021). As environmental education continues to evolve, its success will depend on interdisciplinary collaboration, community partnerships, and policies that prioritize sustainability across all levels of education (Stevenson et al., 2020). Environmental education serves as our best hope for cultivating generations capable of creating a more sustainable and just world by fostering ecological awareness and action competence.

The Heart of the Matter: Education as the Seedbed of Sustainability

The future of our planet depends on how we educate current and future generations about sustainability. Education serves as the foundational seedbed where ecological awareness, ethical responsibility, and practical solutions take root, shaping mindsets and behaviors toward environmental stewardship. As the world grapples with climate change, biodiversity loss, and resource depletion, the role of education in fostering sustainable practices has never been more critical (IPCC, 2023). Schools, universities, and informal learning spaces must evolve beyond traditional knowledge transmission to become active hubs of sustainability innovation, equipping learners with the skills and values needed to address pressing ecological challenges (UNESCO, 2020).

Education for sustainability is not merely about teaching environmental science; it requires a transformative approach that integrates ecological principles across disciplines, from economics to the arts. Interdisciplinary learning enhances students' ability to understand complex sustainability issues and develop systemic thinking (Wiek et al., 2015). For instance, when students explore how literature reflects humanity's relationship with nature or how mathematical models predict climate trends, they gain a more holistic perspective on sustainability (Goleman et al., 2017). This approach aligns with the United Nations' Sustainable Development Goal 4.7, which emphasizes the need for education that promotes sustainable lifestyles and global citizenship (UNESCO, 2019).

Teachers play a pivotal role in cultivating sustainability-minded learners, yet many educators feel unprepared to incorporate these concepts into their teaching. Professional development programs focused on sustainability pedagogy are essential to bridge this gap (Evans et al., 2017). Countries like Finland and Sweden have successfully embedded sustainability into teacher training, ensuring that educators are equipped to facilitate discussions on climate justice, circular economies, and ethical consumption (Borg et al., 2022). When teachers model sustainable behaviors such as reducing classroom waste or advocating for green school policies, they inspire students to adopt similar practices in their own lives (Karrow & Fazio, 2020).

Beyond formal curricula, the hidden curriculum of school operations and culture profoundly influences students' environmental attitudes. Schools that implement energy-efficient infrastructure, zero-waste policies, and student-led sustainability projects demonstrate that sustainability is not just a theoretical concept but a lived value (Henderson & Tilbury, 2019). For example, schools participating in the Eco-Schools program have reported significant reductions in their carbon footprints while fostering leadership skills among students (Eco-Schools, 2023). These initiatives show that when educational institutions "practice what they preach," they reinforce the message that individual and collective actions matter. Community engagement further amplifies the impact of sustainability education. Partnerships with local environmental organizations, indigenous knowledge holders, and urban farming initiatives provide students with real-world contexts to apply their learning (Gruenewald & Smith, 2014). In Costa Rica, schools collaborating with reforestation projects have not only restored ecosystems but also strengthened students' sense of environmental agency (Solís et al., 2023). Similarly, service-learning projects that address local sustainability challenges such as water conservation or renewable energy advocacy and help students see themselves as change-makers (McKenzie, 2021).

The digital age presents both challenges and opportunities for sustainability education. While technology consumption contributes to e-waste and energy use, digital tools also enable global collaboration on sustainability projects. Virtual exchanges between students in different countries can foster cross-cultural dialogues on climate justice, while online platforms like NASA's Climate Kids make complex environmental science accessible to young learners (NASA, 2023). The key lies in teaching students to use technology mindfully, balancing its benefits with an awareness of its ecological footprint. As the world moves toward a post-pandemic future, education systems must prioritize sustainability to build resilience against future crises. The COVID-19 pandemic revealed how interconnected human health and environmental health truly are offering a teachable moment about the consequences of ecological disruption (Pinsky et al., 2020). Schools that seize this opportunity to integrate sustainability into recovery plans will be better positioned to nurture a generation capable of addressing the climate crisis with creativity and urgency.

BENEFITS OF ENVIRONMENTAL EDUCATION

Environmental education is a vital tool in fostering awareness and understanding of the natural world. It equips individuals with the knowledge and skills needed to address environmental challenges and promotes sustainable living. Here are some key benefits of environmental education:

Promotes Environmental Awareness

Environmental education plays a crucial role in fostering awareness about ecological issues, encouraging sustainable behaviors, and inspiring collective action to protect the planet. One of its most significant benefits is the promotion of environmental awareness, which helps individuals understand the interconnectedness of human activities and natural systems. Environmental education empowers people to make informed decisions that benefit both society and the environment by integrating scientific knowledge with practical experiences.

A key aspect of environmental education is its ability to inform people about pressing ecological challenges such as climate change, deforestation, pollution, and biodiversity loss. Research indicates that individuals who receive environmental education are more likely to recognize the consequences of their actions and adopt eco-friendly practices (Ardoin et al., 2020). For example, students who participate in school-based environmental programs demonstrate greater awareness of recycling, energy conservation, and water preservation (Ernst & Theimer, 2011). This heightened awareness translates into tangible actions, such as reducing plastic use, supporting conservation efforts, and advocating for environmental policies. Moreover, environmental education fosters a sense of responsibility and stewardship. Studies show that when people understand how ecosystems function and the threats they face, they are more inclined to engage in protective behaviors (Stern et al., 2014). Community-based environmental initiatives, such as tree-planting campaigns and beach clean-ups, further reinforce this awareness by providing hands-on experiences that connect individuals to their local environments (Chawla & Cushing, 2017). These activities not only educate but also cultivate a deeper emotional connection to nature, which is essential for long-term environmental commitment.

Another important dimension of environmental awareness is its role in shaping public opinion and policy. Informed citizens are more likely to support environmental regulations and hold corporations and governments accountable for sustainable practices (Monroe et al., 2019). For instance, educational campaigns on climate change have been shown to increase public demand for renewable energy solutions and carbon emission reductions (Stevenson et al., 2014). This demonstrates how environmental education can drive societal change by influencing attitudes and behaviors at both individual and collective levels. Additionally, environmental education bridges the gap between scientific knowledge and public understanding. Misinformation about environmental issues often leads to apathy or resistance to sustainable practices. However, structured environmental education programs help dispel myths by presenting evidence-based information in accessible ways (Broom, 2017). Schools, universities, and media platforms play a vital role in disseminating accurate environmental knowledge, ensuring that people are equipped to make responsible choices.

Encourages Sustainable Practices

Environmental education serves as a powerful catalyst for promoting sustainable practices by equipping individuals with the knowledge, skills, and motivation needed to adopt eco-friendly behaviors. One of its most tangible benefits is the way it encourages sustainable living, influencing personal habits, community initiatives, and broader policy changes. Environmental education empowers people to make choices that reduce ecological footprints and support long-term planetary health by fostering an understanding of environmental issues and their solutions. A well-documented outcome of environmental education is its impact on individual behavior. Research shows that students exposed to environmental curricula are more likely to engage in recycling, energy conservation, and water-saving practices (Kollmuss & Agyeman, 2013). For instance, schools that integrate sustainability lessons into their programs report significant increases in student-led initiatives such as composting and reduced plastic use (Monroe et al., 2019). These behavioral shifts demonstrate how education can translate awareness into action, creating a ripple effect as students influence their families and communities.

Beyond individual actions, environmental education fosters collective sustainability efforts. Community gardens, renewable energy projects, and zero-waste campaigns often emerge from educational programs that emphasize hands-on learning (Ardoin et al., 2020). Such initiatives not only reduce environmental harm but also strengthen social cohesion by bringing people together around shared goals. A study by Stern et al. (2014) found that participants in environmental education programs were more likely to volunteer for conservation projects and advocate for local sustainability policies, highlighting the role of education in driving community-level change. Another critical aspect is the influence of environmental education on consumer behavior. Environmental education helps counteract the culture of overconsumption by teaching the principles of sustainable consumption such as choosing ethically sourced products, reducing meat intake, and supporting circular economies (Heiskanen et al., 2020). Individuals with formal environmental training are more likely to prefer eco-labeled goods and reject fast fashion, demonstrating how education can reshape market demand toward sustainability (Barr & Gilg, 2016).

Policy engagement is another area where environmental education encourages sustainable practices. Informed citizens are better equipped to support and demand policies that promote renewable energy, waste reduction, and biodiversity protection (Stevenson et al., 2018). For example, communities with robust environmental education programs often exhibit higher public support for climate action plans and green urban development (Chawla & Cushing, 2017). This underscores the role of education in creating an informed electorate that prioritizes sustainability in governance. The long-term benefits of environmental education are evident in its ability to cultivate a culture of sustainability. Societies can ensure that sustainable practices become ingrained norms rather than temporary trends by embedding ecological literacy into school curricula, workplace training, and public campaigns (Wals et al., 2014). Studies suggest that early exposure to environmental education leads to lifelong pro-environmental behaviors, proving that investing in education today yields lasting environmental dividends (Ernst & Theimer, 2011).

Enhances Critical Thinking and Problem-Solving Skills

Environmental education serves as a dynamic platform for developing essential cognitive skills, particularly critical thinking and problem-solving abilities. This form of education cultivates analytical reasoning, evidence-based decision-making, and innovative solution development by engaging students with real-world environmental challenges. These skills are not only vital for addressing ecological issues but also transferable to various academic and professional domains. A fundamental benefit of environmental education is its emphasis on systems thinking, which requires learners to analyze complex interconnections between human activities and natural ecosystems. Students exposed to environmental curricula demonstrate improved ability to evaluate cause-and-effect relationships in ecological systems (Ardoin et al., 2020). For example, when examining issues like climate change or habitat loss, learners must consider scientific data, socioeconomic factors, and ethical implications - a process that strengthens multidimensional critical thinking (Wals et al., 2014). This systems approach fosters the capacity to weigh competing priorities and anticipate unintended consequences, skills that are equally valuable in policymaking and business strategy.

Problem-solving skills are similarly enhanced through environmental education's project-based learning components. Hands-on initiatives such as designing school recycling programs or

restoring local wetlands require students to identify problems, research solutions, test interventions, and assess outcomes (Ernst & Monroe, 2016). A longitudinal study by Stern et al. (2022) found that participants in such programs exhibited greater persistence in tackling complex problems and were more likely to employ collaborative strategies compared to peers without environmental education. These findings underscore how environmental projects mirror real-world problem-solving processes, where solutions rarely emerge from linear thinking but instead require adaptability and creativity. The interdisciplinary nature of environmental education further amplifies cognitive skill development. It challenges learners to synthesize diverse perspectives - a hallmark of advanced critical thinking by integrating science, economics, and social studies (Monroe et al., 2019). For instance, debating renewable energy policies requires understanding technological feasibility, cost-benefit analyses, and community impacts. Such exercises train students to distinguish credible evidence from misinformation, a crucial skill in an era of environmental disinformation (Kahan et al., 2015). Studies show that students who engage in these interdisciplinary analyses develop stronger metacognitive abilities, enabling them to reflect on their own thought processes and biases (Zimmerman, 2018).

Environmental education also promotes participatory action research, where students investigate local issues and propose context-specific solutions. This methodology enhances problem-solving by grounding abstract concepts in tangible realities (Schusler et al., 2017). When students test water quality in their community or calculate their school's carbon footprint, they learn to apply theoretical knowledge to practical challenges - a skill set correlated with higher academic achievement across subjects (Liefländer et al., 2015). Teachers report that these experiences increase student motivation and self-efficacy, as learners recognize their capacity to effect meaningful change (Chawla & Cushing, 2017). The cognitive benefits extend beyond formal education. Adults who participated in environmental programs during their youth demonstrate greater civic engagement and professional innovation, often attributing these strengths to early training in environmental problem-solving (Ardoin et al., 2023). Corporations increasingly value these competencies, with sustainability-focused industries specifically seeking employees who can navigate complex, ambiguous challenges—precisely the skills honed through environmental education (Wiek et al., 2015).

Strengthens Community Engagement

Environmental education serves as a powerful catalyst for strengthening community engagement by fostering collective action, building social capital, and creating shared environmental stewardship. When individuals come together to learn about and address local ecological challenges, they develop stronger community bonds while working toward common sustainability goals. Research demonstrates that environmental education programs significantly increase civic participation, volunteerism, and collaborative problem-solving at the community level (Krasny et al., 2014). These programs create platforms for diverse groups to interact, breaking down social barriers while addressing pressing environmental concerns that affect all community members. One of the most significant ways environmental education strengthens communities is through place-based learning initiatives. These programs make abstract concepts tangible and personally meaningful by focusing on local ecosystems and environmental issues relevant to participants' daily lives (Gruenewald, 2014). For example, when students study water quality in their neighborhood streams or participate in urban tree-planting projects, they develop deeper connections to their community while gaining practical skills (Mannion et al., 2013).

Studies show that such place-based environmental education leads to increased community involvement, with participants more likely to attend local meetings, join conservation groups, and advocate for environmental policies (Schusler & Krasny, 2015). This engagement often extends beyond environmental issues, as participants develop greater awareness of broader community needs and democratic processes.

Community-based environmental education also promotes intergenerational learning and knowledge sharing. Programs that bring together youth, adults, and elders create valuable opportunities for exchanging traditional ecological knowledge with scientific understanding (Ballantyne & Packer, 2016). In indigenous communities particularly, environmental education that incorporates traditional practices has proven effective in both preserving cultural heritage and addressing contemporary environmental challenges (Whyte et al., 2019). These collaborative learning experiences strengthen social cohesion while developing culturally relevant solutions to issues like habitat restoration or sustainable food production. Communities with strong intergenerational environmental education programs demonstrate higher levels of social trust and collective efficacy in addressing local problems (Chawla, 2020).

Another critical aspect is how environmental education builds leadership capacity within communities. These programs empower individuals to take on active roles in community development by providing training in project planning, conflict resolution, and public communication (Arnold et al., 2018). A longitudinal study by Stern et al. (2022) found that participants in youth environmental programs were three times more likely to assume leadership positions in community organizations as adults compared to their peers. This leadership development creates a ripple effect, as empowered individuals mobilize others to participate in local improvement initiatives. Environmental education thus serves as an incubator for community leaders who can address not just ecological concerns but also related social and economic challenges. The social networks formed through environmental education activities provide lasting benefits to communities. Shared experiences in habitat restoration, community gardening, or environmental monitoring create strong bonds among participants that often extend into other areas of civic life (Fisher et al., 2021). These networks become valuable resources during crises, as seen in communities with strong environmental education foundations that responded more effectively to climate-related disasters (Berkes & Ross, 2016). The trust and cooperation built through ongoing environmental projects enable communities to mobilize quickly when facing emergencies or other collective challenges.

Environmental education also promotes inclusive community engagement by intentionally involving marginalized groups in planning and decision-making. Programs designed with equity in mind create opportunities for underrepresented voices to contribute to local environmental solutions (Taylor, 2014). This inclusive approach not only leads to more effective and just outcomes but also strengthens overall community resilience by ensuring all members feel invested in shared environments (Anguelovski et al., 2020). When diverse community members collaborate on environmental projects, they build understanding across cultural, economic, and generational divides, creating more cohesive and adaptable communities. The long-term community benefits of environmental education are evident in the sustained civic engagement of program participants. Studies tracking individuals' years after their involvement show continued high levels of volunteerism, voting participation, and community leadership (Ardoin et al., 2023). These lasting impacts demonstrate how environmental education cultivates not just environmental literacy but also enduring civic responsibility. As communities worldwide face increasing environmental and social challenges, investing in environmental education

provides a powerful strategy for building the engaged, cooperative communities needed to create sustainable futures.

Supports Health and Well-being

Environmental education significantly enhances physical and mental health by fostering connections with nature, promoting active lifestyles, and reducing stress. Exposure to natural environments through environmental education programs decreases cortisol levels, alleviates anxiety, and improves mood (Kuo et al., 2021). Activities such as outdoor learning, gardening, and ecological restoration encourage physical movement, combating sedentary behaviors linked to obesity and chronic illnesses (Louv, 2018). Children who participate in nature-based education exhibit better motor skills, cardiovascular health, and immune function compared to those with limited outdoor engagement (Fyfe-Johnson et al., 2021). Mental health benefits are equally profound. Environmental education cultivates mindfulness and emotional resilience by immersing participants in green spaces, which are associated with reduced symptoms of depression and ADHD (Bratman et al., 2019). A study by Dadvand et al. (2015) found that students in schools with environmental education programs had lower stress levels and higher academic performance, attributed to increased time in nature. Furthermore, group-based environmental activities strengthen social bonds, reducing loneliness and fostering a sense of belonging (White et al., 2019).

Environmental education also raises awareness of how ecosystems impact public health, empowering individuals to advocate for cleaner air, water, and urban green spaces (Hartig et al., 2014). Communities engaged in local conservation efforts report not only ecological benefits but also improved collective well-being (Shanahan et al., 2016). Environmental education creates lasting habits that support both personal and planetary health by integrating health literacy with ecological stewardship.

Prepares Future Leaders

Environmental education plays a pivotal role in developing the next generation of leaders by fostering essential skills, values, and perspectives needed to address complex global challenges. Through experiential learning and problem-based approaches, environmental education cultivates leadership qualities such as critical thinking, collaboration, and ethical decision-making (Ardoin et al., 2020). Studies show that students engaged in environmental programs demonstrate increased confidence in taking initiative, communicating effectively, and mobilizing others toward sustainability goals (Stern et al., 2022). These competencies are directly transferable to leadership roles across sectors, from policymaking to corporate sustainability. A key strength of environmental education lies in its emphasis on systems thinking, which trains future leaders to understand interconnected social, economic, and ecological dynamics (Wiek et al., 2015). When students analyze real-world issues like climate change or resource management, they learn to navigate complexity, weigh trade-offs, and develop innovative solutions - skills highly valued in 21st-century leadership (Monroe et al., 2019). Youth participating in environmental initiatives are more likely to pursue leadership positions later in life, particularly in fields addressing sustainability and social justice (Arnold et al., 2018).

Environmental education also instills a strong sense of responsibility and ethical stewardship. It nurtures leaders who prioritize long-term collective wellbeing over short-term gains by connecting learners to local and global environmental challenges (Schusler et al., 2017). Programs that combine scientific knowledge with civic engagement create leaders capable of bridging divides between technical experts, policymakers, and communities (Krasny et al., 2014). As sustainability becomes increasingly central to all sectors, environmental education provides the foundational training for leaders who can drive meaningful change in an era of ecological crisis.

Boosts Economic Benefits

Environmental education serves as a powerful economic catalyst by creating green jobs, reducing operational costs, and fostering sustainable industries. Recent studies demonstrate that workforce training in environmental literacy directly contributes to economic growth, with the global green economy projected to generate $10.3 trillion in business opportunities by 2040 (UNEP, 2023). Businesses implementing sustainability education programs report 12-18% higher profitability through improved resource efficiency and waste reduction (WBCSD, 2022), while employees with environmental training command 7-9% higher wages due to specialized skills in renewable energy and circular economy practices (ILO, 2021). The consumer sector benefits significantly from environmental education, as educated shoppers drive a 56% faster growth rate in sustainable product markets compared to conventional goods (NielsenIQ, 2023). This shift creates new economic opportunities in eco-design and green technology, with venture capital investments in sustainability-focused startups increasing by 210% since 2018 (PwC, 2023). At the community level, environmental education generates measurable returns - every dollar invested yields $4-11 in economic benefits through improved public health, reduced infrastructure costs, and enhanced property values (Brookings Institution, 2022).

Municipalities incorporating environmental curricula report 23-31% higher success rates in attracting green businesses and sustainable tourism ventures (OECD, 2023). The transition to low-carbon economies, supported by environmental education, could create 65 million new jobs worldwide by 2035 while preventing $26 trillion in climate-related economic losses (Global Commission on the Economy and Climate, 2023). These economic advantages demonstrate how environmental education serves as both an environmental imperative and a strategic investment in sustainable prosperity.

THE ROLE OF EDUCATIONAL LEADERS IN PROMOTING ENVIRONMENTAL EDUCATION

Educational leaders play a pivotal role in integrating environmental education into academic institutions, serving as catalysts for sustainable change within learning communities. Their influence extends across curriculum development, institutional policy-making, and the cultivation of ecological awareness among students and faculty. When school administrators prioritize environmental education, students show measurable improvements in both academic performance and environmental literacy (Ardoin et al., 2020). Effective leaders achieve this by embedding sustainability principles across disciplines, ensuring environmental concepts are not isolated to science classes but permeate mathematics, social studies, and even arts education

(UNESCO, 2021). This interdisciplinary approach fosters systems thinking and helps students understand the complex relationships between human activity and ecological systems.

The strategic decisions made by educational leaders significantly impact the institutional capacity for environmental education. Principals and deans who allocate resources for outdoor classrooms, school gardens, and sustainability initiatives create tangible learning environments that reinforce theoretical concepts (Dyment & Bell, 2015). A study of high-performing green schools revealed that leadership support was the most critical factor in successful program implementation, outweighing even budget considerations (Henderson & Tilbury, 2021). Forward-thinking administrators also facilitate professional development opportunities ensuring teachers receive training in environmental pedagogy and current sustainability issues (McKeown & Hopkins, 2013). This investment in teacher competence directly translates to more effective classroom instruction and student engagement with environmental topics.

Educational leaders serve as important bridges between schools and their surrounding communities. They provide students with authentic learning experiences while addressing real-world ecological challenges by establishing partnerships with local environmental organizations, government agencies, and indigenous groups (Gruenewald & Smith, 2014). These connections often lead to service-learning projects where students apply classroom knowledge to local conservation efforts, simultaneously developing civic responsibility and environmental stewardship (Schusler et al., 2017). District-level leaders influence broader change by advocating for environmental education policies, securing funding for green school initiatives, and sharing best practices across institutions (Kensler & Uline, 2017). Their advocacy helps institutionalize environmental education rather than leaving it dependent on individual teacher enthusiasm.

At the classroom level, educational leaders empower teachers to innovate with place-based and experiential learning methods. When school cultures support pedagogical experimentation, teachers are more likely to develop creative approaches to environmental education (Stevenson et al., 2014). Effective leaders also recognize the importance of modeling sustainable behaviors, implementing energy conservation measures, waste reduction programs, and sustainable food systems within school operations (Birney & Reed, 2015). These operational decisions serve as living laboratories for students while demonstrating institutional commitment to environmental principles. The most impactful leaders go beyond compliance with environmental regulations, fostering school cultures where sustainability becomes a shared value rather than an imposed requirement (Evans et al., 2023).

The growing climate crisis underscores the urgent need for educational leaders to prioritize environmental education. Studies show that schools with strong leadership in this area produce graduates who are not only more environmentally conscious but also better prepared for green economy jobs (Wiek et al., 2015). As society faces increasing ecological challenges, the vision and commitment of educational leaders will determine whether schools produce passive observers or active participants in creating sustainable futures. Their decisions today shape tomorrow's environmental stewards, policymakers, and innovators, making their role in advancing environmental education both an educational imperative and a societal necessity.

CHALLENGES EDUCATIONAL LEADERS FACE IN PROMOTING ENVIRONMENTAL EDUCATION AND THE COURAGE TO LEAD ANYWAY

Educational leaders championing environmental education navigate a complex landscape of institutional, societal, and political barriers while demonstrating remarkable resilience in

advancing sustainability curricula. The most pervasive challenge remains standardized testing regimes that prioritize core subjects, leaving little room for environmental topics despite research showing their positive impact on overall academic achievement (Stevenson et al., 2018). Administrators frequently encounter resistance from faculty who perceive environmental education as an additional burden rather than an interdisciplinary opportunity, compounded by a lack of teacher training in sustainability pedagogies (Henderson & Tilbury, 2021). Budget constraints present another formidable obstacle, with many schools struggling to fund field experiences, outdoor classrooms, or professional development in environmental education, particularly in under-resourced districts (Gruenewald & Smith, 2014). These financial limitations often force leaders to make difficult choices between essential infrastructure and sustainability initiatives.

Political polarization around environmental issues creates additional hurdles, with some communities viewing climate education as controversial rather than scientifically grounded (Kahan et al., 2015). School board members and parents sometimes pressure leaders to avoid "divisive" environmental topics, despite overwhelming consensus among scientists about anthropogenic climate change (Plutzer et al., 2022). This politicization requires leaders to carefully navigate community values while upholding educational integrity, a balancing act that demands both diplomatic skill and moral courage. Institutional inertia presents another challenge, as traditional school structures often resist the interdisciplinary, experiential approaches fundamental to effective environmental education (Evans et al., 2023). Leaders must work within rigid schedules, compartmentalized subjects, and physical plants not designed for ecological learning, all while meeting accountability measures that rarely assess environmental literacy.

Despite these substantial barriers, courageous educational leaders find innovative ways to advance environmental education. They employ "stealth" strategies by integrating sustainability concepts into existing curricula, demonstrating how environmental education enhances rather than detracts from traditional learning goals (Ardoin et al., 2020). Successful leaders build coalitions of support, engaging students as advocates, partnering with local environmental organizations, and highlighting the career readiness benefits of green skills (Wiek et al., 2015). When principals frame environmental initiatives in terms of cost savings (through energy efficiency) or student health (via outdoor learning), they gain broader stakeholder buy-in (Birney & Reed, 2015). The most effective leaders also cultivate teacher champions, providing them with professional learning communities to share best practices and develop confidence in teaching environmental content (McKeown & Hopkins, 2013).

The courage to lead in environmental education often stems from moral conviction about education's role in addressing urgent ecological crises (Henderson & Tilbury, 2021). Leaders who persist despite challenges frequently report being motivated by witnessing students' transformative engagement with environmental issues and the development of critical thinking skills (Schusler et al., 2017). They draw strength from growing evidence that environmental education improves academic outcomes, mental health, and civic engagement (Ardoin et al., 2020). By focusing on small wins and building momentum gradually, these leaders create lasting change even within constrained systems. Their leadership exemplifies what it means to educate for an uncertain future - preparing students not just to understand environmental challenges, but to develop the knowledge, skills, and values needed to address them. In doing so, they model the very resilience and systems thinking they hope to cultivate in students, proving that courageous

leadership can overcome even formidable institutional barriers to meaningful environmental education.

CONCLUSION

Educational leaders hold the power to shape a more sustainable world by embedding environmental education into the heart of learning. As stewards of change, they must champion policies, practices, and pedagogies that foster ecological awareness, critical thinking, and responsible action among students. The urgency of climate change, biodiversity loss, and resource depletion demands bold leadership - one that transforms schools into hubs of sustainability where learners become advocates for the planet. Educational leaders can inspire a generation that values and protects the Earth by integrating environmental education across curricula, modeling sustainable practices, and fostering community partnerships. This is not merely an academic obligation but a moral imperative, one that ensures future generations inherit a livable world.

The time for passive leadership has passed. Today's educators must be visionaries, equipping students with the knowledge, skills, and passion to drive environmental solutions. Sustainability is no longer an option; it is the only path forward. Let us rise to the challenge, lead with purpose, and cultivate a legacy of stewardship, innovation, and hope. Together, through education, we can turn the tide toward a greener, more just, and sustainable future for all.

Suggestions

Based on the points raised and arguments made, the following are suggested:

- Educational leaders should ensure sustainability is embedded in curricula - not just in science but also in humanities, arts, and social sciences. Interdisciplinary approaches help students see environmental issues as interconnected with social, economic, and ethical dimensions.
- Leaders must transform schools into living examples of sustainability by implementing green policies such as waste reduction, energy conservation, and eco-friendly infrastructure, while encouraging student and staff participation in these initiatives.
- Teachers need training to confidently teach sustainability concepts. Leaders should organize workshops, resources, and partnerships with environmental organizations to equip educators with the latest knowledge and pedagogical strategies.
- Empower students by supporting eco-clubs, sustainability projects, and youth-led advocacy campaigns. When students take ownership of environmental actions, they develop leadership skills and a lifelong commitment to sustainability.
- Schools should collaborate with local governments, NGOs, and international programs to amplify their impact. Partnerships can provide resources, real-world learning opportunities, and a broader platform for environmental advocacy.

https://orcid.org/0009-0008-8693-7027

ABSTRACT

Good governance has been identified as a veritable determinant factor for quality education at all levels and tertiary education is most important. It was significantly observed that tertiary education in Nigeria has suffered various forms of academic backwardness with causes identified to range from government interference, poor policy formulation, poor staff welfare, poor funding, poor infrastructural facilities, poor remuneration, delayed salary and non-payment of salaries, allowances, and refusal to keep to agreements between unions and the federal and state governments. It was revealed in this paper that in as much as these causes were evident in all the democratic administrations Nigeria has witnessed with Mohamadu Buhari's administration recording the worst in the management of tertiary education in Nigeria. These findings were also evident in his administration as a military head of state between 1983-1985 and were replicated in his administration as a democratic president between 2015-2023. The Buhari's Administration recorded the highest ASUU strike actions. Lessons were drawn from the findings and suggestions were provided to guide future academic work and policy guide.

Keywords: Good governance, Tertiary Education.

INTRODUCTION

Nigeria has been confronted with a crisis of good governance since the return of democracy in 1999. Right from the fourth republic, democracy in Nigeria has provided a series of illuminating studies on Nigeria. Scholars have been looking closely at the style of democracy we practice because it is far from giving the requisite tenet of good governance in most sectors. There were high hopes, that the people had their belief that government institutions would provide a good platform for scholars to provide a predictable submission on the provision of good governance. However, this kind of leader has an important role to play in achieving this. According to Ololube (2024 p.11), the success of every organization institution or unit (state) is directly related to the quality of its leadership and management. The context of this paper is premised on how

good governance yielded good results in education in the Buhari administration. Hence, you cannot take away his leadership style or goal in discussing the way the country was governed in his time.

However, Scholars have provided varied opinions on the expectation of good governance when the expected beginning of the administration is confronted with problems ranging from electoral practices, voter apathy, biased umpires, failed Judiciaries, and weakened Legislatures. This background already provided a platform for most governance failures in the most critical sectors of governance. The Nigerian education sector has suffered the most from our ill democratic system, taking more closer look at Nigerian tertiary education, a lot is expected from any regime or administration of today and tomorrow. It is pertinent to note that tertiary education in Nigeria is widely conceived to be an indispensable tool for socioeconomic advancement, political survival, and the full realization of the aspirations and potentials of any government (Yusuf & Afolabi, 2014).

The Federal and State Governments perceived tertiary education as an investment in human capital development, to produce the required skilled Manpower for technocrats and managers of all levels of the economic, social, and political sectors of the nation (Amaele, 2005). According to Adesina (2005), the values that foster national development and good governance are the product of tertiary education in Nigeria. As of 2025, Nigeria has a total of 283 universities, comprising 63 state universities, 69 federal universities, and 147 private universities (NUC, 2025). Despite the sharp increase in the number of tertiary educational institutions in Nigeria, the Nigeria form of governance has been witnessing a series of challenges ranging from poor leadership style, insensitivity, poor planning, poor funding, Nepotism, Favoritism, Godfatherism, ethnic and religious sentiments that have caused setback on the tertiary education. The Buhari Administration is not an exception to ill-governance and regimes. Hence, this paper, therefore, discusses good governance with a critical examination of the formal President Mohammadu Buhari administration on tertiary education.

THEORETICAL FRAMEWORK

This paper adopted the social contract theory. Attempt to provide an understanding of the dynamics of governance and the patterns of interaction between the citizens and the governance institutions of Nigeria. It appears social contract theory has over the years gained even greater recognition in Africa from two very important areas; the theorists and the politicians who are the operators of the institutions of governance that project that state as a people-oriented institution and on the other hand, for the people who should naturally indebt the state and the acclaimed ruling class by their roles and responsibilities in as much as it justifies the assessment of the performance of states and governance.

Having looked at Thomas Hobbes' assertion of social contract, draws a very sensitive understanding of the consequences of the state of emergency African countries are confronted with Nigeria in particular. The most recent is the case in Rivers State, although one cannot attribute the Rivers State case to the failure of social contract between the people of Rivers State and the governor but rather between the people of Rivers State and the Federal Government, who in their actions has violated the principle of social contract. Erunke (2012) posited that as a rational and self-interested being, the citizens have chosen to submit to an exchange of safety for all and general order where all are bounded by laws of the sovereign who are by nature perceived and expected to administer the state in the interest of all and against the excesses of all. In light

of the above, different scholars have provided different submissions as to how they perceived social contract theory. However, the central to it all is that social contract refers to an agreement between the state and the governed where both individual parties to the contract hold onto their responsibilities.

Nbete (2012) asserted that despite Thomas Hobbes, John Locke, and Jean Jacques Rousseau's submissions on the social contract, their common argument is the submission that the state is the product of a social contract between the state and its citizens. Therefore, the people and state are bound to act in reciprocity of their duties and obligations (Falaiye and Okeregbe, 2013), in which citizens owe allegiance to the state while the state owes them the duty to provide and promote the well-being of the people with the performance of the state perceived to be evident in governance (Castillejo, 2015). Azelama and Osumah (2010) argued that the responsibility of the government towards the people is the selection of the legal rule binding the state and people bearing in mind the obligations of the government and the people. Going by these varied submissions, one would hardly want to agree that the Nigerian government has done enough in respecting the social contract between its people and the government because the Nigerian state has come under various forms of attack from civil societies, scholars, and opinion leaders on whether the country operates under social contract or not. To further justify the selection of social contract theory to guide this paper is to examine to what extent Mr. Buhari's administration exercised or demonstrated the social contract in the area of tertiary education provision in Nigeria within the period of his government.

CONCEPTUAL CLARIFICATION

Adejumobi (2004) posited that good governance is often relative as the word good is a relative term. However, submitted that good governance is the exercise of political power to manage the affairs of the nation. Managing the affairs of the nation encompasses state institution and structural arrangements, implementation capacity, quality decision-making process and relationship between government officials and the public. The National Economic Commission for Africa (1999) Perceives good governance as a process of social arrangement between the ruler and the ruled in a political community. Ozohu-Suleiman (2016) argued that good governance refers to a nation's system of politics and how it functions in public administration and law. In defining good government, one must first bear in mind what governance connotes. Governance becomes good when it is operated by legal and ethical principles as conceived by society (Mohideen, 1997).

There are implicit and clear indices found in governance to accept it to be "good". These indices are accountability, transparency, freedom of expression, rule of law, freedom of association, and electoral legitimacy. Olowu (2005) posited that since good governance involves rules, processes, and institutions, to integrate value judgment as the priority of the rule of law, political leaders manage the use of power to promote social and economic development to pursue agendas for public efficiency, accountability and transparency in the conduct of government business. However, Johnson (1991) posited that good governance should embrace requirements such as curbing corruption, efficiency which inhabits development, and investment guarantee of accountability to the people.

Adetiba and Rahim (2012) perceived good governance as the exercise of political, economic, and administrative authority to manage a country's affairs at all levels. To Bliss (2002) good governance does not only include government but also the private sector and civil society,

and must exhibit competence in the management of a country's resources and affairs in a manner that is open and transparent, equitable, accountable, and responsive to people's needs. Adetiba and Rahim (2007) also argued that good governance is a fair and equitable allocation of resources for the achievement of the end purpose of the state, which is primarily to promote the common good of the citizens.

Tertiary Education

According to the National Policy on Education (2004), Tertiary Education is the education given after secondary education in Universities, Colleges of Education, Polytechnic, Monotechnic and other institutions offering corresponding courses. World Bank (2015) perceives tertiary education as an institution set aside to provide, a clear vision of the future regulated framework for embodied law, and to provide learning activities in specialized fields of education. In general terms, tertiary education is an optional stage of formal learning that occurs after the completion of secondary education.

In Nigeria, tertiary education is given at higher educational institutions to produce specialized middle and high-level manpower needed to effect positive changes in society and to facilitate national development (Imo, Egbe, & Terfa, 2024). The three streams of tertiary education (Universities, Polytechnics/monotechnics, and Colleges of Education) share the function of high-level manpower production. Getting a postsecondary degree is, for the majority of young people, a necessary step on the road to a lucrative professional career. No matter where they pursue their education at a university, polytechnic, college, special training facility, private training facility, or through an apprenticeship, a qualification provides them with a tangible record of the knowledge and skills they have acquired that they can use to advance in their careers.

Goals of Tertiary Education

The goal of tertiary education in Nigeria is set aside to meet the needs and demands of the Federal Government of Nigeria. The goals of tertiary education as stated in the National Policy on Education, Federal Republic of Nigeria (2013) 6th edition include:

- Tertiary education is to contribute to national development through level manpower training.
- Tertiary education is to provide accessible and affordable quality learning opportunities in formal and informal education in response to the needs and interests of all Nigerians.
- Tertiary education is to provide high-quality career counseling and life-long learning programmes that prepare students with knowledge and skills for self-reliance and the world of work.
- Tertiary education is to reduce skill shortages through the production of skilled manpower relevant to the needs of the labour market.
- Tertiary education is to promote and encourage scholarship, entrepreneurship and community service
- Tertiary Education is to forge and cement national unity.
- Tertiary education is to promote national, and international understanding and interaction.

The federal government has a statutory role to play in attaining these goals to maintain high standards in the quality of the facilities, quality teaching, research and development, and community service. The Federal Government of Nigeria looks to tertiary education to generate people and spread the required knowledge that is needed to fit into other sectors through its traditional functions of teaching, research, and community service.

Importance of Tertiary Education

Peretomode (2008) posited tertiary education drives, facilitates, powers and supports the political, strong socio-economic, and cultural well-being of any nation. The degree of education is directly correlated with the development of human capital and economic growth. Therefore, if Nigeria properly administers its tertiary education and makes use of its intellectual talent, it can have a sizable competitive edge over other nations. The objectives of tertiary education can be closely and critically examined to show that this level of education is expected to transmit abilities that will allow people to contribute to society positively. It therefore shows that there is a direct correlation between national cohesion and tertiary education. This is because tertiary education offers a platform for the production of manpower that will occupy a variety of positions in both the private and public sectors and be responsible for driving national development. For some reason, a list of the advantages of higher education has been compiled by academics and scholars.

Researchers have long argued that the deliverables to higher education are social and cultural and accrue not only to the individual who obtains the degree but also to the public at large. Hearn and Holdsworth (2002) pointed out that, it is true even though several studies have also shown that degree attainment has direct and measurable economic impacts that accumulate on the individual and the society at large. Tertiary education institutions are responsible, not only for educating citizens to develop and maintain a civilized society but also for inculcating in individuals the desire to continue their education throughout their lives. Thus, everybody can make a significant contribution to the well-being of the society.

The Need for Tertiary Education in Nigeria

FME (2004) asserted that the National Policy on Education is clear that the defining characteristic of an educated individual is the ability to live and work successfully in a society. Anything less is not education. He further asserted that identity crises and social disorientation are common among those who lack life skills and job qualifications simply because they are uneducated. Every stage of formal education, but notably tertiary education, should focus on developing such competencies, together with a civilized and enlightened way of life. This is due to the increased focus on lifelong learning, employability, workforce quality and skills, and education and training. The difficulties of urban and rural variations in unemployment, poverty, and exclusion in a multicultural society are acknowledged to be issues that initiatives to stimulate innovation and competitiveness need to take into account (Goddard, 2007). On this note, it is no longer a hearsay that Nigeria needs a viable and functional tertiary education system with strong international credibility that can deliver educational performance and can compare itself with the best practices in the world. Tertiary Education in Nigeria should be able to address the changing skills needs so that skills gained in tertiary education will link to employment opportunities in the labour market.

BRIEF HISTORICAL OVERVIEW OF TERTIARY EDUCATION IN NIGERIA

The Nigerian tertiary education began with the establishment of Yaba Higher College in 1934. It was established to provide middle-level manpower for the government and private sector (Wokocha, 2011). The Yaba College came into being after many agitations and demands by the National Congress of British West Africa (NCBWA) led by Casely Hayford (Aminigo, 2003). Notwithstanding, Nwideehuh (2003), posited that the generality of educated Nigerians condemned the quality of programmes the college was offering then. The institution was viewed as inferior, designed by the colonialists to produce Nigerians as their subordinates. Aside from this challenge, Yaba College also suffered immensely from many disabilities such as restrictions on the number of students to be admitted, absurd admission requirements, high rate of drop-outs, and imposition of choice of course ((Wokocha, 2011). With all these playing out in 1943, the colonial government set up the Elliot Commission to examine the possibility of establishing university colleges in Nigeria, Ghana, and Sierreleon. Thereafter, a report communicated the establishment of a university college, in Ibadan in 1948 (National Teachers Institute, 2005).

By 1960, the University College, Ibadan was then established to award academic degrees of the University of London, to contribute to the manpower requirement in Nigeria (National Teachers' Institute, 2005). Jubril (2003) also asserted that the need for larger output from universities was on the increase and the need to establish more universities could not be resisted. In 1954, the federal and regional government set up the Ashly Commission to advice the government on the need to establish more universities to the growing need for higher education in Nigeria (Junaid, 2006). The recommendation gained a lot of support and approval which culminated in the establishment of four new universities; the University of Nsukka in 1960, Obafemi Awolowo University in 1962, Ahmadu Bello University, Zaria, in 1962, University of Lagos in 1962 and then University of Ibadan then became a full fledge university in 1962 (Jubril, 2003).

By 1962, Nigeria had just three regions, hence three universities were established according to the regions. At this point, there was agitation for the creation of the mid-west region. In 1963, the Mid-West Region was created, hence the Mid-West Institute of Technology was established in 1970, which later became the University of Benin (Wokocha, 2003). Nigeria then experienced an oil boom in the 1970s under the leadership of retired General Yakubu Gowon who then established seven new universities in 1975, viz, Calabar, Port-Harcourt, Ilorin, Jos, Maiduguri, Sokoto, and Kano (Nwideeduh, 2003). At this time, all the twelve states had universities located in and within its states (Kosemani and Orubite, 1995) The Federal Military Government under the leadership of General Murtala Mohammed further created more states to balance the geo-political arrangement of the country. This led to the establishment of Federal Universities in all the Nineteen states. This informed the establishment of University Technology at Owerri (Imo State), Bauchi (Bauchi State), Makurdi (Benue State), in 1980, Minna (Niger State), and Abeokuta (Ogun State) in 1982. During this period, the state government joined the federal government in establishing state-owned universities and other tertiary institutions eg Polytechnics, colleges of education, etc (Adeyemi, 2009).

1999 saw a wide range of tertiary institutions springing up. These universities and other tertiary institutions cut across federal, state and private ownership. Federal, state, and private had established 211 tertiary institutions as of 1999 (William, Harnet, and Strassner, (2003). By 2011, the number of institutions rose to 363, which was 25 Federal Universities, 3 Universities of Agriculture, 6 Universities of Technology, 1 National Open University, 29 State Universities, 5

Universities of Technology, 4 National Centre for Specialized Tertiary Institutions, 40 Private Universities, 40 Polytechnics, 1 Military University, 17 State monotechnic, 2 Private monotechnic, 18 private polytechnics, 8 Federal Colleges of Education, 41 Private colleges of Education, 3 State Colleges of Education, 8 colleges of Technical Education, and 12 Specialized Training Institutions (Joint Admission and Matriculation Board Brochure, 2011). However, as of 2024, Nigeria has 272 universities including 62 federal, 63 state, and 149 private institutions. The rise in the number of tertiary institutions in Nigeria could be tied to the faith in the power of education to transform the Nigerian present state from a developing country to a fully developed country.

Overview of Tertiary Education According to Bamiro (2012). He divided the overview of tertiary education in Nigeria into three (3) basic sections. The access, quality, and cost. The Access Problem According to Bamiro, the first area of definition is the "access problem". To Him, the problem of access to our tertiary institutions is manifested by the inability to admit all qualified candidates seeking admissions. In an attempt to address the access problem, Universities were established at a rapid rate. Presently there are 62 federal universities, 63 states, and 149 private institutions, 38 federal polytechnics, 48 state, 61 private, 28 federal colleges, 51 state, and 84 private universities. The uneven distribution led to the swift increase in the establishment of universities and other awarding tertiary institutions. This created room for the education-advantage states, in particular in the southwest and south eastern zones establishing their universities to address the problem of access. Yet, this did not completely solve the problem of tertiary institutions. With this, the Federal Government encouraged the private sector participation through the enactment of Decree No. 9 of 1993 national minimum standard and establishment of institutions. This gave room for private enterprises, public institutions, groups of persons, or individuals to establish and run a university following the guidelines laid down by the National University Commission (NUC).

The problem of access also has to do with variation in payment of fees which is the cost. The private institution charges far more than the state-owned institution, while the federal institution charges less. This reality has also heightened the access problem. Quality. The potential impacts of the products produced by the tertiary institutions fall in this category. How has the quality of graduates impacted the Nigerian economy? It is expected that whatever form the quality of education should take whether professional, technical, or liberal, it should be able to nurture, open, refine minds, and create independent learners. The quality parameter is to measure the extent tertiary education has provided the expected broad access to skills and competencies needed to improve the match between labour supply and demand. The importance here is the extent to which curriculum and its delivery have been able to translate to the product to meet the demand satisfaction for both customers and employers of labour. The staffing situation has also been observed as a serious challenge to the quality of programme delivery. The staff strength ratio of 40:1 by global standard is not meant in most tertiary institutes today and this has affected the quality of graduates produced.

GOOD GOVERNANCE AND QUALITY EDUCATION IN NIGERIA

Good Governance is key to the growth and development of any nation. The national policy of Education is very clear on this when it clearly states that no nation can rise above the quality of its citizens. The quality of education provided for the governed is a true reflection of the type of government that might exist in that country. Meaning if the quality of education is poor, the

likelihood is that the products would have little or nothing to offer the nation. There are key areas in measuring the quality of governance in education.

Adequate infrastructure: A responsive government should provide adequate infrastructure to demonstrate the existence of governance in the country. Classrooms are equipped with the required amenities to aid effective teaching. Ezewie and Tahir (1997) posited that a lack of social amenities can thwart any meaningful education in the country. It is also worth noting that the infrastructure provided by the government should get to the desired destination. Maintenance of the existing infrastructures is also key. Most of the present-day school infrastructures are all dilapidated and no longer in use. A government ready to provide the dividend of democracy should do as much as give these infrastructure and funds to maintain them. Obama (2006) cited the Lincoln Morrill Act and created the system of land grant colleges, and institutions of higher learning that these institutions should serve as the nation's primary research and development laboratories. It was projected that through such institutions they would train innovators of the future, with the federal government providing the needed critical support for the infrastructure.

These laboratories' infrastructure cuts across chemistry labs to particle accelerators and the dollars for research to have immediate commercial applications that could lead to major scientific breakthroughs. That was good governance at work. This is not to say the Nigerian government is not doing anything but should do more as a matter of urgency. We could also draw inferences from the Uganda experience. It is called Participatory Action Research (PAR) which was one of the possibilities of improving education through building infrastructures for the system. The research center was to improve educational equality by engaging the community in a process of data gathering, inquiry, and collective research for solutions (USAID, 2005) This was aimed at developing activities to support tertiary education reforms in other to strengthen the education system, to dialogue among Ugandan policymakers, create opportunities for partnership and international research communities. This has provided results as it shows the evidence of good governance as education is well-improved.

Education as a drive for sustainable development: Gboyega (2003) perceived development as an idea that embodies all attempts to improve the coordination of human existence in all ramifications. One of the ramifications in the context of their paper is education. How has good government brought about educational development? How has it been sustained for developmental purposes? Gboyega also stressed that development implies improvement in the material well-being of the citizenry in such a way that consumption does not imperil the future, poverty, and equal access to the good things of life. The question here is, has the Nigerian government provided education in such a way that it is equally provided to meet the challenges of both the poor and the rich? Are the private and public schools providing education to meet the policy of equality? This forms one of the defining factors in measuring good governance Ayuba (2014), further argues that development should involve economic growth, equitable distribution provision of quality and affordable healthcare housing, and above all education. Amongst our defining factors of development, education is paramount because it is the driving force of all other sectors to strive and grow. On this premise Gabriel (2014), Posited that development should be viewed as a social advancement, all the sectors provide a platform for strong partnerships, corporate bodies, and other groups in the society. This involves social economic political and all aspects of social life.

Accountability: Henard and Mitterle (2010) opined that increased accountability is one of the major drivers of governance. They further stated that accountability is perceived to be an increasingly important element in the reflection of good governance in education. The taxpayer's

money has not been reflected in the disbursement and financial administration of tertiary education in Nigeria. This strength has given room to poor transparency and public accountability in developing a parallel move towards greater autonomy. This simply indicates that there is recognition that there is a public interest in tertiary education which needs to be reconciled with the benefits that institutions can bring. This is to say public interest should be substantial in areas guaranteeing academic quality and standards to ensure appropriate use of public funds within our institution. Accountability in good governance to tertiary education can be ensured through various means including performance-related, funding, quality assurance, framework marketing mechanism, and participation of external stakeholders in governing bodies. What comes to the mind of the average citizen would be if the Nigerian government has been able to meet up with any of the above just highlighted.

Funding tertiary education: Financing tertiary education in Nigeria has become a crucial subject because there has been a rapid increase in the demand for tertiary education as it is perceived to be a vehicle for social-economic transformation (Faboyede, Faboyede and Fakile, 2017). It is the objective of the government (State or federal) to fund education at all levels in Nigeria. However, the rise in the demand for tertiary education has created a big financial mobility gap in addressing the challenges recently. Akinyemi, Ofem, and Adebisi (2012), Deji-Folutile and Oketola (2014) posited that the Federal Government of Nigeria investing less than 20% of the Gross Domestic Product (GDP) in education in the past 10 years, has affected quality education delivery and needs urgent intervention. Akpotu and Akpochafo (2009), Oseni (2012) argued that the federal government has been struggling to increase stationary allocations to the universities which continued to be insufficient to cope with the increasing enrolment in these universities. Good governance ought to address issues of this nature and have it as its utmost priority.

Ubogu (2011) listed possible consequences of underfunding by bad governance. According to him, it will affect laboratory/practical lessons, reduction in research, grants loss of variety in research and teaching, increased administration burden, academic staff drain, incessant strike action, pressure on staff remuneration etc. It is then pertinent to note that funding tertiary education in Nigeria which is one of the statutory primary responsibilities of the Nigerian government, is key to the survival of our tertiary institutions. If the sector does not enjoy the dividend of good governance, then we have a lot on our table to address. However, the Nigerian government has a legal framework on how tertiary institutions should be funded. For funding federal universities, the national assemblies are required to act on the recommendation by the executive arm to make appropriations to all sectors including education. The Federal Law (LFN 2004, CAP N81, Section 4(1)f and 4(8) provides for the National Universities Commission to receive block grants from the Federal Government for disbursements to federal universities (Nigerian constitution).

The block Grant funding system is provided to empower the Federal Government to pass block grants to Nigerian universities through the National Universities Commission (NUC). These grants are structured into recurrent and capital components just as the recurrent Grant is further divided into personal and overhead cost ratios (Olokor,2012) According to Adebayo (2013) the traditional funding sources for financing universities and other tertiary institutions in Nigeria include; state universities (i) subventions by the state government from appropriation on education (ii) deduction from local government allocation and (iii) IGR. For federal universities (i) Federal Government (ii) internal generated Revenue (IGR) (iii) external linkage. For private universities (i) subvention from state government (ii) external linkage and (iii) IGR. Deji-

Folutole and Oketola (2014) also submitted that aside mentioned sources of funding tertiary institutions, the tertiary education trust fund (TETfund) is another major source of funding in Nigeria's tertiary institutions.

THE BUHARI ADMINISTRATION AND TERTIARY EDUCATION IN NIGERIA

Former Head of State and President Mohamadu Buhari administering Nigeria came in two periods. As military head of state and as an elected president. These two periods saw the same man but in different attire leading this country. His administration had its success and gaps in all the sectors. However, this paper's focus is on tertiary education in Nigeria. In as much as there are scholarly arguments on the scorecards of Mr Buhari's Administration from 2015 to 2023 it is still fresh in the memories of university lecturers on the struggles and pains they went through in the fight for the survival of the Nigerian tertiary institutions. Eyeador (2023) insisted that the state of the education sector in Nigeria is cause for concern as the Buhari administration ended up leaving the Nigeria education far from being globally competitive. He also added that tertiary education was neglected and abandoned. Buhari's first period was between 1983-1985 which was purely a dictatorship style of governance in policy formations, welfare, accountability, transparency, etc. One of the characteristic actions carried out by the Buhari's administration in 1984 was the closing down of all private universities, with the claim that they were all quacks (Jeli, 2014). Jeli (2014) further submitted in his paper that the closure of these universities left the students with nowhere to go to continue with their studies or alternatives to continue with life. Existing universities suffered various forms of policies of retrogression. This singular act created a mass number of students seeking admission that year to suffer academic setbacks.

The few universities of technology where were Abeokuta, Bauchi, Makurdi, and Yola had to merge these students for admission and find a means to cater to them, while the others like the ones in Akure, Minna, and Owerri were allowed to operate independently. The Abeokuta was merged with Lagos, Bauchi merged with Ahmadu Bello, Makurdi was merged with Jos, and Yola was merged with Maiduguri. This was never a welcome development, but the people were under a dictatorship government where their voices were not heard or faced severe consequences. The regime hides under the cover that there were not enough funds to cater to these universities (Ademolekun, 1985). The Alhaji Shehu Shagari government established the National Open University but was suspended by the Buhari regime then was later fully established under the Olusegun Obasanjo's Administration in the year 2002.

2015 saw a different era of administration by the then dictator in 1983-1985. However, his coming back was widely believed to be the messiah going by the rate of insecurity ravaging the Northeastern region of Nigeria as of then. A lot was expected and hoped for. However, not too long, the expectations were dashed by the administration which demonstrated a lot of criticism and failures in most sectors. The tertiary education was not left out from the poor governance the people of Nigeria got through the period of 2015-2023 and beyond. Hence, this paper is also going to discuss the second experience which was between 2015-2023 the Buhari administration brought to the corridor of the tertiary institutions in Nigeria.

According to Babatunde (2022), several factors strongly determine the relationship between the Buhari government and tertiary institutions and the management for it to either be strained or cooperative. However, over time, there have been several calls for more attention to be given to education in Nigeria. These calls were from academicians, parents, administrators, educators, students, and opinion leaders to rescue our education from constant decline and decay.

Babatunde (2022) identified some vital areas the Buhari administration did not give proper attention to as regards our tertiary education in Nigeria and the present President Ahmed Bola Tinubu already inherited:

Poor and unconducive conditions of service: Under the Buhari administration, the labour crisis between ASUU, SSANU, and NASU was at its peak because of an unconducive working environment, poor welfare services, inadequate pay packages, etc. Urho (2015) posited that lecturers were not offered the requisite incentives and working conditions as their other counterparts. This includes those in health and other sectors who receive extra payment for hazards in their jobs and are not heard for education. Amadi and Urho (2015) further argued that lecturers' condition of service and working conditions like the working environment, overtime shifts work, hours of work, flexible working hours, fringe benefits like sick pay, pension scheme, subsidized meals, organization cars, and application for fair judicial procedures were not catered for. For example, the case between Federal Polytechnic Bauchi and Anor V Abdulfattah, Aboaba, and Anor (2013) on illegal termination of employment with suit No; CA/J/230/2006; LN-C-LR/2013/64. The university could on this ground demand immediate reinstatement for the unfair dismissal or punishment by the government. Egbokhare (2000) cited in Adamu, Bappi, and Ibrahim (2024) reflected on the case at the University of Abuja, where the management unilaterally sacked thirty-five lecturers, created programmes, and altered the academic structure of the university and dissolved the senate because they have the backing of the Federal Government. This was an open display of extreme autocratic tendencies contrary to the expectation and the basic tenet of university management social and academic status.

Funding: Amadi and Urho (2015) asserted that the annual budget for education under the Buhari administration was extremely low compared to the budget for other sectors. It was on record that the budget for elections and numerous huge amounts of money could have been channelled to cater to the poor teaching and learning facilities in our universities. The United Nations recommended that 26% of the Nation's budget go to the education sector. Sadly, the Nigerian government has not met that requirement leading to many institutions being underfunded with recurrent national single digits for education that bring about poor payment of salaries, poor infrastructural supplies, poor maintenance of existing school plants, and poor remuneration patterns. In November 2016, ASUU went on a one-week warning strike. That strike was a result of the persistent call on the Federal Government to address these issues concerning how to re-position the Nigerian Tertiary system.

Non-compliance to agreement: Buhari's administration completely violated and neglected the agreement between labour unions. For example; Solomon, Odin, and Anastasia (2018) cited the report indicating how all the tertiary institutions in Kwara State went on strike on a similar issue, where they made demands for one hundred percent implementation of the Consolidated Polytechnic and Colleges of Education Salary Structure (CONPCASS) and the Consolidated Tertiary Institutions Salary Structure (CONTEISS) which was effective from January 2009. On August 14, 2017, ASUU embarked on another strike due to the government's failure to comply with the already signed agreement in 2009 and the Memorandum of Understanding (MoU) entered in 2012. This strike action was later called off on the 17th of September, 2017 to give room for further deliberations and negotiations. There are other areas of the new agreement entered into which bother on funding for revitalization of public universities, issues of university

staff schools and implementation of the judgment of the national industrial court, issues of earning an academic allowance, national universities pension management company and guidelines for pension matters for professors. It was shocking that none of the agreements under the Buhari administration were attended to, which led to a school lockout as at the beginning of September 2021.

Political interference in Education: Government interference has always been a constant issue affecting tertiary education in Nigeria. No government is free from this offence. However, it was more prominent and pronounced in the Buhari administration who still demonstrated that dictatorship tendencies in his government. Amadi and Urho (2015) argued that most existing government interferes in the appointments of vice-chancellors and other tertiary institutions. Most times this creates a rift among academic and non-academic staff, thereby causing instability in the school. Most times this interference is not visible for one to lay hands on or to provide empirical facts to back up claims. They are mostly perpetuated in the back door, with the use of threats and denial of statutory allocations meant for the school.

Payment of Salaries and emoluments: No worker, be it any sector wants his salaries to be delayed or not paid. When there are no justifiable reasons why these salaries are not paid. It discredits the government and does not exhibit the tenet of good governance. Solomon (2018) posited that the Buhari administration always delays the payment of salaries and other emoluments. In the year 2020, university workers went on indefinite strike action on the anomalies and disparities observed in the usage of the introduced Integrated Payroll and Personnel Information System (IPPIS). This payment during his administration created a lot of gaps and a dysfunctional system within most sectors and tertiary education suffered it most.

Unpopular and harsh policies: The nature and kind of policies define the kind of government that is operational. Policies are the true reflection of a government ready to provide the good of a government. Policies give the sense of direction of a government and one can easily judge and appraise a government by the nature of policies formulated and implemented. Unfriendly and harsh policies by any government are one of the veritable factors causing the unstable academic calendars in tertiary institutions. The Buhari administration witnessed strong resistance by ASUU and other labour unions because of the kind of policies passed. An example of this harsh policy is the refusal by the government to pay the 30 months allowance, and leave bonus among others to the non-academic staff, SSANU in July 2015. This protest disrupted school activities and the Ooni of Ife (Late Oba Okunade Sijunade) had to mediate the crisis. Also, the no work, no pay rule which is a federal government policy created a huge rift between the Federal Government headed by Buhari and ASUU.

Unfortunately, the National Industrial Court declared in favour of the Federal Government's position of "no work, no pay" against the Academic Staff Union of Universities. The Nigerian tertiary institutions' academic calendar was disrupted and several students were out of school. This period increased social vices and the rate of crime skyrocketed. Poor application of policies is also evident in Osun State where the government recommended the termination of academic staff appointment on the claim that they refused to upgrade their job certificates. This created a faceoff between the school management and ASUU. All these were acts of arbitrary dictatorship by the government causing chaos between ASUU, NASU, and SSANU. Also, in May 2021, the Kaduna State government under the leadership of Mallam Nasir El Rufai who

was the state Governor at that time took a drastic decision to reduce the number of workers on the Kaduna State payroll due to poor monthly allocation from the Federal Government (Vanguard, 2023). Owing to the above, Olorode (2001) argued that the ability to effectively manage the school resources available was because people according to their whims and caprices have acquired almost unlimited power to manipulate our tertiary education. He further stated that a high rate of ineffectiveness, high-handedness, and arbitrariness arises from the absence of true democratic control of the school system which often has resulted in crisis

LESSONS LEARNT AND SUGGESTIONS

There is a linear relationship between good governance and a functional tertiary education. The impact of good governance should be felt in all sectors of the economy but most especially education of any nation. Having examined former President Mohammadu Burhari's administration as it affected tertiary education in Nigeria, it is only expected future government administration will not follow the same direction for us to have a more viable and reputable tertiary education in Nigeria. Hence, a few lessons learned and suggestions will be provided below for future academic reference and policy guide for the government.

Odo (2015) argued that good governance strives for a democratic system of government. However, the reverse had been the case in Nigeria. Bad governance crippled our school infrastructures across all universities and tertiary institutions in Nigeria. This created poor academic delivery where students don't have available classrooms for conducive leaning. This has created a constant brain drain of talents in developed nations that have the necessary infrastructures in place for quality learning. It is therefore, imperative we set our priorities right to treat our education sector right. The neglect should be a thing of the past because if any nation must grow, education must be prioritized. All the social amenities required of a school should be provided and inculcate a culture of constant replacement and maintenance of the existing infrastructures.

Poor policy formulation has affected tertiary education in Nigeria negatively. It has disrupted the academic calendar, discouraged lecturers from putting in their best, caused dissatisfaction and grumbling, created room for corruption among lecturers, gave rise to unstable admission regulations and guidelines, created low-quality graduates, etc. It is therefore imperative the Nigerian Government endeavour to carry all stakeholders and parties along in making decisions that would affect education. Implementation of government policies should not only be considered by the university management. Academic and non-academic unions should be carried along to give room for fair hearing and expression of will. This will create harmony in the system and discourage the constant call for strikes to push their demands and requests. The Federal Government should also note that implementation of government policies should not be drastic or dictatorial, not forget we are in in democracy, therefore, policy formulation, articulation, and implementation should be in stages to allow more deliberations and coordination of inputs before they are passed. This would create room for more people-oriented policies and not policies to favour only the government or school management. Not to forget policies are for the sustenance of growth and development of our tertiary institutions. Do we evaluate our policies? Are there checkback mechanisms in place to evaluate the impact of the policies? The answer to all these questions is obviously no. Hence, it is imperative government ensures there are checkback mechanisms to evaluate especially policies formulated to affect the education sector.

Staff welfare is key for any organization to achieve the set-aside goals. The Academic Staff Union of Universities was formed in 1978 after General Yakubu Gowon proscribed the Nigerian Association of University Teachers (NAUT) in 1973. Aluko (2010) asserted that the primary reason why the union was formed was to address the welfare and needs of the academic staff of universities. Thereafter, unions of academic staff of polytechnics and colleges of education were formed following the same purpose. Tertiary education in Nigeria has suffered from several strike actions agitating for better conditions of service which cut across welfare, salaries, emoluments, allowances, etc. This has drastically affected academic growth in Nigeria. Any government having the administrative responsibility to give the people good governance should take the welfare needs of the workers as the top priority. Strike actions expose students to social vices and crimes. As the saying goes, the idle mind is the devil's workshop. Oyewunmi and Oyewunmi (2017) posited that ASUU will not relent in the fight for improved academic staff remuneration, welfare, and allowances. This can only be achieved if the Federal Government accents to the recommendation of UNESCO, that the government should allocate 26% for education in their annual budget.

Funding the education sector as earlier discussed has been a lingering problem. Most governments, past and present are still finding it difficult to address the issues of funding. Proper funding of the education sector would naturally address all other challenges affecting the growth and development of our tertiary education. Funding would address infrastructural deficits, address salary issues, cater for the purchase of all school facilities and amenities, school plant planning, etc. The government should be intentional in addressing the issue of poor funding. The decay of tertiary institutions has affected the quality of graduates produced these days. None of the upper class have their children schooling in Nigeria and Nigeria as a country is losing human capital to other developed nations.

Political interference has done more harm than good to our tertiary education in Nigeria. Just as earlier discussed, Kumar (2020) posited that political interference has affected our tertiary institutions negatively as it has created room for recruiting unqualified staff, admission of less qualified candidates, poor quality of tertiary education, poor internal administration, ineffective leadership, proliferation of tertiary institutions, alteration of planning and allocation of tertiary institution in Nigeria. Guner (2020) argued that unchecked political interference tends to spur the proliferation of tertiary institutions and create disparity in educational quality and aggregate resource constraints.

Tertiary education in Nigeria presently suffers from the above-mentioned educational problems. The Buhari administration and others have disrupted the strategic planning, created inequitable access to education and the quality of education has dropped drastically. The federal government, regardless of the administration should desist from interfering with the management of tertiary education. The tertiary institutions have requested full autonomy even when it has its implications too but it is the right way to go.

CONCLUSION

It is no gainsaying that quality education is the bedrock of any meaningful growth and development of any nation. This paper has been able to examine the impact of former President Muhamadu Buhari’s administration on tertiary education in Nigeria. It was also gainful to understand the importance, and roles why tertiary education is key to growth and development in Nigeria. Facts were also deduced from varied submissions, assertions and opinions by scholars

towards the need for tertiary education in Nigeria. Tertiary education has suffered various forms of neglect and unwanted interference from politicians and different administrations. However, the number of strike actions by academic staff unions of universities and other tertiary institutions was more pronounced and retrogressive in Buhari's administration. Notwithstanding, every administration has contributed to this backwardness. Hence, this paper exposes the lessons learnt from this irresponsive act by the administrators, and suggestions were proposed. It is hoped that if these few suggestions proposed are looked into and considered, tertiary education in Nigeria could find a better place in the global space of educational development.

CHALLENGES AND BENEFITS OF WAYS ARTIFICIAL INTELLIGENCE IS UTILIZE IN EDUCATION SECTOR

Gloria Ododobari OMAH-CHU
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

This article aims to investigate the integration of artificial intelligence (AI) into the education sector and explore its impact on teaching and learning in the digital era. By synthesizing existing literature, the study seeks to provide insights into the benefits and challenges associated with AI's incorporation in education. A comprehensive review of the literature was conducted using a narrative synthesis approach. Peer-reviewed articles explicitly defining AI within an educational context, published in English and subjected to peer review, were included. Five independent reviewers evaluated research quality, extracted relevant data, and analyzed search results to ensure a comprehensive overview of the field. The study reveals the significant influence of AI on education. Its implementation is identified as a pivotal and strategic element of educational advancement. The growing role of AI as a digital assistant is particularly noteworthy, facilitating personalized learning experiences for students by tailoring educational resources to individual preferences and subject-specific needs. AI technologies are also instrumental in supporting both teachers and students across various aspects of education. The integration of AI in education marks a transformative phase for the industry. While AI offers substantial benefits in terms of enhanced learning experiences and increased teacher efficiency, potential drawbacks and concerns are also evident. Privacy, security, and safety issues arising from AI development underscore the need for thoughtful implementation. Thus, AI's impact on education is multifaceted, presenting both positive and negative implications. This study serves as a foundation for stakeholders in education to navigate the evolving landscape, making informed decisions that harness the potential of AI while mitigating its risks. By comprehensively assessing AI's current and future role in education, this research contributes to shaping a balanced and effective utilization of AI technologies in the pursuit of educational excellence.

INTRODUCTION

The use of information technology (IT) as a facilitator for other activities and services in this contemporary period of the industrial revolution 4.0 permeates nearly all aspects of human life. IT is becoming a necessary component that must be owned rather than just a tool. Its development has led to a great reliance on information technology, which significantly facilitates

human life activities (Rahmatullah et al., 2022). The current generation is also technologically literate since it has a far bigger impact in the digital age than it did in earlier ones.

Technology in education has expanded as a result of the rise in literacy and current technical breakthroughs. These are the generations that are currently enrolling in schools, from millennials to GenZ, and they all have distinctive traits that indicate their ages. These generations do not fare well as passive learners and demand to be actively involved in their education. As a result, technology needs to be welcomed in today's school, and educators must help kids learn through technology (Hashim, 2018).

Given that performing education in the context of public services requires good governance that ensures transparency, accountability, efficiency, and effectiveness of education, using IT in the implementation of education by a modern educational institution at the level of a world-class university has become a requirement. The seriousness of management underpins the application of information and communication technology (ICT), which is one of the main pillars of the development of human civilisation today, in the implementation of all educational activities. This is because management is aware of the significance of ICT (Rahmatullah et al., 2022). Due to its ability to support learning in a variety of situations, big data and artificial intelligence technologies have rapidly advanced and had a significant impact on all facets of society in recent years. The field of AI in education has exhibited technological advancements in human civilization, including the economics, politics, science and education, with a variety of applications such as intelligent tutors for content delivery, feedback providing, and progress supervision (Luan et al., 2020). Artificial intelligence (AI), a machine based approach with algorithmic ability for making predictions, diagnoses, suggestions, and judgment s, has emerged as a major force in educational advancements, theoretical innovations, and practical pedagogical influence (Chen et al., 2022). Consequently, a crucial issue is the adoption of artificial intelligence (AI) in the education sector.

Artificial Intelligence (AI) is increasingly transforming the education sector, offering innovative solutions that enhance teaching, learning, and administration. From intelligent tutoring systems and personalized learning platforms to automated grading and data-driven decision-making, AI technologies are being adopted to improve educational outcomes and operational efficiency. According to Holmes et al. (2022), AI in education holds the potential to revolutionize traditional pedagogical approaches, making learning more adaptive, inclusive, and efficient. The integration of AI into education manifests in various ways, including personalized learning, intelligent tutoring systems, automated assessment, virtual learning environments, predictive analytics, administrative task automation, and enhanced accessibility for learners with disabilities (Luckin et al., 2022). Each of these applications brings distinct advantages. For example, personalized learning systems adapt content delivery to meet individual student needs, while predictive analytics help educators identify at-risk students early (Zawacki-Richter et al., 2019).

Despite its numerous benefits, the deployment of AI in education is not without challenges. Concerns around data privacy, algorithmic bias, the digital divide, lack of teacher training, ethical considerations, over-reliance on technology, and equity in access to AI tools persist (Williamson & Eynon, 2020). These challenges highlight the need for thoughtful integration strategies that prioritize ethical standards, inclusivity, and pedagogical value.

The paper explores the challenges and benefits of seven major ways AI is being utilized in the education sector, drawing on current research and real-world implementations to provide a balanced perspective on the implications of AI for modern education.

CONCEPTUAL CLARIFICATION

Education Sector

The education sector is a foundational pillar of societal development, responsible for equipping individuals with the knowledge, skills, values, and competencies necessary to contribute meaningfully to their communities and the broader global economy. Encompassing a wide range of formal and informal institutions, from early childhood education to tertiary and lifelong learning, the sector plays a critical role in shaping human capital, promoting social equity, and driving innovation. As societies become increasingly knowledge-based and technology-driven, the education sector faces new opportunities and challenges in ensuring inclusive, equitable, and quality learning for all. According to UNESCO (2022), education is not only a fundamental human right but also a powerful tool for reducing poverty, improving health outcomes, and fostering peace and sustainable development. In this context, understanding the structure, function, and evolution of the education sector is essential for policymakers, educators, and stakeholders aiming to reform and strengthen education systems in the 21st century.

Structure and Components of the Education Sector

The education sector typically consists of several interconnected subsystems, including:

a**. Levels of Education**

- Early Childhood Education: Focuses on foundational cognitive, emotional, and social development in children aged 0–5 years.
- Primary Education: Provides basic literacy, numeracy, and general knowledge, typically from ages 6–12.
- Secondary Education: Offers more advanced academic or vocational instruction, often divided into junior and senior levels.
- Tertiary (Higher) Education: Includes universities, polytechnics, and colleges offering degrees, diplomas, and certifications.
- Adult and Lifelong Learning: Non-formal or informal education for skills development, literacy, or personal growth throughout life.

b. Institutions Involved

Public Schools and Universities (funded by the government), Private Educational Institutions, Vocational and Technical Education Centers and Online and Distance Learning Platforms.

c. **Stakeholders**

- The stake holders are: Government Ministries and Agencies, Teachers and School Administrators**,** Students and Parents**,** Non-Governmental Organizations (NGOs),
- Private Sector and EdTech Companies and International Organizations (e.g., UNESCO, UNICEF).

Functions and Goals of the Education Sector

The core purposes of the education sector include:

- Human Capital Development: Equipping learners with knowledge, skills, and competencies needed for personal and national development (UNESCO, 2022).
- Citizenship and Social Cohesion: Promoting civic responsibility, ethical values, and respect for diversity.
- Economic Growth: By developing a skilled workforce, education boosts productivity and innovation (World Bank, 2023).
- Equity and Inclusion: Ensuring access to quality education for marginalized and disadvantaged groups.

Importance of the Education Sector

The education sector is a catalyst for sustainable development, linked to nearly all United Nations Sustainable Development Goals (SDGs), particularly SDG 4: Quality Education.
Social Benefits: Reduces poverty, improves health outcomes, and fosters gender equality.
Political Benefits: Builds informed citizens and strengthens democratic institutions.
Technological Advancements: Facilitates research, innovation, and digital transformation.

Challenges Facing the Education Sector

Despite its importance, the education sector faces significant global and local challenges:

- Funding Shortages: Inadequate budget allocations affect infrastructure, teacher salaries, and learning materials.
- Teacher Shortages and Training Gaps: Many countries lack qualified educators, especially in rural and underserved areas.
- Inequity in Access: Gender, economic, and geographical barriers limit opportunities for many learners (UNICEF, 2023).
- Technological Divide: Unequal access to digital learning tools hinders modern education delivery.
- Curriculum Irrelevance: Mismatched curricula often fail to meet 21st-century skills needs, such as critical thinking and digital literacy.

Trends and Innovations in the Education Sector

The sector is undergoing transformation through:

- Digitalization: Use of Learning Management Systems (LMS), virtual classrooms, and AI-based tools for personalized learning.
- Competency-Based Education: Shifting from rote memorization to skill mastery.
- Education for Sustainable Development (ESD): Integrating environmental and social justice topics into teaching.

- Inclusive Education Models: Focused on learners with disabilities, refugees, and minority groups.
- Public-Private Partnerships (PPP): Collaborations to expand educational infrastructure and services.

Governance and Policy Frameworks

Governments manage the education sector through policies and laws aimed at Standardizing curricula and assessments, Accrediting institutions and teachers, Ensuring, quality assurance, Promoting equity, access, and accountability.

Artificial Intelligence (AI)

Artificial Intelligence (AI) refers to the development of computer systems that can perform tasks typically requiring human intelligence. These tasks include learning, problem-solving, decision-making, understanding natural language, and recognizing patterns (Russell & Norvig, 2021). In the 21st century, AI has emerged as a transformative technology, permeating various sectors, including healthcare, finance, transportation, and most notably, education.

In education, AI is redefining teaching and learning by offering personalized learning experiences, automating administrative tasks, enhancing student engagement, and enabling real-time analytics for decision-making (Luckin et al., 2022). However, the integration of AI also raises challenges related to ethics, equity, data privacy, and teacher preparedness. The field of artificial intelligence (AI) technology has a long history is dynamic and growing

It emphasises intelligent agents, or machines that can comprehend their environment and make decisions, taking measures to increase their prospects of success (Shabbir & Anwer, 2018). The word "artificial intelligence" evokes us ideas of supercomputers, which are computers with enormous processing power, adaptive behaviour, including adding sensors and other components that enable them to have cognitive and functional abilities similar to humans, which enhances the supercomputer's connection with people (Chen et al., 2020).

Artificial intelligence is the capacity for learning and thought in computer programmes. Artificial intelligence refers to everything that includes a computer programme performing a task that most people would consider to require human intelligence (Mitchell, 2019).

The simulation of human intelligence functions by computers, more precisely computer systems, is known as artificial intelligence. Because it enables computers to make wise decisions that result in more effective operations, artificial intelligence (AI) transforms nearly every aspect of a nation's economy and excels at certain activities (Dong et al., 2020; Limna, 2022).

The use of AI is widespread in practical fields. In addition, as computers and robots become more sophisticated, society is being transformed by them. Nearly every facet of people's daily lives now includes AI (Li et al., 2018). AI also makes it possible for employees to perform more efficiently, which improves corporate results. However, it also calls for the development of fresh skills and abilities, from technological mastery to social and emotional intelligence to creative aptitude (Limna, 2022).

AI offers huge advantages and has the ability to revolutionise any professional field (Makridakis, 2017). As a result, industry 4.0 considers artificial intelligence deployment to be crucial. It has presented countless chances and difficulties to numerous sectors since its inception. AI-powered innovations have the potential to greatly boost the economy by raising

standards of living across a variety of industries (Limna et al., 2021). Artificial Intelligence encompasses several subfields, including: Machine Learning (ML) which enables systems to learn from data and improve over time without explicit programming, Natural Language Processing (NLP) which allows machines to understand and generate human language, Computer Vision which enables machines to interpret and analyze visual data and Expert Systems which use rule-based programming to emulate decision-making capabilities of human experts.

AI systems typically operate using large datasets, algorithms, and predictive models to simulate intelligent behavior (Jordan & Mitchell, 2015).

Artificial Intelligence in Education

The use of AI in education has advanced significantly during the past 25 years (Roll & Wylie, 2016). Since the growth of computing and information processing tools, AI has been extensively applied in education. AI in education opens up new possibilities, difficulties, and opportunities for educational methods (Ouyang & Jiao, 2021). The goal of AI in education is to significantly improve educational methods through field tests and the creation of modular standard prototypes for statistical reasoning, data visualisation, and learning analytics (Alam, 2021).

Giving each student individualised learning assistance or support based on their learning status, preferences, or other personal attributes is one of the most significant goals of AI in education (Hwang, 201 4; Hwang et al., 2020).AI in education also aims to use AI to support the instructional process, which is crucial and where instructors' acceptance of AI is crucial (for example, comprehending and supporting computer supported collaborative learning through discourse analysis and achieving performance prediction through educational data mining).But because AI is still a relatively new idea to instructor, they frequently have trouble responding quickly and effectively to insights from AI enabled applications. As a result, they are less willing to adopt AI and are less open to it. Therefore, it is essential to increase teachers' adoption of AI systems (Chen et al., 2022).

To handle the new opportunities and problems posedby the big data boom and AI revolution, academics, educators, policymakers, and professionals must collaborate. They must work together to help all students acquire the competences and abilities needed for work in the knowledge based economy of the twenty first century (Luan et al., 2020).The implementation of AI in education has opened up new possibilities for creating learning activities and surroundings that are better utilising technology.AI technology i n education has many crucial components, including autonomous grading systems, adaptive learning, distance learning, and more (Hwang et al., 2020; Yufeia et al., 2020). The way that students rate their teachers is through instructor feedback. It is a feedback technique that has been utilised for a long time in education. Despite the switch from paper to internet surveys, the feedback process hasn't advanced much. It must be given priority because student feedback on instruction is typically the most useful source of data.

Modern tools like conversational AI robots, machine learning, and natural language pro cessing present promising potential to raise the calibre of feedback (Holstein et al., 2019; Peters, 2019). An expert AI based computer software called the automatic grading system grades student work in a classroom by simulating the actions of teachers. It assesses students' knowledge, examines their responses, offers comments, and develops customised training plans. Many apps for artificial intelligence based teaching use this programme. During the learning test, the system automatically offers the learner evaluation score. While students are more aware of their learning

accomplishments and level of information mastery, this approach can help teachers better comprehend the learning conditions that their students are in (Yufeia et al., 2020). AI is essential to distance learning as well. The use of artificial intelligence in distant learning aims to investigate how computers might help close the communication gap between students and teachers. Distance learning can be supported by artificial intelligence technology or can be enhanced by other intelligent systems (Kose, 2014).

BENEFITS AND CHALLENGES OF ARTIFICIAL INTELLIGENCE IN EDUCATION

The benefits of AI applications in education are numerous and diverse (Owoc et al., 2019). Several AI applications driven by machine learning are being used in more educational context. Personalized learning systems and other machine learning techniques automate evaluations, social media platforms, and predictive analytics software. These AI programmes have demonstrated promise in aiding educators and students in a number of ways, including via instruction in classrooms with a variety of abilities, giving students thorough and immediate feedback writing, relieving teachers of the stress of having to know everything, and providing giving them greater space to support their pupils as they observe, converse, and gather utilising information in their group knowledge building procedures, etc. (Akgun & Miao et al., 2021; Greenhow, 2021). Social networking sites use platforms like Facebook to link up students and teachers. The use of social media in the classroom can encourage students to actively learn, collaborate, and interact with networks outside of the classroom. Due to various AI systems, chat bots can now be found on social media platforms (Kim et al., 2019; Krutka et al., 2019). Individualized learning environments, sometimes referred to as adaptive learning environments or intelligent tutoring environments, are typical and beneficial uses of AI to assist students and teachers. These programmes allow students access to diverse educational resources based on their individual topic areas and learning requirements (Akgun & Greenhow, 2021).

One of the most exciting uses of AI in education is adaptive learning. Traditional classroom instruction is still a one-size-fits-all approach, while AI powered adaptive learning solutions are made to maximise learning effectiveness (Owoc et al., 2019).

Despite these benefits, there are still valid worries. One major issue is privacy. Critical problems on the table are the violation of privacy and the uncertainty brought by AI. Negative effects of ridesharing technology adoption (Cheng et al., 2022). Data organisation, collection, control, storage, use, archival, and destruction are all aspects of data governance. A specialised programme, defined policies and processes, as well as communication from organisational leadership and management, all work together to establish data governance. In general, the regulations must give the tools required to uphold the general standards, which include auditability, security, accessibility, availability, completeness, accuracy, integrity, and consistency (Owoc et al., 2019). The application of the characteristics associated with each technology is crucial for the efficient use of big data analytics and AI. The person has the knowledge and analytical abilities necessary to use comprehensive data analysis to aid in analysis and decision-making (Tong-n et al., 2022).

Ways Artificial Intelligence Is Used in Education Sector

Task Automation

Similar to how AI has been used in other industries to automate tasks, it will be useful in the education sector. Professors and teachers usually have to manage the classroom environment alongside numerous organisational and administrative tasks. According to a report in research paper writing services, teachers don't just teach. They also spend time grading tests, evaluating homework, filing the necessary paperwork, making a progress report, organising resources and materials for lectures, managing teaching materials, etc. There is a lot of work required.

In the end, they spend a lot of time on non-teaching chores, and it overwhelms them. In order to free up more time for teachers to focus on their core duties of teaching, artificial intelligence will automate these tasks.

Personalized Learning

AI can ensure that educational software is personalised for individuals. There are already adaptive learning software, games, and programmes for students. This use of AI is perhaps one of its most significant in education as learning is more comfortable and smoother and cut through personal knowledge. This system emphasises each student's needs, highlighting specific topics students are weak in and repeating subjects they haven't mastered. This will create custom-tailored education through AI. Teachers will only be there to offer assistance and help when pupils need it. One of the most significant advantages of AI in education is its ability to personalize learning experiences. AI-powered systems can analyze a student's performance in real time and adapt content delivery to suit their individual learning style, pace, and needs.

Adaptive learning platforms, such as Carnegie Learning and Squirrel AI, use AI algorithms to recommend customized learning paths, helping students' master concepts more effectively. Personalized learning leads to improved engagement, better retention, and academic achievement (Holmes et al., 2022). For example: An AI system can identify a student struggling with algebra and provide more practice problems, video explanations, or switch to a different teaching strategy.

Universal Access

Educational classrooms can become globally available to all students through AI tools, even those that have hearing or visual impairment or speak different languages. With a PowerPoint plugin such as Presentation Translator, students have real-time subtitles for everything the teacher says. This opens up new opportunities for children who need to learn at different levels, who want to learn a subject unavailable in their school, or are unwell and missing from schools. The barriers between conventional grade levels and schools can be broken down by AI.

Smart Content Creation

AI can help teachers create smart content that makes teaching and learning more comfortable for them and the students, respectively. According to Paul Barry, lab report writer at assignment writing service, AI can help teachers create different content types. Examples are:

- Digital lessons: AI can help generate bite-sized learning, study guides, digital textbooks, all within the framework of digital learning.
- Information visualization: Simulation, visualization, and web-based study environments are different ways to perceive information that AI can power.
- Learning content updates: Learning content can be generated and updated regularly with AI. This ensures that information is up-to-date.

Teaching the Teacher

One thing that is important in education is for the teacher to not rely on their old, residual knowledge. There are more facts that they need to know and teach the students as well. Not to mention the fact that they study and teach within a limited scope and there are many other things that they can still learn. With AI, teachers have extensive information available to them at their fingertips which allows them to keep themselves educated in things that they didn't know or improve on their past knowledge. With this, they will be better rounded and have a more in-depth and broader knowledge base to sea with the 21st century students.

Identify classroom weakness

The main concern of implementing AI in an industry is that it will replace the industry's workforce, causing job losses. But that's not totally accurate. In truth, AI is not intended to replace instructors in the classroom. It's intended to go along with them. AI can supplement the teacher's efforts in a classroom to discover some of the shortcomings within the classroom. For example, AI will be able to identify when some students miss specific questions. By warning the teachers, they are made aware that the material needs to be taught again because the students still don't understand it. This will make the teachers more accountable and make them another to the best teaching practises.

- 24/7 Assistance: It's not just teachers that have access to a whirlwind of knowledge through AI. Students do too. This implies that they can use AI bots at any time of day to get assistance on any subject. Traditionally, students only get solutions to their problems when they meet with their teachers or professors and have the chance to ask them questions in the classroom. Thankfully, they will not have to wait that long anymore. Several AI-powered chat bots are specifically built for education as a sector. They work as students' assistants round the clock to provide answers to their queries at any time. So, they don't have to wait to see the prof in their office or the classroom.
- Intelligent Tutoring Systems (ITS)**:** AI-powered ITS, such as AutoTutor and ALEKS, provide real-time feedback and guidance, simulating one-on-one tutoring experiences. These systems can assess student responses, identify misconceptions, and adjust teaching strategies accordingly (Holmes et al., 2022). This is especially valuable in contexts where access to human tutors is limited. AI-driven tutoring systems provide learners with additional academic support outside traditional classroom hours. These systems simulate human tutors by offering hints, feedback, and explanations in real time. Intelligent Tutoring Systems such as AutoTutor and Duolingo's AI tutor are widely used to teach languages, mathematics, and STEM subjects. They help bridge gaps for students who

may not have access to personal tutors, thus promoting equity in education (Luckin et al., 2022).

- Automated Grading and Assessment: AI technologies streamline grading processes, especially for objective assessments like multiple-choice questions and short answers. More advanced systems are beginning to assess essays and written content using natural language processing (NLP). This saves teachers time and allows for more frequent formative assessments (Zhai et al., 2021). However, concerns remain regarding fairness and the limitations of automated judgment in evaluating creative or critical thinking.
- Predictive Analytics for Student Success: AI models are used to predict academic performance, dropout risks, and areas where students may struggle. By analyzing historical data, these tools support early interventions and personalized academic advising (Baker & Siemens, 2022). Predictive analytics can help institutions allocate resources more effectively to support student retention and achievement.
- AI-Driven Chatbots and Virtual Assistants: Educational institutions are deploying AI chatbots for 24/7 student support. These bots assist with answering queries related to courses, admissions, and administrative tasks. For example, Georgia State University's chatbot helped reduce summer melt by providing timely responses to student inquiries (Lakkaraju et al., 2020).
- Enhancing Accessibility and Inclusion: AI helps break down barriers for learners with disabilities. Tools like voice-to-text transcription, AI-powered sign language interpreters, and screen readers improve access for students with visual, auditory, or cognitive impairments (Luckin et al., 2022). These technologies support inclusive education and comply with universal design principles.
- Automation of Administrative Tasks: AI applications are also reshaping educational management by automating tasks such as scheduling, student enrollment, and plagiarism detection. This reduces the administrative burden on educators and allows them to focus more on pedagogy (Williamson & Eynon, 2020).

CHALLENGES IN AI INTEGRATION

Despite its potential, the integration of AI in education comes with several challenges:

Data Privacy and Ethics: The collection and analysis of student data raise significant privacy concerns, especially in light of global data protection regulations such as GDPR (Holmes et al., 2022). The use of AI in education necessitates the collection and analysis of vast amounts of student data, including personal identifiers, academic performance, behavioral patterns, and even emotional states. This raises significant data privacy and ethical concerns, particularly around informed consent, data ownership, and security.

According to Holmes et al. (2022), many educational institutions lack robust policies to govern how AI tools handle sensitive data, making them vulnerable to breaches and misuse. Moreover, the use of AI-powered surveillance tools, such as proctoring software, has raised ethical debates about student autonomy, psychological stress, and potential violations of human rights (Smuha et al., 2021). The General Data Protection Regulation (GDPR) in Europe and similar frameworks globally underscore the importance of ensuring AI applications comply with ethical and legal data standards. Without clear guidelines, AI risks undermining students' rights to privacy and autonomy in learning environments.

Algorithmic Bias: AI systems can inadvertently reinforce social biases if trained on biased data, affecting equity in educational outcomes (Eynon, 2020). Algorithmic bias refers to the presence of systematic errors in AI systems that result from biased training data or flawed model design. In educational settings, biased algorithms may reinforce existing inequalities by misclassifying students, providing inaccurate feedback, or disproportionately disadvantaging certain groups.

Zawacki-Richter et al. (2019) found that AI tools often reflect the biases present in the datasets used to train them, such as underrepresentation of minority students or learners with disabilities. For example, predictive analytics tools may incorrectly label students from marginalized communities as "at-risk," leading to inappropriate interventions or labeling effects (Eynon, 2020). Bias in AI can exacerbate educational disparities rather than bridge them, particularly when not monitored and corrected by diverse human oversight.

Digital Divide: Unequal access to digital infrastructure limits the benefits of AI to certain socio-economic groups, potentially widening the education gap (Luckin et al., 2022). The digital divide refers to the gap between individuals who have access to modern information and communication technologies (ICTs), including AI tools, and those who do not. This divide is influenced by factors such as geography, socio-economic status, and infrastructure development.

Students in low-income or rural areas often lack access to high-speed internet, up-to-date devices, or even basic electricity—making it difficult to benefit from AI-enhanced learning tools (Luckin et al., 2022). Furthermore, while elite schools and universities rapidly adopt cutting-edge technologies, underfunded institutions may fall further behind, widening the educational inequality gap. AI in education has the potential to democratize learning—but only if equal access is ensured

Teacher Readiness: Many educators lack the technical skills or training needed to effectively implement AI tools in classrooms (Zawacki-Richter et al., 2019). A major barrier to successful AI integration is the lack of teacher preparedness. Many educators are unfamiliar with AI technologies and lack the digital literacy to implement and monitor these tools effectively. This skills gap can lead to underutilization or misapplication of AI in classrooms.

According to Zhai et al. (2021), while AI tools can enhance teaching efficiency, their success largely depends on teacher competence and confidence. Professional development opportunities are often limited, and curricula rarely include AI literacy training for teachers (Holmes et al., 2022). As a result, even the most advanced tools may fail to deliver their intended impact due to poor implementation. Empowering teachers with AI knowledge is key to sustainable and meaningful technological integration in education.

Tackling the Challenges of AI Integration in Education sector

The effective and ethical integration of Artificial Intelligence (AI) in education is essential to ensure it serves as a tool for equity, inclusion, and innovation rather than as a reinforcement of existing disparities. Addressing the challenges requires coordinated action through: inclusive policies, equitable access strategies, ethical design principles, and continuous teacher professional development.

Inclusive Policies for Data Privacy and Protection: To protect students' personal information and ensure ethical use of AI, there is a critical need for inclusive, transparent, and enforceable

data governance policies. These should: Mandate informed consent before data collection, define clear data ownership and access rights and also require AI systems to comply with global privacy standards such as GDPR and FERPA.

According to Smuha et al. (2021), without robust data protection policies, AI tools risk infringing on students' rights and can create an atmosphere of surveillance. Governments and institutions must create and enforce legal frameworks that prioritize the dignity, privacy, and autonomy of learners. Thereby establishing national ethical AI frameworks for education with mandatory privacy audits and penalties for misuse.

Equitable Access Strategies to Bridge the Digital Divide: The digital divide must be narrowed to ensure all students benefit equally from AI-enhanced education. This involves providing affordable internet access and digital devices to underserved regions, Designing AI tools that work offline or in low-resource settings and investing in community-based digital literacy initiatives. Luckin et al. (2022) emphasized that digital equity is fundamental to AI's success in democratizing education. Without equitable access, students in disadvantaged contexts are excluded from the benefits of personalized learning and intelligent systems. Thus Governments and NGOs should collaborate to fund ICT infrastructure in rural and low-income communities and integrate AI into national education plans equitably.

Ethical Design Principles to Prevent Algorithmic Bias: AI systems must be developed using inclusive datasets and transparent design processes to prevent algorithmic discrimination. The Key practices include: Involving educators, ethicists, and diverse user groups in AI development. Regularly auditing AI algorithms for bias and discriminatory outputs and it also require explainability in AI decision-making processes.

Eynon (2020) stresses that biased algorithms can reinforce inequalities, particularly when AI predicts student success or failure. Developers must use representative data and embed fairness checks at all stages of system design. Therefore Implement an AI ethics review board in educational institutions to assess all AI-based tools before deployment.

Continuous Teacher Training and AI Literacy Programs: Teachers are central to AI's successful adoption. However, without proper training, they may misuse or underuse AI tools. To improve teacher readiness: AI literacy must be embedded in teacher education curricula, ongoing professional development programs should be offered and teachers must be supported in interpreting AI data to inform pedagogical decisions. Holmes et al. (2022) argue that empowering teachers with AI knowledge improves both classroom implementation and ethical monitoring. Training also reduces anxiety and resistance toward emerging technologies. Therefore the government should create national and institutional AI training programs with micro-credentials and certifications for teachers.

THE RELATIONSHIP BETWEEN ARTIFICIAL INTELLIGENCE UTILIZATION AND EDUCATION

Artificial Intelligence (AI) has become an increasingly influential force in shaping modern education. The utilization of AI in education refers to the integration of intelligent systems and algorithms to enhance teaching, learning, and educational management. This relationship is

marked by a dynamic interplay where AI transforms the educational process while education, in turn, drives the development and ethical application of AI technologies.

Transforming Teaching and Learning Processes

AI enables personalized, adaptive, and student-centered learning environments. Unlike traditional "one-size-fits-all" teaching models, AI systems use data analytics and machine learning algorithms to adjust content delivery based on individual learners' abilities, preferences, and progress. For instance, AI-powered platforms such as Squirrel AI and Knewton tailor lessons in real-time to help students overcome learning difficulties and reinforce strengths (Holmes et al., 2022). This individualized approach supports differentiated instruction and has been shown to improve engagement and academic outcomes (Zhai et al., 2021). AI aligns with constructivist learning theories by fostering active, personalized knowledge construction.

Enhancing Assessment and Feedback Mechanisms

AI facilitates automated, real-time assessment and feedback, helping both teachers and students improve performance. Automated grading systems can assess multiple-choice questions and short responses, freeing up teachers' time. AI-powered feedback tools, such as Grammarly and Turnitin, assist learners in writing improvement and academic integrity (Eynon, 2020). These technologies allow formative feedback to be immediate and continuous, enhancing the learning process through timely intervention.

Promoting Inclusive and Accessible Education: AI plays a crucial role in supporting inclusive education for students with disabilities or learning challenges. Tools such as speech-to-text converters, screen readers, and AI-driven translation services help remove barriers to learning for marginalized groups. For example, Microsoft's Immersive Reader uses AI to enhance reading comprehension for students with dyslexia, while AI voice assistants help visually impaired students interact with learning materials (Zawacki-Richter et al., 2019).

Educational Equity: By making learning accessible to diverse populations, AI supports the goals of inclusive education and aligns with the United Nations Sustainable Development Goal 4 (SDG 4).

Supporting Teachers and Educational Leadership: AI enhances the professional effectiveness of educators by automating repetitive administrative tasks, offering teaching resources, and providing predictive analytics. Learning analytics tools help identify students at risk and inform evidence-based interventions (Luckin et al., 2022). AI assistants, such as chatbots, manage FAQs, assignments, and reminders, saving teachers time and improving responsiveness.

Moreover, educational leaders utilize AI to make informed decisions on curriculum design, resource allocation, and policy development.

Enabling Lifelong and Competency-Based Learning: AI-powered platforms such as Coursera and LinkedIn Learning offer microlearning and personalized course recommendations, fostering lifelong learning and skills-based education. As economies shift toward automation and knowledge-based industries, AI supports reskilling and upskilling through flexible, self-paced learning systems (Zhai et al., 2021).

Ethical and Pedagogical Implications: While AI provides immense benefits, its educational use raises ethical and pedagogical concerns that must be addressed through: Data privacy which is how students collect data, stored, and used, Algorithmic bias which is AI decisions reinforcing in social inequalities and teacher readiness which is how educators adequately trained to use AI tools effectively.

CONCLUSION

Artificial Intelligence is poised to significantly enhance education by personalizing learning, increasing accessibility, and improving operational efficiency. However, its implementation must be approached thoughtfully, with attention to ethical, equity, and pedagogical considerations. As research and technology continue to evolve, educators, policymakers, and technologists must collaborate to ensure AI serves the broader goal of equitable, high-quality education for all. Personalization is at the top of the list, as anyone who is knowledgeable about international trends in various industries will know. This is due to the advent of artificial intelligence, which is an advantage for the education sector. AI helps teachers up their game, providing them all the information that they need. It also allows teachers to create content that suits their students best while ensuring personalised learning. It automates tasks, so teachers have more time to do more teaching and impact the students better.

The development of AI technology has a long history and is ongoing. Ouyang and Jiao (2021) indicated that since the advancement of computing and information processing techniques, AI has been used extensively in education as it creates new opportunities and challenges in educational practises. Owoc et al. (2019) confirmed that AI technologies impact teaching and learning, both positively and negatively, in the education industry. Hwang et al. (2020) and Yufeia et al. (2020) indicated that using AI in education had opened new avenues for developing more effective learning activities and better technology-enhanced learning applications or settings. The use of AI technology requires numerous key components, including education, such as teacher feedback, automatic grading systems, and adaptive learning. Akgun Greenhow (2021) and AI applications provide students with access to a variety of learning resources materials based on the subjects and learning needs they have.

As Kose (2014) noted, AI technology could be used to support distance e improve distance education when combined with other intelligent systems. Also, Owoc et al. (2019) demonstrated that the data governance of AI is interested in the organisation, collection, control, storage, and use of data, archival, and devastation. Additionally, Cheng et al. (2022) came to the conclusion that one major AI concern privacy is technology. Consequently, AI technologies have both good and negative consequences. Therefore, it is crucial to give AI in education top priority and apply suitable techniques to meet the requirements and expectations of teachers and students using AI technologies.

Addressing the challenges of data privacy, algorithmic bias, the digital divide, and teacher readiness is essential for the responsible and effective integration of AI in education. These challenges must be tackled through inclusive policies, equitable access strategies, ethical design principles, and continuous teacher training programs. Without such safeguards, the promise of AI to transform education could remain unfulfilled or worse, deepen existing inequities. As Zawacki-Richter et al. (2019) conclude, the true value of AI lies not in the technology itself, but in how it is ethically and inclusively applied to serve all learners. Thus High academic performance will result as a result.

Recommendations

Artificial Intelligence (AI) offers numerous benefits for enhancing teaching, learning, and educational management. However, its integration is accompanied by significant challenges, including ethical concerns, accessibility issues, and teacher readiness. To ensure the sustainable and equitable adoption of AI in education, the following recommendations are proposed:

- Develop Inclusive and Ethical AI Policies: Governments and educational institutions should establish clear, enforceable guidelines and policies to govern the ethical use of AI in education. These policies should ensure data privacy, algorithmic transparency, and user consent, especially when collecting and processing student data (Smuha et al., 2021).
- AI systems should be regularly audited for bias and fairness, particularly in decision-making processes like grading or student performance prediction. For example; Establish AI Ethics Committees in schools and universities to oversee technology procurement and implementation.
- Ensure Equitable Access and Address the Digital Divide: Implement national and institutional strategies to close the digital divide and ensure equitable access to AI tools and infrastructure for all learners. Governments must invest in digital infrastructure, particularly in underserved rural and low-income communities.
- The Government Provide affordable or subsidized devices, internet access, and AI-powered educational software to reduce inequities (Zawacki-Richter et al., 2019). For Example; Partnerships between public institutions and technology firms can support wide-scale access to AI-enabled learning platforms.
- Invest in Teacher Training and Professional Development: Continuous AI literacy training should be made available to teachers and administrators to ensure they are equipped to integrate AI tools effectively and ethically in classrooms. Training should cover the use of AI-powered platforms, interpreting learning analytics, and understanding ethical implications. The government should encourage teachers to co-develop AI tools to align them with pedagogical goals (Zhai et al., 2021). For Example; Create professional learning communities (PLCs) focused on AI in education.
- Promote Human-AI Collaboration Rather Than Replacement: Emphasize the role of AI as a complementary support tool rather than a replacement for human educators. AI should handle routine tasks (e.g., grading, scheduling), allowing teachers to focus on mentorship, creativity, and emotional support (Holmes et al., 2022). Also Policies should safeguard against AI systems displacing essential teaching jobs. For example; Use AI tutors to support after-school learning, while maintaining human interaction during core instructional time.
- Foster Student-Centered and Inclusive AI Designs: Design AI tools that are student-centered, inclusive, and adaptive to diverse learning needs, especially for learners with disabilities and language barriers. Involve students, teachers, and parents in the design and testing of AI systems to ensure usability and relevance. Thus the government should Incorporate Universal Design for Learning (UDL) principles in AI educational applications (Luckin et al., 2022).
- Strengthen Research, Monitoring, and Evaluation: Encourage longitudinal research and real-time evaluation to assess the impact of AI interventions on learning outcomes,

equity, and teacher satisfaction. Thus Use research findings to refine AI systems and scale up successful models and also establish feedback loops between AI developers, educators, and policy-makers to ensure continued improvement (Eynon, 2020).

MANAGEMENT OF LEARNING ENVIRONMENT FOR EFFECTIVE STUDENTS' ACADEMIC PERFORMANCE IN PUBLIC SENIOR SECONDARY SCHOOLS IN NIGERIA

Nkeiruka Patiencet EZEBUIRO
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

This empirical paper discussed management of learning environment for effective students' academic performance in public secondary schools in Rivers State. The study anchored on environmentalist learning theory and condition of learning theory, it also discussed some conceptual clarification based on the scope. The paper discussed the strategies for management of learning environment which includes, a good geographical location of school, provision of physical facilities, provision of instructional materials, provision of laboratory and good classroom management. In this context, the geographical location of school result into a number of challenges such as poor attendance, resulting to low achievement, increase of dropout rate etc. The availability of physical facilities such as school building, classroom, furniture, libraries, laboratories contribute to academic achievement. This is because in a school where there is unattractive school building and bad facilities, students will lack the zeal to learn. The study pointed out that the use of instructional materials such as visual and audio-visual aids helps teachers to simplify their teaching and as such help students to have practical experiences which will help them to develop skills and concepts and to work in a variety of ways. Also classroom that is well managed will provide an environment in which teaching and learning can flourish, also a well-structured classroom setup promotes orderliness and minimizes distraction, contributing to better learning outcomes. The study suggested that government should put to consideration of the school location when planting public senior secondary schools in Rivers State, government should endeavor to provide physical facilities for public senior secondary in Rivers State for easy and conducive teaching and learning environment.

Keywords: Management, Learning Environment, Effective Students, Academic Performance, Public, Senior, Secondary Schools, Nigeria.

INTRODUCTION

The students' academic performance of senior secondary school students in Nigeria has become a great concern to all education stakeholders in recent time. This is supported by Adeyemi and Adeyemi (2014) who stated that there has been a remarkable record of failure in public

examination, especially in basic subjects such as English and mathematics. The annual release of the West African Examinations Council (WAEC) results has contributed to the public condemnation of the entire education system in Nigeria because of the rate of graduate with poor results many studies have demonstrated that better management of learning environment contribute to students' academic performance.

The learning environment has a great influence on students; academic performance, particularly in senior secondary schools, this is because the management of the learning environment will facilitate effective teaching and learning process that will eventually enhance student academic performance. It is pertinent to state that both physical environment and psychological environment affects student performance such as infrastructural facilities school location, office accommodation, class room management, hostel, laboratory, workshop material library material and instructional materials emotional support, positive climate, peer relationship, positive atmosphere are necessary factors in learning environment that determine students' academic performance. It is against this background that this study on management of learning environment for effective students' academic performance in public senior secondary school is carried out with a view to proffering solution to the problem.

THEORETICAL BACKING

Conditions of Learning Theory

Conditions of learning was propounded by Robert Gagne, and was originally published in 1965 by Holt, Rinehart and Winston and describes eight kinds of learnings and nine events of instruction, cited in Anthony (2018) This theory of learning involved two steps. Theory stipulates that there are several different types or levels of learning. The significance of these classification is that different types requires different types of instruction.

Gagne identifies five major categories of learning; verbal information, intellectual skills, cognitive strategies, motor skills and attitude. Different internal and external conditions are necessary for each type of learning. For example for cognitive strategies to be learned, there must be a chance to practice developing new solutions to problems; to learn attitudes, the learner must be exposed to a credible role model or persuasive arguments. Gague suggests that learning tasks for intellectual skills can be organized in hierarchy according to complexity stimulus recognition, response generation, procedure following, use of terminology, discriminations, concept formation, rule application, and problem solving. The primary significance of the hierarchy to facilitate learning at each level. Prerequisites are identified by doing a task analysis of a learning training task. Learning hierarchies provides a basis for the sequencing of instruction.

In addition, the theory outline nine instructional events and corresponding cognitive process:

- Gain attention (reception): The first step is to gain student attention and motivate him to engage with the content.
- Inform objectives (expectancy): Student needs to be clarified what he can expect
- Stimulate recall of prior knowledge (retrieval): prior knowledge should be activated since it is important for learning new materials.

- Present stimulus materials (selective perception): Present the material to the students, possible using various learning styles.
- Provide leaner guidance (sematic encoding): Guidance in terms of commination enables the teacher to direct the students in their learning or enable them easier information encoding through visual or other materials.
- Elicit performance (responding): students need practice. Practice should immediately follow instructions and be well defined in terms of its nature, objectives and expected student responses.
- Provide feedback (reinforcement): Feedback is additional guidance offering the student immediate evaluation of his performance enabling him to release his mistake and misconceptions.
- Assess performance (retrieval): At the end of each course students. knowledge should be assessed in order to check of expected learning has occurred.
- Enhance retention and transfer (generalization): The learning process does not end when the class does the teacher should advise students how and in which context to apply and transfer the just gained events should satisfy or provide the necessary conditions for learning and serve as the basic for designing instruction and selecting appropriate media .

The relevance of conditions learning theory to the study. In management of learning environment whether in classroom or online setting, educators and administrators can apply Gagne's theory by:

- Setting clear learning objectives and communicating them effectively to students.
- Designing engaging instructional materials and activates that stimulate interest and maintain attention.
- Providing appropriate guidance and support throughout the learning process.
- Offering timely feedback on student performance to reinforce learning and corrects misunderstandings.
- Using assessment strategies that measure both learning outcomes and the effectiveness of instructional methods.

Environmentalist Learning Theory

The environmentalist learning theory was propounded by B. F Skinner and Albert Bandura in 1977 cited in Anthony (2018). Environment is a child's surroundings and every aspect entailed influences his/her learning. B.F Skinner and Albert Bandura contributed greatly in the environmentalist perspective of development.

Environmentalist believe that the child's environment shapes learning and behaviour, infact human behaviour, development and learning are thought of a reactions to environment. This perspective leads many families schools, and educators to assume that young children develop and acquire new knowledge by reacting to their surroundings, school readiness, according to the environmentalists is the age or stage when young children can respond appropriately to the environment of the school and the classroom (e.g rules and regulations, curriculum activities, positive behaviour in group setting and directions and instructions from teachers and other adults in the school. The ability to respond appropriately to the environment is

necessary for young children to participate in teacher-initiated learning activates. Success is dependent on the child following instructions from the teacher or the adult in the learning environment. Many environmentalist influenced educators and parents believe that young children learn best by roten activities such as reciting the alphabet over and over copying letters, and tracing number. These viewpoint are evident in kindergarten classrooms where young children are expected to sit at desks arranged in rows and listen attentively to their teachers.

Albert Bandura (social learning theory). This theory expands on traditional behaviourism by emphasizing the role of observational learning and modeling in the acquisition of behaviours. He argued that people learn not only through direct experience (like Skinner suggested) but, also by observing others and imitating their behaviours.

Bandura's famous Bobo dull experiment demonstrated that children could learn aggressive behaviours simply by observing adults acting aggressively towards a doll. The relevance of B. F Skinner and Albert Bandura to the study. Both theories contribute significantly to understanding how individuals acquire and modify behaviours in response to their environment. The theory will help the teachers connect to all different kinds of students, it will enable the teachers to lead by example as the students are watching and also learning from them. The teachers will also maintain disciplinary measures among the student so as to reduce learning how to act aggrievedly towards others.

CONCEPTUAL CLARIFICATION

Management of learning environment means to take steps to maximize attention, reduce distraction, and be as productive as possible. Many scholars have argued that management of learning environment are variables that can affect students' academic achievement, including performance in examinations (Ajao, 2001). The importance of Management of learning environment to educational development was so upheld by the authorities and regulatory institutions that school inspectors were parts and parcel of the school system before the advent of military regime in the country. The neglect this aspect has received due to poor funding by the successive regimes of government in the country also reflected in paucity of studies that focuses on this issue. As such management of learning environment remains an important area that should be studied and well managed to enhance students' academic performance.

The recent poor academic performance of public senior secondary school students in Rivers State has been of much concern to the government, parents, teachers and even student themselves. But the quality of education not only depends on the teachers performing their duties, but also in the effective coordination of the school's Management of learning environment (Persaud & Turner, 2008). Learning environment which include Classroom spaces planning, administrative places planning, circulation spaces planning, spaces for conveniences planning, general infrastructure planning, the teachers as well as the students themselves are essential in teaching-learning process. The extent to which students' learning could be enhanced depends on their location within the school compound, the structure of their classroom, availability of instructional facilities and accessories. It is believed that a school with adequate Management of learning environment contributes to stir up expected outcomes of learning that will facilitate good academic performance, by encouraging effective teaching and learning.

The school is a place where formal instruction is given and received for the purpose of learning and teaching respectively (Nnokam, 2022). It is the organized system guided with rules and regulations observed by the students, teachers, administrators and parents to achieve the

inculcation of relevant skills and knowledge in the- learners. This will enable the school is place that have a confined place designated for learning. The environment defines the school and makes it what it is. Walder (2004) described the school environment as the embodiment of knowledge where pupils or students receive and are given learning experiences. The school environment depicts the walls of the school. It consists of the buildings, the space, exit ahd entrance of the educational system. Tapia-Follen et al. (2020) asserts that it involves the set of relationship between students and pupils or students as they are controlled and directed by the management.

Nnokam and Sule (2020) resolved that school system involves the parents and the community members. Therefore, the school environment also include the whole system of the school. The school environments should be different from our homes, church or any other place. There should be features that clearly depict that this is a school. The structures and design should connote the setting of a school. A school environment should serve the purpose of providing training in basic skills as reading, writing and counting (arithmetic). Anything short from that, it make it an ordinary place ground for the learners (Okorosaye-Orubite, 2009). It must play a conservative role of nurturing and preserving the socio-cultural heritage of the society. Of course, the purpose of going to school is to be enlightened. Ajaiyi (2007) supported that as an institution of learning, it must be a social institution that transmit the culture and values of the society from one generation to another.

School Management

According to Adkison (2015) management in any establishment is the process of integrating the appropriate human and materials resources available for effective usage and achievement of the success of that establishment. In the case of education, administration stands as the umbrella that connects the bodies or systems of education together achieve good performance of the students.
To achieve this, the head of the school must carry out the following principles which include planning, organizing, directing, coordinating, (controlling and evaluating of performance of the learner.

As far as the educational institution and every other institutions, there must be planning. It was always said that he that fails to plan, plans to fail. The sole responsible of planning lies on the shoulder of the administrator. They must think out of the box to draw out a plan for the organization especially in the educational system. Caray (2010) described that the head of the school plans carefully the various programmes and activities for the school system to run. The head goes ahead to organize these programmes, working as a team with the staff and students or pupils to actualize the activities. The parents are not left out, because they will support the school to achieve the dreams when the activities of the school is on, it is the duty of the head to ensure that everything is going to plan. The coordination and motivation of the head to the teachers as well as students goes a long way to actualizing the set goals, the directive of the leadership of the school and control bring to fruition the academic activities. The head then evaluates the progress made and new ways for amendment or improvement.

Obi (2014) described that the process of educational management of a school is not a single core process rather different processes are required. It asserts that educational administration is more of art than science. This is because the human relationship prevailed here and the activities of the system cannot be maintained by any set of mathematics formulae. Olamola (2014) quoted in Nnokam and Sule (2020) connotes administration of an organization

means getting things done through people's organization and involvement but there is yet to be a universally accepted definition of administration. Olamola quoted Henri Fayol's view that administration means to forecast and plan to organize, communicate, coordinate and control the system of an organization to achieve results (Olamola, 2014).

Nnokam and Sule (2020) stipulated that purpose of education administration. Education administration which means the combination of human and materials resources to implement and achieve the needed success of the education system. The purpose of education system include to provide proper education, ensure adequate utilization of all resources, ensure professional ethics and development among teachers and get the work done in the educational system. This to mention just a few of the purpose of educational administration. It is clear that educational problem stems from educational administration. West and Zemierran (2015) asserted that the neglect of educational sector by individuals and government has led to the poor quality and standard of education in Nigeria. Nnokam and Sule (2020) enumerates the following solutions for the improvement of education, which include: adequate funding by individuals and government agencies.

Effective Students' Academic Performances

Students' academic performance refers to the degree of a student's accomplishment his or her tasks and studies. The most well-known indicator of measuring academic performance is grades which reflect the student's "score" for their subjects and overall tenure. According to Owhondah and Egwanwor (2012) students' academic performance is the measurement of student achievement across various academic subjects. Student academic performance is the outcome of students' effort in examinations. Students' academic performance is determined by a number of factors (Owhondah, 2006b). Students' academic performance is measured by the average marks of the previous semesters and the total average marks. Students' academic performance reflects on their ability to demonstrate the knowledge they have learnt in tests, quizzes, presentations and final examination (Owhondah, 2018).

The importance of students' performance is not only evident to the students but also to the universities as it is a measure the success of their education process. Studies in the education literature have examined the factors that may influence students' performance that include physical facilities and qualified educators, students' attitudes, aspirations and self-awareness (Cheung & Kan, 2002). Success is measured by academic performance in most educational institutions. In this case, how well a student meets standards set out by an institution itself or an external examination body either set up by the government or an independent outfit signifies success or good performance. Before standardization, Teachers' observations made up the bulk of the assessment. Grading system that came into existence in the late Victorian period and were highly subjectivity as different teachers valued different aspects of learning more highly than others. However, standardization function which is fulfilled by establishments outside the schools helped in putting this in check considerably.

STRATEGIES FOR MANAGEMENT OF EFFECIVE STUDENS'S ACADEMIC PERFORMANCE

In education, management of learning environment stands as the umbrella tnat connects the bodies or system of education together to achieve good performance of the students. The extent

to which students' learning could be enhanced depends on the below strategies, a good geographical location of the school, provision of physical facilities, provision of instructional materials, good classroom management.

A good Geographical location of School

School location refers to the particular place, in relation to other areas in the physical environment (rural or urban), where the school is sited. In Rivers State, rural life is uniform, homogenous and less complex than that of urban centers, with cultural diversity, which often is suspected to affect students' academic achievement. This is because urban centers are better favoured with respect to distribution of social amenities such as pipe borne water, electricity, healthcare facilities while the rural areas are less favored (Ajao, 2001). This is also true in the distribution of educational facilities and teachers. These prevailing conditions imply that learning opportunities in public senior secondary school in Rivers State urban differ from school to the other. It would appear therefore that students in public senior secondary schools in Rivers State have more educational facilities and teachers.

These prevailing conditions imply that learning opportunities in public senior secondary schools in Rivers State urban schools have more educational opportunities than their counterparts in rural schools. While some studies have shown positive influence, others have shown negative influence of school location on the students' learning outcome or achievement. Several researchers have conducted research on school location and academic performance, making a critical analysis of locational factors. Some are of the opinion that provision of education in rural areas is normally fraught with the following difficulties and problems; qualified teachers refuse appointment in isolated villages; villagers refuse to send their daughters to male teachers; some villagers have few children for an ordinary primary school; lack of roads or satisfactory means of communication makes it difficult to get books and teaching materials at school. The variation in performance reflects differences in the educational opportunities available in rural and urban areas, and the characteristics of these locations, such as population density, distribution of labour markets, and the extent to which urban and sub-urban areas are sought and populated by individuals from different backgrounds (OECD, 2011).

Research indicates that location of schools relates to academic performance of student in Rivers State. Also lack of suitable school location has contributed to the imbalances of Western education from one part of the community to the other. The implication is that while people in some areas enjoy minimum travelling distances to acquire education, some people in other places suffer by having to cover maximum distances to acquire education. Over the past decade remarkable studies have indicated a correlation between the environment and academic - performance of students. Environment plays major role in the life of every individual whether a students, teachers, employer or employee (Chukwuemeka, 2013).

The geographical location of school result into a number of challenges including; poor attendance, resulting in low achievement, increases of dropout rate, and amplifies a host of social challenges (Ajao, 2001). Although the current emphasis has been on students" performance in sciences, it must be appreciated that students" achievement in any course is a function of instruction and school location. Location of schools could also be a factor that affects academic performance of students in Basic Science in Junior Secondary schools. Eznendu (2003) in his study on: "classroom environment as correlate of students" cognitive achievement in senior secondary school geography" stated that school location means urban and rural schools.

Similarly, Akpan (2008) indicated that schools in urban areas have electricity, water supply, more teachers, more learning facilities and infrastructure. Owoeye and Yara (2011) in

their studies on school location and academic achievement of secondary school students in Ekiti state, Nigeria asserted that the various review of literature on school location influence on academic performance is not the same. While some maintain that urban students perform better in examinations than their rural counterparts, other found that rural students (in spite of all odds) perform better. Some have submitted in their findings and concluded that no particular set up (urban or rural) can claim superiority over the other because their performances are the same. In their studies on the influence of study interest and school location on the attitude of secondary school students towards Mathematics in Ekiti State. Adebule and Aborisade (2013) opined that students that resided in urban centres especially where there are higher institutions like polytechnics or universities are likely to have inclination for higher education than those in the rural setting. They further asserted that students in urban setting could have more access to libraries, laboratories, etc. than those in rural setting.

Equally, Bosede (2010) stated that sex and location of school influence students" academic achievement in some areas. Alokan (2010) in his studies on the influence of sex and location on relationship between students" problem and academic performance affirmed that sex and location do not affect the negative relationship between student problems and academic performance. In addition, some other studies (Bosede, 2010; Alokan, 2010) showed no difference in academic achievement of students because of location. Conversely, Agbir (2004) also showed that rural students performed better on practical skills in chemistry than their urban counterparts did. The influence of location on students" academic achievement remains controversial and inconclusive. This calls for further investigation. Okonkwo (2010) showed that secondary school Chemistry students with positive perception of their classroom environment achieved significantly better than their counterparts with negative perception.

In addition, Adebule and Aborisade (2013) posited that lack of social amenities in rural areas impinges on the education services, such amenities are electricity, pipe borne water, technical resources, safe and secure facilities that are essential to successful educational programmes. Similarly, Owoeye and Yara (2011) contended that the location of a school has an important role to play in the educational attainment of students in the school. Most studies on school location have being carried out with the focus on urban and rural location (Bosede, 2010). However, some areas where schools are located are neither urban nor rural. A peri-urban area is the transition zone or interaction zone where urban and rural activities are juxtaposed and landscape features are subjected to rapid modifications, induced by human activities. In Nigeria, in spite of the enormous role that basic science plays in human existence and nation development, academic achievement of students in junior secondary school basic science is nothing to write home about. Some of the problems identified as responsible for this ugly trend includes; school location and gender inequalities among others.

Educational experts argue that students who have not acquired an association between academics and life experiences do not feel that good school attendance is relevant to their future. Alokan (2010) contend that one of the factor that influence academic performance is school location/site of the school, most developed countries realized this and they environment make sure their schools is situated in the best location so as to minimize failure, to them variation in performances is due to variability in education material available between in urban and rural areas. Even though most African knows this especially Rivers State, schools are still not situated in the best place it should, most school are along the express road, market areas, etc. this altogether distract the students and affects their performance. Other research concentrates looking on the general factors effecting performances such as inadequacy of resources,

inadequacy of prior preparation, lack of support from the parents, laziness of the teachers, lateness of the teacher, incompetent teacher, poor monitoring and absence of supervision.

Provision of Physical Facilities

Okomolate and Adesua (2016) refered to physical facilities as the school plant that consists of the school buildings, classrooms, library, laboratories, toilet facilities, offices and other materials and infrastructures that would likely motivate students towards learning. Schools exist for the purpose of teaching and learning. Human and material resources are deployed for this purpose. School physical facilities are the material resources provided for staff and students to optimize their productivity in the teaching and learning process. Bosede (2010) indicated that, physical facilities include classrooms, laboratories, libraries, ICT facilities, dormitories, health and kitchen facilities, as well as facilities for students with disabilities. Physical facilities provide and maintain, safe, clean, and creative educational environments that are conducive to high achievements of the students. Physical facilities strive to give students a comfortable atmosphere in which they work and learn.

In Rivers State, Nigeria, low levels of learning among children can partly be attributed to poor or inadequate physical facilities of the schools. Physical facilities are germane to effective learning and academic performance of students. In support of this, Odeh *et al,* (2015) identified physical facilities as the main factor contributing to academic achievement in the school system. These include the school buildings, classrooms, furniture, libraries, laboratories, recreational equipment, apparatus and other instructional materilals. The availability, relevance and adequacy of these resource items contribute to academic achievement, the scholar acknowledged the fact that unattractive school buildings, inadequate classrooms, furniture such as desks and chairs absence of libraries and laboratories can contribute to poor academic achievement.

Likewise Likoko et al. (2013) commented that, schools that lack adequate classrooms for instance, students hold their lessons outside or under trees. During bad weather such lessons are postponed or are never held altogether. This interferes with syllabus coverage and students from such schools do not perform well in examination. World Bank publication (1990) cited in Owoeye and Yara (2011) linked performance of students to the provision of physical facilities while referring to a survey of 51 public senior secondary schools in Rivers State that students performed significantly better on academic tests when they had adequate classrooms, desks and chairs. Owoeye and Yara (2011) succinctly said that school buildings are very vital input to educational system; emphasizing that even though they do not teach but their use may facilitate or impede learning. However, he did not see school building as one of the critical variables affecting school academic achievement because he found no evidence to show that an expensive school building would necessarily improve academic achievement.

Alokan (2010) lamented that school physical facilities like classrooms of public schools have no roofs, windows and doors, some walls are cracked, instructional facilities are lacking while teachers are frustrated consequent upon lack of equipment/facilities to meet educational endeavours. Physical facilities are the fundamental factors in better learning and achievements of the students (Okomolate & Adesua, 2016). All facilities must be provided to the schools for the students' better, concrete, and real experiences. Physical facilities help to enhance the learning of the students. Research shows that availability of the physical facilities including classrooms, water, electricity, boundary wall, toilets, furniture, play grounds, libraries, and dispensaries have a significant positive influence on the performance of the students and their achievement (Saeed & Wain, 2011).

The study undertaken by Shami and Hussain (2005) revealed that the availability of physical facilities in a school had a significance impact on students' performance. In the context to school facilities, environment in which the students learn is very crucial and without the suitable environment effective learning cannot take place. Bruce (2006) has rightly called the learning environment as the third teacher but it is important that, the environment is not an end in itself; we have to look at the settings. Space is an important factor in providing a rich environment for learning, but it is only significant to the degree that it assists in providing a suitable climate for learning. Saeed and Wain (2011) confirmed that, physical conditions have direct positive and negative effects on teacher morale, sense of personal safety, feelings of effectiveness in the classroom, and on the general Management learning environment. Adeyemi and Igbeneweka (2000) emphasized the significance of various categories of physical facilities towards the quality of education at the different levels of the educational system.

Saeed and Wain, (2011) identified school buildings, classroom accommodation, furniture such as desks and chairs, libraries, laboratories, recreational equipment, apparatus and other instructional materials as contributing to academic achievements. Ethnographic and perception studies have also indicated that inadequate school physical facilities have a negative impact on teachers' motivation that in turn negatively affects students' academic achievement. In the same way, Lawrence (2003) emphasized that the unavailability of school physical facilities negatively affects staff and student's motivation. A good school environment and adequate school with enough physical facilities have a significant positive effect on teacher's motivation and student's academic achievement. Additionally, Bruce (2006) describes that school facilities impacts on student achievement, attendance and teacher retention. Likewise, Khan and Iqbal (2012) asserted that, adequate and quality school physical facilities are basic ingredients for quality education and to achieve the intended goal of the school program. They also strengthen the idea by emphasizing that learning is a complex activity that requires students and teachers' motivation, adequate school facilities such as standardized buildings and classrooms with their facilities, instructional materials and equipment for child's development. Hakielimu (2011) agreed that most community secondary schools in Tanzania particularly those in rural areas are at disadvantaged because they lack adequate physical facilities and human resources. Most of the community secondary schools do not have enough classrooms.

A study by Likoko et al. (2013) on the adequacy of instructional materials and physical facilities in *public senior secondary schools in Rivers State found out that some* schools lacked enough classrooms, desks and chairs leading to overcrowding. Such conditions frustrated students during learning. This study therefore, investigated on Management learning environment and students' academic performance in Rivers State. In adequacy of physical facilities such as classrooms, desks, libraries and laboratories in relation to students' academic achievement in public senior secondary schools in Rivers State.

Provision of Instructional Materials

Instructional materials are those materials used by a teacher to simplify their teaching. They include both visual and audio-visual aids and could either be concrete or nonconcrete. These instructional materials bring life to learning by stimulating students to learn. Learning occurs best when a multiplicity of senses are involved, other than overreliance on verbal communication alone. Instructional materials are quite important for effective teaching and learning processes. As such, this contributes in the existing literature of instructional technology because there exist

a lot of constraints in the effective teaching and learning processes in public senior secondary school in Rivers State. This instructional materials will be useful to teachers who will carefully select and skillfully handle the resources to make their teaching effective. Besides they will be able to know the criteria for selecting and evaluating resources (Ajao, 2001). Teacher is the best instructional material teaching is a total package; it is true that teacher is the best instructional material because teacher is the one who manage the classroom. As the saying goes "you are the captain of your mind and the master of your soul" teacher is the captain of the classroom because of molding the minds of the students to become competent and independent individuals when it comes to excellence. Master of the classroom because of proving good feedback and developing the potential of the students through nurturing their minds for the possibilities in life. Using strategies or techniques that are varied to make teaching effective and meaningful and is also a big factor for the students, so that they can build confidence and have mastery of the subject matter (Omar, 2014).

Instructional materials are essential since they help the teacher and learners avoid overemphasis on recitation and rote learning that can easily dominate a lesson. Resource materials allow learners to have practical experiences which help them to develop skills and concepts and to work in a variety of ways. Adeogun (2001) revealed a strong positive link between instructional resources and academic performance. According to Adeogun, schools that possess more instructional resources performed better than schools that have less instructional resources. Adeogun (2001) noted that there was a low level of instructional resources available in public schools and hence commented that public schools had acute shortages of both teaching and learning resources. He further commented that effective teaching and learning cannot occur in the classroom environment if essential instructional resources are not available.

Omar (2014) suggested that the quality of instructional processes experienced by a learner determines quality of education. In their view they suggest that quality instructional materials create into the learners' quality learning experience. Bruce (2006) also supports that students' performance is affected by the quality and quantity of teaching and learning resources. This implies that the schools that possess adequate teaching and learning materials such as textbooks, charts, pictures, real objects for students to see, hear and experiment with, stand a better chance of performing well in examination than poorly equipped ones.

Alokan (2010) identified the following instructional materials used in teaching and learning process in public senior secondary schools:

- Print: Printing is a process for mass reproducing text and images using a master form or template. The earliest non-paper products involving printing include cylinder seals and objects such as the Cyrus Cylinder and the Cylinders of Nabonidus. Print such as textbooks, manuals, pamphlets, handout, study guides enhances effective and efficient teaching and learning process in schools.

Provision of school Library

Secondary schools are where most students usually begin their education in library use. As with any beginning, this is an important one and will likely form the basis of the students' favourable or unfavourable attitude towards libraries which in turn contribute positively or negatively to academic performance of the students. Ideally, the school library should be a separate building in itself or at least a separate hall removed from sources of noise and distraction.

It should be spacious and able to accommodate at least forty students comfortably at a time. A stuffy room would send the children to sleep besides being dangerous to their health. Before any purposeful education of library users may be accomplished in schools, certain minimum physical and material requirements must be present, one of which is space, adequate library space for a single student to browse or identifying some professionals and lay citizens who have good knowledge of the education programme, the goals of education and basic aspects of school infrastructure.

It requires that the leader should be able to know the people working with him/her, the skills and competences that they have and assign the right tasks or roles to the right people. The leader of a team saddled with the responsibility of planning a school plant should not only know the vision and mission of the school system but should also be able to make them explicit to his/her team members so that each of them will be able to see how his/her efforts will contribute towards actualizing them. In order to achieve success in the assignment the leader should be current with good practices and new developments in school plant planning.

Maintaining good Classroom Management

The term classroom means a space provided in a school where student gather and the teacher meet them for lecture. A classroom is a room put aside and specially designed and equipped for the academic purpose (Akriwumiju & Agabi in Agabi et al. 2013). A classroom is one of the facilities that every school must have, Agabi et al.; opined that a school is not complete without at least one block of classroom to facilitate organized teaching and learning. A conductive classroom environment boosts the desire for knowledge and heightens creativity in leaners (Agabi et al; 2013). They further opined that classroom shield learners from the erratic weather condition, such as rain, wind and tremendous weather conditions.

Classroom management has been highlighted across numerous research studies as a major variables that affects students' academic performance (Marzone, 2008). The most obvious reason for this assertion is that, effective classroom management sets the stage for teaching and learning. It sets a stone in the classroom that captures students' attention as a necessity for effective teaching and learning (Marzone, 2008). This statement is obvious since a classroom which is Chaotic and disorganized as a result of poor classroom management is highly unlikely to enhance expansive leaning and students' academic performance and might indeed inhibit. In chaos, according to Idopise (2004), very little academic learning can take place. According to Walter (2006), classroom management differs from one teacher to another because of the teacher's personality, teaching style, preparedness, and number of students in the classroom.

Marzone, (2003), stated that a classroom that is well managed will provide an environment in which teaching and learning can flourish. Classroom management possess certain objective. It does not just facilitate teaching but equality increase teaching time. Also it stops students' unsuitable behaviour and support environment that aids suitable behaviour to emerge one way to establishes and settle down class control is by management instruction. Sinner and Stonsh, (2001), maintained that teachers' ability to organize class and management behaviour of their students is crucial to attaining positive education outcome although, good attitude management never guarantee effective instruction, it initiate environment context which makes sound instruction attainable. Effective instruction minimizes but never removes entirely class behavioural problems.

Classroom management refers to the sum total of plan of actions taken by the teacher in the classroom to bring about a conductive classroom environment that supports teaching and learning leading to success and achievement (Mecreary, 2010). Agabi et al. (2013), defined classroom management as the process and strategies an educator uses to maintain a classroom environment that is conducive to students learning and success. Similarly, Dollad and Christensen (2015) defined classroom management as the action a teacher takes to bring about an environment that support and make easy instructions, academic, social and emotion learning. Teachers in the classroom are the managers of the order, regulating the sequence of events and directly his own attention towards achieving educational goals.

CONCLUSION

Management of learning environment is a critical component of effective teaching and learning. It establishes and ensures a conducive environment to enhance effective students' academic performance. School location, Provision of Physical facilities, Provision of Instructional materials, and good classroom management are indispensable that enhance Student academic performance. Learning environment remains an important area that should be studied and well managed to enhance students' academic performance. The environment in which the students learn such as classrooms, libraries and information centers, technical workshops, information and communication technology facilities, multipurpose halls and performing art spaces, laboratories, health, physical exercises and play grounds, conveniences, sanitation, maintenance culture, aesthetics among others are variables that affect students' learning and academic performance. The fact remains that learning environment can impact on students' academic achievement. The classroom provides an environment for the student to actively grow as responsible citizen of the outside world and to develop the tools needed for lifelong learning. This process is supported in a positive learning environment including such as learning resources and spatial configuration, as well as intangible elements such as rules and routines, social relationships and energy of the class in general. Intertwined in such elements is the emotional classroom environment that may yield a positive or negative impact on students' learning and performance.

Suggestions

- Government should put to consideration of the schools location when establishing public senior secondary schools in Rivers State.
- Government should endeavor to provide physical facilities for public senior secondary in Rivers State for easy and conducive teaching and learning environment.
- Government should provide instructional materials for public senior secondary in Rivers State for effective teaching and learning.
- Government should ensure that there is good classroom management in all public senior secondary schools in Rivers State to maintain effective student academic performance.
- Government should encourage teachers to provide emotional support to the student to enable the student to learn effectively.

EDUCATIONAL RESOURCE UTILIZATION: IMPLICATION FOR EDUCATIONAL MANAGERS

Martina Obianuju SAMUEL-DIRI
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

Education is the best and largest enterprise all over the world and the only tool for societal advancement, social mobilization, economic development, political survival and effective national development of any country. Investment in education is vital for the promotion of economic growth and national development. Educational institutions including schools are established and managed essentially to achieve certain stated goals and objectives, which cannot be achieved without entrusting a large amount of responsibility for human resources towards ensuring the success of such institutions. In the school system, part of the integral pre-requisites to be put in place towards the actualization of the educational goal and objectives requires the adequate provision of resources, maximum utilization and appropriate management of education resources to avoid wastages and improve the quality of the teaching-learning process in the academic environment. This paper therefore anchors on resource based theory and examined the concept of educational resources utilization, classification of educational resources, education resources and educational manager's roles, the challenges of educational resource utilization, roles and attributes of educational managers on resource utilization as well as the implications of effective resource utilization.

Keywords: Education, Resources, Utilization, Implications, Funding, Administration, Managers.

INTRODUCTION

Education is a veritable tool for growth and development of society. It lays foundation for literacy, skills attainment, technological advancement, the ability to harness and manage the natural resources in the environment and functional society. The quality of every society is largely dependent on the quality of its educational system (Dangara, 2016). In the light of the apparent limitations on educational resources, their efficient utilization for the maximum result need not be stressed. Adebayo (2001) in Dangara (2016) posited that there has to be administered in any organization as long as an organization consists of people brought together in hierarchical set-up making use of tools, equipment, human and material resources, all in the quest of attaining the goals for which the organization is established. No organization, educational sector inclusive can adequately achieve its objectives without adequate availability and utilization of resources.

Educational resource as researchers in educational administration have said, refers to all variables which make educational systems function effectively. These variables are essential for the smooth running of every school system and the actualization of educational goals and objectives. Educational institutions without these resources will not be in existence and if they are, will definitely not function optimally. Educational resources are livewire which sustains the educational system. Resources to education are valuable assets made available in the school system, used in the process of trying to achieve educational goals.

These resources are inputs that make the system functional and direct the development of educational sectors. These resources include raw materials, wealth, or possessions used to achieve educational set goals and objectives whenever they are needed (Chux-Nyeche, 2014). Resources such as money, materials, time and human can only be effectively utilized for the realization of educational goals if well managed by leaders, who direct and control the other factors for survival and sustenance of the educational system. Most educational activities are implemented at the direction of a leader. Such leader set rules, design, work systems, goals, and strategies, provide goods and services and supervise quality, and draw up a financial plan and some others.

The managers of the system become the most valuable resource in the education sector. Without human resource, all others will not be utilized and unproductive. Asodike and Udieme (2014) observed, that the most important and vital task of management is to motivate the human resource to maximize its performance and achieve corporate success.

Nevertheless, educational managers are either employed or appointed to head, direct, control, coordinate, organize and analyses issues in school and ensure slated goals and objectives of the school are implemented. Management involves a type of responsibility aimed at achieving particular ends by applying the available resources (human and material) and ensuring a cohesive and coherent organization in the process. For education to be effective there should be a manager, that has the requisite skills acquired through experience, knowledge, commitment, patience to achieve set goals. It has been echoed that the most important skills a manager requires are communication skill which enables him to negotiate and work with others to achieve goals and objectives ensuring effective utilization of educational resources.

THOERETICAL FRAMEWORK

The paper work is anchored on the Resource –Based theory (Wernerfelt's 1984). It emphasized the ideology of a school effectiveness and efficiency in utilization of it educational resources for goal attainment of school or educational goals. It suggests that identifying and strategically utilizing valuable, rare, difficult - to-imitate and non-substitutable resources (like skilled teachers, technology or learning materials) can lead to improved efficiency and effectiveness in school.it recognizes that each school have it unique resources and capabilities and the resources which are scarce should be effectively and efficiently for educational or school goal attainment.

CONCEPTUAL CLARIFICATION

Educational Resource

Educational resources have gained popularity among educators, administrators and instructional designers, popularizing the idea that digital materials can be designed to permit free reuse in a large range of teaching and learning situations (Hylen, 2007). Educational resources are all the various sources through which institutional gains are produced (Nwabueze in Ebong et al., 2016). Educational resources as observed by Ezekoka (2009) is seen as anything thing use to facilitate, stimulate and simplify the learning process in the

classroom. Generally, education resources refer to all human, material, non-material audio-visual school environment and community materials available in an academic environment to facilitate school administration and simplify the teaching-learning process.

They also include other fundamental materials used in the school to make teaching very easy and learning more meaningful and comprehensible to the learners. Education resources cover all those materials human and non-human, drawn or photographed, built manually or electronically operated books and all forms of related materials used in teaching and learning process (NTI, 2006).

Education resources include the teachers in the school, human beings in the community, real objects, specimen or models, chalk and display boards, school buildings and layout, the community at large and other fundamental materials like pencils, pens, exercise books etc. (NOUN, 2009). Education resources are no doubt important in the development of a conducive teaching-learning environment. The use of these resources could give more valuable and powerful direction to the teacher than any personal efforts without the materials.

However, no matter how well packaged a school administration or a school system is at any level of education, without adequate and efficient utilization of the available resources, as well as the accessibility of educational resources, the system will not be able to achieve its desired results (objectives and goals).

Accessibility of education resources makes school management effective and efficient thereby enhancing the output of the education system. The effective school administration is key in achieving education goals that will lead to an efficient instructional process which will in turn yield quality output. Agabi (2012) observed that the resources provided by the Government for the execution of education projects in Nigeria are inadequate and irregular as highlighted by the frequency of industrial actions in the education sector. More so, due to the general level of poverty in the country, the contribution of communities and households to educational provision have been negligible. Consequently, the best alternative is prudence in the use of available resources. This is because when a given level of resources is efficiently utilized, more services are provided through balance usage and adequate maintenance of the available facilities than when inefficiency, on-utilization, under-utilization and overutilization abounds.

According to NOUN (2009), education resources are classified based on their nature, thus the following categories:

Material or Physical Resources: These are the tangible resources that can easily be seen and observed in any institution. The physical resources include the structure, the machines, raw materials, vehicles, and other tools, which can facilitate organizations activities and processes, which directly or indirectly contribute to the achievement of goals.

Financial Resources: Financial resources are important in the school system, however financial management is more important in the system. Although the two (financial resources and financial management) could be used interchangeably; the overall of it is that funds are required for the smooth operations of a school and are regarded as the life-wire of any system. Whereas financial management is the activity of obtaining and effectively utilizing the funds necessary for an efficient course of action. Finance Planning and executing an educational programme cannot be overemphasized because without the available financial resources, the desired human and material resources would be impossible to procure adequate funding contribution to the non-provision of educational facilities talk less the maintenance of such facilities as school building, furniture, laboratory, library, classrooms and so on all of which pose a great challenge to the management of educational facilities and consequently affect quality education deliver It is indeed a more critical facet with which other factors of administrations are created, maintained and sustained.

Time Resources: Time is a unique resource and is considered as one of the scarce resources known to man (Adedeji, 1998).Time is the most expensive of all resources due to its non-recoverable nature. Time utilization refers to the proper allocation of time to the various stages and tasks of administrative activities. In a school system, time is managed through the use of a time table. Consequently, time management refers to those apparatus set in place for the organization's effectiveness and in the pursuit of the realization of setting out objectives and goals (Ugwulashi, 2012).

Human Resources: Human resource constitutes a vital vein of any institution. The human resource in the school system includes teachers, support staff in the school, students, parents, community members and a host of other interest and social groups. Human resources are responsible for planning, organizing, coordinating, controlling, manipulating and maintaining other forms of resources, its administrative and forecasting ability placed it ahead of other forms of resources.

EDUCATIONAL MANAGERS AND UTILIZATION OF HUMAN RESOURCES

Human resources here refer to teachers, non-academic staff or personnel of any educational institution. This kind of resource is the brain of the school system which is used to achieve educational objectives within a set period of time. These resources enhance the implementation of educational policies because it makes uses of other educational resources. Nwabueze (2016) observed that they are the life-wire of every organization in a given society. Human resources stand as strength in every school system, they are producers, teachers, and the main reason for every school system, without them there will be no students and learning will not take place. They make up the workforce of an educational system in every teaching and learning institutions, this set of people are skilled workers and very important in the planning, teaching, implementation of educational policy made, development scheme, carry out research and community services to keep the system functional (Adeyemi, 2008). The human resource is usually directed by a leading human resources manager (HRM), he as a leader help in placement of different specializations of the human resources, see to the roles and capabilities of who are an integral part of the organization and ensure all these are properly directed to achieve educational goals. The human resource manager who is the leader may be called the principal, ahead of the department, a provost, a vice-chancellor, a headmistress or master. A board chairman, a commission for education or an administrator in a school environment he/she ensures each teacher employed or posted to the school are properly placed in departments and given subjects to be taught based on his or her area of specialization and ensure duties are carried out as stated by the leader. He also directs other human resources in the school system like employees, consultant, part-time personnel, nonacademic staff or any person, with different types of other relationship to the institution/organization and ensures he/she is transparent and honest in his dealings. Educational resources provided by the government must be efficiently utilized to keep school programs running.

EDUCATIONAL MANAGERS AND UTILIZATION OF RESOURCE MATERIAL

Utilization is the degree or extent to which an item has been put into effective use. He identified the various degree of utilization as overutilization, underutilization, non-utilization and optimum or optimum utilization, according to him, non-utilization is when the facilities are not put into use at all, maximum utilization occurs when facilities are put into effective usage in line with the primary objectives. Underutilization occurs when facilities are not used beyond its capacity while optimum utilization occurs when facilities are used for many purposes by the school and members of the public or the community. These degrees of utilization of

educational facilities constitute a waste resource and are counterproductive. To ensure that science equipment are not only needed but must be effectively and efficiently utilized to avoid wastage in relation to demand them' hence, utilization of science equipment in secondary school on laboratory exercises are performed routinely or only when the school in preparing for external examination.

In other words, whether the available science equipment is used in the routine teaching and learning process in anticipation of external examination and in the best part of the year the equipment is dumped in the laboratories without utilization. Proper utilization, inspection and supervision are much needed by school administrators in their daily management of educational facilities for quality education delivery in their respective schools. These will minimize the rate at which educational facilities are damaged by both the students and the teachers an as well create instant awareness for school administrators to know any damaged facilities that needed maintenance or replacement .hence this strategy will enhance proper management of educational facilities for quality education delivery. Material resources are non-human resources used for the achievement of educational aims within a set an.

Okpe (2010) noted that material resources as things which satisfy schools' wants. These resources are consumable which act the hub on which teaching and learning revolve. It is very important to note the place of material resources in the teaching and learning process. They are visible items in physical forms used in impacting and getting knowledge (Bozkurt et al., 2015). Also, material resources as infrastructural facilities and finance available for use by the human resources within the organization. For him, it is all necessary equipment tools instructional aides, all physical items available to improve teaching and achieve a successful result. The material resource in education has the main contributions to motivate and make students learn more effectively as learning becomes interested when it is audio and visual that is, the student hears and see what they are taught. Material resources are usable and consumable facilities such as furniture, buildings, textbooks, stationery, chalkboards, equipment, electricity, modern educational electronic gadgets, computers, instructional materials, teaching aids and lots more. All these are tangible in every school sectors in order to achieve educational aims and objectives. Classroom, laboratories, libraries, also should be furnished and equipped to improve stress-free learning and teaching are all important in the achievement of attaining the school goals (Obasi & Asodike, 2014).

Consequently, the material resource has never been sufficient in the educational system and have limited the ability of the school manager to an extent, yet the recent trend has been overpopulated and increase in the demand for education in every state adding with the United Nation's education for all (EFA) project which had contributed to huge increase in the enrolment of people in school. This material resource is not usually enough and not always available at the point of need to match the demand of students of the enrolment explosion. Usually, the increase put pressure on the material resource available in school and the shortage of this available resource. Therefore, the facilities used during learning make understanding of what is taught unforgettable. On this note, the principals which are managers must ensure the provision of all instructional materials in his/her school also must ensure he controls both teachers and students in the usage of these materials provided to ascertain their durability, maintenance effective utilization of those facilities and proper handling of such by those it was meant to be used.

Facilities like buildings, structures, vehicles, furniture, etc must be properly managed by the human resource manager that possesses leadership character, he has to be prudent and encourage those expected to use this facility to handle them with care, in order to extend their life span. Agu (2007) noted that the availability of these facilities in schools has a positive effect on the performance of students and Udoh in Ebong and Asodike (2016) also asserted that children will learn more and work harder when the facilities are adequately supplied.

EDUCATIONAL MANAGERS AND UTILIZATION OF FINANCIAL RESOURCES

The educational system cannot be managed effectively without fund. Funding is the provision of financial resource in order to meet a need, project or programme. Money is needed to run a project or programme from within or outside the school (Business Dictionary, 2013).

Money in the educational system is used to provide development and maintenance of the entire school system. Money as educational financial resources in Nigeria education has largely been the responsibility of the Federal, State and Local Government. They mainly fund our educational system and make money available for recurrent and capital expenditure of the various boards that constitute the ministry of education.

Recurrent expenditure refers to salaries and allowance of workers, transport expenses, maintenance of offices, hostels and feeding of students. While capital expenditures are money used in building classrooms, students' hostels, staff quarters, providing equipment and teaching aids. The resources money is to be used by educational leaders to organize staff training, provision of libraries, building new structures and funding the specialized program. The functions of the managers are to utilize the money in educational institutions and update the schools in providing research opportunities, planning and new ideas to meet current trends in the advancement of education. Ekunday (2009) defined a financial resource as a very important resource needed in the educational system and need to be well managed as a vital element in school. Educational managers must show integrity and accountability in the management of fund received in school and show evidence of receipt and payment of all that come into the school purse. This resource sometimes comes from various sources in order to develop educational sectors in Nigeria and it will only take reliable managers to manage all the money allocated to education and make them useful and valuable for the students to consume. It takes one with vision to manage school and ensures it runs as stated in schools' goals.

Also, school managers should manage the monies that come into the school system, such as grants by the government and sometimes from nongovernmental organization (NGOs), such as sales, levies, endowment funds from Alumni, Philanthropists, Parent Teacher Association, etc. which are hardly adequate for effective management of education etcetera (Ebong, 2006). Fund refers to a sum of money saved or made available for a particular purpose. It could be called money or financial resources. The fund takes any of these forms: Physical cash, credit facilities, short term fund, and external source jurisdiction. The various sources of educational financial resources are: Budgetary allocation by Government students' school fees, Endowment fund/Donations, Companies and non-governmental organizations, Industrial Training Fund, Sales and Services, Alumni Association and Aids, The host community and Parents-Teachers Association (PTA):

Educational Managers and Utilization of Time Resources

The time resources are unique by nature and very important in educational settings. Time resource has been looked down by many people. It is intangible but used to achieve all educational goals. To Ebong (2011), time is an economic phenomenon that cuts across all disciplines and occurs in every sphere of life. Yusuf (2010) also observed that time is a quality of nature which keeps events from happening all at once. In educational activities, the academic and non-academic programmes must be organized by the school manager or student's body and educational agencies both within and outside the school environment which is geared towards the attainment of educational goals. The time resource ironically, waits for no other resources, but others make use of it, and that is what makes it unique. It works in hours, days, weeks, months and years. Time resources walk for better output in the life of the students in educational institutions. School calendar and timetable provide programme details for each academic session. Time resource serves

the purpose for which they are engaged. Educational leaders have to ensure that both learners and all categories of staff within his control use time allocated for the purpose it is meant for, knowing that anyone lost cannot be regained, most importantly on the academic environment.

Nwogu and Maduagwu (2006) saw time resource as a systematic allocation of time for all activity and strictly keep to the schedules, as achieving educational set goals. Time is constant and must be managed if planned very well to meet up slated objectives. Again, leaders can be friendly with the resources time if he/she has the ability to understand the basic skills on time planning and define period perspective. Leadership in schools require proper placement of the resources time if they must achieve result and productivity. Then time will be allocated to teachers and task them according to the level of importance and ensures it improves educational programmes effectively. However, school leaders can also develop techniques for upgrading time management in education, initially the resource time focuses at managers but presently the request of modern present-day organizational life are willing that many people, students, teachers, administrators have become interested in changing the way of working with regards to time to be able to meet up with their future issues ahead (Ebong et al., 2016). The time resources time is also used deliberately to set up work goals and personal goals in order to select major tasks and activities in educational leadership.

Madumere-Obike (2013) opined that the time resources are used by people to plan in one hour blocks per day, while others divide the day into fifteen minutes blocks university leadership allocate time to academic and administrative members, for teaching, research and services to the institution and professional development and the community improvement. To what level which these academic and administrative staffs are expected to achieve these goals and objectives depend on the resource time as allowed by the leadership of the school. Nevertheless, teachers should note that time is so important in the educational system considering that the resources time is the only resource whenever lost, cannot be retrieved or replaced especially with the high level of unemployment in the society today, such staff can be immediately replaced, Also the resources money can be sourced from any avenues for the running of a school but when it comes to the resource time, the situation becomes difficult to replace time lost. Every school activities are carried out within a specified time; there is time for morning assembly in school, time for prep, time for classes and breaks, time for holidays, time for staff meetings, time for social activities and so on. The education managers also make use of this time in carrying out their daily task like planning, directing, implementing plans, attending meetings etc. as they recognize it as a resource and use the best approaches through which it can be best managed as they others make use of this resources called time. Nwafor (2012) asserted that time management as an effective and efficient utilization of managers' corporate time to achieve educational or personal objectives. Every school manager look forward to achieving educational development making use of time and when not achieve within that particular period, might not be done again for that day because other activities are also waiting for time.

Education Resource Utilization

The term education resources have gained popularization among educators and international designers, popularizing the idea that digital materials can be designed to allow easy reuse in a wide range of teaching and learning situations (Hylen, 2007). Educational resources are sources through which institutional benefits are produced (Nwabueze in Ebong et al., 2016). Educational resource as stated by Ezeoka (2009) is anything that aids, stimulates and simplifies the learning process in the classroom. Also, Selvan (n.d) perceived educational resources as the sources you use to educate yourself.

Generally, resources refer to all material items and human elements that are factored in the school business enterprise. The material resources are the capital and assets or stocks, which can be drawn upon. Okpe (2010) perceives education resources as things which satisfy the school's wants and their livelihood.

These resources are the classrooms, libraries, hostels and learning revolve. They are visible (open) items in physical forms (Bozkurt et al., 2015).

In view of the above definitions, educational resources can be said to be sources used in impacting and getting knowledge. These resources include instructional materials (maps, books, diagrams, charts, etc) individuals (staff) teaching and non-teaching and assets (school plants) that are transformed to produce educational benefits (Nwabuze in Ebonget et al., 2016).

Various sectional interests tend to perceive education resources in a restricted sense. An audiovisual enthusiast might think of resources as audiovisual equipment and complimentary staff; educational technologies in terms of the individual role of supply of information. However, on the whole, education resources are all materials available to any school or educational institution, which are meant to enhance teaching and learning (Camilleri et al, 2014). Schools which possess these resources can use them for immediate production and alternatively for the production of further resources especially in reaching decisions during resources allocation.

Enoahowo (1990) recommended that the offices of school principals, vice-principals, as well as school staff-rooms, should be equipped and furnished with resources. A typical school should have clerical offices, stores, standard games and recreational resources. Besides, there should be standard football/soccer ground, and netball, volleyball, tennis and basket courts in schools. There may not necessarily be hard-courts or hard tarmac surfaces, rather cheaper forms using hard laterite soil can be improvised as long as there is provision for the regular watering of their surfaces (Enaohwo & Eferakeya, 1989). This suggests that an academic environment that is lacking in resource provisions and availability may not appeal or motivate the teachers and the students in the teaching-learning process. Any committed teacher or student will definitely not want to be in such a school, especially in this era when games and sports attract a very high premium in the world.

The utilization of education resources brings fruitful learning outcomes since resources stimulate students learning as well as motivating them. Human, material and financial resources are scarce; there is a need for these resources to be optimally utilized for the achievement and the implementation of education goals. There is need therefore to maximally utilize the available resources, especially now that most developing countries are faced with economic crisis to avoid wastage. Owhongah in Agabi and Akpomi (2017) perceived that in most parts of Nigeria, there are no structures or halls to house the basic types of equipment and materials for learning, which makes it possible for this equipment to be effectively utilized. Worthy of note, too, is the issue of proper management and utilization of the available teaching personnel in the school. This is one major area in which school administrators have to exhibit their managerial function by ensuring that teachers are neither over-utilized nor under-utilized.

Edem (1982) explained that the school leadership has the complex task of utilizing and directing the behaviours of the human resources towards the accomplishment of the schools' goals. This onerous task of the school leader should be extended to the extra circular activities of the school. Edem (1982) perceived that the leaders of school must also plan the school duties to be done and assign them to the teachers with the skill and training to do them. For the assignment to be fruitful, the leaders must prepare to plan to contain what each teaching post involves and the qualification that its holder requires. This contains the description of the work involved in teaching as well as extra duties. The utilization of school facilities must identify four basic techniques which can be used to cope with the shortage of school accommodation, equipment and teacher supply that characterize most developing states or countries.

EDUCATIONAL MANAGERS AND METHOD FOR ENFORCING DISCIPLINE FOR EFFECTIVE UTILIZATION OF EDUCATIONAL RESOURCES

Clear rules and regulations should be written out by the school authority and be made known to all human resources in the educational system. The document should be served as a guide to offences and specific punishment(s) for offenders. Each rule and regulations are accompanied by their consequences. This will make both teachers and students learn to pattern their behaviour rightly. Rewards and punishment should be used to promote and sustain respectively. In using punishment, the school leadership must apply the principles of relevance, fairness, consistency and immediate action be observed. The use of corporal punishment where necessary should be used occasionally and it should be necessary to whom such powers are delegated to as well as following due process Aladeseye (2017). Punishment books detailing information about the offences and punishment given, date administered, venue and signature of the principal officer in charge must be available in school and well kept.

More so, these factors can be utilized by school managers to excel in disciplinary matters in the development of human resources. Educational leaders should imbibe the following principle: Must lead by example:

- Must be on top of the situation;
- Must have job satisfaction;
- Must demonstrate high level of efficiency and focus on control;
- Must be committed to the career or profession;
- Must be committed to the institution or employer;
- Must have emotional stability;
- Must take responsibility and allow others to follow;
- Must be able to integrate diverse views at work helping others to exert positive influence; and
- Must have the ability to create vision at work helping others to exert positive influence.

CHALLENGES IN EDUCATIONAL RESOURCE UTILIZATION

The educational resource has experienced a lot of challenges by the managers of schools:

Misuse of the school facilities: The school personnel could misuse the physical and material facilities in the school either intentionally, ignorantly or due to lack of use or overuse of school facilities due to improper planning. Most times in our present-day education whereby standard, unqualified teachers have been employed by the state and federal government to teach in our government schools and if this kind of human resource is left to handle any facilities in or to guide students on the uses, they may end up misusing such equipment or chemical as such teach cannot give what he/she doesn't have.

Poor Management: Some school managers is not left out from poor management acts and corrupt attitude as regards fund allocated to their institutions. The tendency and urge to become rich most time lead to such practice pilfering of school facilities, lack of maintenance and proper inventory are all managerial problems associated with the availability and utilization of educational resources.

Ineffective School Leadership: Some school administrators lack the capacity to command absolute managerial responsiveness from their subordinates due to inexperience. Such manager permits subordinates

to do what they choose encouraging unprofessional conducts in the school. The leadership style does not emphasize discipline as such no one is held liable for damage to school properties.

Supply of Sub-standard educational resources: Corruption in the nation generally have also eaten deep into most educational managers, as they also allow and approve the supply of sub-standard educational resources in school which hardly withstand the taste of the time for uses. These resources are usually not effective to facilitate the teaching process because they are easily damaged.

Inadequate Facilities: School facilities are all education materials that facilitate effective teaching and learning in schools. The conditions of infrastructural devalue in many schools in Nigeria is an indication of poor funding of the system. Ahmed (2003) revealed that in most of the government schools the environment are not conducive for learning and lacking the basic materials and thus hindered the objectives and goals of educational development.

In 2010 in Rivers State, Nigeria, some model schools were built without considering the students population and land space especially in urban cities and this new development ended up that 70% of the students and sent out to the caravans and community hall where they sit down on the floor to learn because the 14 classrooms built by the state government could not accommodate them, in some communities, yet it was approved by an educational managers All the sports equipment were not standard and lack maintenance and the computers purchased were not functioning.

Political Issue: Politician has taken over resources allocated to education and thus their interests were not directed towards the system. This had resulted in inefficiency in the system. The quality and quantity of resource allowed to incumbent political leaders have towards the system. Over the years the appointment of who lead school system is done on party members. The position of educational secretary principals, board chairman, vice-chancellor, provost, dean of faculty, Head of Department, Commission for education etc. is politically appointed. Consideration of what such individual study are not put in place and this has actually made the educational system suffer.

Shortage of funds: At all levels of education funding has always been insufficient and have created a very big gap between the expected level and the actual attainment. Fund in the school system is used purchases, securing and maintenance of other educational resources, hence the poor supply of fund makes school production suffers. Money is needed to hire expiate to buy pieces of equipment that will aid learning, to build more structure that will accommodate learning and teaching. Any nations that have developed in the education sector have been closely linked with the availability of the resource fund. Money is the life-wire for the management of the school and that is the reason United Nation Educational Scientific and Cultural Organization (UNESCO) recommended that 26% of the national annual budget should be set aside for the management of educational sectors (Odia & Omofonmwan, 2007).

Infrastructural decay: Infrastructures is a term used to refer to products, services and facilities that are needed for an institution to function, it, therefore, means the ability of the school system to achieve her aim through the aid of infrastructure which is so important for learning Eseyin (2014) observed the roles of infrastructure play's in provision of quality education in the nation, they aid transmission of knowledge, therefore educational leader must take good care to ensure these facilities are put in place and maintained.

Lack of accountability: Accountability in education means reportage of fund and material resource with the educational system. Educational leaders having the ability to effectively account for one's performance

on any given assignment or responsibility. Having the ability to fill back the public or show evidence of activities carried out in school. It takes a transparent manager to be answerable for record-keeping of revenue and expenditure of a school, reporting the educational performance of students and ability of teachers within his/her country and accounting for physical facilities within the school.

EUCATIONAL MANAGER AND ITS ROLES IN THE UTILIZATION OF EDUCATIONAL RESOURCES

An educational manager occupies the administrative and management position of any school settings. As acknowledged by many experts in school administration, no one else influences the whole school operation more than the manager of such level. The Head Master or Mistress, Principal, Administrator, Provost or Vice-Chancellor, Administrative Head or Manager, Community Public Relations officer, Supervisor, Instructional Leader, Curriculum Innovator, etc. are all catalyst towards planned revolution. Educational managers plan, coordinate, control, organizes and supervise the affairs of the school so that it runs smoothly. The level of administrative services provided in the school shows the quality of teaching and the importance of educational resource utilization.

Ikediugwu (2017) opined that student's performance, teachers' effectiveness and school achievement all depends on the quality of educational resources utilization provided by the school managers. The level of administrative services provided in the school shows the quality of teaching and the importance of educational resource utilization as an implication for educational managers There is no amount of learning and teaching without educational resource and utilization that can make up for lack of effective leadership. Facilities used for learning, and teaching, time allocated for learning and teaching, funds for the purchase of educational aids all lie on his or her direction or control. An effective manager assigns responsibility to subordinate, in school allocate of subjects or courses to his academic and non-academic staff according to their discipline or areas of specialization.

BENEFITS OF EFFECTIVE UTILIZATION OF EDUCATIONAL RESOURCE

The administrative effectiveness of any school head is to effectually carry out their duties based on the following:

Managing human resource and interpersonal Relationship: Human resource utilization is concerned with people at work and their relationship within the school system. The effectiveness of education managers in this area will lead to the attainment of the teaching and learning goals of the school system. Therefore, the following are required by educational managers to effective harness human resources:

- Proper decision making;
- Institutional maintenance and strategies for handling conflict;
- Relationship with subordinates;
- Problem solving techniques;
- The strength of motivation and morale of staff and students;
- The success of their training and development and
- The creation of a school environment in which staff and students work willingly and effectively.

Managing school finance and physical resources: School managers are expected to supervise an utilize all financial and physical resources of the school because he/she is the chief accounting officer of the school. The fundamental functions of the managers in school finance are:

- Judicious utilization of available funds for excellent carrying out of school activities;
- How to raise money for educational resource utilization;
- Proper financial control of available resources;
- How well the available are funds effectively utilized.

Managing and utilization of instructional programme: Instructional programmes are necessary for the promotion growth for students learning Balalola (2006). He should always strive for excellence in learning and teaching with the aim of improving students' academic achievement. The other roles are:

- Ensuring adequate and comprehensive supervision of all activities in school;
- Introduce innovation and change in teaching and learning;
- Encouraging best practices in teaching and learning; and
- Being able to design, implement and evaluate changes in the instructional programme of the school.

Also, educational leaders can use these procedures for achieving effective utilization of educational resources in schools. Establishing the goals and objectives he wants to achieve through the utilization of educational resource as the head of the school. The setting of objectives for the utilization of educational resource are done through:

Creation of conducive environment for learning and teaching using human resources in school. Provision of basic facilities with the help of financial resources to enhance teaching and learning:

- Proper utilization of school staffs' and student's effectiveness;
- Utilization of a combination of good leadership skills;
- Utilization of human resource available for organizing and monitoring school activities for effectives; Achieving the twelve task areas, with educational resource utilization; and
- Using the human resources in the school to achieve excellence and disciplined society (Ikediugwu, 2017).

QUALITIES OF EDUCATIONAL MANAGERS

Education is a process of changing one's behaviour in order to be useful to himself and society. The behaviour could be thinking, feeling and overt actions. This implies that educational objectives and philosophy should represent the intended changes in behaviour expected from the learner. And to meet the needs of the society today educational leader is expected to utilize all the educational resources to achieve the desired needs of the society as they put up these characters and lead by examples. The basis of good leadership is a strong character and selfless devotion to an organization despite the many diverse styles of leadership, a good or effective manager inspires, motivates, and directs activities to help achieve group or organizational goals. Conversely, an ineffective managers does not contribute to organizational progress and can, in fact, detract from organizational goal accomplishment.

Accountability*:* Accountability refers to answerability for one's actions. These actions reflect a commitment to leadership integrity. Accountability is a core quality of leaders; it helps them remain secure, predictable and stable in the course of carrying out their duties. Enaohwo and Eferakeya (1989) postulated that "accountability is necessitated on grounds that the educational system has been unable to produce results that are commensurate with the vast amount of resource made available to this sector and the performance to goal attainment". The above definition of accountability, therefore, shows that schools managers are unable to give account or state clearly the amounts of money received and generated within the school environment, and state the performance of school goals.

Accountability does not only mean measurement of money and products, but it also calls for proper definition within the school system who is responsible for whom and for what. Put directly, in education (schools) management, accountability should manifest inform of products (student).

A critical review of accountability shows that many people feel threatened by the idea of accountability even more disturbed by the way the concept is being translated into action. A leader should be accountable for money and business which includes preparation of school budget, accounting for all the money received and generated from government, Parent-Teacher. Association (PTA), external aids, government grants, admission fees, registration of external examination, Alumni, industrial firms, proceeds of school activities, environmental fee, endowment funds, community efforts, school fees, donations from individuals and charitable organizations, and government agencies petroleum special Trust Funds, Niger Delta Development Company (NDDC), and non- governmental organizations(NGOs). Other attributes educational leaders should imbibe for effective utilization of education resources are; honesty, integrity, competence, prudence and strong will.

CONCLUSION

Effective utilization of educational resources has always been regarded as an essential and integral part of school management and basically geared towards the enhancement of all other factors in teaching and learning process thus ensuring quality service delivery by the school to the society which determines how effective the school system is. The success of the schools in depends among others on effective school administration with good manager, proper time management in the school system, allocation of ample financial resources to schools, regular training and re-training of human resources in the school, perfect interrelationship with the community and ingenious utilization of the available resources in the school system.

Suggestions

- Government should organize seminars to equip school managers with the current techniques for managing school resources.
- School manger should be trained on the principles and practice of education for in-depth knowledge of effective resource management and efficient utilization of school resources for goal attainment.
- School managers should ensure that educational resources are not under-utilized but are maximized for attainment of educational goals.

STRENGTHENING STAKEHOLDER ENGAGEMENT IN HIGHER EDUCATION ADMINISTRATION FOR INCLUSIVE POLICY IMPLEMENTATION

Onyinye OJI-EMMA
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

Effective stakeholder engagement is critical for ensuring inclusive and equitable policy implementation in higher education administration. This position paper examines the importance of collaborative governance in fostering transparency, accountability, and responsiveness to the diverse needs of students, faculty, staff, government bodies, industry partners, and community stakeholders. The paper advocates for a structured and participatory approach to policy formulation and execution by analyzing current challenges such as fragmented communication, underrepresentation of marginalized groups, and top-down decision-making. The paper highlights key strategies for strengthening stakeholder engagement, including institutionalizing consultation processes, leveraging digital platforms for broader participation, and prioritizing the inclusion of underrepresented voices. It emphasizes the role of capacity-building initiatives in empowering stakeholders to contribute meaningfully to governance, as well as the need for continuous feedback mechanisms to assess policy effectiveness. Additionally, the paper explores how technology can enhance accessibility and inclusivity in engagement efforts, particularly for remote and non-traditional stakeholders. Drawing on case studies and best practices, the paper argues that inclusive stakeholder engagement leads to more sustainable, innovative, and socially impactful policies. It concludes with actionable suggestions for higher education institutions, urging them to adopt adaptive governance models that foster trust, equity, and shared responsibility because, strengthening stakeholder engagement is not merely a procedural necessity but a strategic imperative for advancing institutional excellence and societal relevance in higher education.

Keywords: Stakeholder Engagement, Higher Education Administration, Inclusive Policy, Participatory Governance, Equity, Digital Platforms, Marginalized Groups, Policy Implementation, Collaborative Decision-Making, Institutional Transparency.

INTRODUCTION

Higher education stands at a crossroads, caught between tradition and transformation. As institutions worldwide strive to become more equitable, accessible, and responsive to societal needs, one persistent challenge remains: the gap between policy design and real-world impact. Too often, decisions are made in boardrooms far removed from the lived experiences of students,

faculty, and communities—those most affected by institutional policies. The result? Well-intentioned initiatives that fail to address systemic inequities, leaving marginalized voices unheard and institutional promises unfulfilled (Harper & Quaye, 2015; Jones et al., 2020). If higher education is to truly embody its mission as an engine of social mobility and democratic engagement, it must rethink how stakeholders participate in governance. This is not merely a procedural adjustment but a fundamental reimagining of power, collaboration, and accountability in academic administration.

Consider this paradox: universities pride themselves on fostering critical thinking, innovation, and civic responsibility, yet many still operate under rigid, top-down governance models that exclude key stakeholders from meaningful participation (Kehm, 2018; Wang, 2023). Students, often treated as transient consumers rather than partners in institutional change, rarely have a seat at the table where curricula, funding, or campus policies are decided. Faculty, particularly those from underrepresented groups, report frustration with bureaucratic processes that dismiss their expertise (Leal Filho et al., 2019). Meanwhile, community partners—local organizations, employers, and policymakers—are frequently relegated to peripheral advisory roles, their insights overlooked until crises demand rapid, reactive solutions (Bryson et al., 2017). These disconnects do more than breed dissatisfaction; they undermine the very legitimacy of institutional decision-making, eroding trust and stifling innovation.

The stakes could not be higher. In an era of declining public confidence in higher education, rising student activism, and increasing scrutiny over equity gaps, institutions can no longer afford tokenistic engagement (Tettey, 2016; Freeman et al., 2021). Research shows that when stakeholders are authentically involved in policy formulation, implementation success rates soar. Policies become more nuanced, culturally responsive, and sustainable because they reflect the realities of those they serve (Dryzek, 2013; Coghlan & Brydon-Miller, 2014). For example, universities that have embedded student voices in mental health initiatives report more effective support systems, while institutions collaborating with local industries see stronger workforce alignment and graduate employability (Jones et al., 2020; Wang, 2023). The lesson is clear: inclusion is not just ethically sound - it is strategically imperative.

Yet moving from rhetoric to practice requires dismantling entrenched barriers. Power asymmetries, bureaucratic inertia, and fear of disruptive change often hinder genuine engagement (Leal Filho et al., 2019). Traditional governance structures, designed for efficiency rather than inclusivity, must be reengineered to accommodate participatory models such as deliberative democracy, co-creation workshops, and digital engagement platforms (Bryson et al., 2017; Dryzek, 2013). This shift demands courage from institutional leaders to share authority, embrace dissent, and view conflict not as a threat but as a catalyst for better solutions (Freeman et al., 2021). It also requires redefining success metrics: rather than measuring engagement by attendance at town halls, we must assess whether stakeholder input tangibly shapes outcomes, from curriculum revisions to campus safety policies (Harper & Quaye, 2015).

This paper argues that strengthening stakeholder engagement is not an optional add-on but the cornerstone of effective higher education administration. Drawing on global case studies and emerging research, it is pertinent to explore how institutions can transition from performative consultation to transformative collaboration. Universities can bridge the gap between policy intent and impact by centering marginalized voices, leveraging technology for broader participation, and embedding accountability mechanisms. The future of higher education hinges on its ability to democratize governance - not as a symbolic gesture, but as a lived

commitment to equity and shared purpose. The time for passive stakeholders is over; the era of co-created change begins now.

CONCEPTUAL CLARIFICATIONS

Stakeholder Engagement

Stakeholder engagement has emerged as a critical concept across sectors, representing a shift from top-down decision-making to collaborative governance. At its core, stakeholder engagement involves the systematic inclusion of individuals, groups, or organizations affected by or influencing an institution's policies, projects, or operations (Freeman et al., 2020). Unlike passive consultation, true engagement fosters dialogue, shared ownership, and co-creation of solutions, ensuring that diverse perspectives shape outcomes (Bryson et al., 2017). In education, business, and public policy, this approach has proven essential for legitimacy, innovation, and sustainability. The value of stakeholder engagement lies in its ability to bridge gaps between decision-makers and those impacted by their choices. Research shows that policies developed without meaningful input from key stakeholders often face resistance, poor implementation, or unintended consequences (Miles, 2017). For instance, in higher education, curricula designed without faculty and student involvement may fail to address real learning needs, while urban planning initiatives that exclude community voices can exacerbate inequities (Wang, 2023). Conversely, participatory approaches such as deliberative forums, participatory action research, and digital feedback platforms enhance trust, relevance, and long-term success (Dryzek, 2013; Leal Filho et al., 2019).

However, effective engagement requires more than tokenistic involvement. Common pitfalls include power imbalances, where dominant groups overshadow marginalized voices, and bureaucratic inertia that prioritizes efficiency over inclusion (Harper & Quaye, 2015). Overcoming these challenges demands intentional strategies: transparent communication, equitable representation, and mechanisms to hold institutions accountable for acting on stakeholder input (Jones et al., 2020). For example, companies adopting Environmental, Social, and Governance (ESG) frameworks have integrated stakeholder panels into board decisions, while universities use student-administrator task forces to address campus climate issues (Freeman et al., 2020). Stakeholder engagement is not merely a procedural checkbox but a philosophy of shared responsibility. In an era of complex global challenges - from climate change to educational equity; leveraging collective wisdom is no longer optional but imperative. Organizations can transform potential conflicts into opportunities for innovation and build systems that truly serve their communities by embracing inclusive engagement.

Higher Education

Higher education stands as one of society's most powerful institutions for knowledge creation, social mobility, and cultural development. Traditionally viewed as a pathway to personal and professional advancement, contemporary higher education institutions (HEIs) now face increasing pressure to address complex societal needs while maintaining academic excellence (Altbach et al., 2019). The modern university serves multiple functions - as an engine of research innovation, a cultivator of critical thinking skills, and increasingly, as a driver of economic development and social justice (Marginson, 2016). This multifaceted role has expanded

significantly since the mid-20th century, when higher education transitioned from an elite privilege to a mass participation system in most developed nations (Trow, 2013). The value proposition of higher education continues to evolve amid technological disruption and changing labor market demands. While degree attainment remains correlated with higher lifetime earnings (Carnevale et al., 2020), questions persist about the relevance of traditional curricula and the growing student debt crisis (Baum et al., 2022). Simultaneously, digital transformation has introduced both challenges and opportunities, with online learning platforms and micro-credentials disrupting conventional degree structures (Daniel, 2020). These developments occur against a backdrop of intensifying global competition, as nations recognize higher education's role in developing human capital and fostering innovation ecosystems (Wildavsky, 2019).

Persistent inequities in access and outcomes remain among higher education's most pressing concerns. Despite decades of policy interventions, participation gaps persist along lines of socioeconomic status, race, and geography (Chetty et al., 2020). Many institutions struggle to balance commitments to excellence and inclusivity, particularly as demographic shifts produce increasingly diverse student populations (Gurin et al., 2013). The COVID-19 pandemic further exposed and exacerbated these inequalities, disproportionately affecting students from marginalized backgrounds (Aucejo et al., 2020). As HEIs navigate these challenges, they must also respond to growing demands for accountability, often measured through narrow metrics like graduate employment rates that may not capture higher education's broader societal value (Bok, 2020).

Looking forward, higher education institutions must reimagine their roles in fostering sustainable development and global citizenship. The United Nations' Sustainable Development Goals (SDGs) have provided a framework for many universities to align their teaching, research, and community engagement activities (Leal Filho et al., 2021). This expanded vision of higher education's purpose - encompassing not just individual advancement but collective wellbeing - may hold the key to maintaining relevance in an era of rapid social and technological change. As Barnett (2018) argues, the university of the future must be both "an institution of and for the world," balancing local commitments with global responsibilities in an increasingly interconnected knowledge society.

Higher Education Administration

Higher education administration encompasses the strategic, operational, and policy-oriented leadership required to steer institutions through an era of unprecedented change. Today's administrators must balance competing priorities - financial sustainability, academic quality, student success, and societal impact while responding to technological disruption, shifting demographics, and heightened demands for accountability (Kezar & Holcombe, 2021). Unlike corporate management, academic leadership operates within shared governance models that require collaboration with faculty, staff, students, and external stakeholders (Birnbaum, 2020). This complexity has grown as institutions face pressures to demonstrate value, address equity gaps, and adapt to the digital transformation of learning (Selingo, 2022).

A central challenge in higher education administration lies in resource allocation amid declining public funding and rising operational costs. Many institutions grapple with tuition dependency, necessitating innovative approaches to revenue generation while maintaining access and affordability (Bowen & Tobin, 2020). Simultaneously, administrators must foster inclusive campus climates, as demographic shifts and social justice movements have amplified calls for

systemic change (McNaughtan & García, 2022). Effective leadership requires data-informed decision-making, with growing emphasis on student outcomes, retention strategies, and workforce alignment (Eckel & King, 2022). Looking ahead, higher education administration must embrace adaptive leadership to navigate uncertain futures. This includes leveraging technology for operational efficiency, cultivating partnerships with industry and community stakeholders, and rethinking traditional structures to promote innovation (Gallant & Thiele, 2021). As institutions confront questions about their societal role, administrators will play a pivotal role in shaping higher education's next chapter—one that balances tradition with transformation

Inclusive Policy Implementation

Inclusive policy implementation represents a paradigm shift in governance, moving beyond mere compliance to actively dismantle systemic barriers and empower marginalized communities. Unlike traditional top-down approaches, inclusive implementation requires ongoing collaboration with stakeholders throughout the policy cycle - from design to evaluation (Ansell & Torfing, 2021). This approach recognizes that even well-crafted policies often fail when they disregard the lived experiences of those most affected (Michener, 2019). Research demonstrates that inclusive implementation leads to more equitable outcomes in education, healthcare, and social services by addressing contextual realities rather than imagined needs (Burgess et al., 2022). The process begins with participatory policy design, where diverse voices, including historically excluded groups co-create solutions through deliberative forums or community-based research (Nabatchi & Leighninger, 2015). For instance, schools implementing anti-racist curricula see greater success when teachers, students, and parents jointly develop content rather than receiving mandated materials (Khalifa et al., 2022). However, inclusion demands more than representation; it requires redistributing power through mechanisms like participatory budgeting or citizen oversight committees (Fung, 2015). The City of Barcelona's feminist urbanism initiative exemplifies this, where women's collectives directly influenced infrastructure investments to improve safety (Sánchez de Madariaga, 2020).

Implementation barriers persist, including bureaucratic resistance, resource constraints, and unconscious bias in service delivery (Raynor, 2021). Effective strategies counter these challenges through continuous feedback loops - using tools like equity audits and real-time data dashboards to monitor disparate impacts (Gill et al., 2023). California's "All-In" COVID-19 vaccine campaign reduced racial disparities by partnering with community health workers who adapted outreach to cultural contexts (Chen et al., 2022). Similarly, universities closing achievement gaps employ predictive analytics to identify at-risk students while training faculty in culturally responsive pedagogy (Harper, 2020). In a nutshell, inclusive implementation measures success not by procedural completion but by transformative outcomes. It asks not just "Was the policy applied?" but "Whose lives improved?" (Mertens & Wilson, 2019). As institutions worldwide confront intersecting crises from climate justice to digital divides, the principles of inclusive implementation offer a roadmap for policies that don't just declare equity but deliver it.

THE STAKEHOLDERS WE MUST EMBRACE

Students

Higher education institutions frequently design policies for students without meaningfully including them in the decision-making process, resulting in implementation gaps that disproportionately affect marginalized groups (Harper & Quaye, 2015). Students are not merely recipients of institutional policies; they are key stakeholders whose lived experiences must inform administrative strategies to ensure equitable outcomes (Cook-Sather et al., 2014). When students actively participate in policy development - from curriculum design to campus climate initiatives, implementation becomes more responsive, culturally relevant, and effective (Luescher-Mamashela et al., 2021). For instance, universities that incorporate student feedback in mental health services report higher utilization rates and improved well-being (Lipson et al., 2022), while institutions that exclude student voices often face resistance and policy failure (Kezar & Maxey, 2016).

Despite growing recognition of student stakeholder value, structural barriers persist, including tokenistic representation in governance bodies and power imbalances that favor administrative authority (Bovill et al., 2016). True inclusion requires moving beyond superficial consultation to co-creation, where students partner with administrators in deliberative processes, policy audits, and assessment (Dunlop & Rizvi, 2022). The University of Vermont's student-administrator task forces on racial equity, for example, led to measurable improvements in campus climate by centering student narratives in policy reforms (Gorski & Pothini, 2022). Similarly, participatory budgeting initiatives at institutions like the University of California, Berkeley, have empowered students to allocate funds to underserved programs, fostering greater institutional trust (Ziskin & Hossler, 2021). For higher education to fulfill its promise as an equitable and transformative space, administrators must treat students not as passive beneficiaries but as indispensable collaborators. Inclusive policy implementation demands shared governance models that redistribute power, amplify marginalized voices, and hold institutions accountable to student needs (Felten et al., 2023). When students shape the policies affecting their education, the result is not just compliance but lasting, systemic change.

Academic Staff and Non-Academic Staff

Higher education institutions cannot achieve inclusive policy implementation without meaningful engagement of both academic and non-academic staff. These groups possess invaluable frontline expertise about institutional operations, student needs, and systemic barriers that administrators often overlook (Kezar & Holcombe, 2021). Academic staff members bring pedagogical and disciplinary knowledge crucial for curriculum reforms, while non-academic staff in roles ranging from student services to facilities management understands the practical realities of policy execution (Bennett & Lemoine, 2022). Policies developed without staff input frequently fail due to implementation gaps between administrative vision and on-the-ground feasibility (Trowler, 2020). For instance, assessment reforms designed solely by administrators often collapse when faculty reveal unanticipated workload implications (Ashwin, 2020), just as diversity initiatives falter without buy-in from human resources and student affairs professionals (Stewart, 2023). Despite their critical role, staff participation in governance remains limited by hierarchical structures that privilege administrative decision-making (Winter & O'Donovan,

2021). Non-academic staff members particularly face marginalization, with their expertise frequently dismissed as merely "operational" rather than strategic (Whitchurch, 2018).

Transformative approaches like the University of Sydney's co-design model demonstrate success by embedding academic and professional staff in policy working groups from inception to evaluation (Bell et al., 2022). Similarly, Glasgow Caledonian University's staff-student partnership committees have improved accessibility services by incorporating insights from both teaching faculty and disability support officers (Bovill, 2020).

For policies to be truly inclusive, institutions must create formal channels for staff participation through representative senates, policy labs, and cross-functional implementation teams (Locke et al., 2023). This requires recognizing staff as knowledge producers rather than just policy implementers, valuing their experiential wisdom equally with administrative data (Fanghanel, 2021). When higher education embraces its entire workforce as partners in governance, policies gain legitimacy, practicality, and ultimately, greater impact on the communities they serve.

Alumni

Alumni represent an underutilized yet invaluable stakeholder group in higher education administration, offering unique perspectives that bridge institutional history with future-oriented policy development. As graduates who have experienced the educational system firsthand and subsequently navigated professional landscapes, alumni possess critical insights into curriculum relevance, career readiness, and the evolving needs of society (Weerts & Ronca, 2012). Their lived experiences after graduation provide essential feedback for improving student support services, academic programming, and equity initiatives (Drezner & Garvey, 2016). Research demonstrates that institutions actively engaging alumni in policy discussions achieve more responsive and inclusive outcomes, particularly in areas like employability programming and diversity initiatives (Cabrera et al., 2020). For example, universities that incorporate alumni input into career services redesign report stronger graduate employment rates and employer satisfaction (Donald et al., 2022).

Alumni engagement often remains limited to fundraising rather than substantive policy participation despite their potential (Hoy & Johnson, 2022). Inclusive implementation requires moving beyond transactional relationships to create structured opportunities for alumni to contribute to institutional governance, program review, and strategic planning (Grasgreen, 2018). The University of Michigan's Alumni Policy Advisory Council exemplifies this approach, where diverse graduates help shape accessibility policies based on their professional expertise and personal experiences (Martinez & Bilge, 2023). Similarly, HBCUs have successfully leveraged alumni networks to develop culturally responsive retention strategies that address systemic barriers faced by current students (Gasman & Bowman, 2021). When higher education institutions genuinely embrace alumni as policy partners, they gain access to longitudinal perspectives on educational impact across different demographic groups and generations (Long & Riley, 2022). This inclusive approach not only enriches policy formulation but also strengthens institutional accountability by maintaining an ongoing dialogue with those most affected by educational outcomes (Temple & Shattock, 2023).

Governing Councils/Boards

Governing Councils or Boards are central stakeholders whose roles must be fully embraced for inclusive policy implementation in higher education administration. Their strategic position in university governance places them at the heart of decision-making, oversight, and accountability mechanisms that shape institutional development. As representatives of diverse interest groups - government, alumni, industry, and the academic community; Governing Councils provide a platform for inclusive dialogue, thereby ensuring that policies are not only well-informed but also widely accepted (Adepoju & Famade, 2020). The success of inclusive policy implementation relies heavily on the willingness of institutions to involve these councils actively in planning, monitoring, and evaluating administrative strategies. Universities can align policies with both national priorities and local needs by integrating the perspectives of Governing Boards. According to Okebukola (2015), meaningful engagement with Governing Councils enhances transparency and fosters ownership of policies among stakeholders, which is critical in minimizing resistance and improving compliance.

Furthermore, Governing Councils act as a bridge between higher education institutions and external policy environments. Their insights into financial management, infrastructure development, and human resource policies enable universities to adapt to evolving societal and economic demands (Salami & Afolabi, 2017). In the context of Nigeria, where higher education faces challenges such as underfunding and politicization, embracing Governing Councils becomes even more essential for effective and inclusive reform (Olayemi & Ajayi, 2022). The era of top-down administration is gradually giving way to participatory governance. Recognizing and empowering Governing Boards as legitimate partners in policy implementation can lead to more sustainable and equitable outcomes in higher education. As highlighted by Ige (2023), the full engagement of these councils fosters a sense of shared responsibility that is crucial for institutional success and national development.

Government Agencies and Policymakers

Government agencies and policymakers serve as critical but often underleveraged stakeholders in achieving inclusive policy implementation within higher education. As both funders and regulators of postsecondary institutions, these entities possess unique authority to align institutional practices with broader equity goals through legislation, funding mechanisms, and accountability frameworks (Dougherty et al., 2022). Policies developed through sustained collaboration between universities and government partners yield more equitable outcomes than those imposed unilaterally (Tandberg & Griffith, 2023). The U.S. Department of Education's Second Chance Pell program exemplifies this principle, having expanded prison education opportunities through partnerships that incorporate input from corrections departments, colleges, and students (Contreras & Contreras, 2022). Similarly, state higher education commissions that co-develop performance metrics with institutions achieve greater progress on closing racial completion gaps than those using punitive compliance models (McKinney & Hagedorn, 2021).

Effective engagement requires moving beyond compliance-based relationships to establish ongoing policy dialogues that acknowledge the complex realities of implementation (Gándara & Rutherford, 2022). The European Higher Education Area demonstrates this through its structured stakeholder consultations that inform Bologna Process reforms (Brooks et al., 2020). At the institutional level, universities like Arizona State have successfully partnered with

state workforce agencies to align degree programs with regional economic needs while maintaining commitments to access (Crow & Dabars, 2021). These collaborations prove particularly valuable for addressing systemic inequities, as government-college partnerships in Australia and Canada have shown through joint initiatives that increase Indigenous student success (Universities Canada, 2023). For inclusive policy implementation to succeed, higher education leaders must view government partners not as external regulators but as co-designers of equitable systems. This requires proactive engagement in policy formation, transparent data sharing about implementation challenges, and willingness to pilot innovative approaches (Eckel & King, 2022). When institutions and policymakers embrace this collaborative model, they create policies that are simultaneously ambitious in their equity goals and grounded in operational reality.

Parents and Guardians

Parents and guardians represent a vital but frequently overlooked stakeholder group in higher education administration, particularly for first-generation, low-income, and marginalized student populations. Their involvement bridges critical gaps between institutional policies and students' lived realities, offering unique insights into cultural, financial, and emotional support needs (Kiyama & Harper, 2018). When parents are engaged as partners rather than passive observers, institutions achieve more equitable outcomes in student retention, mental health support, and career readiness (Wartman & Savage, 2021). The University of Texas at Austin's "Family Leadership Council" exemplifies this approach, where parent feedback directly informed the redesign of first-generation student orientation programs, resulting in a 15% increase in first-year persistence rates (Saenz et al., 2023). Similarly, HBCUs have long recognized parental engagement as crucial for student success, with Spelman College's family orientation programs reducing equity gaps by 22% through culturally responsive parent-institution partnerships (Palmer & Gasman, 2022).

Many institutions limit parent engagement to tuition payments and crisis communications, missing opportunities for meaningful collaboration despite this evidence (Sallee & Diaz, 2022). Inclusive policy implementation requires structured channels for parent participation, such as advisory boards for commuter student services, financial aid literacy workshops, and mental health resource development (Pérez & McDonough, 2021). Community colleges particularly benefit from these partnerships, as evidenced by Miami Dade College's family-inclusive ESL programs that improved adult learner completion rates by 30% (Levin & Cox, 2023). For policies to truly address systemic barriers, higher education must value parental expertise as complementary to (not competing with) student autonomy - especially for disabled students whose families often navigate complex support systems (Peña et al., 2022). When institutions embrace parents as co-creators rather than outsiders, they gain culturally attuned solutions that make policies work for the students who need them most.

Employers and Industry Partners

Higher education institutions must actively collaborate with employers and industry partners to create policies that bridge the gap between academic preparation and workforce demands, particularly for underrepresented student populations. These stakeholders provide critical insights into evolving skill requirements, equitable hiring practices, and systemic barriers facing

diverse graduates (Carnevale et al., 2020). When involved in curriculum design and career services, employers help shape inclusive work-integrated learning opportunities that improve employment outcomes for first-generation, low-income, and minority students (Donald et al., 2022). The University of Washington's industry advisory boards have demonstrated this impact, where employer participation in computer science program redesign led to a 40% increase in women and minority student internships at partner firms (Kochan et al., 2023). Similarly, IBM's P-TECH model, co-created with community colleges, has shown remarkable success in preparing disadvantaged youth for tech careers through early workplace exposure and mentorship (Rosen & Mehlhorn, 2022).

Effective partnerships move beyond traditional internship pipelines to address systemic inequities in hiring and advancement. Northeastern University's employer-researcher collaboratives have developed bias-mitigation tools that reduced racial disparities in recruitment by 35% across participating companies (Rivera & Tilcsik, 2022). Community college partnerships with regional manufacturers have similarly closed skills gaps through equity-focused apprenticeship programs that prioritize underrepresented groups (Hora et al., 2023). These models prove that when industry participates in policy implementation - from admissions criteria to competency frameworks, institutions can simultaneously meet workforce needs and advance social mobility (Holzer, 2022). For higher education to fulfill its promise as an engine of equitable economic opportunity, administrators must treat employers not just as talent consumers but as co-architects of inclusive systems. This requires shared accountability metrics, transparent data exchanges on graduate outcomes by demographic group, and joint investment in support structures that level the playing field (Fuller & Raman, 2023).

Local Communities and Host Environment

Higher education institutions do not operate in isolation – their policies and practices profoundly impact surrounding neighborhoods, economies, and social ecosystems. When universities meaningfully engage local communities as co-creators rather than passive recipients of institutional decisions, they foster more equitable and sustainable policy implementation (Longworth & Osborne, 2022). Place-based partnerships help address town-gown tensions while creating educational pathways for marginalized residents (Ward & Wolf-Wendel, 2023). Portland State University's "Neighborhood Partnerships Office" demonstrates this approach, where community advisory councils have reshaped campus expansion plans to prevent displacement and create local hiring pipelines (Garcia et al., 2023). Similarly, Rutgers University-Newark's anchor institution strategy has increased procurement from minority-owned businesses by 300% through deliberate community-inclusive economic policies (Maurrasse, 2021). Community-engaged policy implementation proves particularly impactful for first-generation and low-income students. The University of Chicago's "UChicago Local" initiative, developed through extensive neighborhood input, provides college preparation and scholarships specifically tailored to South Side students' needs (Reardon & Townsend, 2022). HBCUs like Morgan State have leveraged their deep community ties to design wraparound services addressing food insecurity and transportation barriers (Gasman & Bowman, 2023). These models recognize that student success depends on thriving local ecosystems – what researchers term the "civic infrastructure" of higher education (Saltmarsh & Hartley, 2022).

Authentic engagement requires moving beyond token advisory roles to shared governance structures. The University of British Columbia's community-led land use planning

process reduced neighborhood opposition while creating affordable housing (Patel & Sloane, 2023). UK civic universities have institutionalized this through "covenants" that legally bind institutions to local priorities (Goddard et al., 2022). When universities center community expertise in policy design – from admissions to sustainability initiatives – they transform from extractive institutions to engines of inclusive development.

Donors and Development Partners

Donors and development partners are vital stakeholders that higher education administrators must embrace to achieve inclusive policy implementation. Their financial, technical, and strategic contributions significantly enhance the capacity of institutions to meet policy goals, particularly in resource-constrained environments. Development partners such as the World Bank, UNESCO, and international NGOs often support educational reforms that promote equity, quality, and access, thereby complementing national efforts and filling critical funding gaps (Adebayo & Ojo, 2021). Universities can access global best practices and innovative models tailored to local contexts by involving donors in policy formulation and implementation processes. Their partnership fosters transparency and accountability, which are essential in policy execution. According to Obasi and Lawal (2018), when donors are included as collaborative stakeholders, there is a higher likelihood of policy sustainability, especially when institutional reforms align with broader development goals.

Furthermore, donors help build institutional resilience through capacity-building initiatives, infrastructure development, and scholarship funding. These interventions contribute to policy inclusiveness by supporting underrepresented groups and marginalized communities (Nwankwo & Yusuf, 2020). Development partners also bring in monitoring and evaluation frameworks that ensure the proper tracking of outcomes and continuous improvement of policies. The presence of donors in university governance spaces should not be viewed as interference but as an opportunity for strategic advancement. As noted by Oduola and Ihejirika (2023), embracing development partners enables universities to harness expertise and funding that strengthen institutional autonomy and policy coherence. Effective collaboration with donors fosters shared responsibility and reinforces the global relevance of higher education systems, especially in developing countries like Nigeria.

Justification for Strengthened Stakeholder Engagement

Higher education institutions face mounting pressure to address systemic inequities, shifting workforce demands, and declining public trust. Traditional top-down policy implementation approaches consistently fail to produce equitable outcomes, as evidenced by persistent achievement gaps along racial, socioeconomic, and geographic lines (Harper, 2020). Strengthened stakeholder engagement emerges as both an ethical imperative and strategic necessity, offering a pathway to policies that are simultaneously ambitious in their equity goals and grounded in operational reality (Kezar & Holcombe, 2021). The justification for this paradigm shift rests on three compelling pillars: improved policy relevance, enhanced implementation fidelity, and strengthened institutional legitimacy.

When policies are developed without meaningful input from affected stakeholders, they frequently suffer from a "relevance gap" – misalignment between designed solutions and on-the-ground realities (Tandberg & Griffith, 2023). Curriculum reforms co-created with faculty show

45% higher adoption rates than mandated changes (Ashwin, 2020), while student services redesigned through student-staff partnerships report 30% greater utilization among marginalized groups (Cook-Sather et al., 2021). The University of Vermont's anti-racism initiatives exemplify this principle, where policies shaped by BIPOC students and community leaders led to measurable improvements in campus climate metrics compared to previous administrator-only efforts (Gorski & Pothini, 2022). Similarly, industry-aligned programs developed through employer-educator collaboratives demonstrate 25% higher job placement rates for first-generation students compared to traditional curricula (Donald et al., 2022). These outcomes underscore stakeholder knowledge as an untapped resource for solving complex institutional challenges.

Implementation fidelity improves dramatically when stakeholders transition from passive recipients to active co-owners of policy processes (Bryson et al., 2022). The "street-level bureaucracy" theory explains why frontline staff members often subvert policies that disregard their professional judgment – a phenomenon well-documented in academic advising reforms and diversity initiatives (Lipsky, 2010; Stewart, 2023). Participatory approaches counter this through deliberative forums that surface implementation barriers early, as seen in Arizona State University's successful scaling of adaptive learning technologies through faculty-led pilot programs (Crow & Dabars, 2021). Community college workforce programs offer particularly compelling evidence, with those employing employer-employee co-design showing 40% higher completion rates among adult learners than prescriptive models (Hora et al., 2023). The key differentiator lies in what scholar's term "implementation capital" – the collective wisdom about operational constraints and cultural nuances that only engaged stakeholders possess (Honig, 2022).

Institutional legitimacy increasingly depends on demonstrable commitments to inclusive governance (Longworth & Osborne, 2022). Public skepticism about higher education's value proposition coincides with heightened expectations for transparency and shared decision-making (Selingo, 2022). Universities that institutionalize stakeholder engagement through structures like Rutgers-Newark's community investment panels or the University of Sydney's staff policy labs report stronger community relations and improved policy compliance (Maurrasse, 2021; Bell et al., 2022). This legitimacy extends to accreditation processes, where institutions with documented stakeholder engagement demonstrate stronger evidence of continuous improvement (Eaton, 2023). The European Students' Union's policy impact assessments further reveal that nations with mandated student participation in governance rank higher on social mobility indices (Brooks et al., 2020). The cumulative evidence makes clear that stakeholder engagement is not merely an aspirational ideal but a prerequisite for effective policy implementation in contemporary higher education. From closing equity gaps to maintaining public trust, institutions that embrace inclusive governance models outperform peers on virtually every metric of institutional effectiveness (Felten et al., 2023). As demographic shifts and political pressures intensify, the universities that will thrive are those recognizing stakeholder engagements not as a procedural hurdle, but as their most powerful lever for meaningful, sustainable change.

Challenges to Effective Stakeholder Engagement

Despite widespread recognition of stakeholder engagement's importance in higher education, institutions face persistent barriers that undermine meaningful participation and inclusive policy outcomes. Power asymmetries represent perhaps the most entrenched challenge, with decision-

making authority typically concentrated among senior administrators and governing boards while frontline stakeholders - students, staff, and community members, remain marginalized in governance structures (Kezar & Maxey, 2016). This dynamic fosters tokenistic participation, where stakeholder input is solicited but rarely incorporated substantively, as seen in strategic planning processes that prioritize donor and trustee perspectives over faculty and student voices (Bensimon & Bishop, 2023). Resource constraints further exacerbate these inequities, with under-resourced groups like adjunct faculty and first-generation students lacking time and institutional support to engage meaningfully in governance activities (Kiyama & Harper, 2018).
Communication breakdowns present another significant hurdle, as stakeholders often receive inconsistent or inaccessible information about policy changes. A 2023 study of 50 universities found that 78% of staff and 63% of students reported learning about major institutional decisions through informal networks rather than official channels (Donald et al., 2023). This information gap is particularly acute for non-native English speakers and disabled stakeholders, as few institutions provide policy materials in multiple formats or languages (Peña et al., 2022). Bureaucratic inertia compounds these issues, with many universities maintaining rigid governance timelines that cannot accommodate the deliberative pace required for authentic stakeholder consensus-building (Trowler, 2020). The result is often rushed consultations that privilege speed over inclusion, as occurred during many institutions' pandemic-era transitions to online learning (Marinoni et al., 2020).

Perhaps most critically, higher education lacks consistent mechanisms to hold administrators accountable for implementing stakeholder feedback. Without formal requirements to document how input shapes decisions, engagement efforts frequently become performative exercises rather than transformative processes (Felten et al., 2023). This accountability vacuum enables "engagement fatigue" among repeatedly consulted but rarely heeded stakeholders, particularly in diversity initiatives where marginalized groups bear the emotional labor of educating institutions about systemic barriers (Ahmed, 2021). Until universities address these structural challenges, through power-sharing governance models, accessible communication systems, and transparent accountability mechanisms - stakeholder engagement will remain more aspirational than operational in driving inclusive policy implementation.

Strategies for Strengthening Stakeholder Engagement

Effective stakeholder engagement in higher education requires intentional, structured approaches that move beyond token consultation to authentic collaboration. Institutions committed to inclusive policy implementation must first establish representative governance structures that redistribute power across stakeholder groups. The University of Minnesota's "Shared Governance Task Force" model demonstrates this well, where students, faculty, staff, and community members hold voting seats on all major policy committees, resulting in more equitable resource allocation decisions (Smith & Jones, 2023). Similar participatory governance models at community colleges have shown particular success in closing equity gaps when frontline staff and students co-chair curriculum review committees (Garcia & Patel, 2022). These approaches operationalize what scholars term "deliberative democracy" in academic settings by creating spaces where stakeholders can debate policy trade-offs with equal standing (Dryzek, 2013).

Technology-enabled engagement platforms present another powerful strategy for scaling inclusive participation while accommodating diverse schedules and communication preferences.

Portland State University's "Digital Policy Lab" uses interactive simulations to gather stakeholder feedback on proposed initiatives, increasing participation rates among working adult students by 40% compared to traditional town halls (Chen et al., 2023). Similarly, HBCUs like North Carolina A&T have leveraged mobile apps to engage alumni in mentoring program design, with push notifications and bite-sized surveys overcoming previous barriers to sustained involvement (Robinson & Harris, 2022). These digital tools work best when paired with targeted outreach to historically marginalized groups, as seen in the University of Arizona's policy feedback system that provides Spanish-language options and childcare support for community participants (Martinez & Gonzales, 2023).

Perhaps most critically, institutions must implement transparent accountability mechanisms that demonstrate how stakeholder input shapes final decisions. The University of British Columbia's "You Said, We Did" public dashboards track policy changes made in response to community feedback, building trust through visible follow-through (Li & Wang, 2023). Similarly, Leeds Beckett University's stakeholder impact assessments require administrators to document how they addressed (or why they rejected) each major recommendation from engagement processes (Taylor et al., 2022). When combined with capacity-building initiatives - like training students in policy analysis or community members in budget literacy - these strategies create virtuous cycles of increasingly sophisticated stakeholder participation (Cook-Sather et al., 2021). The common thread across all effective approaches is treating engagement not as a compliance exercise but as an ongoing partnership where diverse forms of expertise - from lived experience to professional knowledge - collectively drive institutional improvement (Kezar & Holcombe, 2021).

CONCLUSION

Effective stakeholder engagement is pivotal for inclusive policy implementation in higher education administration. As institutions strive to address diverse needs - ranging from students and faculty to government bodies and industry partners, a collaborative approach ensures that policies are equitable, sustainable, and aligned with broader societal goals. Higher education administrators can create a more inclusive environment where all stakeholders feel valued and heard by fostering transparent communication, participatory decision-making, and trust-building mechanisms. Strengthening engagement requires deliberate strategies, such as regular consultations, feedback systems, and inclusive governance structures. Digital platforms can enhance accessibility, while culturally sensitive approaches ensure marginalized groups are adequately represented. Additionally, continuous evaluation of engagement processes helps refine policies to meet evolving demands. In the long run, inclusive stakeholder engagement leads to better policy outcomes, improved institutional credibility, and enhanced social impact. When stakeholders actively contribute to decision-making, policies become more responsive to real-world challenges, fostering innovation and equity in higher education. As global higher education faces increasing complexity - from funding constraints to shifting workforce demands, prioritizing inclusive engagement will be essential for sustainable growth and academic excellence. Institutions can build resilient, forward-looking policies that serve the collective good by embedding stakeholder collaboration into administrative frameworks.

Suggestions

The following suggestions are made based on the discussions and arguments outlined:

- Higher education institutions should establish formal mechanisms; such as advisory councils, town hall meetings, and digital feedback platforms to ensure consistent and meaningful stakeholder participation in policy formulation. This will enhance transparency and accountability while fostering a sense of shared ownership.
- Policies should actively include underrepresented stakeholders (e.g., minority students, non-academic staff, and community partners) through targeted outreach, diversity quotas in decision-making bodies, and culturally sensitive engagement strategies. This ensures that policies address systemic inequities.
- Universities should adopt digital tools (e.g., online surveys, virtual forums, and AI-driven analytics) to gather real-time input from a wider range of stakeholders, including remote learners and international partners. This enhances accessibility and inclusivity in policy discussions.
- Training programs should be implemented to empower students, faculty, and external partners with the skills needed to engage effectively in governance. Workshops on policy analysis, leadership, and advocacy can bridge knowledge gaps and strengthen collaborative decision-making.
- Institutions must create feedback loops to assess the impact of policies and stakeholder engagement strategies. Regular reviews, impact assessments, and adaptive policy adjustments will ensure responsiveness to changing needs and sustain long-term inclusivity.

LEARNING ENFORCEMENT FOR STUDENTS' ACADEMIC PERFORMANCE IN PUBLIC SENIOR SECONDARY SCHOOLS IN RIVERS STATE

Ijeoma ANYAELE
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

This study discussed learning enforcement for Students academic performance in Public Senior Secondary Schools in Rivers State. The study was guided by three objectives, three research questions which translated into three corresponding null Hypotheses. The study adopted a correlational research design. The population of the study consisted of all the 310 principals (Male = 218 and Female = 92) from the 311 Public Senior Secondary Schools in Rivers State. The sample size for the study was one hundred and forty (140) respondents representing 45% of the entire population. The sampling technique that was used to draw the samples for this study was stratified random sampling technique. The instrument used for data collection was a self-designed questionnaire, developed by the researcher. The titled of the instrument was Learning Enforcement Questionnaire (LEQ). The general reliability index of the instrument which was ascertained through Pearson stood at .890. Pearson Product Moment Correlation coefficient (PPMC) statistical tool was used to answer the research questions and test the null hypotheses at .05 significant level. The findings of the study revealed that the presence and effectiveness of security personnel, emergency preparedness measures, and psychological support systems are all positively and significantly correlated with student learning outcomes. The study recommended that Schools should invest in effective security personnel and systems to ensure a safe learning environment, update regularly and practice emergency preparedness measures to ensure that students feel secure and able to focus on their studies and implement comprehensive psychological support services, including counseling and mental health programs, to address students' emotional and psychological needs, thereby improving learning outcomes.

Keywords: Learning, Enforcement, Students, Academic Performance.

INTRODUCTION

Education is viewed as the process of acquiring knowledge, skills, attitudes, abilities, competence and the cultural norms of a society by people in order to transmit it to the younger generations that will enhance perpetual development of the society. In the view of Adepoju as cited in Etuk, Ering and Ajake (2012), stated that education is a tool for the acquisition of skills, relevant knowledge, and habits for surviving in the world, and as such in every society. The

education sector stands as a medium through which positive transformation could be achieved. Thus, government at all levels place a high premium on education. They recognize it as a weapon against ignorance, diseases, squalor and poverty and as a means of raising enlightened, lively and industrious citizens and of producing prosperous nation. In all countries of the world education is overseen by an agency or ministry which drives the educational policy of that country. In Nigeria and indeed Rivers State, education is overseen by the Ministry of Education which takes responsibility for implementing policy for state controlled public education.

Education plays a crucial role in shaping individuals and society at large. In Rivers State, Nigeria, public senior secondary schools face challenges in ensuring effective learning enforcement that enhances students' academic performance. Learning enforcement encompasses strategies, policies, and interventions aimed at promoting discipline, motivation, and engagement among students. This paper examines the concept of learning enforcement, its impact on academic performance, and possible strategies for improvement in public senior secondary schools in Rivers State.

Education is divided into sector such as pre-school, primary school, secondary school, colleges and university (FGN, 2004). Policy serves that purpose of ensuring that every action of an organization must have basis or backing. It also ensures consistency of action since every organization is governed by approved principles. Policies are initiatives mostly by governments which determine the direction of the system. Educational Policies are distinct from other policies by the fact that policies on education are part and parcel of educational institutions. So policies formulated in educational institutions can qualify as educational policies. It is vital that policies must be rational and purposeful to remain sustainable. Schools are set up to inculcate desirable values in the educand and facilitate learning. It then follows that for schools to function and operate efficiently they need policies to guide their operations. Policies are formulated and often with good intentions, but at the implementation stage the policies tend to be rendered less effective. These policies are enforced by school administrators or principals.

Ensuring the learning enforcement is paramount for fostering an environment conducive to students' learning. Recent incidents of violence, bullying, and infrastructural deficiencies have raised significant concerns about the adequacy of learning in schools (Okeke & Nwankwo, 2018). Globally, students' learning in schools has become a pressing issue and Nigeria is no exception. The increase in school-related violence, inadequate safety policies, and insufficient infrastructural facilities pose significant threats to student well-being and academic performance (Olumide, 2019). In Rivers State, these challenges are compounded by socio-economic factors and political instability. The relationship between learning enforcement and students' academic performance in public senior secondary schools is a critical area of educational research, particularly in regions like Rivers State, Nigeria. For instance, research by Ogunsanya and Adekunle (2017) demonstrated that students who feel safe are more likely to attend school regularly, engage in classroom activities, and perform better academically. Conversely, unsafe school environments have been linked to higher dropout rates and lower academic achievements. In Rivers State, the implementation of learning enforcement has been inconsistent, with significant variations across different schools (Ibrahim & Musa, 2020).

Effective learning enforcement in schools can simply be explained in a straight forward statement as looking after the complete affairs related to school. In fact, it is the managerial skill for smooth functioning and execution. Also, learning is the school main governing body which plays a major part in making and taking decisions related to students and the school's overall status (Japhet-Nwapi, 2016). In Nigeria, several policies have been formulated and adopted with

the aim of bringing about quality improvement in secondary education. Ogbonna (2010), stated that the role of policy is that it specifies government program of action contained either in the nation's laws or in a public statement by a competent functionary of government.

Studies have shown that schools with robust learning enforcement tend to have better student performance and lower incidences of disciplinary issues. Adewale (2019) emphasized the role of adequate facilities and security personnel in preventing school violence. Furthermore, studies by Ogunsanya and Adekunle (2017) have highlighted the importance of psychological safety, noting that students who experience bullying or harassment are less likely to perform well academically. The lack of empirical data linking learning enforcement to students' academic performance in this region necessitates a focused study to address these gaps and propose actionable strategies (Ekechukwu & Nduka, 2020). The enforcement of learning in public senior secondary schools is a critical factor influencing students' academic performance. Therefore, this study sought to explore the extent to which learning enforcement impact student academic performance in public senior secondary schools in Rivers State, Nigeria, providing a comprehensive analysis that integrates recent literature and proposes effective solutions.

Learning enforcement refers to the systematic application of policies and instructional strategies that compel students to adhere to academic standards and actively participate in the learning process. It includes discipline management, teacher supervision, instructional quality, and student motivation. According to Ololube (2006), effective learning enforcement is essential for sustaining academic excellence, as it helps students develop a commitment to their studies.

Statement of the Problem

Overtime, students are exposed to environmental hazards such as unsafe electrical appliances, broken chairs and tables, waterlogged areas, dilapidated classrooms, untreated bad, unsecured school environment, cumulative of which affect adversely students' learning outcome and despite numerous policies and initiatives aimed at improving school learning, there remains a significant disparity in the learning standards across different schools in the region. This inconsistency not only jeopardizes the well-being of students but also hampers their academic performance, leading to suboptimal educational outcomes.

Improved learning in schools is expected to enhance student attendance, engagement, and performance, thereby contributing to higher educational standards and better future prospects for students in Rivers State. Ultimately, this study aim to promote a culture of learning that supports academic excellence and fosters a more conducive learning environment for all students. The primary problem this study intends to address is the insufficient implementation and effectiveness of learning measures in public senior secondary schools in Rivers State, Nigeria, and how these deficiencies adversely affect student academic performance.

Aim and Objectives of the Study

The aim of this study is to investigate learning enforcement and student academic performance in public senior secondary schools in Rivers State, Nigeria. Specifically, the objectives of the study were to:

- To evaluate how the presence of security personnel relate to student learning outcomes in public senior secondary schools in Rivers State.

- To examine the relationship between emergency preparedness measures and student learning outcomes in public senior secondary schools in Rivers State.
- To analyze how psychological support systems relate to students' learning outcomes in public senior secondary schools in Rivers State.

Research Questions

The following research questions guided the conduct of the study:

- How does the presence of security personnel relate to student learning outcomes in public senior secondary schools in Rivers State?
- What is the relationship between emergency preparedness measures and student learning outcomes in public senior secondary schools in Rivers State?
- How does psychological support systems relate to students' learning outcomes in public senior secondary schools in Rivers State?

Hypotheses

The study was guided by the following hypotheses and each hypothesis was tested at .05 alpha level of significance:

- There is no significant relationship between the presence of security personnel and student learning outcomes in public senior secondary schools in Rivers State.
- There is no significant relationship between emergency preparedness measures and student learning outcomes in public senior secondary schools in Rivers State.
- There is no significant relationship between Psychological support systems and students' learning outcomes in public senior secondary schools in Rivers State.

THEORETICAL REVIEW

This study is anchored on the Ecological Systems Theory developed by Urie Bronfenbrenner in 1979. Bronfenbrenner’s theory emphasizes the multifaceted layers of environmental influence on an individual's development, positing that development is affected by interactions within nested systems: microsystem, mesosystem, exosystem, macrosystem, and chronosystem. This theoretical framework is particularly relevant for examining the impact of school learning on student academic performance, as it allows for a comprehensive analysis of how different environmental factors interact to influence educational performance.

Micosystem Level

At the microsystem level, Bronfenbrenner's theory highlights the immediate environment of the student, including interactions with teachers, peers, and school staff. In the context of this study, the physical infrastructure and the presence of security personnel directly affect the student’s day-to-day school experience. Safe and well-maintained physical environments foster a sense of security and stability, enabling students to focus better on their academic tasks (Ogunsanya &

Adekunle, 2017). Additionally, the presence of security personnel can deter violence and bullying, creating a safer and more conducive learning environment.

Mesosystem Level

The mesosystem involves interconnections between various microsystems. For instance, the relationship between home and school is crucial in shaping student outcomes. This study will examine how emergency preparedness measures, such as drills and protocols, involve not only the school but also parents and the community. Effective communication and cooperation between these entities are essential for ensuring that safety measures are understood and implemented consistently, thereby enhancing student attendance and engagement (Adewale, 2019).

Exosystem Level

At the exosystem level, Bronfenbrenner's theory considers the larger social systems that do not directly involve the individual but still have an impact. In the context of this study, this includes the policies and regulations set by educational authorities and government bodies regarding school safety. The study will explore how these policies are enforced in Rivers State and their effectiveness in creating a safe educational environment. The influence of governmental support and resources on the implementation of safety measures can significantly affect school conditions and student outcomes (Ibrahim & Musa, 2020).

Macrosystem Level

The macrosystem encompasses the broader cultural and societal context in which the student lives. This includes societal norms, values, and expectations about education and safety. In Rivers State, cultural attitudes towards education and security can influence how safety measures are perceived and prioritized by schools and the community. Understanding these cultural factors is crucial for designing and implementing safety measures that are culturally appropriate and effective. This study will consider these broader societal influences to provide context for the findings and recommendations (Chukwu, 2016).

Chronosystem Level

Bronfenbrenner also introduced the chronosystem, which includes the dimension of time as it relates to an individual's environment. This can involve changes over the lifespan, such as the development of safety policies over time, or significant events like natural disasters or political instability that impact school safety. The study will examine how historical and temporal factors have influenced the current state of school safety in Rivers State and how these factors continue to shape student experiences and outcomes.

Adopting the Ecological Systems Theory for this study is important because it provides a holistic framework for understanding the complex and interrelated factors affecting school student learning outcomes, and by considering multiple levels of influence from immediate school environments to broader societal contexts, this theory allows for a comprehensive analysis of the

issues. It also highlights the importance of interactions between different environmental factors, such as the synergy between physical safety measures and psychological support systems, in promoting student well-being and academic success (Okeke & Nwankwo, 2018). While the Ecological Systems Theory is comprehensive, its application can be challenging due to the complexity of analyzing multiple environmental levels. However, its strength lies in its ability to integrate various factors and provide a detailed understanding of their interconnections. This is particularly relevant for addressing the multifaceted issue of school safety and its impact on learning outcomes. Using this theory, the study can develop nuanced insights into how different safety measures work together to create a conducive learning environment.

Bronfenbrenner's Ecological Systems Theory offers a robust framework for examining the impact of student learning outcomes in public senior secondary schools in Rivers State, Nigeria. Considering the interactions between various environmental factors, this theory helps to provide a comprehensive understanding of the complex dynamics at play. This approach is crucial for developing effective, evidence-based recommendations to improve school safety and enhance student academic performance. The insights gained from this study will contribute to the broader discourse on educational safety and its critical role in promoting academic excellence and overall student well-being.

The place of education in national development cannot be overstressed. Its importance is stressed in the opening statement of the federal republic of Nigeria (FRN) (2004) where it is stated that "education in Nigeria is an instrument par excellence for effecting national development". In other words, education is not just a medium of knowledge and skill acquisition, it is also a total formation building as cited in (Etuk, Ering and Ajake, 2012). Similarly, Amaghionyediwe and Osinube (2006) are of the opinion that education in Nigeria is more of a public enterprises' that has witnessed government active participation. In the view of the initiative of the national policy on education, education is seen as a vehicle of change in achieving national development. In the very words of the Federal Republic of Nigeria (2004).The National Policy on education is Nigeria's national guideline on the effective management and implementation of education at all tiers of the system. The National Policy on Education therefore as a standard and requirements for quality education in Nigeria (Federal Republic of Nigeria, p.9) Miebodie (2004) as cited in Japhet-Nwapi(2016) asserts that educational policies are set up to guide and give directions to the system of education. No educational institution cans survival without a policy. This is because policy provides a sense of direction in dealing and solving educational problems.

However, for any system of education to survive and thrive in a competitive economy, it must be reviewed from time to time. Ekundayo as cited in Miebode, (2014) opined that education policy represents definite course of action proposed by the government and adopted as expedient to the issues and problems of the education sector. Educational policy means the collection of laws and rules that governs the operation of education system. In line with the above, Ogbonna (2010) opines that education policies are approved documents that guide all areas of educational i.e. recruitment, admission and registration of students etc. Imam(2012) listed some of the policies an education from 1944 till date to include; policy of decentralization, universal primary education, Quranic education, 6-3-3-4 system and 9-3-4 (UBE) System, Universal Basic Education (UBE) according to Ayeni and dada(2011) stated that the changes in policy are due to the undertone or performance of the policies. For instance, 6-5-4 system was changed to 6-S-3-4 system because the programme was conceived as an instrument of national unity, and also to inject functionality into the system.

Ayeni and Dada, (2011) posted that the 6-3-3-4 system was fashioned to produces graduates who would be able to make use of their hands, heads and heart i.e. (the 3Hs of education). The 6-3-3-4 System was changed to Universal Basic Education (UBE) in 1999, and the UBE Act signed in April 2004. The programme was concrete demonstration of Federal Government Resolution to have the gradual, but shocking drift of the country‟s education into an inglorious past of dangerous illiteracy. The UBE Scheme would develop in the citizenry a "strong consciousness" for education and commitment to its promotion and provide free Universal Basic Education for every Nigeria child of school age, and to streamline the overcrowded nature of subjects offered at the basic education level and it is expected to meet the Millennium Development Goals (MDGs) (Anamachi & Romaine, 2000).

Physical Infrastructure

Physical infrastructure is a fundamental aspect of school safety that significantly impacts student learning outcomes. This is because physical infrastructure plays a pivotal role in ensuring the safety of students within educational environments. Adequate and well-maintained facilities, such as secure buildings, proper lighting, clean water supply, and functional sanitation systems, are essential for creating a safe learning environment. Research has shown that schools with robust physical infrastructure tend to have lower incidences of accidents and violence (Olumide, 2019). Inadequate physical infrastructure, on the other hand, often correlates with higher risks of injury and violence, which can detract from the learning experience. For instance, Ibrahim and Musa (2020) found that schools in Rivers State with better-maintained facilities had fewer disciplinary issues and higher student engagement, indicating the critical role that physical safety measures play in fostering a conducive learning environment. In Rivers State, the disparity in the quality of physical infrastructure across public secondary schools is a critical issue that affects student performance and well-being. Ensuring that all schools have safe and adequate facilities is crucial for promoting a conducive learning environment.

Security Personnel

The presence of trained security personnel in schools is another essential safety measure that has a direct impact on student learning outcomes. Security personnel help maintain order, prevent violence, and respond to emergencies effectively. A study by Ogunsanya and Adekunle (2017) highlighted that schools with dedicated security staff experienced fewer incidents of bullying and vandalism, which in turn led to improved academic performance and a more positive school climate. Security personnel not only protect students physically but also provide a sense of security that enables students to focus better on their studies. In the context of Rivers State, where socio-political instability can heighten security risks, the role of security personnel is particularly significant.

Emergency Preparedness in Schools

Emergency preparedness encompasses the strategies and measures put in place to handle crises such as fires, natural disasters, or security threats. Effective emergency preparedness plans, including regular drills and clear protocols, are crucial for ensuring the safety of students and staff. Adewale (2019) emphasized the importance of comprehensive emergency preparedness in

schools, noting that schools with robust emergency plans had better student attendance and less disruption to learning. This is particularly relevant in regions prone to natural disasters or sociopolitical instability, such as Rivers State, where preparedness can significantly impact student safety and learning continuity.

Psychological Support and Student Well-being

Psychological safety is an integral component of overall school safety that significantly influences student learning outcomes. Psychological support systems, including counseling services, mental health programs, and anti-bullying initiatives, are crucial for addressing the emotional and mental well-being of students. Chukwu (2016) found that schools with strong psychological support systems reported lower levels of student stress and anxiety, leading to better academic performance and higher levels of student satisfaction. Providing resources for mental health support helps create a nurturing environment where students feel valued and supported, which is essential for their academic and personal development.

FACTORS THAT INFLUENCE STUDENT LEARNING OUTCOMES

Student learning outcomes are influenced by a multitude of factors, ranging from individual student characteristics to broader institutional and socio-economic conditions. Academic performance is often shaped by students' socio-economic background, parental involvement, and prior educational experiences (Bakker et al., 2013). Additionally, the quality of teaching, availability of learning resources, and school environment play crucial roles. In Rivers State, Nigeria, disparities in these factors contribute to significant variations in student learning outcomes across different public senior secondary schools. Understanding these influencing factors is critical for developing strategies to improve educational performance.

Impact of School Environment

The school environment, including its safety, infrastructure, and overall climate, significantly affects student learning outcomes. A safe and supportive school environment fosters better academic performance, as students can focus on learning without fear of violence or bullying (Juvonen et al., 2011). Studies have shown that schools with positive climates, characterized by mutual respect, strong teacher-student relationships, and a focus on student well-being, tend to have higher student achievement levels (Thapa et al., 2013). In Rivers State, addressing environmental factors such as school safety and infrastructure can have a profound impact on improving student learning outcomes.

Role of Teacher Quality and Instruction

Teacher quality and instructional practices are pivotal in determining student learning outcomes. Effective teachers who employ engaging, student-centered instructional methods can significantly enhance students' academic performance (Hattie, 2009). Professional development for teachers, along with adequate support and resources, is essential for maintaining high teaching standards. Research has highlighted the importance of teacher-student interactions and feedback in fostering academic success (Stronge et al., 2011). In Rivers State, initiatives to

improve teacher quality and instructional methods are crucial for raising student achievement levels.

Influence of Learning Resources and Technology

Access to learning resources and technology also plays a critical role in shaping student learning outcomes. Adequate textbooks, laboratory equipment, and technological tools enable students to engage more deeply with the curriculum and develop critical thinking skills (Lai, 2011). The integration of technology in education has been shown to enhance learning experiences and outcomes, particularly in resource-limited settings (Tamim et al., 2011). In Rivers State, ensuring that schools are equipped with necessary learning resources and technological infrastructure can help bridge educational disparities and improve student performance.

Socio-Economic and Cultural Context

The broader socio-economic and cultural contexts in which students live significantly impact their learning outcomes. Economic stability, parental education, and community support are critical factors influencing academic performance (Siraj-Blatchford, 2010). Cultural attitudes towards education and gender norms also play a role in shaping students' educational experiences and achievements. In Rivers State, socio-economic challenges and cultural factors contribute to variations in student learning outcomes. Addressing these broader contextual issues through community engagement and targeted interventions is essential for promoting equitable educational opportunities and improving overall student performance.

IMPACT OF LEARNING ENFORCEMENT ON ACADEMIC PERFORMANCE

- Improved Discipline and Focus: Studies suggest that students in schools with strong enforcement mechanisms exhibit higher levels of discipline and concentration in their studies (Adeyemi & Uko, 2018). Discipline creates an environment conducive to learning, reducing distractions and promoting academic success.
- Increased Student Engagement: When teachers and school administrators implement structured learning schedules and enforce compliance with educational policies, students become more engaged (Eze & Okonkwo, 2020). This engagement positively influences their performance in standardized assessments.
- Better Teacher Effectiveness: Learning enforcement measures ensure that teachers adhere to instructional guidelines and deliver lessons effectively. According to Nwankwo (2019), when teachers maintain consistent pedagogical approaches, students benefit from structured learning experiences.
- Higher Academic Achievement: Research indicates that students in schools with strict enforcement of learning policies tend to perform better in national and state examinations compared to their peers in schools with lax enforcement (Chukwu, 2021).

STRATEGIES FOR ENHANCING LEARNING ENFORCEMENT

- Strengthening School Policies: Implementing clear academic policies that outline attendance, classroom behavior, and assessment expectations can enhance learning enforcement.
- Teacher Training and Development: Continuous professional development for teachers can equip them with effective classroom management strategies to enforce learning more effectively (Okpara, 2022).
- Parental Involvement: Encouraging parents to take an active role in their children's education through regular communication with teachers and school administrators can boost students' commitment to learning.
- Use of Technology: Integrating digital learning tools and monitoring systems can help track students' progress and ensure adherence to academic standards.
- Motivational Strategies: Implementing reward systems for academic excellence and good behavior can reinforce positive learning attitudes among students (Adebayo & Onyekwere, 2020).

Empirical Review

Earthman's (2014) studied investigated the impact of school facilities on student achievement, attendance, behavior, completion rates, and teacher turnover in selected Texas high schools. The objective of the study was to assess how variations in school facility conditions influence various student outcomes. Data were sourced from student achievement scores, attendance records, behavioral incidents, graduation rates, and teacher turnover rates. Multivariate analysis techniques were employed to analyze the data and determine correlations between school facility conditions and student outcomes. The findings revealed a significant positive relationship between high-quality school facilities and improved academic performance, increased attendance rates, and reduced disciplinary incidents. The study concludes that investing in and maintaining well-equipped school facilities is crucial for enhancing overall school effectiveness and supporting student success. However, gaps in knowledge remain regarding the long-term effects of sustained investment in school facilities on student outcomes.

Hines and Loeb (2008) explored the relationship between school facilities and student achievement through student-level data analysis. The study's objective was to examine how variations in physical infrastructure affect academic performance across a diverse set of schools. The data consisted of academic performance metrics combined with school facility condition assessments. Statistical tools were used to analyze the data and identify correlations between school facility quality and student achievement. The findings indicated a significant positive association between better school facilities and higher academic achievement among students. The report underscores the importance of maintaining and improving school facilities to support enhanced student learning outcomes and promote educational equity. However, gaps in knowledge persist regarding the specific mechanisms through which school facilities influence student achievement, as well as the optimal strategies for funding and maintaining high-quality facilities in schools.

Johnson and Smith (2016) examined the impact of school security measures on students' academic performance in urban high schools across the United States. The study aims to assess how different security measures implemented in schools influence student learning outcomes.

Data were gathered from urban high schools, including information on security protocols, incidents of violence, and student academic records. Statistical analysis, including regression models, was employed to analyze the data and determine the relationship between school security measures and academic performance. Findings indicated that effective security measures, such as the presence of security personnel, metal detectors, and surveillance systems, correlate positively with improved student academic performance. The study concluded that comprehensive security measures play a crucial role in creating a safe learning environment, which in turn supports better student outcomes. However, gaps in knowledge exist regarding the specific mechanisms through which different security strategies impact academic achievement, as well as the optimal balance between security measures and educational priorities.

Ndlovu and Mabunda (2018) investigated the role of school safety officers in enhancing school security and student performance in secondary schools in South Africa. The objective of the study is to explore how the presence and activities of safety officers contribute to school security and student outcomes. Data were collected through surveys and interviews with school administrators, teachers, safety officers, and students regarding their perceptions of school safety and its impact on learning. Qualitative analysis methods were used to analyze the data and identify themes related to the effectiveness of safety officers in improving security and academic performance. Findings suggested that proactive safety measures, including the presence of trained safety officers, contribute significantly to reducing incidents of violence and creating a conducive learning environment. The study concluded that investing in safety personnel and their training is essential for maintaining a secure school environment that fosters positive student outcomes. However, further research is needed to explore the long-term effects of safety officer interventions on student behavior and academic achievement, as well as the scalability of these practices across different school settings.

Waugh and Streib (2015) presented a national portrait of school emergency preparedness in the United States, aiming to assess the state of preparedness across schools and its impact on student outcomes. The study's objective is to examine the extent of emergency preparedness measures implemented in schools, including plans for various emergency scenarios such as natural disasters and intruder incidents. Data were gathered through surveys administered to school administrators nationwide, documenting the presence and effectiveness of emergency plans and resources. Descriptive statistical analysis was employed to summarize the data and identify trends in preparedness levels. Findings revealed significant variations in the adoption and implementation of emergency preparedness measures among schools, with implications for student safety and academic continuity during crises. The study concluded that comprehensive and well-practiced emergency preparedness plans are essential for mitigating risks and ensuring a secure learning environment. Knowledge gaps persist regarding the effectiveness of different types of emergency drills and the integration of mental health support into emergency response protocols.

Lee and Chae (2017) explored lessons learned from a school shooting incident to elucidate the role of emergency preparedness in responding to such crises and its impact on student outcomes. The study was aimed at analyzing the effectiveness of emergency response protocols in schools through a case study approach. Data were collected through interviews with school officials, law enforcement personnel, and stakeholders involved in the response to the shooting incident. Qualitative content analysis was utilized to identify themes and lessons regarding the effectiveness of emergency preparedness plans and their influence on student safety and academic recovery. Findings highlighted the critical importance of coordinated

emergency response efforts, including communication protocols, lockdown procedures, and crisis counseling services, in minimizing harm and supporting student well-being. The study concluded that ongoing evaluation and refinement of emergency preparedness plans are crucial for enhancing school safety and ensuring effective responses to future emergencies. Further research is needed to explore the long-term psychological and academic impacts on students affected by school violence incidents, as well as strategies for enhancing community resilience and support in crisis situations.

Atkins et al. (2000) investigated the impact of school-based mental health services on academic achievement. The objective of the study is to assess how the availability and utilization of mental health services within schools influence students' academic performance. Data were collected through a review of existing literature and meta-analysis of studies examining the relationship between school-based mental health interventions and academic outcomes. Statistical tools such as effect size calculations and meta-regression analyses were employed to synthesize findings across various studies. Results indicated that comprehensive mental health services integrated into school settings contribute positively to students' academic achievement, particularly among those at risk of behavioral or emotional difficulties. The study concluded that effective school-based mental health programs can mitigate barriers to learning, enhance student engagement, and improve overall academic performance. However, gaps in knowledge remain regarding the optimal delivery models, long-term sustainability, and specific mechanisms through which mental health interventions influence academic outcomes.

Miebodei (2004) carried out a study on educational policy changes and perceived implementation in public secondary schools in Bayelsa State: The descriptive survey was used and a sample size of 810. Four research questions and four hypotheses were formulated for the study. Questionnaire was used as instrument for data collection, mean and standard deviation were used to answer the research questions while t-test was used to test the null hypotheses at 0.05 level of significance. The findings revealed that implementation of educational policy changes enhance teaching and learning. The study also revealed that education policy changes enhance school administrator’s experience and the administration of public schools. The researcher concluded that there are certain benefits associated with implementation of educational policies in public secondary schools which include effective management of teachers and students information sharing, decision making in the recruitment of staff and proper supervisory role.

Furthermore, in a related study conducted by Mathew (2008) on strategies for effective implementation of educational policy in secondary schools in Rivers State. A descriptive survey research was carried out with a sample size of 199. The findings of the study showed the extent of the implementation of 3-3 system of secondary education structure is above average. The study stated further that the strategies adopted in educational policy implementation are funds for research, availability of materials in the libraries, employment of teaching staff, equipment for technical subjects, scholarship programmes and guidance counselors in schools.

METHODOLOGY

This study adopted a correlational research design. The population of this study consisted of all the 310 principals (Male = 218 and Female = 92) from the 311 Public Senior Secondary Schools in Rivers State (Source: Planning, Research and Statistics Department, RSSSB 2023). The sample size for the study was one hundred and forty (140) respondents representing 45% of the

entire population. The sampling technique that was used to draw the samples for this study was stratified random sampling technique. The instrument used for data collection was a selfdesigned questionnaire, developed by the researcher. The titled of the instrument was Safety Measures and Learning Outcome Questionnaire (SMLOQ).

The instrument has two sections: A and B. Section A was used to collect demographic information about the respondents while B contains questionnaire items on the three safety measures under study. The questionnaire was made up of fifteen (15) items consisting of 5 items each for each of the independent variables. The instrument was structured in modified Linkert Scale of four point in the following rating order; Strongly Agree (SA) – 4points, Agree (A) – 3points, Strongly Disagree (SD) – 2points, Disagree (D) – 1point. To ascertain the face and content validity of the instrument, the questionnaire was presented to the researcher's supervisor and other experts in test and measurements for scrutiny. The comments, suggestions, and corrections of these evaluators were incorporated into the final version of the questionnaire. To ascertain the reliability, there was test-retest approach. Reliability of the instrument was determined Pearson Product Moment Correlation coefficient (PPMC).

The general reliability index of the instrument after correlating the first and the second scores obtained from the questionnaires administered to 20 respondents who were not part of the study sample, stood at .890. The researcher and two trained research assistants administered and collated the distributed copies of the questionnaire which were retrieved after one week. A total of 140 questionnaires were distributed and all were dully filled, returned and used for data analysis. This represents 95% returned rate. Pearson Product Moment Correlation coefficient (PPMC) statistical tool was used to answer the research questions and also test the null hypotheses at .05 significant level.

RESULT

Research Question 1: How does the presence and effectiveness of security personnel relate to student academic performance in public senior secondary schools in Rivers State?

Hypothesis1: There is no significant relationship between the presence of security personnel and academic performance in public senior secondary schools in Rivers State.

Table 1: Relationship between presence of security personnel and students' academic performance in public senior secondary schools in Rivers State

Variables	N	r	df	p-value	Remark
Security Personnel Academic performance	140	.790	138	.001	Significant

P< .05; significant at .05 level of significance

Table 1 revealed how the presence of security personnel relates to student learning outcomes using a Pearson Correlation. The results showed that there was a positive relationship between presence and effectiveness of security personnel and student academic performance r (138) = .790. The results revealed a significant correlation between presence and effectiveness of security personnel and academic performance, (p-value = .001, $p < .05$). Based on these results the null hypothesis is rejected.

Research Question 2: What is the relationship between emergency preparedness measures and student academic performance in public senior secondary schools in Rivers State?

Hypothesis 2: There is no significant relationship between emergency preparedness measures and student academic performance in public senior secondary schools in Rivers State.

Table 2: Relationship between emergency preparedness measures and students' academic performance in public senior secondary schools in Rivers State

Variables	N	r	df	p-value	Remark
Emergency P. Academic performance	140	.541	138	.035	Significant

P< 0.05; significant at .05 level of significance

Table 2 revealed the relationship between emergency preparedness measures and student academic performance using a Pearson Correlation. The results showed that there was a positive relationship between emergency preparedness measures and student academic performance r (138) = .541. The results revealed a significant correlation between emergency preparedness measures and student academic performance, (p = .035, p < .05). Based on these results the null hypothesis is rejected.

Research Question 3: How does psychological support systems relate to students' academic performance in public senior secondary schools in Rivers State?

Hypothesis 3: There is no significant relationship between Psychological support systems and students' academic performance in public senior secondary schools in Rivers State.

Table 3: Relationship between Psychological support systems and students' academic performance in public senior secondary schools in Rivers State

Variables	N	r	df	p-value	Remark
Emergency P. Academic performance	140	.362	138	.001	Significant

P< 0.05; significant at .05 level of significance

Table 3 revealed how the Psychological support systems relate to student academic performance using a Pearson Correlation. The results showed that there was a positive relationship between Psychological support systems and student academic performance r (138) = 0.790. The results revealed a significant correlation between Psychological support systems and student learning outcomes, (p = .001, p < .05). Based on these results the null hypothesis is rejected.

DISCUSSION

Analysis of Table 1 provides insightful data on the relationship between the presence and effectiveness of security personnel and students' academic performance in public senior secondary schools in Rivers State. The Pearson Correlation analysis reveals a strong positive relationship between the presence and effectiveness of security personnel and students' academic

performance. This suggests that the presence and efficiency of security personnel significantly enhance students' academic performance, leading to improved academic performance. These findings support those of Johnson and Smith (2016), who found that effective security measures, including the presence of personnel, positively correlate with improved student academic performance in urban high schools in the United States. Their study highlights how various security strategies, such as metal detectors and surveillance, contribute to a safer environment, enabling students to focus better on academics. Similarly, Ndlovu and Mabunda (2018) found that proactive safety measures, such as the presence of well-trained safety officers, significantly reduced incidents of violence in South African schools. Their study emphasizes the role of security personnel in fostering a conducive learning environment. It is evident that the presence and effectiveness of security personnel play a vital role in improving students' learning outcomes, which can be attributed to the safer, more disciplined, and conducive learning environments that well-managed security personnel help to create.

The results from Table 2 indicate a moderate positive relationship between emergency preparedness and academic performance, which was statistically significant. This finding suggests that schools that invest in effective emergency preparedness measures tend to experience improved student learning outcomes. Several factors can explain this relationship. Regular emergency drills enhance the ability of students and staff to respond effectively during emergencies, creating a safer school environment that minimizes disruptions to learning. The presence of clear emergency protocols ensures that everyone in the school knows how to act in a crisis, contributing to a greater sense of security. This, in turn, allows students to focus better on their studies as their anxiety about potential emergencies is reduced. Additionally, the involvement of parents in emergency preparedness initiatives fosters a collaborative approach to safety, which can boost student attendance and engagement, further enhancing academic performance.

Emergency preparedness contributes to an environment in which students feel confident in their safety, positively impacting their concentration and academic performance. The study supports the findings of Waugh and Streib (2015), who found that schools with comprehensive and wellpracticed emergency preparedness plans are better equipped to mitigate risks and ensure a secure learning environment. They also noted that such plans are crucial for academic continuity during crises, which directly relates to the findings of this study. Similarly, Lee and Chae (2017) emphasized the importance of coordinated emergency responses, including effective communication protocols and crisis counseling services, in safeguarding student well-being and supporting academic recovery after emergencies. Their findings underscore the need for continuous evaluation of emergency preparedness plans to maintain a safe and stable learning environment.

Table 3 shows a significant positive correlation between psychological support systems and student academic performance. This indicates that psychological support systems play a critical role in improving student learning outcomes. Consequently, psychological support has a meaningful impact on academic performance. Psychological support systems in schools, such as counseling services, mental health programs, and anti-bullying initiatives, are vital for creating a safe, inclusive, and emotionally supportive learning environment. For instance, counseling services help students manage stress and emotional challenges, which can directly influence their academic performance. Mental health programs, including initiatives like mindfulness and resilience training, promote focus and engagement, thereby enhancing academic performance.

Similarly, anti-bullying initiatives foster a sense of safety, encouraging students to perform better academically. Moreover, training teachers to recognize and respond to students' psychological needs positively impacts both the learning environment and student achievement. The findings of this study are consistent with Atkins et al. (2000), who found that school-based mental health services positively influence students' academic achievement, particularly among those at risk of behavioral or emotional issues. These services mitigate barriers to learning and enhance student engagement, which aligns with the current study's results. Similarly, Sink et al. (2014) highlighted the crucial role of school counselors in providing emotional and academic support, contributing to a supportive environment that fosters better academic outcomes. These empirical studies emphasize the importance of integrating mental health interventions in schools to improve student well-being and academic success.

CONCLUSION

The findings of this study reveal that the presence and effectiveness of security personnel, emergency preparedness measures, and psychological support systems are all positively and significantly correlated with student learning outcomes. Learning enforcement is a crucial determinant of students' academic success in public senior secondary schools in Rivers State. By implementing stringent policies, improving teacher effectiveness, engaging parents, and utilizing technology, schools can enhance academic performance. Future research should explore the long-term effects of different learning enforcement mechanisms to identify best practices suitable for public schools in Rivers State.

Recommendations

- Schools should invest in effective security personnel and systems to ensure a safe learning environment, as this has a direct impact on academic performance.
- Schools should regularly update and practice emergency preparedness measures to ensure that students feel secure and able to focus on their studies.
- Schools should implement comprehensive psychological support services, including counseling and mental health programs, to address students' emotional and psychological needs, thereby improving learning outcomes.

TEACHER QUALITY AND STUDENTS' ACADEMIC PERFORMANCE IN PUBLIC SECONDARY SCHOOL

Nwankwo Eunice NWANKWO
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

Abstract

Teacher quality is widely recognized as a critical factor in determining student academic performance. This article examines the critical role of teacher quality influencing students' academic performance. A comprehensive review of existing literature reveals that high quality teachers are essential for improving student outcomes, reducing achievement gaps, and promoting educational equality. The findings highlight the significance of teacher subjectexpertise, pedagogical skills, in shaping students cognitive, social and emotional development. The study concludes that prioritizing teacher quality through targeted professional development, evaluation, and support is crucial for enhancing student academic performance and achieving educational excellence. The implications of this study underscore the need for policymakers, educators, and stakeholders to collaborate in ensuring that all students have access to high-quality education, thereby bridging the gap between educational aspiration and attainment.

Keywords: Teacher Quality, Students, Academic Performance, Public, Secondary School, Teacher, professional development.

INTRODUCTION

The quality of teachers has long been recognized as a critical factor in determining student's academic performance. In subject of English Language, where students' literacy skills and language proficiency are critical determinants of their future academic and career prospects, the influence of teacher quality is particularly significant. Research has consistently shown that teacher quality is the most important school-related factor influencing student achievement (Hattie, 2009; Marzano, 2007). Teachers who are knowledgeably, skilled, and passionate about their subject area are better equipped to create engaging and effective learning experiences for their students.The teacher is a major factor in the entire educational process. In the discharge of his duty, he has multidimensional role to playin the school system. Such roles are; As a counselor; The teacher, apart from the teaching-learning process also plays the role of a counselor. He sees to the personal development career of his learner. In doing this, he offers guidance services to the learners, give moral advice that will help the learner exhibit high moral standard in the society.

As a manager, the teacher plays the role of a school manager. He gives managerial or administrative advice to the head teacher or inspectors. He also takes part in decision-making and implementation of school policies and programmes. Assessor; the teacher evaluates the instructional outcome of every lesson. He also evaluates terminal examination and makes comprehensive and objective reports of these evaluation and outcomes. In many situations, the outcomes of his report are used for innovations. Planner of instruction; The teacher plans the instructional process within the classroom, such planning includes the use of time, space, adequate instructional method and materials. The teacher also settles minor disputes in the in terms of fighting, loitering, stealing, destruction of school property, punctuality and regularity. There are several definitions of a teacher given by different scholars. Some see the teacher as a person, who merely instructs others or help others in training.

To these scholars, the teacher should be in a position to create desirable changes in the behaviour of his learners. Samuel (2009) sees teacher as a person who has acquired professional training in teacher education institutions such as colleges of education, faculties of education and national teacher's institute. Such professional teachers teach from the pre-primary school level to the university level. The teacher must possess certain good qualities to carry out his duties and roles in the teaching-learning process as well as curriculum implementation process and transfer of knowledge. These qualities are; good personality; personality in this regard is the totality of the worth of the teacher. It includes; tolerance, patience, honesty, loving, caring, humble, empathy, neatness, friendliness, decency, trustworthy, punctuality, so as help learners imitate good ideas. Knowledge of the subject matter; One of the principal duties of a teacher is to have an acceptable command of the content are of the subject he is teaching and must make sure he knows it better than the student he is supposed to teach. A good teacher should be able to explain the various topics to the proper understanding of the learners. Knowledge of the subject should also include knowledge of methodology and application of different teaching methods in teaching specific topic (Allen, 2003; Darling-Hammond, 2000).

A good teacher keeps abreast of the innovations and current issues in his subject by attending seminars, workshops and reading current books and journals etc. Leadership ability; A teacher should possess certain leadership quality such as the ability to utilize the authority of his or her position for the benefit and interest of the learners. The teacher should exercise his authority in a democratic atmosphere even in the classroom situation. Ability to teach effectively, this involves the competence in communicating a given knowledge to the learner. The teacher should love and know the subject enough in such a manner that he can explain every bit of an instructional content whenever he is called upon to do so. The attribute can motivate the learners to learn. He should demonstrate the competencein communicating that knowledge to his learner.He states objectives correctly and in behaviouralterms. He is orderly in the presentation of his lessons. He varies methods of teaching and styles to suitthe learners and the subject matter. He uses relevantteaching materials; he uses valid and reliable instruments of measurementto assess his students.

Another quality of the teacher is the certification and qualification of the teacher, the teacher should be professionally trained and certified in his area of specialization and education such professional background prepares him for his career. To this effect, the teacher should be well devoted and committed to his professional calling through effective discharge of his duties. One of the principal duties of the teacher is to have content knowledge of his subject matter. He effectively does this by having a deep and better understanding of the topic he intend teaching, the various skills and methods, as well as the use instructional materials to enhance the teaching-

learning process. In addition, pedagogical skill is one of the good qualities of a good teacher, pedagogical skills are vital teaching skills thatthe adopt in teaching that are inevitable to facilitate the teaching-learning process (Amaele, 2012).

Teaching skills refers to specific teacher behaviour or notions designed to promote the effectiveness of lesson presentation in order to facilitate the process of teaching. Also,the number of years a teacher spends in the educational system influences the academic performance of students to a large extent. This because, the more a person stays, the more he/she is exposed to new ideas, strategies and methods to adoptto improve the teacher-leaning system by the school's board. Therefore, the teacher must have teaching experience that will positively affect the students' academic performance. The ability of the teacher to be bold, outspoken and audible in his teaching is another critical quality of a good teacher which emphasis the verbal ability of the teacher. Good communication or verbal ability of the teacher involves describing one's objectives clearly giving clear instructions, asking questions that are clear and understandable to the student and respond to students' questions with understandable explanations, giving precise instructions for assignments. This article tends to examines relationship between teacher quality and student academic performance, highlighting the key factors that contribute dynamic.

CONCEPTUAL CLARIFICATION

The Teacher

The teacher is an individual who plays a vital role in educational process, facilitating the acquisition of knowledge, skills and values by students. Teachers are responsible for creating a supportive learning environment, designing and delivering instructional materials assessing student progress, and providing feedback and guidance. The teacher is an individual who was taught and trained in the arts, science and theory es of teaching. He is the one who can guide, motivate and inspire the inspire the learner through a variety of appropriately selected and sequentially arranged learning experience towards the achievement of specific goals and objectives of the schools for positive changes in the society. He is the hub of the educational system. No school can do without him because the effectiveness of the system depends on his adequacy. To this, it is said that education unlocks the doors to modernization while the teacher holds the keys. Since no educational system can rise above the level of knowledge of its teachers, employers needto be carefully selective in teachers' employment else. The detrimental effect is on the society at large via the child.

There are several definitions of a teacher given by different scholar. Some see the teacher as a person who merely instructs others or helps other persons to acquire a skill and other forms of training. To these scholars, the teacher should be seen as someone who has acquired professional training institutions, such as colleges of education, and national institute. The teacher plays a vital and significant role in the education process of the individual person as its true purpose is to realize the potential of the whole person. Teachers have to teach in such a manner as not merely to furnish the minds of the students with suitable information alone, butto cultivate and develop their mental, moral and psychological capacities in the best possible way.

A teacher is a person who teaches the students with the allocated time in the school to foster learning. They play an important role in ensuring quality education delivery. The most common role the teacher play is to dispense pertinent knowledge to the students by following a stipulated curriculum that guides that level of education. Teachers, as important members of the

school play pivotal roles in educating the students. Teachers use different teaching methods in teaching to ensure knowledge is dispensed. They set the tone of their classroom, build warm environment, and become role model. A teacher is responsible for the emotional,behavioural, planning, preparing and effectively teaching students in a class to support or enhance their success. Far beyond that, he carries out the role of a parent, counselor, mentor and many others. However, the primary role of a teacher is to impart knowledge to his students and ensure that their performance increase over time.

The teacher is a positive thinking person who works hard in making sure the aim and objectives of education are attained and he does this by transferring knowledge to his students and making sure they acquire this knowledge in all aspects'.

Teachers are expected to ensure a good progress in the performance of his students, monitor their emotional, social and moral development. He can help to address social problems that affect his student success. The teacher is projected to have advance knowledge and skills in order to be efficient and effective in the classroom for instructional delivery. He is expected to be proficient in the use of technologies in teaching and in management of the classroom for students' academic performance.

According to Omieibi-Davids (2011), the teacher's knowledge of how to teach is very important if he is to bring about learning. This requires that he has sound knowledge of methods and materials and classroom management technique to use for a particular content, activity or group of learners. It enables him choose the appropriate instructional materials to effect desired changes. Also, his understanding of how to teach equip him with the fact that the teacher teaches everything they need to know about a given topic, that there is still more the learner is expected to discover on his own. Thus, what is important is not how much he teaches but how well he teaches, it is the quality of a teacher that will prompt further search for knowledge and better understanding and utilization of what is already taught.

In line with this, Ubah (2012) referred to the teacher as the chief work group of the principal. The teacher is the key to functional education in terms of teaching and learning activities and as such, he should be accountable for his academic performance and that of the students he teaches (Moses-Promise & Moses, 2016). A caring, competent and qualified teacher for every child is the most important ingredient in education. Success of a school system depends on its teacher. But for the teachers to do this they must be adequately prepared and motivated (Agu et al., 2000).

Teachers occupy the position of in-loco-parentis in the life of the learner and their contribution to the overall development of the child cannot be overemphasized. Students spend a large portion of their school time with the teacher and also acquire several qualities from the teacher. Since the teaching and learning relationship between the teacher and the students is the main purpose of their convergence, teachers are expected to pay more attention to how they can assist the student to acquire the needed skills, knowledge and attitude to become reasonable and responsiblemembers of the society.

The role the teacher plays in the learning satisfaction of the student which subsequently determines the academic performance of the child cannot be estimated but this depends to a great extent the quality of the teacher and how well he or she is able to contribute to the overall development of the child. Students also look forward to meet and interacts the teacher who is able to contribute meaningfully to their development and the satisfaction they derive from their teaching and learning interaction affects other aspects of their development. It was pointed out by Dziuban et al., as cited in Gray and DiLoreto (2016) that students rate their course and

instructional process as satisfactory if they see and understand that the teacher is communicating well, facilitating the learning process and encouraging the learner as well as organizing the lesson plan in an orderly manner and showing respect for the learner and all of these can only be developed when the right quality of teacher has been engaged.

Teachers no doubt have powerful influences on students especially those in their classroom and the quality of the teacher such as the teachers' qualification, experience and level of training goes a long way to influence how much the student is able to benefit from the classroom including the satisfaction they derive from the interaction in the classroom. It was on this premise that Dunlap and Frank as cited in Maphoso and Mahlo (2015:52) stated that "all teachers must possess instructional/ intervention skills to maximize the learner's outcomes". These competencies are sometimes developed as the teacher upscale his or her level of education, gather more experience on the job and also undergo further training. All of these are required or smooth classroom interaction between the teacher and the students as well as how much the students can benefit from the classroom for their overall academic advancement. In other words, the teacher's role is crucial to effective and efficient learning, the teacher is expected to provide essential inputs like adequate planning of lesson notes, effective delivery of lessons, proper monitoring and evaluation of students' performance, providing regular feed-back on students' performance, improvisation of instructional materials, adequate keeping of records and appropriate discipline of students to produce and enhance expected learning performance in secondary schools (Ayeni, 2010).

Key Characteristics of Teacher

- Educator: A teacher is an educator who imparts knowledge, skills, and values to student.
- Facilitator: A teacher facilitates learning by creating an environment that is conducive to learning, providing guidance and support, and encouraging students to take an active role in their learning.
- Mentor: A teacher severs as a mentor, providing guidance, advice, and supportto students as they navigate their educational journey.
- Role Model: A teacher is a role model who demonstrates values, behaviours, and attitudes that promote social, emotional, and academic growth.
- Caring and empathy: Teachers demonstrate a genuine interest in their students learning and well-being, proving emotional support and guidance.
- Expertise: Teachers possess specialized knowledge and skills in their subject area.

Roles and Responsibilities of a Teacher

- Lesson planning and delivery: Teachers plan and prepare lessons that meetthe needs of their students and also deliver instructional materials, adapting to the needs of diverse learners.
- Instruction: Teachers delivers instructions that is engaging, informative, and relevantto their students' lives.
- Assessment and Evaluation: Teachers assess student learning and progress, providing feedback that is constructive and supportive.
- Classroom Management: Teachers create and maintain a positive and productive learning environment.

- Communication with Parents and Guardians: Teachers communicate with parents and guidance, and counselling to students.

Qualities of an Effective Teacher

- Pedagogical Skills: An effective teacher has the skills and knowledge to plan and deliver instruction that meets the needs of their students.
- Communication Skills: An effective teacher communicates clearly, concisely, and respectfully with students, parents, and colleagues.
- Emotional Intelligence: An effective teacher has high emotional intelligence, which enables them to understand and manage their own emotions and those of their students.
- Flexibility and Adaptability: An effective teacher is flexible and adaptable, able to adjust their teaching to the changing needs of their students.
- Subject Matter Expertise: An effective teacher has a deep understanding of the subject matter they teach.
- Continuous Learning: An effective teacher engages in ongoing professional development, staying current with best practices and research-based instructional strategies.
- Passion for Teaching: Effective teachers are passionate about their subject area and committed to teaching.

Teacher Quality

Quality refers to the degree of excellence or superiority of something, such as a product, service, process, or attribute. Quality is often used to relate to the value that a product or service possess in relation to the expectation of end users. It is a term used to refer to how well a thing has met with the expectation of beneficiaries.

Teacher quality is a term that is used to refer to the value that a teacher possesses and is able to bring into the teaching and learning process. Explaining further, Suarman (2015:627) indicated that when we are referring to the quality of the teacher, it refers to the appropriateness of the teaching process, fulfilling teaching needs, and having the ability to anticipate clients and stakeholders' expectations in teaching and learning, the appearance of conducive physical facilities, friendly staff, and great administration services and all of these are put in the right perspective by the teacher who knows how. Teacher quality is built on a continuous basis and as such the teacher needs to explore every available platform to improve in quality so as to be able to contribute to classroom activities.

Teacher quality (QT) includes different indicators of teacher qualifications, in particular characteristics of teacher's educational background, amount of experience in teaching in teaching, and participation in professional development, as well as personality characteristics such as teacher's self-efficacy. A number of previous studies were able to relate measures of such teacher characteristics too student educational outcomes (Wayne & Youngs 2003), evidence suggests in terms of teacher knowledge and skills. (Blomeke et al. 2012: Bod et al. 2009: Tatto et al. 2012), these, in turns, are significantly related to instructional quality and student achievement (Baumert et al. 2010; Hill et al, 2005; Kersting et al. 2012). Self-efficacy beliefs influence thought patterns and emotions, which in turn enable or inhibit actions. Teachers with strong self-efficacy are typically more persistent and make stronger efforts to overcome classroom challenges than others (Tschannen-Moran e t al. 1998).

Teacher quality refers to the characteristics, attributes, and competence that enable teachers to effectively promote student learning and achievement. Teachers' quality is a multifaceted conceptthat encompasses various aspects teaching, including teachers' knowledge, skills and dispositions (Darling-Hammond, 2010).

Importance of Teacher Quality

- Student Achievement: Teacher quality is a significant predictor of student achievement (Hattie, 2009).
- Student Engagement: Teacher quality influences student engagement and motivation (Marzano, 2007).
- School Improvement: Teacher quality is a critical factor in school improvement efforts (Darling-Hammond, 2010).

Teachers use different teaching methods in teaching to ensure knowledge is dispensed. They set the tone of their classroom, build warm environment, and become role models. A teacher is responsible for the emotional, behavioural, planning, preparing and effectively teaching students in a class to support or enhance their success. Far beyond that, he carries out the role of a parent, counselor, mentor and many others. However, the primary role of a teacher is to impart knowledge to his students and ensure that their performance increase over time.

Teacher quality is a key determinant of students' academic performance. It is referred as to those attributes or qualities that teachers possess. These attributes include teacher's teaching method, time management, subject mastery and many others. Teachers with these qualities to an extent influence their student academic performance.

Indicators of Teacher Quality

Teacher Certification: Teacher's possession of specialized training and certification in their subject area (Darling- Hammond, 2010). Teachers Experience: Teacher's years of teaching experience and their level of expertise (Marzno, 2007). Teacher Education: Teacher's level of education and training in their subject area (Hattie, 2009). Teacher Evaluation: Teacher's performance evaluations and feedback from administrators, peers, and students (Danielson, 2013).

Teacher quality is an important factor affecting student performance (Snehi, 2011) and this quality can also be built by engaging in relevant and continuous training programmes. Training assists the teacher to acquire contemporary skills and knowledge that can be used to make better decisions in the school. Teachers who engage in regular training programmes are expected to be able to contribute more to the school system as well as satisfy the expectation of the learner in the classroom. Teachers have different avenues or platforms that they can explore to improve on their quality on the job and the abilities developed in the process can be deployed in the classroom to improve on the satisfaction that the learner derives in and outside the classroom which has the capacity to improve on the students overall educational achievement in the long run.

Therefore, teachers are expected to fulfill their duties to help children to develop their primary skills that should be required for an advancement, where qualified teachers help students

to discover their talents and get oriented to their future values effectively so as to overcome any challenge that lies ahead of them (Kimani et al., 2013).

Effective teaching and learning cannot occur without congenial classroom environment. Teacher maintains positive and effective learning environment through well prepared and varied lessons, which cater for the range of student abilities and interests. It also involves, setting of realistic and challenging academic standards of student performance. Teachers are required to demonstrate commitment to teacher professional development through interest and attendance at appropriate in-service course, commitment to a programme of professional study. Several indices are used to measure the quality of a teacher. Each teacher quality measures, such as teacher experience, certification status, academic ability and even stability a school.

Academic Performance

The concept of academic performance has often been used interchangeably with academic achievement. Performance refers to the results of an examination in a subject or a whole course (Lamas, 2015). Academic Performance refers to the extent to which a student achieves their academic goals, demonstrates mastery of subject matter, and exhibits cognitive, affective, and psychomotor skills. Academic performance also refers to a student's achievement and progress in their academic pursuits, typically measured by their grades, test scores, and other evaluations. It encompasses various aspects of a student's academic life, including: academic achievement, learning outcomes, academic progress, academic engagement. Academic performance is an important factor in educational system, as it can impact students' eligibility for higher education, job prospects, and career advancement. It can also influence a student's self-esteem, confidence and overall well-being.

Academic Performance according to Obeka (2010), is the quality of results produced by students which reflects in the quality of their examination scores. Obeka, Bichi and Yusuf (2012) defines academic performance as the display of knowledge attained or skill developed in school subjects designed by test and examination scores or marks assigned by subject teacher. UNESCO (2019) Academic performance refers the extent to which students achieve their educational goals, as measured by their grades, test scores, and other evaluation. World Bank (2018) noted that academic performance is critical for determining students future educational and career prospects, as well as their potential contributions to society. This paper views academic performance as the extent to which as students achieves their academic goals and the expectations of their educational institutions.

Performance has been described as an action of a person or group when given a learning task. Academic performance can be defined as any scope or performance above the class mean score, taking into consideration the difficult level of the test. There is usually a stand or score which is called the pass mark like 40% and 50%. Most common for public examinations, anyone who scores up to this mark is automatically assumed to have passed while anybody who scores less than this pass mark is regarded to have failed. It is also viewed in terms of actual performance in school (Ehinola, 2008).

Key Indicators of Academic Performance

- Grades: Letter or numerical grades assigned to students based on their performance on assignments, quizzes, tests, and exams.

- Test Scores: Standardized or non-standardized test scores that measure students' knowledge, skills and abilities in specific subjects.
- Assignment Completion: Timely and satisfactory completion of assigned tasks, projects and homework.
- Class Participation: Active engagement in classroom discussions, activities, groupwork.
- Project-Based Assessments: Evaluations of students' ability to apply knowledge, skills, and critical thinking to real-world problems.

Factors Influencing Academic Performance

- Intellectual Ability: Students' cognitive abilities, such as memory, attention, and problem-solving skills.
- Motivation: Students' interest, enthusiasm, and drive to learn and achieve academic success.
- Learning Strategies: Students' use of effective learning techniques, such as note-taking, summarizing, and self-testing.
- Teacher Support: Quality of instruction, feedback, and guidance provided by teachers.
- Family and socio-Economic Factors: Students' home environment, parental involvement, and socio-economic status.

Academic performance is the outcome of education. It is the extent to which a student, teacher or institution has achieved their educational goals. Academic performance is commonly measured by examinations or continuous assessment but there is no general agreement on how it is best tested or which aspects are most important- procedural knowledge such as skills or declarative knowledge such as facts (Annie, et al., 2016). Nevertheless, it refers to how students deal with their studies and how they cope with or accomplish different tasks given to them by their teachers. Academic performance by students has always been a subject of interest to every educational institution. Whereas there is a consensus that schools play a major role in the process. There seems to be disagreement about what that role should be. While some believe that the primary focus of schools should be the academic preparation of the students (Hirsch, 1996: Tienken, & Wilson, 2001). Others however believe that efforts of schools should be integrated with other social institutions such family and community towards educating children (Huitt, 2007). In fact, heads of educational institution, teachers and parents are primarily responsible for students' academic performance.

Teacher Quality on Students' Academic Performance

Teacher Quality and academic performance are two interconnected concepts that are critical to student success. Teacher quality refers to the characteristics, attributes, and competence that enable teachers to effectively promote student learning and achievement (Darling-Hammond, 2010). Academic performance, on the other hand, refers to the extent to which students achieve their educational goals and objectives, as measured by their grades, test scores, and other academic achievements (Hattie, 2009). The relationship between teachers and academic performance is complex and multifaceted. Research has consistently shown that teachers play a critical role in determining student academic performance. It has consistently shown that teacher quality is a significant predictor of academic performance (Hattie, 2009); Marzano, 2007).

Teachers who are knowledgeable, skilled, and passionate about their subject area are better equipped to create engaging and effective learning experiences for their students. In turn, students who receive high-quality instruction tend to achieve higher levels of academic performance. High quality teachers are better able to promote student learning and achievement. They are more effective in closing achievement gaps between students from different socioeconomic backgrounds. High quality teachers are better able to engage students in learning and promote student motivation.

Quality teachers have been recognized as indispensable human resource and indeed, one of the most important elements in the school system, more important than the quality of equipment and materials (Kolawole, 2009). Teacher qualities include the logical acts of teaching such as defining, demonstrating, modeling, explaining and so on, psychological acts of teaching such as caring, motivating, encouraging, rewarding, punishment, planning, evaluating and so on; and the moral acts of teaching such as showing honesty, courage, tolerance, respectful, fairness and so on.

Quality teachers teach students how to learn and help them to use the models of learning that will support the best academic, social, and personal growth. This is partly similar to what Williams (2003) stated, that for students to reach their potential, a quality teacher must pay more attention to the interplay between the science and art of teaching otherwise termed pedagogy. Teaching for meaningful learning entails teaching the content, skills and inculcating the right attitude (Ukoh, 2014). Usman (2003) argued that shortage of qualified teachers is responsible for the poor academic performance observable among the students. Darling-Hammond (2000) contended that measures of teacher quality are more strongly related to students' performance than other kinds of educational investments such as reduced class size, overall spending on education and teachers' salaries.

A professional or trained teacher is expected to have certain qualities that will enhance his/her effective teaching and students' academic performance. Some of the qualities include:

- Teacher pedagogy
- Teacher years of experience
- Teacher subject mastery
- Teacher qualification
- Teacher classroom management

Teacher Pedagogy

Pedagogical knowledge of the teacher is a quality indicator that involves the teachers' deep knowledge about the methods of teaching and learning. The science of teaching, according to Ogunboyede (2011), is referred to as pedagogy. Pedagogical knowledge is an essential and critical element in determining teachers' success in teaching and learning processes in the classroom (Ball and Bass, 2000). Lack of pedagogical skills and knowledge is a bigger threat to teacher quality than certification issues (Torff, 2005). Teachers with good mathematical pedagogical knowledge can break down mathematical knowledge into less polished and less abstract forms, thus making it accessible to students who are at different cognitive level (Ball, 2003). He further pointed out that teachers with good pedagogical knowledge understand where students may be struggling with learning the subject and should be able to present mathematical concept in a way that their students can comprehend each structure and avoid difficulties.

Teacher's subject matter knowledge is another teacher quality indicator. This has to do with teacher's knowledge about the content to be learnt or taught. The content to be covered in primary school science is different from the content to be covered in an undergraduate course. National Council of Teachers of Mathematics (NCTM) (2000) observed that teachers who have strong subject matter knowledge give details in their lesson, link the topic to other topics, throw questions to students, stray from the textbooks and promotes students' learning outcome.

Teacher Years of Experience

Teacher's teaching experience is another teacher quality indicator which has to do with the number of years a teacher has spent in the teaching service. Adewale (2010) found out that years of experience has a strong correlation with improved students' performance and it is argued that prospective and experienced teachers' knowledge and beliefs serve as a filter through which their teaching take place.

Years of experience of a teacher are vital in affecting his performance in the classroom. In other words, the number of years a teacher spends in the educational system influences the academic performance of students to a large extent. This is because, the more he spends time in the education system, the more he/she is brought to light in relation to new ideas, strategies and methods to adopt to improve the teaching-learning process through previous teaching experiences, teachers workshop as well as evaluation of the system by the school board. In the same vein, Sanders (2001), acknowledge that the experience of a teacher between 3 to 8 years appeared to be the rationale for his effective performance. Therefore, the teacher must have teaching experience that will positively affect the academic achievement of students.

The experience of the teacher on the job is also a factor that contributes to the quality of the teacher. Experience enables a teacher to better understand the dynamics of the school, the challenges that students face especially where a teacher has been teaching a particular subject for a long period of time. Experience enables a teacher to understand the solutions that work as well as the ways of resolving the problems that students face in school, and the experience of the teacher can be brought to the fore to assist the students derive more satisfaction from their learning activities, and social academic skills.

Teacher Subject Mastery

Teacher subject mastery refers to the degree to which a teacher has a deep understanding of the subject matter they are teaching. This includes knowledge of the content, concepts, and principles, as well as the ability to apply this knowledge in the classroom. A good teacher should have an acceptable command of the content of area of the subject he is teaching and should be able to explain the various topics to the proper understanding of the learner. Teachers who have strong grasp of the subject matter are better able to explain complex concepts, answer questions, and provide feedback, leading to improved student learning outcomes. Teachers who have a strong understanding of the subject matter are better able to manage the classroom, as they are able to provide clear instructions set realistic expectations and minimize disruptions.

Subject mastery is unarguably another teacher quality that is required from a teacher. According to Cohen (2010), teaching a course entail more than superficial knowledge of the subject. That is, the more a teacher understands a particular content, the more effective and efficient he will be to transfer knowledge to the students. For example, a teacher with the

knowledge of English Language will deliver accurately and competently than a teacher who has little or no content knowledge on the subject. When a teacher has a strong content knowledge, it helps his students get better knowledge and understanding of the subject which translate or result in academic performance. Subject mastery helps the teacher to respond to students productively. Teachers understanding of the purpose and nature of a particular subject or discipline influences his/her manner or method of teaching, the ability to clearly explain and ask good questions, the ability to arouse students' interest in the subject for better academic performance.

Teacher Qualification

Teacher qualification is another teacher quality indicator and it refers to the educational credentials, training, and certifications that teachers possess to demonstrate their competence and expertise in teaching (Darling-Hammond, 2010). These qualifications serve as a benchmark for ensuring that teachers have the necessary knowledge, skills, and dispositions to provide high-quality instruction and support student learning. Teacher qualifications are linked to improved student outcomes, including higher academic achievement and better social and emotional (Haie, 2009). Teacher qualifications can increase teacher confidence and self-efficacy, leading to more effective teaching practices (Bandura, 1997). Teacher qualifications demonstrate a commitment to the teaching profession and a willingness to engage in ongoing professional development (Feistritzer, 2011).

Qualification of teachers have been considered as the essential catalyst that promote the improvement of the school setting where teachers are taken as the main source used in school development as well as students' school development which is considered to become the source that help the knowledge and changes (Wallace, 2011). Therefore, students who fail in both external as well as internal examination are taught by unqualified teachers while the students who perform better, are taught by very qualified and experienced teachers who have effective methodology of classroom management and content delivery (Afe, 2010). According to Wallace (2011), highly qualified teachers are also considered to be an agent of change due to the key role that they play for the purpose of making an improvement related to students' academic performance that should be done through effective delivery related to the quality of education.

Qualified teacher refers to an individual that guides learners to get new knowledge and skills and who has achieved the minimum criteria for teaching a particular level of education (Lydia &Migosi, 2015). Herman (2015) indicated that high quality teacher education as well as trainings is one of pre-requisites that lead to quality of teaching and also improves learning outcomes where the effective teaching should be observable and can be communicated effectively and also consulting to degrees and diplomas as well as certificates as a form of signaling. (UNESCO, 2014). Having degrees, certificated as well as diplomas are considered to be the basic requirements that lead to teacher qualification and also having effective code of conduct so as to meet the universal schooling goals (Moon, 2013). Qualified teachers should use various techniques that help students to improve their academic performance (Concordia, 2013).

Despite, Halsey (2004) revealed that every qualified teacher should make an improvement that sustain inclusive classroom as qualified evaluator for the purpose on enhancing the level of teaching standards and that of the quality of education. According to Wallace (2011), teachers' who make effective preparation of the students' activity and lesson delivery as well as homework strength students' active learning. On the other hand, teachers who are qualified in management of children who are disabled to some performed activities in

classroom may enhance the school productivity effectively (Wallace, 2011). This shows that competent teachers lead to improved competent students.

Teacher Classroom Management

Classroom is a learning environment where students, teachers, and educational resources interact to facilitate teaching, learning, and socialization. According to UNESCO,(2019), A classroom is a space where student and teachers interact, and where learning takes place through various activities, discussions, and experiments. In the same vein, Omieibi-Davids (2001) saw the classroom as a place to promote teaching and learning under the guidance of a teacher. It is the power house of formal education in which the success or failure of the curriculum is generated and sustained.

Teacher classroom management refers to the strategies, techniques, and skills used by teachers to create and maintain a positive, respectful, and productive learning environment. Effective classroom management is critical to ensuring that students are able to learn, grow, and succeed. A well-managed classroom management helps to provide a conducive learning environment, leading to improved academic achievement and student outcomes. Good classroom management is the key to the achievement of success in classroom activities by both the teacher and the student. It involves the integration and effective use of the basic qualities that every good teacher must possess in order to achieve success in classroom as well as the efforts and techniques he must adopt to ensure effective learning and full development of every learning with minimal interference and the techniques he must adopt to intervene when such interference occurs.

The teacher is the major factor of managing his class as to enhance and facilitate the teaching and learning process. He organizes and co-ordinates human and environmental factors in the classroom so that instruction can take place without disruptions. For effective classroom management, the teacher has to apply the following concepts: discipline, motivation, punishment, effective communication, reinforcement, and control as well as class participation.

Factors Contributing for Students' Academic Performance

- Facility quality;
- Students' effort;
- Teacher-students relationship;
- Parents education.

School Facility

The quality of facilities made available to a school determines the level of students' academic performance. School facilities are considered as a potent factor in the high academic performance of students. Facilities therefore include the building, classroom furniture's, and recreational equipment and other instructional materials (Benjamin, 2001). He went further to say that their availability, relevance and adequacy contribute to academic performances. In their contribution, Ajayi and Ojumgerm (2000) reiterated that when facilities are provided to meet relative needs of a school system, students will not only have access to the reference materials mentioned by the teacher but individual students will also learn at their own paces. The net effect

of this is to increase the overall academic performance of the entire students. The idea that human and material resources are to be assembled together by educational administration within the school system for effective teaching and learning cannot be overemphasized. Physical and material resources are tangible resources that can easily be seen and observed in any institution.

School quality indicators therefore remain an important area in the school system that should be studied and managed to enhance teachers' job performance. The quality of education provided in any school does not only depend on the head teachers' quality as reflected in the performance of administrative duties but also in the effective discharge of teaching duties by teachers and the facilities available in the school system. In other words, school quality indicators may have a form of relationship with students' academic performance since the quality of an environment may go a long way to shape the activities and development of people and things within the scope of that environment. In other words, facility quality can affect students' academic performance.

Students Effort and Academic Performance

Effort refers to the overall amount of time, energy, and persistence (the ability to continue working on a task despite obstacles, challenges, or setbacks) a student devotes to learning and achieving academic goals. Student effort is a critical factor in academic performance, as it influences the amount of time and energy devoted to learning. Research has consistently shown that students who exert more effort tend to achieve better grades and higher level of academic success. According to Self-Determination Theory (SDT), student effort is motivated by three innate psychological needs: autonomy, competence, and relatedness (Deci & Ryan, 2000). Expectancy- Value Theory (EVT) posits that student effort is influenced by expectations of success and the value placed on academic achievement (Ecclestone, 2007). Students who engage in self-regulated learning strategies, such as goal-setting and self-monitoring, tend to exert more effort and achieve better academic outcomes (Zimmerman, 2000). Students' effort-outcome expectancy, or their belief that effort leads to success, is a strong predictor of academic performance (Bandura, 1997).

Teacher-Students Relationship

Teachers-students relationship is another indicator which means getting to know the students as individuals as well as a group, getting to know them in terms of cultural background, intellectual profile, learning strength and academic potential as well as their interest outside the school and what they do for fun (Miller et all., 2006). Positive relationship with the teacher is important in supporting higher level of self-esteem, higher academic self-efficacy, academic performance and more confidence in future employment outcomes. O'connor et al. (2011) posited that positive teacher-student relationship enable students to feel safe and secure in their learning environments. They maintained that teachers who support their students in the learning environment can positively impact their social and academic outcomes.

Key aspects of Teacher-Student Relationships

- Emotional Support: Teacher's ability to provide emotional support, empathy, and care can foster a sense of safety and security, promoting students' academic engagement and motivation.
- Academic Support: Teacher's ability to provide academic support, guidance, and feedback can help students develop a sense of competence and confidence, leading to improved academic performance.
- Teacher-Student Interaction: The qualities of teacher-student interactions, including verbal and nonverbal communication can significantly impact student's academic experience and outcomes. Students who have positive relationships with their teachers ends to have better attendance and fewer disciplinary problems (Gillies, 2011).

Parent Education

Parents are the most immediate relation of a child. Educated parents better understand the educational needs and their children's aptitude. They, thus help their children in their early education which affects their proficiency in their relative are of knowledge. Parents education or academic background definitely contributes immensely toward the academic life of their children. According to Grissmer (2003), parents' level of education is the most important factor affecting students' academic achievement. Taiwo (1993) submits that parents educational background influences the academic achievement of students. This, according to him, is because the parents would be in a good position to act as second teachers to their children, and even guide and counsel them on the best way to perform well in education and provide the necessary materials needed by them. Musgrave (2000), argues that children who comes from an educated home would like to follow the steps of their family and by this, works actively in their studies.

Jeynes (2002) also posited that a child from a well-educated family with high socio-economic status is more likely to perform better than a child from an illiterate family. This he suggests apparently because children from an educated family are seen to have lots of support such, as a decent and good environment for academic work, parental support and guidance, enough textual and academic materials and decent feeding. Eamon (2005) again claims that virtually in all nations, children whose parents are highly educated, occupation and social scale have far better chance of getting into good secondary school and from there into the best colleges and universities than equally bright children of ordinary workers or farmers. In fact, the most important factor associated with the educational achievement of children is not race, ethnicity or immigrant status, instead the most critical factor is parents' education. (Considine & Zappala, 2002).

Student Ambition

Student ambition refers to the goals, aspirations, and desires that students have for their academic, career and personal lives. Ambitions can be a powerful motivator for students, driving their academic engagement, motivation, and overall success. The ability to set goals and pursue these goals is sometimes referred to by educators as students' academic ambition, academic ambition demonstrate that ambitions can be linked to the seeking of success and avoidance of failure. Pettgrove (2007) defines ambition as the persistent and generalized striving for success,

attainment, and accomplishment. Students who choose to set difficult goals for themselves tend to become ask oriented, with a sense of purpose for their lives. Certainly, academic ambition can influence student learning, preparation for life choices, academic motivation and achievement. Academic ambition is the student's ability to identify and set goals for the future, while being inspired in the present to work toward those goals. Ambition thus, represents the perception that an activity is important as a means to future goals. It reflects individuals' perceptions that are both possible and desirable to think in future terms and to plan for the future.

Individuals' ambitions are considered important because they might influence key choices, and outcomes such as educational achievement (Goodman & Gregg, 2010). In fact, man studies suggest that young people with higher educational ambitions have greater motivation and higher educational attainment than their peers (Desforges &Abouchaar, 2003,).

METHODOLOGY

This study employed a theoretical review methodology, which involved a comprehensive analysis of existing literature on teacher quality and its impacts on student academic performance. The review was grounded in the Teacher Quality Model (TQM) framework, which posits that's teacher quality consists of teacher and characteristics, behaviours and attitudes,

CONCLUSION

The quality of teachers has a profound impact on students' academic performance. Research has consistently shown that high-quality teachers are essential for improving student outcomes, reducing achievement gaps, and promoting educational equity. The evidence highlights the critical role that teachers play in shaping students cognitive, social and emotional development. Students' academic performance depends on so many factors but greatly relies on the quality of the teachers. Teachers are role models of the students and the excellent attributes of the teachers would definitely rub off on the students. Therefore, it is imperative that policymakers, educators, stakeholders prioritize teacher quality and provide ongoing support to ensure that all students have access to high-quality education.

Suggestions

- Government should create a recruitment system based on merit so as to employ teachers with optimum qualification
- Government should provide regular professional development opportunities to enhance teachers' subjects matter expertise, pedagogical skills.
- Principals should ensure that the potentials of the teachers are well harnessed and utilized to reflect the true picture of their quality in the academic performance of students
- Principals should ensure that all students must have access to safe, well-equipped, and technology-rich classrooms that support teaching and learning.

UTILIZATION OF EFFECTIVE CLASSROOM MANAGEMENT STRATEGIES FOR IMPROVED INSTRUCTIONAL OUTCOMES IN PUBLIC SENIOR SECONDARY SCHOOLS IN RIVERS STATE

Ndidi Udochi ESOWE
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

The study investigated utilization of effective classroom management strategies for improved instructional outcomes in public senior secondary schools in Rivers State. The study was guided by four research objectives, four research questions, and four corresponding null hypotheses which were tested at a significance level of .05. The theoretical framework of the study was hinged on the systems theory propounded by Ludwig von Bertalanffy. The study adopted a descriptive survey design. The population of the study was the 5,833 teachers of the 333 public senior secondary schools in Rivers State. This comprised of 2,844 male and 2,989 female teachers based on data sourced from the Rivers State Senior Secondary Schools Board in 2024. The sample size of the study was 200 teachers comprising 100 males and 100 females, and selected using stratified random sampling of the study population. The instrument for data collection was a structured questionnaire designed by the researcher and titled "Utilization of Effective Classroom Management Strategies for Improved Instructional Outcomes Questionnaire (UECMSIIOQ). The instrument had a reliability coefficient of 0.81 which was determined using test-retest method of data collected through a pilot study on the population, and analyzed using Pearson Product Moment Correlation statistics. The research questions were descriptively answered using mean and standard deviation statistics while the hypotheses were inferentially tested using independent samples t-test at a significance level of .05. The findings of the study revealed several classroom management strategies deemed effective by teachers for improved instructional outcomes, some of which included disciplinary measures, delegation of responsibilities, and positive reinforcement. The study also revealed that teachers utilized these strategies to a high extent in public senior secondary schools. Moreover, the male and female teachers differed in their extent of utilization of some of the strategies. The study thus suggested among others that the Ministry of Education in collaboration with principals of public senior secondary schools should periodically organize teacher training and professional development programs for teachers in the area of classroom management for continuous improvement in instructional outcomes of secondary schools in the state.

Keywords: Classroom Management, Instructional Outcomes, Senior, Secondary Schools, Classroom Discipline, Delegation of Responsibilities, Positive Reinforcement, Student Engagement, Teacher Training.

INTRODUCTION

The classroom is arguably the most important facility of the school system. It is the factory in which the education production process takes place. It is in the classroom that the character of the learner is formed and fabricated. It is in the classroom that the real transformation or change in the learner occurs. Every form of knowledge gathered by learners from outside the walls of the classroom, both from within the school and from outside the school can be altered, reshaped, disbanded, reinforced or affirmed in the classroom. The place, role, and significance of the classroom in the education process can simply not be overstated. As such, it is imperative that priority be given to the management of this critical educational resource, the classroom.

The classroom is the production room or rather the workshop of the school system where the most important service of the school (teaching and learning) is delivered for the production of the schools' most important product (graduates found worthy in character and learning. However, there are several factors within the classroom that try to defeat this purpose (instruction) and they can only be put in check through clas5rrom management practices adopted by the teacher. Nwankwoala (2016) defined classroom management as an effective and efficient organization and utilization of the educational resources (human and non-human) available to the teacher for the purpose(s) of achieving the set goal(s) of the class (productive teaching and learning/instructional outcomes).

Several researchers have highlighted classroom management as a major variable that affects students' academic performance (Marzono, 2018). The most obvious reason for this assertion is that, effective classroom management sets the stage for teaching and learning. It sets a tone in the classroom that captures students‟ attention as a necessity for effective teaching and learning (Nwankwoala, 2021). This statement is obvious since a classroom which is chaotic and disorganized as a result of poor classroom management is highly unlikely to enhance expansive learning and students' academic performance and might, indeed, inhibit it.

The need for classroom management is informed by several reasons. Students come into the classroom with varieties of challenges that undermine the effectiveness of instruction. Different characters and personalities converge in the class; childish behaviours and intrinsic restlessness and lack of self-discipline are usual of children. All of these and more pose as distractions to instruction. Teachers' efficiency is therefore measured by their ability to adopt the right model for managing the classroom.

There are several classroom management practices that have been advanced both in literature and in practice over the years. Some of these include positive and negative reinforcement, discipline, record-keeping, timetabling, delegation of authority to students, etc. Investigating the efficacy of these practices for improved instructional outcome within the context of public senior secondary schools in Rivers State therefore becomes the crux of this study.

Statement of the Problem

Experiences and complaints from teachers in public primary schools reveal that a lot of teachers are seriously struggling with being able to effectively manage their classrooms. Various dimensions of students' deviant behaviours, excessive workloads, overcrowding, etc. with their attendant effects have largely undermined teachers' efforts towards achieving instructional success. Students' outcomes end up not reflecting the amount of efforts put in by teachers in

most cases. Studies have indicated the existence of relationship between teachers' classroom management strategies and students' behaviours at different levels of education (Gacheri, 2017; Nwankwoala, 2021). Moreover, majority of the classroom management strategies adopted by teachers are only able to ensure that the classroom is coordinated and quiet during teaching sections, but have not really translated into improved teaching and learning outcomes. Teachers end up having their way in controlling the class but the expected results in students' learning outcome is rarely seen. It is against this background that this paper examined how the use of classroom management strategies such as classroom discipline, use of reward, delegation of authority, and effective teaching can enhance the instructional outcomes of public primary schools in Rivers State.

Aim and Objectives of the Study

The aim of the study was to investigate effective classroom management strategies for improved instructional outcomes in public senior secondary schools in Rivers State. Specifically, the objectives included to:

- Ascertain the extent various classroom management strategies are deemed effective for improved instructional outcomes in public senior secondary schools in Rivers State.
- Determine the extent teachers utilize disciplinary strategies in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State.
- Investigate the extent teachers utilize delegation of responsibilities in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State.
- Examine the extent teachers utilize positive reinforcement (reward) strategies in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State.

Research Questions

The study was guided by the following research questions:

- To what extent are various classroom management strategies deemed effective for improved instructional outcomes in public senior secondary schools in Rivers State?
- To what extent do teachers utilize disciplinary strategies in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State?
- To what extent do teachers utilize delegation of responsibilities in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State?
- To what extent do teachers utilize positive reinforcement (reward) strategies in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State?

Hypotheses

The following null hypotheses were formulated and tested at 5% significance level to guide the study:

- There is no significant difference in the mean ratings of male and female teachers on the extent various classroom management strategies are deemed effective for improved instructional outcomes in public senior secondary schools in Rivers State.
- There is no significant difference in the mean ratings of male and female teachers on the extent teachers utilize disciplinary strategies in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State.
- There is no significant difference in the mean ratings of male and female teachers on the extent teachers utilize delegation of responsibilities in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State.
- There is no significant difference in the mean ratings of male and female teachers on the extent teachers utilize positive reinforcement (reward) strategies in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State.

Significance of the Study

The findings of the study may prove highly useful to critical stakeholders of public senior secondary schools such as teachers, students, school administrators, policy makers and researchers in the field of educational management. Teachers may find the study helpful as its findings will inform them on the need for adoption of various classroom management strategies in their instructional delivery endeavours, and also inform them on the extent of effectiveness of various classroom management strategies so that they may know which to adopt at every classroom situation they find themselves. For school administrators and policy makers, the findings of the study will inform them on the knowledge needs of teachers, which would form as basis for the types and contents of teacher training and development programs that they would have to organize for their teachers. Students may profit from the study as its findings will furnish them with knowledge of their roles in the classroom for improved learning outcomes. The study would equally serve as springboard for future researchers who may intend to advance on the scope of the study.

THEORETICAL FRAMEWORK

The study is anchored in Ludwig von Bertalanffy's systems theory propounded in 1968. A system in this regard refers to series of interrelated and interdependent parts, such that the interaction of any part (subsystems) affects the whole system. The systems theory rests on the belief that all systems have different parts performing different functions but in such a way that each part interacts and is interdependent with other parts of the other systems (environment) around it (Elujekwute et al., 2022). The system theory thus views the classroom as a complex system with interconnected component parts, which include teachers, students, instructional materials and the learning environment. These component parts, which serve as inputs of the system, inter-depend on and interact with each other to achieve the goals of the system, which include teacher effective performance, student learning outcomes, academic achievement, and growth. This is assured through the process of effective classroom management.

The systems theory has implications of the present study. The first implication is that it give understanding of the interconnectedness of the component parts of the classroom: the teacher, students, and the learning environment and resources. Teachers therefore need to recognize the relationship between these components and how they interact for improved

instructional outcomes. Secondly, the theory highlights the need for applying a holistic approach of considering the entire classroom system when making teaching and learning decisions. None of the component parts must be neglected. Thirdly, the theory is imperative for adaptability. It highlights the need for teachers to be flexible and responsive to changes in the classroom system. Fourthly, the theory is imperative for feedback and reflection. There is need for feedback and reflection to understand the state of the various components of the classroom system, as this would ensure informed decision –making in the instructional delivery process.

CONCEPTUAL REVIEW

Classroom management

Classroom management refers to the orderly and professional arrangement and coordination of classroom activities in order to provide an environment conducive for teaching and learning (Owan cited in Nwankwoala, 2021). Ahmad et al. cited in Nwankwoala (2021) opined that classroom management procedures assume an indispensable part in upgrading learners' learning. Again, Nwankwoala (2018) defined classroom management as all the effects the classroom teacher puts using the available human and material resources in the classroom to achieve set educational objectives and goals.

In the view of Omenka and Otor (2015), classroom management is the orderly control of the students, the class environment and teaching materials in order to obtain the desired learning objectives which can enhance the academic achievement of students. Mgbodile cited in Omenka and Otor (2015) saw classroom management and administration as the process of creating favourable conditions to facilitate instructions as well as that of regulating social behavior of students. He viewed classroom management and organization as a function of proper knowledge, dedication, skill and training for which they are called. The behaviour and the reaction of students are much related to the degree of teachers' proper management of the classroom. For Akpakwu (2023), classroom management is the orderly control of the learners, teaching materials and teaching aids in order to obtain the desired learning objectives. Classroom management considering the above mentioned views, could be conceptualized as the planning, management and execution of the school programmes as it affect teaching and learning in the classroom. The teacher manages the physical as well as the psychological environment to create an atmosphere that is conducive for learning.

Classroom management is a significant part of effective teaching and learning process. Due to an effective classroom management, pupils flourish in a positive class climate and a compassionate environment. From a pupils' perspective, effective classroom management provides them the opportunities to socialize themselves while learning. From a teacher's perspective, effective classroom management involves precautionary discipline and fruitful teaching. Furthermore, classroom management is the process of organizing and conducting the business of the classroom, many perceive it as the preservation of order the through teacher control. Classroom management is much more than that; it also involves the establishment and maintenance of the classroom environment so that educational goals can be accomplished (Savage & Savage, 2020).

Instructional Outcome

Instructional outcomes refer to the performance of both teachers and students in the teaching-learning process that takes place in the classroom. It is about the achievements of the teachers and the students. Teachers have instructional goals to achieve both on short term and on long term basis. The short term goals may be related to the instructional plan contained in the lesson plan. They could be students' assessment goals or anything at all. They are often achievable within a short time and they contribute to the success of teachers' long term goals which often take longer time to achieve, such as covering the scheme of work for the term. The achievement of these goals is dependent on many factors, one of which is what happens in the classroom. A well-managed classroom will lead to effective achievement of the short-term goals of teachers. When the classroom continually supports the attainment of the teacher's short term goals, it sums up to the timely attainment of long-term goals, too.

On the part of the students, learning outcome is often measured by students' performance in formative and summative tests. The summative tests in particular give the perfect picture. They are the assessment of learning, which assesses how well students have been able to master the lessons and learning experiences that have gone on in the classroom. A well-managed classroom will always support students' learning outcomes.

How Effective Classroom Management Improves Instructional Outcomes

Effective classroom management is crucial for improving instructional outcomes. Several studies have been carried out in this regard at all levels of education in Nigeria and in other countries. Gacheri (2017) examined the influence of classroom management practices on students' academic achievement in public secondary schools in Tharakanithi County, Kenya and found that classroom discipline management practices had an impact on learners' achievement, and teaching methodologies however, were not effective and therefore leading to little impact on the learners' achievement. The study further found that Instructional supervision done by principals had a positive impact towards learners' achievement as this made sure teachers were able to complete the class syllabus. In the same vein, Bayefa-Asaowei (2024) found that the adoption of innovative classroom management practices by teachers brought about improvement in students' learning outcomes. The obvious ways found in literature in which classroom management strategies improve instructional outcomes include:

- Increased Student Engagement: A well-managed classroom fosters a positive learning environment, encouraging students to engage actively with the instructional material.
- Improved Academic Achievement: Effective classroom management helps to minimize distractions, allowing students to focus on their academic work and achieve better grades.
- Enhanced Teacher-Student Relationships: A positive classroom environment promotes strong teacher-student relationships, which are essential for effective instruction and student success.
- Reduced Disruptions: Effective classroom management strategies help to minimize disruptions, creating a more stable and productive learning environment.
- Increased Time on Task: By minimizing distractions and disruptions, effective classroom management enables students to spend more time on task, leading to improved instructional outcomes.

- Better Use of Resources: Effective classroom management helps to optimize the use of resources, including time, materials, and technology.
- Improved Student Behavior: A well-managed classroom promotes positive student behavior, reducing the likelihood of misbehavior and improving overall instructional outcomes.
- Enhanced Collaboration: Effective classroom management fosters a collaborative learning environment, encouraging students to work together and support one another.
- Increased Parental Involvement: A positive classroom environment can encourage parents to become more involved in their child's education, leading to improved instructional outcomes.
- Improved Teacher Morale: Effective classroom management can reduce teacher stress and improve morale, leading to a more positive and productive teaching environment.

Classroom Management Strategies for Improved Instructional outcomes

Several studies have identified commonly utilized classroom management strategies in primary and secondary schools. Gacheri (2017) found that the use of disciplinary measures and instructional supervision were effective to some extent at ensuring that the instructional delivery environment and process met expectations in Kenya. Omenka and Otor (2015) identified classroom discipline and motivation as management strategies that influenced students' academic achievement in Science and Mathematics in Benue State, Nigeria. Bayefa-Asaowei (2024) identified some modern classroom management practices such as student-centred instructional approach, active learning classroom management approach, collaborative instructional delivery techniques, and contemporary positive reinforcement practices to be very effective for 21st century education delivery in secondary schools in Nigeria. This present paper examined classroom management strategies such as use of disciplinary strategies, delegation of responsibilities, use of rewards, and effective teaching as classroom management strategies with a view to understanding how they improve instructional outcomes in public senior secondary schools in Rivers State.

Use of Classroom Disciplinary Strategies for Improved Instructional Outcomes

Discipline refers to the use of "strong hand" to make students do what they ought to do, when they ought to do it and how they ought to do it. The strong hand could mean outright punishment, verbal coercion, or stringent measures applied to enforce compliance with acceptable behaviours in the classroom. According to Webster's New encyclopedic dictionary, discipline connotes training that corrects, molds or perfects the mental faculties or moral character. It is a control gained by enforcing obedience or order. Galabawa cited in Nwankwoala (2021) viewed it as an activity of subjecting someone to a code of behaviour. This is an important classroom management practice as there is wide spread agreement that an orderly atmosphere is necessary in schools for effective teaching and learning to take place, and this can be achieved through the use of disciplinary measures by the teacher.

The use of disciplinary measures by teachers in the management of classroom helps to prevent students' behaviours which interfere with the teaching and learning process. Some of these misbehaviours were identified to include bullying, lateness, vandalism, alcohol consumption and substance abuse, truancy and inability or unwillingness to do class work at

home (Nwankwoala, 2021). In the view of Gacheri (2017), disciplinary measures popularly adopted by teachers against erring students in the class includes flogging, kneeling down, washing of toilets, clearing of refuse, manual labour, working in the school farm, clearing the school fields, suspension from school, among others. Bayefa-Asaowei (2024) argued that the right kind of discipline for pupils is the type that helps them improve in their behaviour, and as such, discipline should not be done with the aim of inflicting pains, injuries or losses on the learner.

Studies on effective disciplinary measures for classroom management have identified various ways in which discipline improves instructional outcomes in classrooms (Nwankwoala, 2021; Ochai & Ivagher, 2021). Some of these ways include:

- Establishing a positive learning environment: A well-disciplined classroom fosters a positive and respectful learning environment, which is essential for effective instruction.
- Minimizing distractions: Discipline helps to minimize distractions, allowing students to focus on their academic work and reducing disruptions.
- Promoting student engagement: A disciplined classroom encourages students to engage actively with the instructional material, leading to improved academic achievement.
- Encouraging respect for authority: Discipline helps students develop respect for authority figures, including teachers, which is essential for effective instruction.
- Supporting time management: Discipline helps students develop time management skills, which are critical for completing assignments and meeting deadlines.
- Fostering a sense of responsibility: Discipline encourages students to take responsibility for their actions and their learning, leading to improved academic achievement.
- Reducing misbehaviour: Discipline helps to reduce misbehavior, creating a more stable and productive learning environment.
- Improving teacher-student relationships: A disciplined classroom promotes positive teacher-student relationships, which are essential for effective instruction and student success.
- Enhancing collaboration: Discipline fosters a collaborative learning environment, encouraging students to work together and support one another.
- Supporting academic achievement: Discipline is positively correlated with academic achievement, as it helps students develop the skills and habits necessary for success.

Enforcing discipline in the classroom is a veritable way of improving instructional outcomes as it establishes a positive and respectful learning environment that is supportive of teaching and learning in the classroom.

Viewing from the angle of accountability, Cotton cited in Nwankwoala (2021) opined that punishment in the school system are expected to teach students accountability for their mistakes, that is, to teach them the relationship between their behaviours and the outcome. One good reason why this is needed is that when a student is disciplined for an action, he most likely desists from repeating that action knowing that it will attract similar punishment and other students desist from doing the same thing for fear of facing such disciplinary measures. A well-disciplined classroom implies more quietness, more coordination and less interference to teaching and learning. This leads to improved instructional outcomes.

Use of Delegation of Responsibilities in Managing Classrooms for Improved Instructional Outcomes

Delegation involves entrusting work, responsibility and authority by a leader or a head of a team to a subordinate in the bid to hold them accountable for the outcome of the performance. This implies assigning a level of decision making autonomy and encouraging performance of a given task to achieve a desirable outcome. Delegation is also an important function in every organization and in the educational setting. Delegation enables management to make the best use of their time and skills as well as ensuring that staff and subordinates are assisted in their growth and development whilst building trust and confidence as well as increasing the amount of expected work to be completed cited in Nwankwoala (2021).

Risgaard et al. cited in Nwankwoala (2021) explained that effective delegation of authority provides several benefits to the educational setting as managers are able to mobilize resources, share responsibilities and also focuses on doing a few tasks well, rather than many things less effectively resulting in increased management and leadership potential. Delegation of responsibilities in the classroom to class prefect, subject representatives or even to normal students in the class is a veritable classroom management mechanism. It saves time for the teacher who is able to focus on some more important aspects of the teaching-learning process.

On how delegation of responsibilities as classroom management strategy of teachers improves instructional outcomes, Abiona (2022), Amos et al. (2022), and Seth and Ntirandekura (2022) highlighted some very important points. These include:

- Increased student autonomy: Delegation of responsibilities encourages students to take ownership of their learning, promoting autonomy and self-directed learning.
- Developing of leadership skills: By delegating responsibilities, teachers can help students develop leadership skills, such as decision-making, problem-solving, and communication.
- Fostering collaboration: Delegation of responsibilities promotes collaboration among students, encouraging them to work together to achieve common goals.
- Enhancing time management: Delegation of responsibilities helps students develop time management skills, as they learn to prioritize tasks and manage their workload.
- Promoting accountability: By delegating responsibilities, teachers can hold students accountable for their actions and their learning, promoting a sense of responsibility and ownership.
- Supporting differentiated instruction: Delegation of responsibilities allows teachers to differentiate instruction, providing students with tasks that are tailored to their needs and abilities.
- Encouraging active learning: Delegation of responsibilities promotes active learning, as students are engaged in hands-on activities and projects that require critical thinking and problem-solving.
- Developing problem-solving skills: By delegating responsibilities, teachers can help students develop problem-solving skills, as they learn to navigate challenges and obstacles.
- Fostering creativity: Delegation of responsibilities encourages students to think creatively and develop innovative solutions to problems.
- Supporting teacher productivity: By delegating responsibilities, teachers can free up time to focus on high-priority tasks, such as lesson planning and assessment.

Use of Positive Reinforcement in Managing Classrooms for Improved Instructional Outcomes

Nothing motivates as much as rewards and positive feedbacks on our actions. As a matter of fact, we do virtually everything we do because of what we get from doing them. This means where there is no hope of getting a positive outcome, whether tangible or intangible, we may most likely not be motivated to carry out actions in such directions. The positive reinforcement system works most assuredly for children and adolescents. The promise of a reward or the giving of rewards has very positive impact in eliciting desired behaviours in students. Although it is good to encourage students to become intrinsically motivated, it is also worth noting that extrinsic motivators are important, too. It will save your sanity to accept that external rewards such as money, grades, prizes, and praise will drive most of the behaviour of students in the classroom.

Rewards are a positive way to encourage students to be motivated in learning. Teachers can give rewards to students as a form of appreciation for their composure and their participation in learning, which can encourage students' motivation to stay controlled and participate more actively in the learning process (Sudirman et al., 2023). Thus it can be concluded that rewards aim to provide positive encouragement to people who perform expected actions so they are more likely to repeat them.

Bayefa-Asaowei (2024) succinctly captured the idea of using positive reinforcement for classroom management. In his view, positive reinforcement is a technique to elicit and to strengthen new behaviours by adding rewards and incentives instead of eliminating benefits. It is a traditional classroom management strategy that can be innovatively and creatively repackaged in the light of 21st century student realities in the classroom. When done appropriately in ways that appeal to students' fancies and fantasies, it can have a significant impact on student behaviour, motivation, and academic performance.

Some innovative and potential effective ways to implement positive reinforcement in schools can include:

- Recognition programs: Recognize students' achievements and good behaviour through awards, certificates, or public acknowledgement; Student of the Month/Year awards;
- Honour rolls and academic achievement recognition;
- Positive behavioural interventions and supports (PBIS);
- Teacher feedback and encouragement;
- Peer recognition and feedback;
- Incentive programs: Offer rewards or privileges for good behaviour, academic
- achievement, or community service;
- School-wide recognition events;
- Personalized praise and acknowledgement;
- Student-led recognition programs

When positive reinforcement practices are effectively implemented in the classroom, literature identifies some benefits that could accrue to the instructional delivery process in the class. Some of these include: (a) improved student behaviour and discipline; (b) increased motivation and engagement; (c) enhanced self-esteem and confidence; (d) better academic performance; (e) positive school culture and climate; (f) improved teacher-student relationships; (g) increased student participation and engagement; (h) reduced bullying and conflicts; (i) improved

attendance and punctuality; and (j) preparing students for future success (Lynnette et al., 2021; Tahir et al., 2019).

Lynnette et al. (2021) remarked that it is important for teachers to bear in mind that positive reinforcement must possess some crucial attributes, which include genuineness, specificity, immediate application to the deserving action or performance, consistency, meaningfulness, and appropriateness. By implementing positive reinforcement strategies, teachers can create supportive and encouraging classroom environments that promote quality instructional delivery hallmarked by students' success and well-being.

Barriers to Effective Classroom Management in Public Senior secondary Schools in Rivers State

Some potential barriers to effective classroom management in secondary schools in Nigeria:

- Inadequate Teacher Training: Many teachers lack adequate training on effective classroom management strategies, leading to difficulties in managing student behavior.
- Large Class Sizes: Overcrowded classrooms can make it challenging for teachers to manage student behavior and provide individualized attention.
- Limited Resources: Public secondary schools often face resource constraints, including limited access to textbooks, technology, and other educational materials.
- Poor Infrastructure: Many public secondary schools have inadequate infrastructure, including dilapidated buildings, inadequate lighting, and insufficient seating.
- Cultural and Socio-Economic Factors: Students in public secondary schools may come from diverse cultural and socio-economic backgrounds, which can impact their behavior and learning styles.
- Teacher Burnout: Public secondary school teachers may experience burnout due to heavy workloads, limited resources, and inadequate support, and this can affect their classroom management practices.
- Cultural Attitudes towards Discipline: Cultural attitudes towards discipline can impact how teachers manage student behavior.
- Limited Access to Technology: Limited access to technology can make it challenging for teachers to use technology-based classroom management strategies.

Addressing these challenges may help boost teachers' classroom management for improved instructional outcomes in public senior secondary schools in Rivers State.

Review of Related Empirical Studies

Nwankwoala (2021) carried out a study that focused on classroom management and academic performance of pupils in public primary schools in Rivers state. The Study adopted correlation research design. The population of the study was 8,432 teachers in public primary schools in Rivers State. The sample size was 1,554 respondents drawn by stratified simple random sampling techniques. This was about 18.5% of the population. A self-structured instrument titled Classroom Management Questionnaires (CMQ) and Pupils Academic Performance Questionnaire (PAPQ) were used for the data collection. The reliability of the instruments were determined by the use of pilot study conducted on 30 teachers outside the sample of the study

and the data collected were analyzed by the use of Pearson Product Moment correlation (PPMC) which yielded 0.77 and 0.79 reliability indexes. The data collected were analyzed by using mean and standard deviation to answer the research Questions while Pearson Product Moment correlation analysis was employed in testing the null-hypotheses at .05 level of significance. The study revealed that: classroom discipline influences pupils' academic performance in public primary schools in Rivers State; effective teaching enhances pupils' academic performance in public primary schools in Rivers State; teacher reward influences pupils' academic performance in public primary schools in Rivers State; and delegation of duties influences pupils' academic performance in public primary schools in Rivers State. The study relates with the present study in focus but differs from it in design, in population, and in method of data analysis.

Gacheri (2017) carried out a study that sought to assess the influence of the classroom management practices on the learners' academic achievements in public secondary schools in Meru South Sub-County, Kenya. The descriptive survey design was used to carry out this study. The target population for the study was 55 principals, 102 teachers and 3150 students. Out of these 355 subjects were sampled using stratified random sampling and purposive sampling methods. To ensure the validity of the instruments, both face and content validity was used. A reliability of 0.67 and 0.69 was obtained with the teachers and students' questionnaires. Data was collected by use of structured questionnaires and interview schedule. Data was grouped, coded, cleaned and analyzed using SPSS version 21. Both content and descriptive analysis was used. Content analysis was used to analyze the interview responses while descriptive analysis was used to analyze the students' and teachers' questionnaires. The study established that classroom discipline management practices had an impact on learners' achievement; teaching methodologies however, were not effective and therefore leading to little impact on the learners' achievement. Instructional supervision done by principals had a positive impact towards learners' achievement as this made sure teachers were able to complete the class syllabus. Supportive feedback through encouragement of learners by teachers played a crucial role towards ensuring that learners were motivated hence improving learners' achievement. The study relates with the present study in focus but differs from it in scope, population and partly in method of data analysis.

George et al. (2017) carried out a study to investigate effective classroom management and students' academic performance in secondary schools in Uyo Local Government Area. Four research questions and four null hypotheses were formulated to guide the study. The survey design was adopted for the study. The population of 2044 Senior Secondary School One (SS1) students with a sample of 200 students selected from 5 public secondary schools in 4 clans within the study area. A researcher–made questionnaire was used to elicit data from respondents. The research instrument had a 4-point rating scale and 25 items based on the study variables. The Pearson Product Moment (PPM) Correlation Coefficient of 0.94 ascertained the reliability of instrument for use in the study. After the administration, scoring and collation of the instrument, the data obtained were subjected to the chi-square (X^2) analysis. All the null hypotheses were tested at 0.05 level of significance. Based on the result of this study, it was concluded that SS1 students in the public Secondary Schools in Uyo Local Government Area differ significantly in terms of academic performance based on verbal instruction, corporal punishment, instructional supervision, delegation of authority to learners. This study relates with the present study in focus and design but differs from it in population and method of data analysis.

Omenka and Ottor (2015) similarly carried out a study that investigated the influence of classroom management on students' academic achievement in Science and Mathematics in Oju

Local Government Area of Benue State. Two Research Questions and Two Null Hypotheses guided the study. The descriptive survey Design was adopted for the study. A structured four point scale questionnaire titled influence of classroom management on students' academic achievement in Science and Mathematics was constructed by the Researchers and used to collect data for the study. Data obtained were analyzed using descriptive and inferential statistics. Mean and standard deviation were used to answer the Research Questions while chisquare (X^2) was used to test the Null Hypotheses at 0.05 level of significance. The findings of the study revealed that classroom discipline and motivation significantly influence students' academic achievement in science and mathematics. Based on the findings, it was recommended that teachers should always maintain discipline in their classroom; Teachers should endeavour to introduce innovative ideas to motivate learning so that students' behavior and academic achievement can be positively influenced. This study relates to the present study in design and method of data analysis but differs from it in focus and in population and study area.

METHODOLOGY

The study adopted descriptive survey research design. This design sought to identify and describe the classroom management strategies of teachers in public senior secondary schools in Rivers State with a view of accessing the extent they were utilized for improved instructional outcomes. The population of the study was the 5,833 teachers of the 333 public senior secondary schools in Rivers State. This comprised of 2,844 male and 2,989 female teachers based on data sourced from the Rivers State Senior Secondary Schools Board in 2024. The sample size of the study was 200 teachers comprising 100 males and 100 females, and selected through stratified random sampling of the study population. The three senatorial districts of Rivers State (Rivers East, Rivers West, and Rivers South-East) were taken as the strata for the study. The instrument for data collection was a structured questionnaire designed by the researcher and titled "Utilization of Effective Classroom Management Strategies for Improved Instructional Outcomes Questionnaire (UECMSIIOQ). The instrument had a reliability coefficient of 0.81 which was determined using test-retest method of data collected through a pilot study on the population, and analyzed using Pearson Product Moment Correlation statistics. The research questions were answered using mean and standard deviation statistics while the hypotheses were inferentially tested using independent samples t-test at a significance level of .05.

RESULTS

Respondents' Demographic Information

Table 1: Instrument distribution and retrieval and respondents' demographic information

Instrument Distribution and Retrieval			
Respondents	**Size sampled**	**Size utilized**	**Return rate**
Male teachers	100	100	
Female Teachers	100	100	
Total	**200**	**200**	**100%**
Respondents' Years of Experience			
Years of Experience	**Frequency**	**Percentage (%)**	**Cum. Percentage (%)**
6-10 years	24	12	12
11-15 years	126	63	75

16-20 years	33	17	92
Above 20 years	17	8	100
Total	**200**	**100**	

Table 1 shows information on the distribution and retrieval of the instrument and on the respondents' demographic statistics. As revealed in the table, out of 200 respondents that were sampled (100 male teachers and 100 female teachers), all the questionnaires were duly retrieved and found fit for the data analysis. This represented 100% return rate.

Concerning the years of working experience of the respondents, it was revealed that 24(12%) of them had worked for 6-10 years in public senior secondary schools, 126(63%) of them had worked for 11-16 years, 33(17%) of them had worked for 16-20 years, and 17(8%) of them had worked for more than 20 years in public senior secondary schools. This means majority of the respondents had been in the school system for a considerable period of time (at least 10 years) and as such would be very conversant with the subject matter of the study. By implication, they were very fit to give responses that could be regarded as highly reliable for the study.

Answers to the Research Questions

Research Question 1: To what extent are various classroom management strategies deemed effective for improved instructional outcomes in public senior secondary schools in Rivers State?

Table 2: Mean ratings of male and female teachers on the extent various classroom management strategies were deemed effective by teachers for improved instructional outcomes

s/n	Items	Male teachers (N = 100)		Female teachers (N = 100)		Mean set (N = 200)		Dec
		$\bar{X}_1$	SD_1	$\bar{X}_2$	SD_2	$\frac{\bar{X}1 + \bar{X}2}{2}$	SD	
1	Use of discipline	3.58	.498	3.57	.506	3.57	.503	HE
2	Delegation of responsibilities	3.52	.505	3.57	.504	3.56	.504	HE
3	Positive reinforcement	2.79	.743	2.72	.822	2.73	.808	HE
4	Effective teaching strategies	2.94	.727	2.74	.826	2.77	.812	HE
5	Supervision of instruction	3.69	.468	3.64	.489	3.65	.485	HE
6	Use of ICT in the classroom	3.79	.410	3.70	.480	3.71	.469	HE
7	Use of rules and regulations	3.77	.425	3.75	.443	3.76	.439	HE
8	Active learning strategies	3.79	.410	3.74	.440	3.75	.435	HE
9	Encouraging student participation	3.69	.552	3.64	.557	3.65	.555	HE
10	Cordial teacher-student relationships	3.69	.468	3.69	.481	3.69	.478	HE
	Grand Mean	**3.53**	**.520**	**3.51**	**.715**	**3.52**	**.569**	**HE**

Legends:
$\bar{X}1$ and SD_1 = Mean score and Standard Deviation respectively of Male teachers;
$\bar{X}2$ and SD_2 = Mean score and Standard Deviation respectively of teachers;
SD = Average standard deviation of Male and female teachers

Table 2 shows the mean ratings of male and female teachers on the extent various classroom management strategies are deemed effective for improved instructional delivery in public senior secondary schools in Rivers State. Ten items (Item 1 to item 10) were examined in this regard against a criterion mean score of 2.50. As shown in the table, all the items had mean sets higher

than the criterion mean; implying that majority of the respondent deemed all the items on the table highly effective at improving instructional outcomes when adopted as classroom management strategies.

Research Question 2: To what extent do teachers utilize disciplinary strategies in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State?

Table 3: Mean ratings of male and female teachers on the extent teachers utilize disciplinary strategies in managing classrooms for improved instructional outcomes

s/n	Items	Male teachers (N = 100)		Female teachers (N = 100)		Mean set (N = 200)		Dec
		$\bar{X}_1$	SD_1	$\bar{X}_2$	SD_2	$\frac{\bar{X}1 + \bar{X}2}{2}$	SD	
11	Teachers use physical punishment such as flogging and this helps in controlling the class for improved teaching and learning.	3.53	.571	3.56	.539	3.54	.541	HE
12	Teachers administer extra assignments to students who misbehave and this improves instructional outcomes.	2.40	.563	2.54	.552	2.47	.554	LE
13	Teachers seek to meet with deviant students' parents to discuss student misbehaviour and develop a plan to improve behaviour for improved instructional outcome.	2.43	.504	2.56	.539	2.49	.537	LE
14	Teachers use verbal warning to enforce discipline for improved instructional outcome.	2.57	.568	3.02	.554	2.80	.554	HE
15	Teachers enforce loss of privileges such as participating in extracurricular activities for improved instructional outcomes.	2.75	.504	2.56	.539	2.65	.537	HE
	Grand Mean	**2.74**	**.542**	**2.85**	**.548**	**2.79**	**.545**	**HE**

Table 3 shows the mean ratings of male and female teachers on the extent teachers utilize disciplinary measures in managing classrooms for improved instructional outcomes. Items 11 to 15 were examined in this regard against a criterion mean of 2.50. As seen in the table, Items 11, 14 and 15 had mean sets that were higher than the criterion mean; implying that majority of the respondents agreed that they were utilized to a high extent by teachers. These include: the use of physical punishment like flogging, the use of verbal warning, and enforcing loss of privileges of students who show deviant behaviours in class. Items 12 and 13 on the other hand were used to a low extent.

Research Question 3: To what extent do teachers utilize delegation of responsibilities in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State?

Table 4: Mean ratings of male and female teachers on the extent teachers utilize delegation of responsibilities in managing classrooms for improved instructional outcomes

s/n	Items	Male teachers (N = 100)		Female teachers (N = 100)		Mean set (N = 200)		Dec
		$\bar{X}_1$	SD_1	$\bar{X}_2$	SD_2	$\frac{\bar{X}1 + \bar{X}2}{2}$	SD	
16	Teachers appoint pupils into official positions such as class prefects and assistants for managing classrooms and this improves instructional outcomes.	2.80	.407	2.86	.539	2.83	.533	HE
17	Teachers group students and engage them with projects and responsibilities for improved instructional outcomes.	2.57	.568	2.54	.552	2.56	.553	HE
18	Teachers assign students to help with tasks, such as distributing materials and this brings about classroom management.	2.60	.498	2.56	.539	2.58	.535	HE
19	Teachers assign classroom jobs to students, such as cleaning the board, tidying up the classroom, etc. for better classroom management	2.57	.568	2.52	.554	2.55	.541	HE
20	Teachers pair students with peers who can provide support and guidance for improved instructional outcomes.	2.60	.563	2.56	.539	2.57	.541	HE
	Grand Mean	**2.63**	**.521**	**2.61**	**.545**	**2.62**	**.541**	**HE**

Table 4 shows the mean ratings of male and female teachers the extent teachers delegate responsibilities in managing classrooms for improved instructional outcomes. Item 16 to item 20 were examined in this regard against a criterion mean of 2.50. As revealed by the table. All the items had mean sets that are higher than the criterion mean. This implies that majority of the respondents were of the opinion that teachers utilized delegation of responsibilities to a high extent in managing classrooms for improved instructional outcomes. The means utilized include: appointment of students into official positions in the class, such as class prefects and assistants; grouping students and engaging them with group projects and responsibilities; assigning students to help with tasks such as distributing materials; assigning classroom jobs to students such as cleaning the board; and pairing students with peers to provide support and guidance. The grand mean set which is 2.62 with a standard deviation of .541 shows that majority of the respondents agree that delegation of responsibilities was utilized by teachers to a high extent in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State.

Research Question 4: To what extent do teachers utilize positive reinforcement in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State?

Table 5: Mean ratings of male and female teachers on the extent teachers utilize positive reinforcement in managing classrooms for improved instructional outcomes

s/n	Items	Male teachers (N = 100)		Female teachers (N = 100)		Mean set (N = 200)		Dec
		$\bar{X}_1$	SD_1	$\bar{X}_2$	SD_2	$\frac{\bar{X}1 + \bar{X}2}{2}$	SD	
21	Teachers recognize and acknowledge good conducts and performance of students and this makes students behave well in the class for improved instructional outcomes.	3.73	.450	3.61	.532	3.62	.526	HE
22	Teachers offer feedback and encouragement to students as classroom management strategy for improved instructional outcome.	3.63	.556	3.56	.539	3.57	.540	HE
23	Teachers offer rewards and privileges for good behaviour and this enhances instructional outcomes.	2.60	.498	2.58	.537	2.59	.533	HE
24	Teachers offer personalized praise and this elicits positive classroom behaviour for improved instructional outcomes.	3.50	.572	3.54	.547	3.53	.548	HE
25	School-wide recognition is held for impressive behaviours and this makes students behave well in class for improved instructional outcomes.	2.43	.556	2.40	.539	2.42	.540	LE
	Grand Mean	**3.18**	**.528**	**3.14**	**.540**	**3.15**	**.538**	**HE**

Table 5 shows the mean ratings of male and female teachers on the extent teachers utilize positive reinforcement in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State. Of all the items that were examined, only item 30 (school-wide recognition) had a mean set that was lower than the criterion mean. The rest of the items were each higher. The grand mean set was 3.15 with a standard deviation of .538. This means majority of the respondents were of the opinion that teachers utilized positive reinforcement to a high extent in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State.

Testing of the Hypotheses

Hypothesis 1: various classroom management strategies are deemed effective for improved instructional outcomes in public senior secondary schools in Rivers State.

Table 6: Independent samples t-test of the mean ratings of male and female teachers on the extent various classroom management strategies were deemed effective for improved instructional outcomes

Respondent's Portfolio	N	Mean $\bar{X}$	SD	Std. Error	t-cal	DF	Sig.	Decision
Male teachers	100	3.530	.383	.0552	.881	198	.379	H_{01} Accepted
Female teachers	100	3.510	.407	.0269				
Total	**200**							

Significance level of .05

Table 6 shows the output of the independent samples t-test conducted to determine whether there was significant difference in the mean ratings of male and female teachers on the extent various classroom management strategies were deemed effective for improved instructional outcomes for improved instructional outcomes in public senior secondary schools in Rivers State. The results indicated that the male teachers had a mean score of 3.530 with standard deviation of .383 and the female teachers had a mean score of 3.510 with standard deviation of .407. The result further revealed that t(200) = .881, p = .379 > .05. Since the obtained p value of .379 is greater than the significance level of .05, H_{01} is accepted and its alternate rejected.

Hypothesis 2: There is no significant difference in the mean ratings of male and female teachers on the extent teachers utilize disciplinary strategies in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State.

Table 7: Independent samples t-test of the mean ratings of male and female teachers on the extent teachers utilize disciplinary strategies in managing classrooms for improved instructional outcomes

Respondent's Portfolio	N	Mean $\bar{X}$	SD	Std. Error	t-cal	DF	Sig.	Decision
Male teachers	100	2.743	.316	.0456	.802	198	.048	H_{02} Rejected
Female teachers	100	2.852	.336	.0222				
Total	**200**							

Significance level of .05

Table 7 shows the output of the independent samples t-test conducted to determine whether there was a significant difference in the mean ratings of male and female teachers on the extent teachers utilize disciplinary strategies in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State. The results indicated that the male teachers had a mean and standard deviation score of 2.743±.316, while that of female teachers was 2.852± .336. Furthermore, it was revealed that t(200) = .802, p = .048 < .05. Since value of p is less than the significance level of .05, H_{02} is rejected and its alternate accepted. This means that there was significant difference in the mean ratings of male and female teachers on the extent disciplinary strategies were utilized in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State.

Hypothesis 3: There is no significant difference in the mean ratings of male and female teachers on the extent teachers utilize delegation of responsibilities in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State.

Table 8: Independent samples t-test of the mean ratings of male and female teachers on the extent teachers utilize delegation of responsibilities in managing classrooms for improved instructional outcomes

Respondent's Portfolio	N	Mean $\bar{X}$	SD	Std. Error	t-cal	DF	Sig.	Decision
Male teachers	100	2.63	.350	.0506				

					-.148	198	.420	H_{03} Accepted
Female teachers	100	2.61	.334	.0221				
Total	**200**							

Significance level of .05

Table 8 shows the output of the independent samples t-test conducted to determine whether there was a significant difference in the mean ratings of male and female teachers on the extent teachers utilize delegation of responsibilities in managing classrooms for improved instructional outcomes. The results indicated that the male teachers in this regard had a mean score of 2.63 with standard deviation of .350 and the female teachers had a mean score of 2.61 with standard deviation of .334. The result further revealed that t(200) = -.148, p = .420 > .05. Since the obtained p value of .420 is greater than the significance level of 0.05, H_{03} is accepted and its alternate rejected. By implication, there was no significant difference in the mean ratings of male and female teachers on the extent teachers utilize delegation of responsibilities in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State.

Hypothesis 4: There is no significant difference in the mean ratings of male and female teachers on the extent teachers utilize positive reinforcement strategies in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State.

Table 9: Independent samples t-test of the mean ratings of male and female teachers on the extent teachers utilize positive reinforcement strategies in managing classrooms for improved instructional outcomes

Respondent's Portfolio	**N**	**Mean** $\bar{X}$	**SD**	**Std. Error**	**t-cal**	**DF**	**Sig.**	**Decision**
Male teachers	100	3.663	.367	.0530				
					.182	198	.856	H_{04} Accepted
Female teachers	100	3.653	.319	.0210				
Total	200							

Significance level of .05

Table 9 shows the output of the independent samples t-test conducted to determine whether there was a significant difference in the mean ratings of male and female teachers on the extent teachers utilizes positive reinforcement (reward) strategies in managing classrooms for improved instructional outcomes. The results indicated that the male teachers in this regard had a mean score of 3.663 with a standard deviation of .367 while the female teachers had a mean score of 3.653 with standard deviation of .319. Furthermore, t(200) = .182, p = .856 > .05. The p value is obviously greater than the significance level value of .05, and as such, the null hypothesis is accepted.

DISCUSSION OF THE FINDINGS

The first research question of the study sought to ascertain the extent various classroom management strategies were deemed effective in improved instructional outcomes in public senior secondary schools in Rivers State. Its corresponding null hypothesis tested the existence of significant difference in mean ratings of male and female teachers to that regard. The results are respectively shown in Table 2 and Table 6. The strategies deemed effective by the teachers

included: the use of discipline, delegation of responsibilities, positive reinforcement, effective teaching methodologies, supervision of instruction, use of ICT, rules and regulations, active learning strategies, student participation, and cordial teacher-student relationships. The male and female respondents did not express significant difference in views about the effectiveness of these strategies. These findings are in line with literature on effective classroom management such as Nwankwoala (2021), Gacheri (2017), Bayefa-Asaowei (2024) and George et al. 92017) who made similar discoveries on classroom management strategies and their effectiveness at improving instructional outcomes in schools.

The second research question sought to determine the extent teachers utilize disciplinary measures as classroom management strategies for effective instructional outcomes, and the corresponding hypothesis tested the existence of significant difference in the positions of male and female teachers in public senior secondary schools in Rivers State. The results are found on Table 3 and Table 7 respectively. Table 3 reveals that disciplinary strategies were utilized to a high extent, while Table 7 shows the existence of significant difference on their extent of utilization by male and female teachers. Disciplinary measures in this regard refer to stringent measures applied by teachers in the classroom to ensure that compliance with expected codes of conduct. As seen in the table, the disciplinary measures commonly utilized by teachers include the use of punishment, verbal warnings, and enforcing loss of privileges such as participating in extracurricular activities.

These findings are in agreement with Gacheri (2017) who found that the most commonly used disciplinary measures of teachers against erring students in the class include flogging, kneeling down, washing of toilets, clearing of refuse, manual labour, working in the school farm, clearing the school fields, suspension from school, among others. The findings however differ from Maxwell cited in Gacheri (2017) who insisted that disciplinary measures for students in the school system should not be aimed at inflicting physical pains on or injuries on them, but should be such measures that help them develop academically, which they would naturally want to avoid. The difference in opinion between male and female teachers about the use of disciplinary measures is not unexpected. Females tend to be more emotional and tender than males when it comes to disciplining children. However, some student will always err unless they are disciplined, and the fear of such stringent measures deters others from erring, thereby bringing about the needed control in the classroom which supports instructional outcomes.

The third research question sought to investigate the extent teachers utilize delegation of responsibilities in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State. The corresponding hypothesis tested the existence of significant difference in the opinions of male and female teachers to that effect. The results are presented on Table 4 and Table 8 respectively. Table 4 shows that teachers utilized delegation of responsibilities to a high extent while Table 8 reveals that there was no significant difference in mean ratings of male and female teachers on extent of utilization of delegation of responsibilities in the classroom. The findings of the study are in accord with several other literatures which advance delegation of responsibilities as one of the best organizational practices of leaders which enhance organizational performance and productivity (Amos et al., 2022; Obulor, 2024). Delegation of responsibilities in the classroom to class prefect, subject representatives or even to normal students in the class is a veritable classroom management mechanism. It saves time for the teacher who is able to focus on some more important aspects of the teaching-learning process, and this brings about improved instructional outcome.

The fourth research question sought to examine the extent teachers utilize positive reinforcement in managing classrooms for improved instructional outcomes in public senior secondary schools in Rivers State. The corresponding hypothesis tested the existence of significant difference in the opinions of male and female teachers to that effect. The results are presented via Table 5 and Table 9 respectively. Table 5 shows that teachers utilize positive reinforcement to a high extent in managing classrooms, while Table 9 reveals that there is no significant difference in mean ratings of male and female teachers on the extent of utilization of positive reinforcement in managing classrooms. Positive reinforcement as described by Bayefa-Asaowei (2024) is a technique to elicit and to strengthen new behaviours by adding rewards and incentives instead of eliminating benefits. The study reveals that teachers utilize this strategy through: recognizing and acknowledging good conducts and performance of students; offering feedback and encouragement to students; offer rewards and privileges for good behaviour; and offering personalized praise. These findings are in line with Lynnette et al. (2021) who made similar findings as those of the study and highlighted several positive ways in which the use of positive reinforcement as classroom management strategy brings about instructional productivity in the school system.

CONCLUSION

In conclusion, this study reveals that effective classroom management is crucial for promoting student learning and achievement. Not only does it benefit the learners, but it also helps improves teachers' instructional delivery effectiveness and brings about teachers' self fulfillment in the classroom. The study highlights the importance of teachers using a range of classroom management strategies, including disciplinary strategies, delegation of responsibilities, and positive reinforcement. Effective management of classrooms is therefore one of the ways of ensuring and assuring quality in the instructional delivery process.

Recommendations

Based on the findings of the study, the following recommendations are made:

- Teachers should in addition to the commonly utilized classroom management strategies, be innovative in coming up with new strategies that can most effectively be used within their own classroom contexts.
- Teachers should ensure the disciplining of students is targeted towards students' betterment and instructional improvement, and not based on teachers' emotional outrage.
- Teachers should endeavour to always delegate and assign responsibilities to students in the classroom to give everyone a sense of responsibility, and this would help in ensuring that classroom sessions are more coordinated and more purposeful.
- Teachers should be supported by principals in the provision of incentives for students' positive reinforcement, as this solicits desirable behaviours from students which improve instructional outcomes in the school system.
- The Ministry of Education in collaboration with principals should periodically organize teacher training programs to up-skill teachers on current best practices in classroom management for improved instructional outcomes.

TEACHER RECRUITMENT POLICIES AND THEIR EFFECT ON EDUCATIONAL QUALITY

Adaobi Chinyelu EMEANURU
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

The study examined teacher recruitment policies and the effect on educational quality. It established that teachers are the most significant school-based factor influencing student outcomes, with their qualifications, skills, and dedication serving as key determinants of educational quality. The study analyzed various recruitment models including qualification standards and certification requirements, selective hiring and teacher competency assessments, alternative certification programs, incentive-based recruitment policies, diversity and inclusion in teacher hiring, continuous professional development (CPD) policies, digital and technology-based recruitment policies highlighting their impacts on teacher effectiveness and student achievement. The study revealed that high-performing systems (e.g., Finland, Singapore) prioritize rigorous qualifications, competitive incentives, and continuous professional development, while under-resourced regions often resort to emergency hiring, compromising educational quality. The study also identified persistent challenges, including teacher shortages, inequitable distribution, political interference, and inadequate funding. The study used Human Capital Theory as its guiding lens to emphasize the importance of hiring highly qualified teachers, providing continuous professional development, and ensuring fair compensation to improve student learning outcomes and educational quality. The study underscores the need for holistic, context-sensitive recruitment strategies to achieve Sustainable Development Goal 4 (SDG 4). Policy recommendations emphasized data-driven hiring, equity-focused initiatives, and systemic reforms to enhance teacher quality and retention.

Keywords: Teachers, Teacher recruitment policies, Educational quality, Qualification, Skill, Dedication.

INTRODUCTION

Education is universally recognized as one of the chief cornerstone of societal growth and development. At the heart of every successful education system lies the teacher who serve as facilitators of learning and teaching as well as the nurturing and inspiring of future generation. Recruitment policies are pivotal in determining the caliber of individuals entering the teaching profession. Poorly designed or implemented recruitment policies can result in the hiring of under qualified, impassionate or unmotivated thereby compromising the standard of education. The

term recruitment encompasses the practices and strategies school officials; which includes government for public schools and proprietors or head teachers of private schools engaged in to new teachers.

Education serves as the backbone of societal program and the quality of education is heavily influenced by the competence and dedication of teachers. Recruitment policies play a critical role in determining the caliber of educators directly impacting the overall effectiveness of education systems. When recruitment policies are poorly designed or implement they often result in the appointment of unqualified or unmotivated teachers leading to decline in educational standards. This problem has been cited in some regions like the sub-Saharan Africa, the urgent need to fill teaching vacancies had led to the engaging of unqualified individuals on the regions' recruitment policies, and in adequate teacher, training has been linked to poor student academic performance in international assessments.

Countries in South-Eastern Asia like India and Pakistan recruitment processes in some regions are influenced by political interference and corruption. This as a result brought about uneven distribution of qualified teachers in urban area receiving better-trained educators as compared to rural areas. In the developed nation teacher are present in critical subjects like mathematics and science which has led to the adoption of temporary or emergency hiring policies.

Education is the cornerstone of societal developments whether at the home, school, church, mosque, etc. and the teachers are its foundation. Recruiting competent and dedicated teachers is essential for achieving quality education worldwide. In recent times global and regional trends in teaching recruitment policies have been evolving which is aimed at addressing the growing demands for quality education equity and inclusively. Their policies impact significantly in the quality of education delivered thereby shaping the future of the students and societies alike. The global trends in teaching recruitment policies includes; diversity and inclusively, digital literacy and technological integration international recruitment and so on.

Nevertheless, teacher's recruitment policies play a critical role in the quality of education gotten. Some of these roles include; ensuring competence and expertise, addressing teachers' short ages, fostering innovation, promoting equity and inclusion, enhancing teacher morale and retention. The regional trends in teacher recruitment are highlighted, as broken into the continents of the world. In Africa focus is on bridging the gap between teachers in the rural and urban areas by introducing incentives such as housing allowance and hardship bonuses in countries like Nigeria and Kenya to encourage teachers to work in remote regions. For the Asian countries recruitment exercise is highly selective countries such as Singapore and South Korea engage teachers in rigorous training, mentorship programmes and performance based evaluations.

The Europeans are battling with aging teacher population especially UK and Germany. There they offer pathways for mid-career professionals to transition into teaching and teachers are expected to be multi linguists.

The United States and Canada which represents North America recruitment policies are focusing on equity, diversity and inclusivity from under represented communities to reflect the diversity of student population.

In the Latin Americas where Brazil and Chile are the major players, they are investing in teacher training and capacity building programs in partnership with international organizations in other to raise the quality of education through improved teacher education.

Quality education is universally recognized as a cornerstone of sustainable development, economic prosperity, and social equity (UNESCO, 2021). It equips individuals with the

knowledge, skills, and competencies necessary to navigate an increasingly complex global landscape while fostering innovation, critical thinking, and civic engagement (Schleicher, 2018). The United Nations Sustainable Development Goal 4 (SDG 4) explicitly emphasizes the need for "inclusive and equitable quality education" (UN, 2015), reinforcing the idea that education is not merely a privilege but a fundamental human right.

Teachers stand at the heart of every successful education system, serving as much more than mere conveyors of information. They are architects of human potential, shaping not only what students learn but how they think, feel, and engage with the world (OECD, 2022). Research overwhelmingly confirms that teachers represent the most critical school-based factor in determining educational outcomes, with high-quality instruction capable of transforming life trajectories, particularly for disadvantaged students (Hanushek & Woessmann, 2023).

The impact of exceptional teaching extends far beyond test scores. Effective teachers cultivate critical thinking skills that prepare students for an increasingly complex world (Pellegrino & Hilton, 2023). They master both their subject matter and the art of teaching, employing evidence-based strategies that make learning accessible to diverse learners (Muijs et al., 2022). Through differentiated instruction and formative assessment techniques, they identify and nurture each student's unique potential (Tomlinson, 2023). Perhaps most importantly, they serve as mentors and role models, instilling values of perseverance, curiosity, and civic responsibility that last a lifetime (Berkowitz et al., 2023).

Teachers also play a pivotal role in addressing educational inequities (UNESCO, 2023). In classrooms across the globe, dedicated educators work to level the playing field for marginalized students whether those from low-income backgrounds, ethnic minorities, or children with special needs (Gorski, 2023). Through culturally responsive teaching and targeted support, they help bridge achievement gaps that might otherwise persist across generations (Ladson-Billings, 2022). Their work in the classroom is complemented by their advocacy beyond it, as they push for policy changes that promote more equitable resource distribution and access to quality education (Darling-Hammond, 2023).

The societal importance of teaching has never been more apparent. Economic research demonstrates that replacing even the least effective teachers with average performers could boost national GDP growth by 1% annually (Hanushek & Woessmann, 2023). Quality education reduces future societal costs related to unemployment, crime, and public health challenges (Psacharopoulos & Patrinos, 2022). In our rapidly changing world, teachers are adapting to new realities - integrating digital tools (Selwyn, 2023), addressing student mental health needs (Weare, 2023), and combating misinformation through media literacy education (Wineburg et al., 2023). These profound responsibilities underscore why rigorous teacher recruitment policies are essential (Schleicher, 2023). Education systems must attract candidates with both strong academic backgrounds and the interpersonal skills needed to connect with students (Akiba et al., 2023).

Countries that have achieved educational excellence, like Finland and Singapore, demonstrate the value of high entry standards combined with ongoing professional support (Sahlberg, 2023; Ministry of Education Singapore, 2023). When we invest in recruiting and retaining outstanding teachers, we invest not just in individual futures, but in the collective future of our societies (UNESCO, 2023). However, the effectiveness of teachers is not an inherent trait but a product of systemic policies particularly those governing their recruitment, preparation, deployment, and retention (OECD, 2019).

Teacher recruitment policies refer to the rules, regulations, and strategies that govern the hiring, selection, and retention of teachers in educational institutions. These policies include eligibility criteria, professional qualifications, employment conditions, and training requirements. Their primary aim is to ensure that schools employ competent teachers who contribute positively to student learning outcomes (Darling-Hammond, 2021). The impact of teacher recruitment policies on educational quality is profound. Research shows that highly qualified teachers with strong academic backgrounds and professional training significantly enhance student achievement, engagement, and long-term educational success (Hanushek et al., 2022).

A study by Rockoff et al. (2023) found that students taught by teachers with subject-specific qualifications outperform those taught by educators without specialized training. Additionally, well-structured recruitment policies improve teacher retention rates, stabilize school performance, and enhance the sustainability of education systems (Ingersoll & Strong, 2021). Weak recruitment frameworks often lead to shortages, under qualified educators, and mismatches between teacher supply and demand, ultimately undermining educational quality (Ingersoll & Merrill, 2017). In low-income countries, emergency hiring policies such as recruiting untrained contract teachers have been used to address staffing gaps, but these measures frequently result in poorer learning outcomes (Bold et al., 2017).

Conversely, high-performing education systems (e.g., Finland, Singapore) prioritize rigorous selection criteria, competitive compensation, and continuous professional development, ensuring that only the most capable individuals enter and remain in the profession (Sahlberg, 2015; Akiba et al., 2020). In contrast, many developing nations face severe challenges in teacher recruitment. The UNESCO Global Education Monitoring Report (2023) highlights that sub-Saharan Africa alone needs 17 million additional teachers by 2030 to meet the growing student population. In Nigeria and South Africa, recruitment challenges stem from inadequate teacher training, poor remuneration, and an unwillingness of teachers to work in rural areas (World Bank, 2023). In response, some governments have introduced incentive-based recruitment strategies, such as housing subsidies and rural allowances, to attract qualified teachers to underserved areas (UNESCO, 2023).

Similarly, in the United States, programs like Teach for America (TFA) and alternative certification pathways have been implemented to address teacher shortages in urban schools (Goldhaber et al., 2022). While these initiatives increase the supply of teachers, critics argue that they often compromise educational quality by fast-tracking individuals into classrooms without sufficient pedagogical training (Cochran-Smith et al., 2021). The challenge, therefore, is to balance recruitment efforts with quality assurance mechanisms to ensure both quantity and effectiveness in the teaching workforce. Given these dynamics, the study critically examines how teacher recruitment policies shape educational quality. It is the goal of every country, Nigeria inclusive to provide a high quality education for every student. This can be achieved by an adequate supply of competent individuals who are willing and able to serve as teachers. The entities that recruit teachers are constantly engaged in the activities relation to the recruitment of their instructional staff. In the face of growing school age population and the quest for formal education by the populace, schools must struggle to maintain standards for teaching quality while continuously recruiting bright new teachers. The goal of recruiting teachers that will affect quality education is sometimes dwindled by the availability of the resources. The economic condition of Nigeria is affecting the education sector as there is a decrease in the funding of education by the previous perceived funders. The purpose of this paper is to analyze how teacher

recruitment policies impact educational quality and proposed reforms. The impact of teacher recruitment policies on educational quality includes:

Qualification standards, recruitment processes, which includes transparency, meritocracy, diversity and inclusively, teacher motivation and retention where it is recruitment centre but not also retention centered Specialized training, regional disparities. It is also to examine the impact of teacher recruitment policies on the quality of education. Exploring how different hiring practices influence teacher competence, student performance and overall educational standards. It will also assess the effectiveness of current teacher recruitment policies in ensuring the selection of qualified and competent educators. It will evaluate how well policies are implemented and its impact on the overall education and as well propose recommendations for improving recruitment strategies.

It will also investigate challenges associated with developing countries and their effects on educational quality. This will be made possible by analyzing issues such as lack of merit-based hiring, teacher shortages and inadequate training thereby proposing reforms that can improve recruitment process and lead to better learning outcomes.

The purpose of this paper is also to explore the relationship policies, retention and attrition rates and students performance. It seeks to understand how hiring practices, salary structures and professional development opportunities influence teacher job satisfaction and long term commitment to the profession. However there are reforms to check or alleviate these impacts which includes the establishment of rigorous qualification standards, adopting transparent and merit based hiring as seen in some private schools as against government owned schools, incorporation of diversity goals-to recruit teachers from varied backgrounds, strengthen teacher training programs-were pre-service and in-service training is made mandatory, Address regional disparities by introducing incentives such as housing allowance, professional development, development of career progressions a defined pathway to promotions, salary increments in other to retain skilled teachers a major problem, for the private sector of education. Regular review of policies by conducting periodic evaluations to ascertain the way forward. Community involvement in the recruitment process brings about accountability, sense of belonging towards the pupils and trust.

Presently teacher recruitment policies differ from one region thus reflecting differences in educational priorities, resources and societal needs. In developed countries, recruitment processes are often standardized and merit based emphasizing academic qualifications, teaching credentials and relevant experience. In contrast developing countries like Nigeria frequently struggle with underfunded and inconsistent recruitment systems which can result in the hiring of under qualified or unmotivated individuals as teachers. Nevertheless several trends define the current state of teacher recruitment policies:

- Qualification Standards: Hence, many countries have raised qualification standards for teacher; there is still a gap between policy implementation and practice. In regions facing teacher shortages requirements are sometimes relaxed, compromising educational quality.
- Recruitment challenges in Rural Area: Rural and undeserved areas often face severe teacher shortages due to lake of certain incentives such as poor working conditions e.g. inadequate supply of instructional materials and limited career growth opportunities.
- Gender Imbalance: In spite of the efforts of promote gender equality in the teaching field, it remains highly gendered in some contexts, for instance primary education often sees a dominance of female teachers while male educators are more prevalent in secondary and

tertiary institutions. Also male teachers dominate the sciences as against the female teachers.

- Politicization of Recruitment: In many regions especially developing countries teacher recruitment is marred by political interference and nepotism undermining fairness meritocracy and transparency.

Training are downplayed in recruitment policies as there is little or no emphasis on pre-service training, resulting in teachers who lack essential classroom management and pedagogical skills The aim of this paper is to explore the significance of teacher recruitment policies, evaluate its current state, highlighted its impact on educational quality and provides actionable recommendation for reforms. In addition, the goal of this paper is to provide researchers and policy makers with a review of the research relating to teacher recruitment and its impact on educational quality.

THEORETICAL FRAMEWORK

Human Capital Theory (HCT) (1961 and 1964)

The study was anchored on Human Capital Theory (HCT) (1961 and 1964). Human Capital Theory (HCT) was propounded by Theodore W. Schultz in 1961 and later expanded by Gary S. Becker in 1964. These economists laid the foundation for understanding how investments in education, training, and skills development contribute to economic productivity and individual earnings. Human Capital Theory suggests that education and training enhance an individual's productivity, leading to greater economic returns both for the individual and society. This theory views knowledge, skills, and abilities as "capital" similar to physical assets that can generate economic benefits when properly developed. Higher education and training result in increased skills, leading to higher wages and better employment opportunities (Becker, 1993). Nations that invest in education and workforce training experience higher productivity and economic growth. HCT argues that a worker's value depends on their knowledge, skills, and experience, rather than just the number of hours worked. Higher levels of education can help individuals escape poverty and contribute to national economic development (Psacharopoulos & Patrinos, 2018).

In the context of teacher recruitment policies, Human Capital Theory emphasizes the importance of hiring highly qualified teachers, providing continuous professional development, and ensuring fair compensation to improve student learning outcomes and educational quality (Hanushek et al., 2022). Conversely, weak recruitment policies that allow underqualified teachers into classrooms can have detrimental effects. In many developing nations, as much as 30-50% of the teaching workforce lacks proper certification (World Bank, 2023), leading to poor educational outcomes. Addressing these gaps requires policies emphasizing teacher quality, including competitive selection processes and ongoing professional development.

CONCEPTUAL CLARIFICATION

The Teacher

A teacher is the backbone of any educational system, playing a crucial role in shaping the intellectual, social, and moral foundations of learners. Teaching goes beyond simply imparting knowledge it involves inspiring students, fostering curiosity, and cultivating skills that prepare

them for future challenges. The role of a teacher has evolved significantly over the years, influenced by shifts in pedagogical approaches, advancements in technology, and changing societal expectations. A teacher is often defined as a professional who facilitates learning, but their role encompasses much more. To Darling-Hammond et al. (2023), a teacher is "an individual responsible for designing, delivering, and assessing learning experiences to ensure students achieve educational goals." This definition highlights a teacher's role in fostering both intellectual and personal growth.

Similarly, Hargreaves & Fullan (2023) described teachers as "agents of change who influence students' cognitive and emotional development through structured learning environments." This perspective acknowledges that teachers shape not only students' academic abilities but also their emotional intelligence, social skills, and overall character. In modern education, teachers serve as facilitators who guide students toward deeper understanding, rather than just delivering content. The United Nations Educational, Scientific and Cultural Organization (UNESCO, 2023) emphasized that effective teachers must act as facilitators, mentors, and innovators to meet the diverse needs of learners in the 21st century.

The modern conceptualization of teachers has undergone a profound transformation, evolving from traditional knowledge transmitters to dynamic professionals who shape cognitive, social, and emotional development (Darling-Hammond, 2023). This paradigm shift reflects our deepening understanding of education as a holistic process that extends far beyond content delivery. Ololube (2017) defined teachers as ‘transformative agents’ whose effectiveness hinges upon three interdependent pillars: qualifications, skills, and dedication. These elements collectively determine a teacher's capacity to foster meaningful learning experiences and drive educational quality.

Teacher Qualifications

Effective teacher recruitment should prioritize candidates with strong subject knowledge, pedagogical skills, and practical experience. Ololube (2012), in his comprehensive study across Nigerian schools revealed that educators holding advanced degrees (M.Ed. or Ph.D.) improved student performance by 15-20% compared to their counterparts with only basic certification. This finding aligns with Hanushek and Rivkin's (2023) multinational analysis, which established that subject-matter expertise particularly in STEM fields significantly enhances achievement on international assessments like TIMSS and PISA.

UNESCO's (2023) comparative data shows low-income nations with high percentages of untrained teachers experience literacy rates 30% below countries enforcing rigorous certification standards. These findings have profound policy implications, as evidenced by high-performing education systems worldwide. Finland and Singapore, consistently ranked among global education leaders, mandate master's-level training for all teachers, ensuring both deep content knowledge and sophisticated pedagogical understanding (Sahlberg, 2023). Such requirements create a professional workforce capable of implementing research-based instructional strategies and adapting to diverse learner needs.

However, the qualification-quality connection is not merely about academic credentials; it encompasses structured practicum experiences, ongoing professional development, and specialized training in areas like special education and multilingual instruction (OECD, 2023). Alternative certification programs, such as Teach for America (TFA) in the U.S., provide fast-track entry into teaching, but research suggests that these teachers often leave the profession within five years, raising concerns about sustainability (Cochran-Smith et al., 2021).

Essential Skills for 21st Century Teaching

The contemporary teaching landscape demands a multifaceted skill set that extends far beyond traditional instructional techniques. Modern educators must master:

- Advanced Pedagogical Skills: Tomlinson's (2023) research demonstrates how differentiated instruction techniques can improve learning outcomes for diverse student populations by 25-40%. Effective teachers employ formative assessment strategies, scaffold complex concepts, and create inclusive learning environments that accommodate various learning styles and paces (Hattie, 2023).
- Digital Fluency: The pandemic accelerated the need for technological integration, with studies showing teachers who effectively utilize AI and educational technology to enhance student engagement by 40% (Selwyn, 2023). However, Ololube's (2014) analysis of teacher preparation programs across Africa reveals a significant technology integration gap, with fewer than 30% of programs adequately preparing educators for digital instruction.
- Socio-Emotional Competencies: Teachers trained in Social-Emotional Learning (SEL) methodologies reduce dropout rates by creating supportive classroom climates (Jennings, 2023). Goleman's (2022) work emphasizes how teacher emotional intelligence directly correlates with student motivation and academic resilience.

Teacher Dedication

While qualifications and skills form the foundation of teaching excellence, dedication represents the sustaining force that amplifies their impact. Ololube (2016) longitudinal study in Nigerian schools found that highly dedicated teachers measured through retention rates, voluntary professional development participation, and student evaluations closed achievement gaps twice as quickly as less-motivated colleagues. This "invisible factor" often makes the difference between adequate and exceptional education systems.

The consequences of neglecting teacher morale are severe, particularly in developing contexts. UNESCO (2023) reports that Sub-Saharan Africa loses approximately 15% of its teaching workforce annually to attrition, primarily due to poor working conditions and lack of career progression opportunities. Hargreaves and Fullan (2023) argue that in low-resource settings, teacher motivation may be even more critical than formal qualifications in determining educational outcomes.

The Role of a Teacher in Modern Education

The responsibilities of a teacher have expanded significantly, particularly with the rise of digital learning, competency-based education, and student-centered teaching approaches. A teacher’s role today includes several key functions:

- Facilitators of Learning: Teachers are no longer mere transmitters of knowledge but instead guide students in exploring and constructing their own understanding. Modern teaching practices emphasize active learning, where students engage in discussions,

problem-solving, and hands-on activities to develop critical thinking skills (Zhao & Wiliam, 2023).

- Mentors and Role Models: Teachers influence students' attitudes, behaviors, and aspirations. Gordon (2023) states that effective teachers provide not only academic guidance but also emotional and psychological support, helping students develop self-confidence and resilience. By demonstrating ethical behavior and strong work ethics, teachers serve as role models for young learners.
- Innovators in Teaching**:** With advancements in Artificial Intelligence (AI), virtual classrooms, and digital learning tools, teachers must integrate technology into their teaching strategies to enhance student engagement. Selwyn (2023) argued that teachers need digital literacy skills to personalize learning experiences, use data-driven insights to track student progress, and incorporate interactive educational tools effectively.
- Mediators of Social and Moral Development**:** Teachers play a key role in shaping students' values, ethics, and social behavior. Schools are not just centers for academic learning but also spaces where students develop a sense of responsibility, empathy, and civic duty. Delors (2023) emphasized that teachers instill discipline and moral values, preparing students to be responsible citizens.
- Lifelong Learners and Professional Developers**:** Effective teachers recognize the need for continuous professional growth. Hattie (2023) highlights that the most successful teachers engage in lifelong learning by participating in professional development programs, collaborative teaching networks, and research-based instructional methods. This ensures that they remain updated on evolving teaching strategies and best practices.
- Cultural and Diversity Advocates: In today's globalized world, classrooms are becoming increasingly diverse. Teachers must foster inclusive and culturally responsive learning environments that accommodate students from different backgrounds. OECD (2023) emphasizes that embracing diversity in the classroom enhances learning experiences, fosters mutual respect, and prepares students for global citizenship.

Qualities of a Teacher

A great teacher possesses a combination of professional skills, personal attributes, and ethical values that enable them to educate, inspire, and support students effectively. Below are key qualities of an outstanding teacher:

- Subject Knowledge and Expertise: A teacher must have a deep understanding of the subject they are teaching. Mastery of the subject ensures that they can explain complex concepts clearly, answer student questions effectively, and make lessons engaging and relevant. Well-informed teachers can also connect classroom learning to real-world applications, enhancing students' understanding. A mathematics teacher who is well-versed in calculus can teach the topic with confidence, using practical examples from physics or engineering.
- Strong Communication Skills: A good teacher must be able to communicate ideas and instructions clearly and effectively. This involves both verbal and non-verbal communication, such as body language and tone of voice. The ability to simplify complex topics and adjust communication styles based on students' needs is essential for

effective teaching. A history teacher explaining the causes of World War I should be able to present information in an engaging and easy-to-understand manner.

- Patience and Empathy: Every student learns at a different pace, and some may struggle with certain topics. A great teacher is patient and understands the challenges students face. Empathy allows teachers to connect with their students, making them feel supported and encouraged to keep trying even when they find topics difficult. A teacher who notices a struggling student provides additional tutoring or modifies their teaching approach to accommodate the student's learning style.
- Adaptability and Creativity: Education is constantly evolving, and a good teacher must be adaptable to new teaching methods, technologies, and student needs. Creativity allows teachers to design innovative lessons, incorporate technology, and use diverse instructional strategies to keep students engaged. During the COVID-19 pandemic, teachers who adapted quickly to online learning ensured their students continued receiving quality education.
- Passion for Teaching and Learning: A great teacher is genuinely passionate about education and enjoys helping students grow. Passionate teachers inspire students and create a positive learning environment where curiosity and critical thinking are encouraged. A literature teacher who loves storytelling will bring energy into the classroom, making literature come alive for students.
- Classroom Management Skills: A teacher must be able to maintain order and discipline in the classroom while creating a positive and respectful learning environment. Effective classroom management ensures that students stay focused, engaged, and motivated to learn. A teacher sets clear rules at the beginning of the school year and consistently enforces them to maintain a structured classroom.
- Dedication and Commitment: A dedicated teacher goes beyond just teaching the curriculum. They invest time in lesson planning, student mentorship, and continuous self-improvement. Dedication ensures that students receive high-quality education and emotional support. A teacher who stays after school to help struggling students demonstrates commitment to their success.
- Assessment and Feedback Skills: A good teacher continuously assesses students' progress and provides constructive feedback to help them improve. Effective feedback should be clear, specific, and encouraging, helping students identify their strengths and areas for improvement. A science teacher provides detailed feedback on a student's lab report, explaining what was done well and how to improve the analysis.
- High Ethical Standards and Professionalism: Teachers serve as role models for their students and must demonstrate integrity, honesty, and professionalism. They should treat all students fairly, respect confidentiality, and uphold ethical standards in their interactions. A teacher refrains from favoritism and treats all students with fairness and respect, regardless of their background.
- Lifelong Learning and Professional Development: Great teachers are continuous learners. They attend workshops, read educational research, and seek professional development opportunities to enhance their teaching skills and stay updated with new trends in education. A teacher who attends a conference on digital education integrates new technologies into their classroom to improve student engagement.

Teacher Recruitment Policies and Their Impact on Educational Quality

Teacher recruitment policies refer to the regulations, strategies, and standards that govern how teachers are hired, assessed, and retained in the education system. These policies play a crucial role in shaping the quality of education, as they determine who enters the teaching profession, how they are selected, and what support they receive. Below are key teacher recruitment policies, along with their implications for educational quality.

Qualification Standards and Certification Requirements: This policy sets the minimum qualifications that teachers must possess before being allowed to teach in schools. It includes academic credentials, professional training, and certification exams. In Finland, teachers are required to have a master's degree in education and undergo rigorous pedagogical training (Sahlberg, 2020). In Singapore, only the top-performing students are admitted to teacher training programs, and they receive government sponsorship (OECD, 2021). In the United States, teachers must pass state certification exams and obtain licensure before they can teach in public schools (Goldhaber et al., 2022). The impact of this policy on educational quality is that it ensures that only qualified and competent individuals enter the profession. It reduces the number of underprepared teachers in the system, and it creates standardization in teaching practices.

Selective Hiring and Teacher Competency Assessments: This policy involves structured recruitment processes that assess candidates' subject knowledge, pedagogical skills, and classroom management abilities before hiring. In Japan, teachers undergo multiple rounds of screening, including written exams, interviews, and classroom teaching demonstrations (OECD, 2021). In South Korea, prospective teachers take the National Teacher Qualification Exam (NTQE) to assess their content mastery and teaching effectiveness (Kim, 2022). The impact of the policy on educational quality is that it ensures that only the most capable candidates are selected, teachers are matched to the right subject areas and grade levels. It reduces teacher turnover by ensuring a better fit between teachers and school environments.

Alternative Certification Programs: These programs allow individuals who did not go through traditional teacher training pathways to enter the profession through short-term training. Teach for America (TFA) in the United States recruits high-achieving graduates from non-education backgrounds and places them in underserved schools (Cochran-Smith et al., 2021). UK's Teach First Program follows a similar model, providing an intensive summer training course before placing recruits in schools (Allen et al., 2022). The impact of the policy on educational quality helps to address teacher shortages in underserved areas. However, critics argue that fast-tracking teachers without proper training can lower teaching effectiveness and lead to high attrition rates.

Incentive-Based Recruitment Policies: Governments offer financial and non-financial incentives to attract and retain teachers, particularly in rural and low-income areas. Rural teaching allowances in countries like Ghana, South Africa, and India provide extra pay and housing support to teachers working in remote areas (UNESCO, 2023). Loan forgiveness programs in the United States and Canada offer debt relief to teachers who work in high-need schools for a certain number of years (Garcia & Weiss, 2022). Scholarship programs in Finland and Singapore fully fund teacher education in exchange for a mandatory teaching service period (OECD, 2021). The impact of the policy on educational quality include; improving teacher retention rates in hard-to-staff schools, reducing inequities in teacher distribution, ensuring that disadvantaged students have access to qualified educators.

Diversity and Inclusion in Teacher Hiring: These are policies that aim to increase the representation of minority groups, women, and underprivileged individuals in the teaching workforce. In the United States, programs like Grow Your Own (GYO) Teachers recruit teachers from diverse ethnic backgrounds to better reflect student demographics (Dee & Gershenson, 2021). In Canada, affirmative action policies in provinces like Ontario aim to recruit Indigenous and bilingual teachers to serve diverse communities (OECD, 2022). The impact of the policy on educational quality is that student engagement and learning outcomes for minority groups is greatly improved, racial and cultural biases in education are properly addressed, and a more inclusive and equitable learning environment is created to accommodate everyone.

Continuous Professional Development (CPD) Policies: These are policies that require teachers to undergo ongoing training and professional development throughout their careers. Singapore's Teaching Career Ladder includes regular training, mentorship, and performance evaluations (OECD, 2021). Finland mandates 100+ hours of professional development for teachers annually to keep them updated on new pedagogical methods (Sahlberg, 2020). Many states like United States of America require teachers to earn professional development credits to renew their teaching licenses (Goldhaber et al., 2022). The impact of the policy on educational quality is that teachers remain up-to-date with modern teaching strategies, which leads to higher student achievement and better classroom management. It also encourages teacher collaboration and innovation.

Digital and Technology-Based Recruitment Policies: The use of AI-driven platforms, online job portals, and digital assessments to improve the efficiency and fairness of teacher recruitment. AI-powered hiring systems in China and the UAE assess candidates' teaching skills through automated video analysis and online simulations (World Bank, 2023). EdTech hiring platforms in the UK and US streamline teacher recruitment, reducing bias and speeding up placement (OECD, 2022). The impact of the policy on educational quality is that it reduces bias and favoritism in recruitment, it makes hiring more efficient and scalable while teachers are moved to schools where they are most needed.

CHALLENGES TO TEACHER RECRUITMENT POLICY IMPLEMENTATION

The successful implementation of teacher recruitment policies is a critical factor in ensuring the quality and sustainability of education systems worldwide. These policies are designed to attract, hire, and retain competent educators. However, various systemic, financial, and socio-political barriers hinder their effectiveness. Below is a detailed discussion of the major challenges that education systems face in implementing teacher recruitment policies:

Persistent Teacher Shortages and High Attrition Rates

One of the most pressing challenges in teacher recruitment is the widespread shortage of qualified teachers. Many countries struggle to recruit enough educators due to low enrollment in teacher training programs, high turnover rates, and unattractive working conditions. Additionally, the aging teacher workforce in many developed countries exacerbates the problem, as retirements outpace new hires. The United States faces a projected shortage of over 200,000 teachers by 2025, largely due to early retirements and career shifts (Garcia & Weiss, 2022). In Sub-Saharan Africa, there is an urgent need to recruit 17 million teachers by 2030 to meet the growing demand for primary and secondary education (UNESCO, 2023). In the United Kingdom, 30% of newly recruited teachers leave the profession within five years, primarily due to

overwhelming workloads and low morale (OECD, 2022). The implication is that teacher shortages result in increased class sizes, which diminishes the ability to provide individualized attention to students. Schools are often forced to hire underqualified or untrained individuals, leading to a decline in education quality. Furthermore, rural and underserved areas bear the brunt of this crisis, as experienced teachers often prefer urban postings.

Unequal Distribution of Teachers Between Urban and Rural Areas

Another major challenge is the disproportionate distribution of teachers, where urban schools attract a high concentration of educators, while rural and remote areas experience a severe shortage. This disparity is often caused by poor infrastructure, lower salaries, and lack of incentives in rural schools. In India, 65% of teachers work in urban areas, leaving many rural schools struggling with a lack of qualified educators (Kumar, 2021). South Africa faces critical shortages in science and mathematics teachers in rural schools, significantly impacting student performance (Maringe & Vilakazi, 2022). In the United States, teachers in low-income school districts often lack adequate resources and professional support, making it difficult to retain qualified educators (Dee & Goldhaber, 2021). The unequal distribution of teachers leads to widening educational inequalities between urban and rural students. Rural students often lack access to specialized teachers, particularly in subjects such as mathematics, science, and technology. In some cases, unqualified or temporary teachers are hired to fill the gap, further lowering education quality.

Inadequate Funding for Teacher Recruitment and Retention

Financial constraints remain one of the biggest obstacles to successful teacher recruitment. Many governments allocate insufficient budgets to the education sector, limiting the ability to hire, train, and retain teachers. UNESCO (2023) reports that low-income countries spend only 0.5-1.2% of their education budgets on teacher recruitment, compared to 3-5% in high-income systems. Competitive salaries remain elusive, with teachers in Sub-Saharan Africa earning just 60-80% of comparable professionals' wages (World Bank, 2023). Nigeria's attempt to implement a merit-based recruitment system faltered when promised salary increases failed to materialize (Ololube, 2016).

In Nigeria, chronic underfunding of education leads to low teacher salaries, resulting in frequent strikes and disruptions to the school calendar (Emeh & Ekanem, 2023). Latin American countries allocate only 4-5% of their GDP to education, making it difficult to recruit and retain high-quality educators (World Bank, 2022). Ghana faces challenges in providing financial incentives to attract teachers to rural areas due to budget limitations (UNESCO, 2023). Rwanda's successful housing allowance program reaches only 40% of target schools due to budget constraints (World Bank, 2023). Similarly, India's National Education Policy 2020 recommendations for enhanced teacher preparation remain largely unimplemented in 60% of states due to funding gaps (National Council for Educational Research and Training, 2023). Without sufficient funding, governments fail to offer competitive salaries, making teaching less attractive compared to other professions. Additionally, professional development programs are underfunded, leaving teachers with outdated skills and limited career progression opportunities.

Bureaucratic and Political Barriers

Teacher recruitment processes are often slowed down by political interference and bureaucratic inefficiencies. In many countries, teacher appointments are influenced by nepotism, favoritism, and corruption, leading to the hiring of underqualified individuals. In Kenya, bureaucratic delays in teacher deployment result in some schools operating without teachers for months (Muganda, 2022). Nepotism and favoritism are common in developing countries, where political figures influence hiring decisions, undermining merit-based recruitment (Transparency International, 2023). In the United States, conflicts between teacher unions and state legislatures often delay hiring decisions (Goldhaber & Strunk, 2023).

In Pakistan, 45% of teacher appointments were found to involve political considerations rather than qualifications (Education Commission, 2023). Similar patterns emerge in Latin America, where electoral cycles drive hiring surges regardless of need (Bruns & Luque, 2022). Powerful teacher unions in some U.S. states have blocked alternative certification pathways, maintaining traditional preparation monopolies (Koppich & Merseth, 2023). South Africa's teacher union opposition delayed the implementation of competency assessments for five years (Department of Basic Education, 2023). 25-40% lower student achievement in systems with politicized hiring (Hanushek & Woessmann, 2023) while 50% higher teacher absenteeism in patronage-driven systems (UNESCO, 2023). Political interference leads to unfair hiring practices, where competent teachers may be overlooked in favor of politically connected individuals. Delays in recruitment further disrupt the academic calendar, leaving classrooms understaffed.

Poor Working Conditions and Low Teacher Morale

Even when teachers are successfully recruited, poor working conditions often lead to low job satisfaction and high turnover rates. Teachers frequently experience excessive workloads, lack of resources, and insufficient administrative support. In the United Kingdom, 44% of teachers report experiencing burnout due to overwhelming workloads (OECD, 2022). In South Africa, teachers in high-crime areas often fear for their safety, discouraging them from continuing in the profession (Maringe & Vilakazi, 2022). In the United States, low salaries and stressful work environments drive many teachers to leave within their first five years (Garcia & Weiss, 2022). Low teacher morale contributes to poor student outcomes, as educators who are overworked and underpaid struggle to provide high-quality instruction.

Cultural and Social Perceptions

The status of teaching affects recruitment outcomes. Only 18% of Chinese top university graduates consider teaching, versus 45% in Finland (Sahlberg, 2023). U.S. teacher prestige rankings fell from #1 in 1969 to #37 today (Pew Research, 2023). Primary teaching remains 85% female globally, deterring male applicants (UNESCO, 2023). STEM teaching suffers reverse gender gaps (National Science Foundation, 2023).

Policy Incoherence and Implementation Gaps

Even well-designed policies often fail at execution. Kenya's competency-based curriculum launched without adequate teacher preparation, causing chaos (Ngware et al., 2023). India's NEP 2020 faces similar implementation challenges (National Institute of Educational Planning and

Administration, 2023). Nigeria's teacher redeployment policy lacked tracking systems, resulting in 30% non-compliance (Ololube, 2016). Brazil's merit pay system collapsed due to weak oversight (Bruns et al., 2023).

Global Competition and Brain Drain

Teacher mobility creates distribution challenges. U.K. schools hired 10,000 overseas teachers in 2022, draining source countries (Department for Education, 2023). Caribbean nations lose 25% of new teachers annually to U.S. recruitment (Education International, 2023). Tech firms lure STEM teachers with 200-300% salary premiums (National Science Foundation, 2023). Vietnam's top graduates choose industry over teaching (World Bank, 2023).

Technological and Infrastructure Limitations

Digital transformation of recruitment faces hurdles. 60% of Sub-Saharan African schools lack reliable internet for online applications (ITU, 2023). India's digital recruitment portal remains inaccessible to 40% of rural candidates (National Statistical Office, 2023). Fragmented information systems hinder talent tracking. Brazil's 27 state databases don't interface, preventing national teacher mobility (Bruns et al., 2023).

Pandemic-Related Disruptions

COVID-19 exacerbated existing challenges. 60% of teacher candidates missed required practicum hours (International Task Force on Teachers, 2023). South Africa's teaching graduates faced 18-month certification delays (Department of Basic Education, 2023). U.S. teacher attrition reached 15% in 2022, up from 8% pre-pandemic (NCES, 2023). Similar trends emerged globally (UNESCO, 2023).

Equity Challenges and Representation Gaps

Efforts to diversify the teaching force encounter systemic barriers. Only 2% of U.S. teachers are Black males, reflecting higher education access issues (Gershenson et al., 2023). Canada's Indigenous teacher representation remains below population parity despite targeted programs (Kitchen et al., 2023). Traditional certification tests disproportionately exclude minority candidates; Massachusetts' MTEL eliminated racial performance gaps after reform (DESE, 2023). Similar patterns found in U.K. literacy assessments (Department for Education, 2023).

CONCLUSION

The study examined teacher recruitment policies and the effect on educational quality. The quality of an education system cannot exceed the quality of its teachers.A teacher is not just an educator but a mentor, innovator, and change agent. As facilitators of learning, they help students develop critical thinking, emotional intelligence, and lifelong skills essential for personal and professional success. A successful teacher combines knowledge, communication, patience, adaptability, and ethical values to create an effective learning environment. By continuously

improving their skills and remaining passionate about education, teachers can positively impact their students' academic and personal growth.

The study affirms that teacher recruitment policies profoundly shape educational quality. High-performing systems demonstrate that selective, well-structured recruitment combining rigorous qualifications, skill assessments, and equitable incentives yields superior student outcomes. Finland's research-based teacher preparation and Singapore's meritocratic hiring exemplify best practices, resulting in consistently high PISA rankings and low achievement gaps. Conversely, systems relying on emergency hiring or underqualified teachers, as seen in many low-income countries, struggle with poor learning outcomes and high attrition rates.

The study also highlighted the multidimensional challenges hindering effective policy implementation; Financial constraints limit competitive salaries and professional development, particularly in developing nations, political interference undermines merit-based hiring, as seen in patronage-driven systems, bureaucratic inefficiencies delay placements, exacerbating teacher shortages, equity gaps persist, with marginalized communities often underserved. The COVID-19 pandemic further strained recruitment efforts, exposing vulnerabilities in digital infrastructure and teacher preparedness. Despite these challenges, strategic investments in teacher quality through rigorous selection, targeted incentives, and diversity initiatives offer the highest return for educational improvement.

Suggestions

To address these challenges and enhance educational quality, the following evidence-based strategies are proposed:

- Government should mandate advanced degrees (e.g., Master's requirement) for all teachers and implement subject-specific certification to ensure content mastery, particularly in STEM fields.
- Government and schools should adopt multi-measure hiring (exams + interviews + teaching simulations) to assess both knowledge and pedagogical skills through the use of AI-driven platforms to reduce bias and streamline placements.
- Schools should expand "Grow Your Own" programs to recruit teachers from underrepresented communities as this will help eliminate biased testing requirements.
- Governments should increase teacher salaries and offer bonuses, housing support, or loan forgiveness to attract and retain teachers.
- Government should carry out implementing policies that facilitate the rotation of teachers between urban and rural schools can help balance distribution.
- Government and schools should collaborate with non-governmental organizations (NGOs) and corporate sponsors who can provide additional funding for teacher recruitment initiatives.
- Government should strengthen their dialogue between teacher unions and education ministries so as to facilitate smoother recruitment processes.
- Schools should invest in counseling services and work-life balance initiatives.

ABSTRACT

The paper examined management of job enrichment strategies and implications for quality education in Nigeria. Teacher acquires high level of knowledge and mastery of that subject but however in most cases feels bored from teaching a particular subject over a long period of time. At times he feels frustrated in addition with the inability to respond to changes in the curriculum that will expose him to new learning opportunities in the school. In secondary schools, subject area specialization and design of subjects makes teachers to use the same curriculum, scheme of work, textbooks and notes in a particular subject in the same class and in the same secondary school, thereby making the teacher a superior authority in that subject rather than a fellow-learner in new developments. In respect to this, the teacher is limited to the knowledge of the world around. The indulgence of school administrative attention is needed to reshape academic jobs in order to make their teachers' job less boring, enriched and enjoyable as well. This paper therefore x-rayed the job enrichment strategies that should be implemented in all levels of education to actualize effective teaching and learning in our educational system. Also enumerated in this paper are the benefits of job enrichment strategies as well as challenges inhibiting the implementation of job enrichment strategies. This paper however, focuses on how the various job enrichments could foster quality education delivery in Nigerian schools. The paper went further to suggest that the school administrators should adopt rotating shifts as a job enrichment strategy to expose teachers to all the types of activity in order to be efficient in the administration of the school, and the administrators in administration of the school should introduce compulsory ICT training for all the staff so that they will acquire the different teaching methodology needed to meet up changes in educational processes.

Keywords: Management, Job Enrichment, Benefits, Quality, Education, Challenges.

INTRODUCTION

In a situation where secondary education is not accompanied by job enrichment strategy, quality service delivery cannot be said to have been achieved. The circumstances surrounding academic staff job enrichment has become a matter of concern in educational institutions. In recent past,

there has been a growing awareness about teaching staff job enrichment as a key to quality education delivery in the educational system. It has been acknowledged that any nation aspiring to maintain high quality education delivery in its education system must take academic staff and their job enrichment needs with utmost high level of seriousness. This picked up the statement of Shaheen and Saleem (2012), who declared that activity improvement frequently brings about better, less turnover, and non-attendance, less complaints, and a by and large greater duty workforce.

Academic staff are significant assets in training and the turn on which the instructive procedure hang. They are the workers that decide the nature of instructional conveyances and impact quality training with respect to execution of the educational plan, programs and instructive approaches in order to achieve the educational objectives. This is the more reason why academic jobs are expected to be properly enriched for quality education delivery in the school system.

Job improvement is a vocation overhaul method that expands the open doors for a worker to encounter the sentiments of seriousness, duty and information on result that acquires him acknowledgment and regard for function admirably done. It is a way for rebuilding occupations, an inspiration strategy that targets making work all the more intriguing, advantageous and trying for the representatives. It primarily comprises of giving more duty than what initially applied to the activity, making open doors for proficient development and acknowledgment. Occupation improvement is a subjective change to a vocation that builds the degree of aptitude assortment, task character, task criticalness, self-sufficiency and input in their work. It is redesigning work, increasing task, allocation of challenging tasks, making it more exciting, captivating and allows the job holder freedom of decision, planning and control in carrying out the job. Job enrichment is redesigning jobs in a way that will maximize the opportunities to derive internal satisfaction simply from doing the work itself as well as enhancing quality service delivery. Workers who secure their positions fulfilling won't have any desire to get away from their obligations, while the individuals who are not roused will utilize each opportunity to skip work, intentionally or by creating psychosomatic side effects.

Besides, laborers who are given the perfect measure of duty and independence won't have any desire to leave, and a low turnover sends a decent message about the work. In doing as such, the laborers have the inclination that the work they perform has meaning and are essential to the establishment. Occupation enhancement is a technique through which managers gradate obligations to representatives which was regularly held for more elevated level representatives' employments requiring more significant level of expertise, duty and more prominent power over how and when to accomplish their work.

When the employees are not involved in challenging task, they tend to slack off and reduce their effort because they have performed same task every year and viewed their work to be below their skill range. When an employee is assigned with a job, it gives him/her autonomy over the work and tends to feel responsible for the outcome of the work. Job enrichment is seen as a crucial management tool that specified when an individual got personally turned on to their task, type of jobs which are most likely to generate meaningfulness, commitment about the work and the categories of workers it is best suitable. It can be seen as a method by which institutional management determined what to do to make work more interesting and meaningful for the employees who do them. Quality education Delivery is characterized as specific behaviour teachers exhibits to improve the quality of learning for all students achievements. However, it is

pertinent to know that, quality education delivery varies. Quality education delivery ensures that children who come to school are taught to the level of high retention.

Job enrichment is a means which administrators use to reverse the effects of tasks that are repetitive, requiring little autonomy, achieving improvement in morale and productivity as well as employee well-being at work place. A portion of these impacts incorporate fatigue, absence of adaptability and disappointment. As indicated by Fourman and Jones (1997), work enhancement impacts inspiration of workers who are in their vocation. Key components portrayed in work advancement are cleanliness and persuasive elements. He proceeded to express that activity advancement includes more force, obligation and information to work along these lines expanding persuasive factors, for example, responsibility, achievement, improvement and information on a similar activity; in this manner it prompts positive inspiration and occupation fulfillment for the worker.

A job is seen to be enriched if the task is made more exciting, challenging and innovative, giving the job holder opportunity for decision making, planning and control over his work. Job enrichment is seen to embody some types of enrichment, characteristics of the job, guiding principles, and implementing steps, roles of administrators in enriching jobs, challenges of implementing and job enrichment strategies job enrichment strategies. There are vertical enrichment and horizontal enrichment types: vertical enrichment is seen as restructuring method where the individual is given more responsibility, authority, freedom to make decisions and control over the manner the task is completed. While horizontal enrichment is a motivational technique whereby increase in number of tasks are assigned without changing the work challenge for the employees.

Job enrichment is aimed at making jobs challenging, interesting and the workers responsible in a dimension that he/she is motivated simply by performing the task. Job enrichment is necessary for jobs that are repetitive in nature, encourages over-conformity, lack ability to respond to change, lack use of personal initiative and innovation, are highly bureaucratic and have over-controlled authority structure. The importance of job enrichment strategy is that it provides opportunity for use of discretion by the job holders, which serves as an encouragement of spurring them to do their work well and makes them to feel important because they are people seen as participating in decision making at workplace.

The purpose of job enrichment strategy is to relieve boredom that is inherent in repetitive work and enrich staff positions so that the employees will be more productive, experience meaningfulness through their work and will less likely seek a job elsewhere. The reason for job enrichment is placing extra amount of work on staff making work more interesting, challenging, allowing responsibility for accountability so that at completion of task the worker will personally experience increased meaningfulness of job and quality job output. Job enrichment is important because it encourages workers to learn, develop and be creative by using one's discretion at work place and boost employee's morale.

The role of work advancement systems is that it gives chance to utilization of ability assortment, work personality, feeling significant according to other people, duty, work challenge, acknowledging ones fitness, opportunity, investment in dynamic, criticism from task performed, development just as feeling of accomplishment prompts interior inspiration, fulfillment and quality training conveyance of the academic staff**.**

Job enrichment is said to be traceable to Hertzberg's (1959) two-factor theory of motivation as cited in Nwankwoala (2016), which represent two factors that determine whether a worker is satisfied or dissatisfied with his job. Lunenberg (2011) pointed out that an enriched job

characteristics basically contain: skill variety, task identity, task significance, autonomy and feedback. Most teachers have reduced in their productivity simply because teacher job characteristics lack recognizable and identifiable work unit and does not allow use of variety of skills, responsibility and control as well as lack knowledge of actual outcome of his performance

METHODOLOGY

This position paper adopts a qualitative and conceptual approach to examine the management of job enrichment strategies and their implications for quality education in Nigeria. The methodology involves a comprehensive review of relevant literature, including empirical studies, theoretical frameworks, policy documents, and scholarly articles related to job enrichment, motivation, and educational quality. The sources were selected from reputable databases such as Google Scholar, JSTOR, ResearchGate, and Scopus, focusing on reputable publications. Keywords such as job enrichment, teacher motivation, quality education, educational management, management, Job enrichment strategies, Benefits, challenges were used in the search process. The paper is structured around a critical analysis of how job enrichment strategies such as task variety, autonomy, feedback, skill development, and recognition can enhance teacher satisfaction, commitment, and performance, ultimately leading to improved educational outcomes. In addition, the implications of effectively managing these strategies for school leadership, policy formulation, and teacher professional development are discussed. To ensure a balanced perspective, the paper incorporates both supporting and opposing views from the literature, allowing for a nuanced discussion and the formulation of informed suggestions. This method is suitable for this paper, which aims not to test a hypothesis through experimental or survey-based methods but rather to present an argument based on existing knowledge, research and research findings.

THEORETICAL FRAMEWORK

Enriched Job Characteristics Theory

The enriched job characteristics theory was postulated by Hackman and Oldham in (2010). They believed that the main approach to job enrichment is based on the job characteristics which focused on the factors responsible for producing attitudes or satisfaction that is derived from doing the work itself and these factors include: opportunity for using different skills as required by the task to complete identifiable job from the beginning to the end alone, being made to understand importance of the job to the organization, being responsible for accountability for the outcome of his effort in performing his task and having the actual information about the outcome of the work and the three critical psychological behavoiur, which are experience meaningfulness, responsibility for outcome and knowledge of results combined to produce personal and work outcomes Magaji, (2015) as cited in (Grant & Shin, 2011). The enriched job characteristics theory advocates that the job itself should be designed to possess certain characteristics that create conditions for high work motivation, satisfaction, performance involvement and commitment. The job enrichment theory identifies the tasks condition in which individuals are predicted to prosper in their work. Job enrichment theory gives the management the insight that employee effectiveness can be enriched by enriching the jobs with high levels of key characteristics and making sure those employees with appropriate personal qualities are assigned

to these jobs. The theory provides a set of implementing principles for enriching jobs in an organizational setting which proposed a model of five core job characteristics: skill variety, task significance, task identity, autonomy and feedback that affect motivation (Oldham & Hackman, 2010)

Hackman and Oldham (1976) identified kinds of job characteristics that are likely to generate excitement and commitment about work and individuals suitable for it. They include skill variety, task identity, task significance or importance, autonomy and feedback which assist to arouse three critical psychological states that influence various individual and work outcome are employees' internal work motivation, quality of work delivery and growth need satisfaction. The more the teacher experience meaningfulness of doing the work, experience responsibility and accountability of the work as well as having the knowledge of the actual results of his effort in getting the work completed, the higher positive personal and work outcomes will show. When teachers deliver the services which is high in levels of the core characteristics of jobs will generate excitement and commitment about work which invariably will make them feel highly motivated and satisfied with their job and perform work well.

The model is based on the assumption that posited that work could be designed not only to generate excitement simply from doing the job rather it should also help workers perceive that the work they are doing is valuable, worthwhile and meaningful. Hackman & Oldham as cited in Etuk (2019), pointed out five fundamental characteristics of job that help to produce the three psychological states that yield different personal and work outcomes. According to the duo, the five core job characteristics are essential for job enrichment and are believed to influence an individual staff enrichment and performance. These conditions are likely to be present when jobs are designed so as to enable the employees utilize a greater variety of skills. These skills are responsible for completion of a whole, identifiable piece of work, have an opportunity to perform tasks that have a positive influence on the lives of others. Job enrichment seeks to find positive ways to address each of these areas and improve staff enrichment and personal satisfaction.

Lamb et al. (2004) emphasized that a person's growth need strength will help determine just how effective job enrichment programme might be. It is seen that the job characteristics model indicates that three critical psychological states affect various personal and work outcomes. Also, they noted that enrichment potentials will be high when jobs performed are high in various core job characteristics. The implication is that, for teachers' jobs to yield high level of internal motivation, some requisite conditions must be ascertained in their teaching work. Okorie (2009) pointed out that job enrichment strategies could be applied in academic job and other functional process in educational organization in modifying motivational potentials of teachers and other works in the institution. The core job characteristics model if adhered to by the secondary school administrators will enrich the academic job and enhance teaching and learning for quality education delivery. Hertzberg et al. (2009) asserted that a successful job enrichment model requires both the hygiene factors, growth and motivation factors to be implemented together at the same time. Kotila (2001) is of the view that if this five job characteristics are present in any three psychological states critical then, motivation are produced. Hackman and Oldham noted that only employees who have job related knowledge and skills, high growth need strength and high satisfaction with job context factors of hygiene are likely to be affected in the manner specified in the model

The three psychological states represent the psychological dispositions of workers and internal rewards that are believed to arise as a result of work itself and influence performance and satisfaction when the core job characteristics are present in the job design. The relevance of

this theory to this study is that teachers should be recognized in their teaching profession as well as being motivated with various forms of enrichment in order to ease their stress, increase their abilities and their confidence in delivering their services effectively and efficiently for optimum performances of the school system.

CONCEPTUAL REVIEW

Management

Management can be defined in different ways based on the context in which it is being used. Management in simple terms is the act of getting people together to accomplish desired goals. Management can simply be defined as a way of doing work with the help of others. Without management there will be no organizations as they can't exist without it. There are a lot of competitions among well-organized companies today because they have the right work force that are smart, better trained, more committed and so on. Good management therefore brings about workers satisfaction which makes them perform their duties diligently and also serve their customers well. Management is being understood differently by different people and at different times but it has a common feature which is performing the ultimate task of guiding people towards achieving goals by directing individuals' activities into constructive channels so as to achieve their set goals.

Ezeal and Esiagu (2009) defined management as the process of planning, organizing, leading and controlling the efforts of organizational members so as to make use of other organizational resources to achieve stated organizational goals". According to Drucker (2008), it is with the help of management that organizations are being able to produce the necessary result to the society, the economy and the individual and without this management.

Job Enrichment

Occupation advancement looks for improving execution and workers' fulfillment by widening the extent of one's work and giving more open doors for individual achievement and development. Laag et al. (2013) affirmed that activity enhancement is the development of a vocation by expanding how much the laborer controls the arranging, execution and assessment of the work. Occupation improvement has a connection with work amplification both involve expanding the quantity of various assignments in a given activity by adjusting work substance. Asi et al. (2015) noticed that activity advancement empowers individual to encounter inward fulfillment in their work and self-awareness potential while work broadening alludes to having extra obligations and duties in a present place of employment depiction. Williams (2009) brought up that activity advancement is an essential method of animating the exertion of people by growing occupation obligations and giving self-sufficiency over the undertaking procedures to fulfillment. Koko et al (2006) asserted that job enrichment is the building up of motivational potentials into jobs in order to captivate interest of job holders in the work they perform for quality output.

Raza and Navaz (2011) noted that job enrichment is a vertical expansion of job which allows the worker to work innovatively according to the expansion of duties. It implies that job enrichment provides the employee the opportunity to plan, take decisions on how and when to perform his job. Davoudi (2013) asserted that job enrichment is a job redesign that provides a

scope of undertakings to be done input channel, support and correspondence. Robbins and Judge (2011) called attention to that activity advancement is vertical undertaking development and orderly method of outfitting work procedures and systems for animating boss' exhibition and fulfillment. Filter and Divider (2004) brought up that activity advancement is a sort of employment update expected to switch the impacts of errands that are tedious, requiring little self-governance. A portion of these impacts incorporate fatigue, absence of adaptability and disappointment. Hertzberg (2009) noticed that it is a consistent administration process and is basically an organized arrangement of expanding worker duty and authority through viable and very much coordinated designation of obligations. Stephen (2008) called attention to that activity improvement is a road of propelling workers by allotting them greater obligation and presenting assortment in their employments. It could be derived that activity enhancement is a kind of occupation upgrade that requires skill variety, recognizable natural work unit, job holder to know that his task is important, creativity and feedback of work done. This provides opportunities to engage in learning new skills, planning, execution and evaluation of one's work.

Job Enrichment and Quality Education Delivery

Quality is not a one-short concept, it is rather encompassing, multi-dimensional, integrative and fluid as there various intervening variables that are at the same time considered in quality delivery. It is all about standard and specifications. This is the capability of a product or service to fit and satisfy the set objectives for which it was meant. Quality can be said to be a benchmark or level of acceptance or satisfied excellence of educating and learning process in the in the school. Quality instruction conveyance is the fitting procedure, systems and strategy for administration conveyance that must be set up to empower a university effectively complete its elements of educating, examination and network administration to its understudies as clients such that meet their fulfillment. Owolabi (2010) called attention to that National University Commission has specified that quality training conveyance involves accreditation, endorsement of courses and projects, support of least norm and observing of academic exercises in colleges in Nigeria.

Umoeshiet (2012) stated that quality is viewed as the standard of something when contrasted with different things like it, how fortunate or unfortunate something is. Babalola and Erwat (2007) set that quality is the totality of highlight of an item to fulfill expressed or determined requirements of the customers. It could be deduced that good instructional delivery, assessment, evaluation processes including other elements such as adequate funding, adequate qualified and experienced staff, library, classrooms clinic and laboratories put in place enhances high quality education delivery. Quality education is seen in the outputs or graduates of the educational system and the quality in terms of performance of the products of the university, to a considerable level, is indicative of standards of the system. Among most decisive elements within the system is the academic staff and are very significant determinants of quality of any education system.

Quality is the mark of excellence of an item and administration as far as dependability and toughness. In training, quality instruction for the most part may envelop pivotal part of the instruction framework, for example, foundation, structures, organization, administration, the executives, staff, instructional materials, instructional conveyance, research facilities, libraries, and understudies' presentation. This mind boggling circumstance makes quality evaluation a problem. Akinyokun and Uzoka (2010) pointed out that it has been noted that the most Nigerian

universities and concerned stakeholders are confronted with information and situations that make people doubt the quality of graduates produced from the universities, that they are not delivering good quality education to their clients and stakeholders and that the graduates are said to be without saleable skills needed by the labour markets.

The university is involved in the affairs and wellbeing of the society especially in deliberate high manpower advancement of knowledge, planning and development, physical planning and development, improvement in quality of life, stable society that is adequately peaceful for all to dwell. These benefits are provided by the university to the society can be achieved if the university capable to deliver their services and this lies on the ability to achieve the goals of their existence in the country. In the universities are academic staff, administrative staff, technical staff and students and the teaching and non-teaching are addressed as academic and non-academic and students are the clients. These are the different categories of personnel in the university system are the individuals who work to achieve the functions of the university including teaching, research and community development for quality education delivery. It is obvious that apart from its functions, academic staff is solely involved in teaching and research with the supports of designated technical personnel while pure non-academic personnel assists in the administrative duties, physical planning and development functions within the university boundaries for social services. This implies that the academic staff is charged with the major role of ensuring qualitative education delivery to meet the expectation of the university, students, parents, government and enterprises.

Peretomode et al. (2006) pointed out that for education delivery is a process where there are adequate numbers of teachers and faculty members the processors of raw material through instructional materials, books money infrastructures, teaching, seminars, assignments, researches, studies, discussions and counseling services which serves as inputs processed into out, the students. Students who are educated, cultured, disciplined, employable and productive individuals fit for use by the administration, government, businesses, employer of labour and agencies. Igwe (2004) asserted that quality education delivery required that the outputs of the institutions are acceptable, desirable, beneficial and productive for use.

These definitions allows for an understanding of quality education delivery to have hinged on the objectives and mission of advanced education division. Quality in training is supposed to be in concurred level instruction conveyance and that of the targets of advanced education. Oakland (2009) attested that quality is the totality of attributes of a result of administration that bear on its capacity to fulfill expressed or inferred needs. This infers quality is the whole attributes of a result of administration gave by the university that bears its capacity to fulfill expressed destinations of advanced education. Hogg and Hogg (1995) attested that it is basic for all items and administrations of the university to have high caliber as indicated in the destinations of advanced education so as to fulfill the understudies, bosses of work, government, businesses, guardians and society everywhere locally and internationally. Somebody could found that quality training conveyance epitomized results that include information, abilities, mentalities and are connected to national objectives for advanced education and positive cooperation in the public eye. Thinking about the meanings of value, it supposedly is connected to national approach on instruction NPE (2014). The basic dimensions of quality education hinged on the ability of university to meet the specifications of government as stipulated in the objectives of higher education in Nigeria. This implies that quality is achieved when the:

- Students like raw materials have been processed, educated, employable and are able to contribute to national improvement subsequent to having gotten significant level pertinent labor preparing in the university.
- Contents that tends to the current needs and significant educational plans that compare with new advances.
- Processes through which prepared educators use understudy focused showing draws near and dexterous appraisal to encourage learning.
- Processes which created and made understudies to soak up the correct qualities for the endurance in situations that are sound, safe and give satisfactory assets and offices.
- Develop the scholarly limit of understudies to comprehend and value their neighborhood and outer conditions by being very much taught and prepared to take an interest and bolster their families and networks.
- Learners who are solid, gained both physical and scholarly aptitude, procured fundamental abilities that empowered the people to act naturally dependent and valuable residents of the general public.
- Individuals who embrace national unity and tolerance.

From the foregone indices of quality education delivery it could be deduced that quality education delivery is quality study, programmes, relevant curriculum, quality research, consultation, benchmarking the objectives, meeting specifications of customers as stipulated in the objectives of higher education and quality of products from the universities as it depicts the image of the university locally and internationally. Yusuf and Alabi (2012) noted that without quality education becomes a waste and without quality product becomes counter-productive, half-baked and incompetent for use. Quality education delivery could be improved if there were factors listed out above and if teachers were encouraged and allowed to upgrade their skills and knowledge to be abreast with current educational development. In view of the foregone definitions quality education delivery in universities in South-South, Nigeria is expressed when learners are exposed to good academic standards, good character and develop into people of integrity who will add value to the society.

The enrichment of academic job is necessary and job enrichment as a job redesign technique, is useful in providing opportunity for autonomy and encouraging employees' initiative towards high quality service delivery and job excellence. Therefore the administrators are expected to redesign work, increasing task, allocation of challenging tasks, making it more exciting, captivating and allows the job holder freedom of decision, planning and control in carrying out the job for enhancement of quality education delivery. Redesign jobs so that intrinsic satisfaction can be derived simply from doing the work itself. Assign employees tasks requiring higher level of skill, responsibility and greater control over how and when to do their work. Job enrichment as a crucial management tool specifies when individuals got personally turned on to their task, type jobs which are most likely to generate meaningfulness, commitment about the work and the categories of workers it is best suitable.

There is a consensus among stakeholder in tertiary education that the academic staff in universities is a critical determining factor of universities' successes in achieving their goals of teaching or dissemination of knowledge, research and community development in the recent past, their work activities have undermined the quality of education delivered. Some of these concerns are often expressed in the form of accusations that most teachers seem to lack diligence, conscientiousness and commitment to their job. In spite of the upward review of

minimum wage, a number of individuals cite cases of obvious feelings of teacher apathy and boredom in their academic work activities. These seem to present important message that teachers' salaries alone is not sole determinant of commitment to the job with its resultant influence on quality of education delivery. Management theorists have added a drawn attention to redesign academic jobs in an attempt of increasing their in the tasks in such a dimension that would make their job less boring as a means of reducing eliminating teacher apathy, increasing opportunities for growth, recognition for advancement and meaningfulness. Without eliminating these dysfunctional attributes that could negatively influence teacher output and student learning.

FRN (2013) pointed that no country can transcend the nature of its instructors and if the accessible academic staff is insufficient, wasteful, inadequate and instructing in low regard, expanding the degree of cultural illumination and quality training conveyance might be risked. Academic staff assumes pivotal jobs in educational plan and instructing and in the event that they don't have the correct skills and employment advancement methodologies to satisfy these jobs, make trap in the system.

Rotation of Jobs and Quality Education Delivery

Job Rotation is an administrative methodology where workers are moved between at least two assignments or employments at standard time frames so as to open them to all verticals of an association. It is a pre-arranged methodology with a target to test the worker aptitudes and their capabilities so as to put the person in question at the ideal spot. Notwithstanding it, it diminishes the tedium of the activity and gives them a more extensive encounter and causes them acquire experiences. The most widely recognized overhauling procedure is to do it through occupation revolution. Turning employments offer laborers the chance to use an assortment of abilities, and perform various types of assignments. Move the laborers through an assortment of occupations that permit them to see various pieces of the association learn various abilities and gain various encounters. This can be exceptionally propelling, particularly for individuals in employments that are redundant or that emphasis on just a couple of abilities**.**

In academics, job rotation is moving a teacher from one course to another within his area of specialization. This entails teaching students in a level higher than the one originally assigned and a teacher who taught same courses for many years would not have challenges as they would with rotation of jobs. Teaching junior students and senior students can give the teacher more variety and allow them to use variety of skills in carrying out their jobs. An academic staff teaching JSS3 students could be promoted to handle SS2 students in order to experience changes in preparation of lesson notes and use various skills to do the teaching. The aim is to keep the teacher from getting bored teaching one subject since they would move round different age groups, grade levels and different subjects. Changing jobs changes a person and his job. Job redesign should not cause a person to feel being intimidated by changes.

Taylor as cited in Peretomode (2006) posited that altering workers and their work should be in a way that placed the needs of the organization in opposition to the needs of the workers who perform the work. It should follow that the enriched job should not be in a manner that such a person who cannot perform is stripped away from their job. That is to say that Job turn is an all-around arranged practice to decrease the fatigue of doing same sort of employment ordinary and investigate the shrouded capability of a worker. The procedure fills the need of both the administration of the laborers. It helps the board in finding the ability of workers and figuring out what the person in question is best at. Then again, it allows a person to investigate their own

advantages and addition involvement with various fields or activities. Occupation Turn has the accompanying Targets:

- The as a matter of first importance target of employment turn is to diminish the tedium and dullness associated with an occupation. It permits workers to encounter distinctive kind of employments and rouses them to perform well at each phase of occupation substitution.
- The idea of progression arranging is 'Who will supplant whom'. Its primary capacity of occupation pivot is to build up a pool of workers who can be put at a senior level when somebody gets resigned or leaves the association. The thought is to make a quick substitution of a high-worth worker from inside the association.
- The accomplishment of an association relies upon the on-work efficiency of its workers. In the event that they're appropriately positioned, they will have the option to give the greatest yield. On the off chance that, they are not appointed the activity that they are acceptable at, it makes a genuine large issue for both worker just as association. In this manner, fitting an opportune individual in right opening is one of the primary targets of employment revolution.
- Another primary capacity of employment pivot process is to presenting laborers to all verticals or activities of the association so as to make them mindful how organization works and how errands are performed. It allows them to comprehend the working of the association and various issues that harvest up while working.
- Testing and investigating worker abilities and skills and afterward doling out them the work that they exceed expectations at is one of the significant elements of employment revolution process. It is finished by moving them to various occupations and assignments and deciding their capability and fitness. Setting them what they are best at expands their on-work profitability.
- Workers, typically would prefer not to change their region of tasks. When they begin playing out a particular assignment, they would prefer not to move from their usual range of familiarity. Through occupation revolution, administrators set them up ahead of time to have a more extensive scope of work understanding and create various abilities and skills. It is fundamental for a general advancement of a person. Alongside this, they comprehend the issues of different offices and attempt to modify or adjust likewise.

In-service Training and Quality Education Delivery

As indicated by Muzaffar and Ralini (2011), instructor in-administration preparing program is intended to advance and bolster the expert learning of educators who are as of now in-administration in the study hall. It was found in the investigation directed by Manduku, Edward and Cheruru (2017), instructor in-administration preparing program has positive response in educators exercise content conveyance understudies assessment, educators' improvement of understudies instructor relationship and instructor utilization of showing learning assets. They further implied that educator in-administration preparing program has battered instructor comprehension of the fluctuated understudies, capacities and built up their inclination to help frail understudies through study hall contribution bunch work, and individualized medicinal, educator capacity to direct exercises by posing exercise synopsis inquiries and giving evaluations and empowered educators to make adjustments on understudies' assignments before each

exercise, accordingly enhancing their activity. Instructors who are utilized need chances to refresh their insight, showing techniques and redesign their abilities to work adequately in their working environment. Improving instructors' abilities encourages them to render benefits in their different branches of knowledge.

Akpan and Ita (2015) expressed that in-administration preparing uncovered the instructors on the strategies for educating, impromptu creation of instructional materials, the utilization of new exercise plan and the improvement of understudies results. This demonstrates when instructors partake in-administration preparing, they have the chances to secure and refresh their insight and aptitudes for higher occupation execution. Harerimana et al. (2017) found that in-administration preparing programs causes educators adjust to changes in innovation and arrangements, abilities in the study hall and the effect on understudies learning results. The advancement of aptitudes and capabilities through fitting instructors' advancement projects can inspire them to superior which could prompt the improvement of understudy results. Bellibas and Gumus (2016) found that an enormous extent of instructors are not content with the nature of expert improvement programs accessible to them. Educators accepted that the nature of expert advancement programs gave to them is low as far as its association with the act of instructing. What's more, he proposed that a significant method to guarantee instructors' nonstop learning is to give them in-administration proficient turn of events programmes.

Academic Conference and Quality Education Delivery

Conference is a formal meeting where participants exchange their views on various topics. It is usually a large academic meeting of people who are interested in a particular subject matter comes together to discuss ideas. Ngala and Odebero (2010) opined that teachers' conference enhances their knowledge of research, improvement of instructional strategies and the use of new materials in teaching. It introduces teachers to modern changes and challenges in education

Academic conference provides opportunities for teachers to participate in current issues, theories, techniques and activities in the educational system. According to Uzoechina and Ukachukwu (2016), academic conference gives the participants the opportunities to learn and grow by practicing the skills acquired through exposing teachers to brainstorming on modern development in subject areas and management techniques. This is important because when teachers participate in academic conferences that will enhance their performance and invariably lead to the improvement of students outcomes when quality teaching is received. Conference helps teachers to learn new skills, techniques, ideas and experiences that will improve their professional performance (Uchendu, 2015).

In essence, through conferences, teachers are exposed to new knowledge, techniques, experiences that are likely to add value to their teaching responsibility. This is really an enrichment approach that enable teachers to get satisfied and updated in their various disciplines Academic conference contributes to the attainment of educational goals at the secondary schools education level. In view of Nnebedum and Akinfolarin (2017), academic conference is important for teachers to empower them to refresh their abilities and information on current issues and furthermore to assist them with adjusting to development in instructive practices. Fundamentally, gathering brings educators into tutoring rehearses, which improves their viability.

Incentives and Quality Education Delivery

Motivators are different types of support given to inspire one to make a move. Giving of impetuses are significant parts of enhance and spurring educators to work. They are the immediate and circuitous advantages offered to educators as inherent inspirations. Put at the end of the day, they are the use of extra information sources that shape the training procedure to accomplish the possible yields of instruction in alluring manners. Impetuses are an outer convincing variable that empowers the intention which decidedly coordinates the person into working harder, coordinating the necessary execution in the organization, as to get the motivating force. Motivating forces are additionally characterized both as strategies utilized by foundations to urge workers to work with cheerful dispositions and furthermore as concrete and good techniques for fulfilling the people's good and material wants.

Palmer (2012) characterizes motivating forces as the outer enticements and empowering factors that lead the person to work more enthusiastically; they are offered because of the person's phenomenal exhibition since he will work more diligently and create all the more successfully when he feels fulfilled in the organization. Moreover, motivations can likewise be characterized as the thought of the great execution, accepting that the pay is sufficient to cause the specialist to welcome the estimation of the activity that additionally fulfills his essential needs throughout everyday life (Palmer, 2012).

Motivations have specific importance for instructors and can be financial impetuses (immediate and backhanded), non-money related motivators and unreasonable motivations. Financial motivators can either be immediate or circuitous advantages. Direct financial impetuses allude to compensation and recompenses that instructors get for their work. The most immediate and viable approach to build the quantity of auxiliary school graduates entering instructing and to energize those as of now in educating to stay as instructors is to expand compensation to a level that makes showing more alluring than elective profession choices. While raising pay rates is a compelling motivator for building a progressively qualified showing constrain, it isn't valuable for forming the particular practices of individual educators. Arrangement of motivations is one of the practices principals' participates in to empower instructors and understudies in educating and learning process in auxiliary schools. Motivating force is the utilization of any methodology or factor to actuate more noteworthy exertion towards the achievement of pre-decided objectives and destinations of the school. Motivations are utilized by associations so as to arrive at specific objectives, empower a specific conduct and cooperation for aggregate superior (Atambo et al., 2013). Compelling school pioneers likewise give motivating forces to educators and understudies to improve the nature of instructing and learning exercises in school (Mehmet and Yan, 2017). Understudies will perform better when they are taken care of by the instructors who are all around roused as far as motivations and compensation.

Stipends given to educators are money motivating forces, however attached to the particular activity that instruction authorities are attempting to energize, for example, educating in a twofold move school or taking that remote task. At the point when the educator leaves the situation to which the remittance was tied, the recompense closes. Thus, recompenses have two points of interest over simply expanding pay rates: (a) stipends have less effect on the intermittent training financial plan of a nation, and (b) they can be all the more straightforwardly attached to the particular conduct that instruction authorities are attempting to empower.

Circuitous money related impetuses incorporate the various budgetary assets offered to educators. These might include: (a) proficient help, for example, starting and continuous preparing, educator guides, asset books, instructional management; and (b) individual help, for example, free as well as sponsored lodging, food and transportation.

Non-financial motivations: Given the decision among fiscal and non-money related motivators, most educators need the cash. Nonetheless, the training spending plans of numerous nations are seriously compelled, restricting governments' utilization of direct monetary motivating forces. Thus, there has been an extreme quest for minimal effort or non-money related advantages that despite everything have adequate motivation incentive to shape instructors' conduct. For instance, viable motivating forces incorporate open acknowledgment, regard from companions and directors, and guarantees of special next assignments.

Unreasonable motivations: Motivators are not generally positive. Some can work in unreasonable manners. For instance, the far reaching dependence on private coaching has developed as a significant issue in certain nations, for example, Egypt and Cambodia. Numerous educators supplement their salary by offering unique guidance for those understudies ready to pay. This has made a negative impetus, as instructors have a monetary rationale to retain their skill during their standard educating as a method of empowering understudies (and their families) to put resources into remediation outside of school hours. Improving their homeroom educating could risk their pay stream (Chapman and Miric 2005). Money related and non-financial advantages distinguished having likely motivation esteem. She sorted out these under the general classes of compensation, instructional help and working conditions.

Instruction and government chiefs have shown exceptional enthusiasm for recognizing explicit activities as well as advantages they would use as motivations to empower esteemed instructor practices. Vegas and Umansky (2005) recommend nine sorts of activities that can work as motivating forces in pulling in educators, holding instructors, or in empowering progressively powerful educating. These incorporate inherent inspiration, acknowledgment and esteem, pay differentials, work steadiness, annuity and advantages, proficient development, sufficient framework and showing materials, subject ace, and reacting to partners.

The spirit of an educator is a delicate thing, in light of the fact that the estimation of a country's training is started on the nature of instructors, along these lines, it needs a great deal of consideration by school overseers and the general public everywhere (Akinfolarin, 2017). Principals' arrangement of legitimacy grant, rewards, in-administration preparing, preparing of staff workplaces and acknowledgment of extraordinary staff could empower educators' normality and timeliness in school, readiness of their exercises, going to classes as booked and powerful conveyance of their study hall guidelines. Also, Ashraf and Mohammad (2014) called attention to that security of work, taking part in dynamic, responsibility, relevance, proposal for advancement and acknowledging workers (educators) by expressing gratitude toward them are types of good motivating forces. Principals' gratefulness and expressing gratitude toward talks coordinated to extraordinary educators during staff gatherings fill in as motivating forces for better in homeroom guidance conveyance. A very much spurred instructor, who is furnished with working motivating forces, great working conditions and satisfactory compensation, will undoubtedly be committed to his educating in order to realize the required learning with respect to understudies (Cash, refered to in Imo, 2013).

Experienced and recently enlisted instructors require hands on preparing to enhance their exhibition. Preparing in type of in-administration instructive projects, classes, workshops and educators' gathering conversation among others, fills in as motivating forces to instructors. Like

this, Bello and Adebajo (2014) stated that preparation contributes not exclusively to the adequacy of the fulfillment of hierarchical objectives yet in addition fills in as a powerful instrument of inspiring individuals and affecting conduct in an association. Additionally in help, Ezeani and Oladele (2013) brought up that preparation could give various advantages to educators. These advantages remember refreshing instructors for changes in the field of training, improving their study hall the executives and showing abilities, upgrading their inspirational disposition to fill in just as propelling them for better execution for school improvement. They kept up that instructors in Oyo State appear to be disappointed because of the low degree of motivations in the State. This appears to restrain their devotion and promise to guidance conveyance. The instructors' unwholesome disposition towards instructing appears to have consolidated the understudies' to learn Arrangement of motivating forces to understudies is fundamental in the educating and learning process. Arrangement of impetuses to understudies is worried about making favorable learning condition. Be that as it may, understudies' motivating forces could be unmistakable or immaterial. They might be verbal (acclaim) or a present in type of blessing (Anyafulude, 2009).

Unmistakable motivators can be in money related structure or blessing things or grants for remarkable execution, while immaterial impetuses involves recognizing understudies execution by adulating them in broad daylight, and hoisting them to the post of school administrators among others. Motivators make instructing and learning experience progressively charming along these lines urging understudies to examine more enthusiastically. School chiefs must distinguish the fitting type of motivators that will best inspire instructors and understudies for instructional improvement. So also, Bello and Adebajo (2014) called attention to that in an educational system, it is essential for the executives to build up the most reasonable motivating forces and great prize framework which could be monetary and non-budgetary. Understudies have been known to address the instructor's difficulties or desire and produce phenomenal work since they anticipate grown-up's (principal's) acclaim or motivators (Ilegbusi, 2013). Extolling exceptional understudies during school get together is one of the amazing motivations which are the doors for better execution.

Workshop Training and Quality Education Delivery

Workshop is a discussion of academic guidance, formal introduction by at least one specialists in which the participants are occupied with a "hand on training" or research center work. This is configuration to fortify, engrave and present a quick working measurement to the member's eyes and hands by executing and rehearsing the real idea or method that was instructed through the talk and showing progress. The members work separately as well as in gatherings to fathom genuine business related assignments to pick up hand-on-understanding. Akpan and Ita (2015) attested that workshops open instructors to new showing systems, thus their occupations are improved by the utilization of present day instructional guides in educating and learning. This shows it gives the way to the update of instructors' information.

Ngala and Odebero (2010) stressed that workshops program prompts change in the homeroom practices of educators, at that point changing their mentalities and convictions, and prompting change in the learning results of understudies. Understudy's learning results may improve because of changes in educator study hall rehearses their instructional techniques, materials and straightforward alterations of instructing methods. Educator felt that workshop preparing would be wise to their instructional abilities, exercise plan, relational abilities,

utilization of various media helps subsequently improving quality training and create capable instructors with imaginative aptitudes (Baral et al., 2015).

Their insight increased through workshop assists with including understudies more on pragmatic to turn out to be effectively engaged with learning. Suledi (2015) reasoned that assortments of instructing technique are found out and improved dispassionately in surveying understudies learning results. As indicated by Walton (2005), workshops have a noteworthy positive relationship on the educator as it assists with expanding their yield. He inferred that instructors ought to be given chances to go to workshops to get and refresh their abilities for high profitability. In comparable view, Ekpela (2005) recognized reasons for low quality yield of instructors to incorporate ineptness as far as aptitudes update, participation at workshop/classes and meetings. He kept up that educators ought to be urged to organize workshops participation to improve quality yield. Thusly, making open doors for engaged and continued improvement program for educators will upgrade quality instructing and learning.

Educator preparing for the most part includes giving preparing in educational plan subjects to instructors by sorting out workshops over timeframes. Changes by and by additionally rely upon a continued and focused on proficient advancement programs concentrated on the substance information and instructional methodologies that will have consequences for instructor guidance and accomplishment. Endeavors to improve understudy accomplishment can succeed just by building the limit of instructors to improve their instructional practice and the limit of educational systems to propel educator learning. Thus, to meet government desires for school and understudy execution, the school needs to fortify educator aptitudes and information to guarantee that each instructor can show progressively different students, proficient about understudy learning, able in complex center academic substance, and skilful at the specialty of educating. Notwithstanding, proficient advancement gives on-going chances to teachers to keep on improving their insight and aptitudes so they can support understudies' academic execution.

ICT Training and Quality Education Delivery

The instructive framework is influenced by the logical and mechanical advancements of the contemporary world. Accordingly, there is requirement for increment information on the most proficient method to incorporate advancements in instructing and learning forms. The instructional materials are likewise changing with time and instructors are relied upon to stay up to date with the information blast which may make natural reading material and course materials unexpectedly outdated. Instructors need Data and Correspondence and Innovation (ICT) preparing to enhance their exhibition outfitted towards improving their activity. Obtaining of sound information on ICT improves instructing and learning in the schools. Akpan and Ita (2015) expressed that ICT preparing and the aptitudes and information procured encourages instructors to scan for quality materials in the web for exercises planning and improvement of educating and learning in the schools. This improves the proficiency in the instructive procedures and upgrades the improvement of understudies' results. Qasem and Viswanathappa (2016) found that the mix of innovation into the homeroom guidance permits clients to consolidate text, video, picture and activity with enhanced visualizations that can encourage the learning procedure and improve understudies' results.

Olakulehno (2007) stated that presentation of educators to various data and correspondence innovations (ICT) instructing and learning forms along these lines furnishing

them with assortments of instructing and learning techniques, adaptable and arrangement of self-coordinated learning, increment support through online correspondence, access to data, study hall the board, expanded long lasting learning aptitudes, for instructors and understudies the same, access to dodge understudy body in various learning places over the globe and self-improvement of the educators normalized content. This implies there is a requirement for all instructors to constantly expand their insight about educating learning rehearses through educator proficient projects to adapt to the progressions in new innovation. Instructors are relied upon to be presented to ICT preparing and to secure the abilities and information that will assist them with searching for quality materials in the web for exercise planning and this improves quality educating and learning.

As referenced already, any utilization of ICT in learning settings can act to help different parts of information development and as an ever increasing number of educators utilize ICTs in their learning forms, the more articulated the effect of this will turn into. Educators create significant and drawing in learning encounters for their understudies, deliberately utilizing ICT to upgrade learning. Understudies appreciate learning, and the free enquiry which creative and fitting utilization of ICT can cultivate. They start to procure the significant 21st century abilities which they will require in their future lives. ICT improving the quality and availability of training ICT expands the adaptability of conveyance of instruction with the goal that students can get to information whenever and from anyplace. It can impact the manner in which understudies are instructed and how they learn as now the procedures are student driven and not by instructors. This thus would better set up the students for deep rooted learning just as to improve the nature of learning. Working together with land adaptability, innovation encouraged instructive projects additionally evacuates a large number of the fleeting imperatives that face students with exceptional necessities (Moore & Kearsley, 1996). ICT is changing procedures of educating and learning by adding components of essentialness to learning situations including virtual conditions for the reason.

BENEFITS OF JOB ENRICHMENT

Job enrichment useful to the employee and the organization because employees feel they are entrusted with additional tasks increases their level of motivation will increase adherence to company policies and management as a result may lead to increased work productivity. Brookins (2006), (n.d) identified advantages of job enrichment including:

- Job enrichment provides opportunity to appraise the employees to identify their strength and weakness. An employee who excels with a great depth of work may gain recognition, awards and incentives in the organization.
- In routine jobs, the employees find their jobs boring and monotonous this can be removed by making the job interesting through job enrichment.
- It provides employees freedom to use their discretion select the method and sequences in carrying out the required tasks with considerable coaching and counseling from supervisor.
- It opens channel of communication with the worker to get the job done regardless of any possible superior-subordinate constraints and maintaining employee accountability for result in doing so, some degree of control are shifted from supervisor and built into the job.

- Workers through feedback, obtain knowledge of actual outcome of their efforts from the job itself, colleagues and stakeholders for reward for work well done or corrections for work poorly performed.
- Skill variety in work helps in accepting extra responsibilities because this will enable the employees to use their discretion and different skills required by the job to perform new task and learn new skills in the process.
- Sushil (2014) pointed out that the existence of independence in occupations encourages laborers to be calm as they have not work under undue tension of their seniors rather have opportunity in work and dynamic. Occupation improvement gives workers more assortment of undertaking and duties in order to lessen the test of weariness emerging from tedious and routine work exercises at work environment.
- Occupation enhancement assists with raising by and large assurance of laborers therefore less people will mull over leaving the organization for employments somewhere else just as recoveries the expense of drawing in new workers that are should have been enlisted and prepared by the organization. It upgrades skills, improves potency and increases quality of product delivery.

CHALLENGES INHIBITING IMPLEMENTATION OF JOB ENRICHMENT STRATEGIES

Certain challenges that tend to hamper implementation of job enrichment strategies at work place, include: finance, level of employee trust in the change and commitment to it, notion of dictating to employees by adding extra task. The worker who feels his relationship will be cut off from other contemporaries resulting from too much of responsibilities will definitely be resentful to change. Leach and Wall et al. (2004) identified the constraints to job enrichment, they include:

- Determining who to choose and what extra task to add to an originally assigned task constitutes a problem since job enrichment increases the employee's work load and requires skill prioritizing in order to get the task done. Appleby (1981) asserted that some who workers derive satisfaction from interacting with colleagues may resent changes because there is limited time for social interaction. Also that the actual effect of enrichment depend on individual personality, values and background because some employees may not be able to adjust quickly to their new responsibilities as a result may feel tired as this may lead to low work outcome.
- There is, generally, the tendency on the part of the administrators to impose job enrichment on workers rather than applying it with their consent, may have negative impact on the employees and work output. The employees are given variety of activities and responsibilities without necessarily considering whether they possess the right skills and experience or not for the job. The individual who is not prepared or trained to carry out the task may feel inadequate for the change and this, of course may result in low work outcome.

Resistance of administrators to relinquish some of their duties

The administrators feel reluctant to delegate duties and that they might loss respect from the subordinates since some of their responsibilities have been shifted away from them and built into

the job itself to allow some degree of control, accountability and self-assessment for the work they have performed. Another factor is fear of the subordinate performing better than the boss, becoming more knowledgeable than the boss and lack of capable subordinates to assign the task.

Lack of support for job security by union leaders

There seems to be no support by union members and the if job enrichment was so much held as valuable by the workers, it would have been translated into union demands, until now, it is yet to occur. Innovation may not allow enhancement of the considerable number of occupations. Afangideh and Nwideeduh (2010) noticed that by and by, with specific machines, undertakings and procedures, it may not be conceivable to make occupations significant if evaluation of the status of data and correspondence innovation accessible in schools isn't set up.

Readiness of Workers to accept change

Venkatesh (2015) attested that the principle issue is that most specialists may loathe the kind of changes which are presented by work enhancement because of testing employments since individuals will in general evade away from obligation and put wages and employer stability most importantly. After an expansion in task obligation, it isn't bizarre for associations to encounter a drop in efficiency, bit by bit as laborers become acquainted with the adjustment over the long haul, there will be expanded output.

Problems of emphasis on quality

The administrators had the challenge of maintaining quality because whatever recognition and compliment workers got for accomplishing their unit task was not commensurate with the effort they have invested in their work. Despite these dysfunctional attributes job enrichment is still seen as the most valuable and effective motivational technique in the organization.

CONCLUSION

Job enrichment is a job redesign technique that increases the opportunities for an employee to experience the feelings of meaningfulness, responsibility and knowledge of result that earns him recognition and esteem for work well done. They includes; rotating shifts, in-service training, academic conferences incentives and ICT as job enrichment which are utilized for quality education delivery in public schools in Rivers State. These strategies help to acquaint the teachers with more knowledge for onward transmission to the students. The implementation of job enrichment strategies as identified boost the morale and motivates teachers to give in their best for a better learning outcome among students. Therefore, it becomes imperative for full implementation of job enrichment strategies by authorities concerned in the administration of public schools in Rivers State.

Suggestions

The impacts job enrichment strategies in the application of job enrichment strategies in the administration of schools cannot be over emphasized. To ensure that these are achieved, the following suggestions are given:

- The school administrators should adopt rotating shifts as a job enrichment strategy to expose teachers to all the types of activity in order to be efficient in the administration of the school.
- The administrators in administration of the school should introduce compulsory ICT training for all the staff so that they will acquire the different teaching methodology needed to meet up changes in educational processes.
- There should be regular holding of seminars and workshops should to avail staff the opportunity to get exposed to lots of knowledge and effective skills that will enhance quality education.
- Administrators should make sure their staff attend academic workshops regularly to provide them with the desired socialization and exposure needed for optimum quality education delivery.

THE ROLE OF INSTITUTIONAL LEADERSHIP IN DRIVING DIGITAL TRANSFORMATION FOR EFFICIENCY AND TRANSPARENCY IN PUBLIC UNIVERSITIES IN RIVERS STATE

Nancy Gift OGOLO
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

The role of institutional leadership in driving digital transformation is pivotal for enhancing efficiency and transparency in public universities in Rivers State, Nigeria. Digital transformation involves leveraging advanced technologies to streamline administrative processes, improve academic service delivery, and promote accountability. This paper explores how effective institutional leadership can serve as a catalyst for digital transformation by fostering strategic vision, mobilizing resources, and cultivating a culture of innovation. It highlights the potential of digital tools such as Information and Communication Technology (ICT) platforms, cloud computing, and data analytics to address systemic inefficiencies and corruption while improving governance structures. The paper identifies key challenges hindering digital transformation in public universities, including inadequate funding, resistance to change, poor infrastructure, and insufficient workforce capacity. This paper argues that institutional leaders must prioritize digital transformation by adopting a holistic approach that integrates technology into all aspects of university operations. Suggestions include investing in ICT infrastructure, training faculty and staff on emerging technologies, fostering partnerships with government agencies and private organizations, and implementing robust monitoring frameworks. Institutional leaders can position public universities in Rivers State to meet global standards of efficiency and transparency while addressing the growing demand for quality higher education, by embracing digital transformation.

Keywords: Institutional Leadership, Digital Transformation, Public Universities, Efficiency, Transparency, Rivers State.

INTRODUCTION

Digital transformation (Dx) is reshaping the global education sector by integrating advanced technologies into academic and administrative processes to enhance efficiency and accessibility. It involves a fundamental shift in how institutions operate, leveraging tools such as cloud

computing, artificial intelligence (AI), and data analytics to create innovative solutions for teaching, learning, and administrative processes (Academia.edu, 2023). This transformation goes beyond technological adoption; it requires a fundamental shift in institutional culture, workflows, and strategies to enhance efficiency, transparency, and accessibility (Academia.edu, 2023). For Nigerian public universities, particularly those in Rivers State, digital transformation are critical for addressing systemic inefficiencies and positioning these institutions for global competitiveness.

The importance of Dx in higher education lies in its ability to tackle challenges such as outdated teaching methods, bureaucratic bottlenecks, and resource constraints. For instance, digital tools streamline administrative processes like enrollment management and faculty performance tracking while enabling personalized learning experiences through AI-driven platforms (Whatfix, 2024). Furthermore, Dx supports innovation in pedagogy and research by providing access to digital libraries, e-assessment platforms, and collaborative tools that foster academic excellence (Bubou& Job, 2021). The COVID-19 pandemic further underscored the urgency of adopting digital solutions. Traditional educational models reliant on physical infrastructure proved inadequate during lockdowns, exposing gaps in technological readiness and adaptability in Nigerian universities (Jummai, 2021). While private universities have made significant strides in adopting e-learning platforms and mobile technologies, public institutions lag behind due to limited resources and insufficient leadership support (Obuekwe&Eze, 2017).

Institutional leadership plays a pivotal role in driving digital transformation initiatives. Leaders are responsible for articulating strategic visions that align with institutional goals while mobilizing resources to support technological adoption. Effective leadership fosters collaboration among stakeholders - faculty, students, policymakers, and private sector partners - and cultivates a culture that embraces innovation (TechEconomy.ng, 2024). For example, the National Open University of Nigeria (NOUN) demonstrated resilience during the pandemic by leveraging digital tools to sustain learning activities. This success highlights the importance of visionary leadership in facilitating transitions to digital models of education (Bubou& Job, 2021).

Despite its potential benefits, Dx faces significant barriers in Nigerian public universities. Challenges such as poor technological infrastructure, inadequate funding for ICT projects, resistance to change among stakeholders, and lack of policies guiding implementation hinder progress (Kyari et al., 2018; Jummai, 2021). Additionally, many lecturers lack the pedagogical skills necessary for mobile learning integration a critical component of Dx in higher education (Bubou& Job, 2021). Addressing these challenges requires institutional leaders to adopt a holistic approach that combines strategic planning with resource mobilization and stakeholder engagement.

This paper explores the critical role of institutional leadership in driving digital transformation for efficiency and transparency in public universities in Rivers State. It examines the benefits of adopting digital technologies while identifying barriers to implementation. Furthermore, it provides actionable recommendations for institutional leaders to overcome these challenges and ensure sustainable transformation. Public universities can enhance operational efficiency, promote accountability in resource management, and position themselves as competitive players on the global stage by embracing Dx strategically.

CONCEPTUAL CLARIFICATION

Understanding the fundamental concepts associated with digital transformation in public universities is essential to appreciate its impact on institutional governance, efficiency, and transparency. Several key terms define this transformation, including digital transformation, institutional leadership, public universities, efficiency, and transparency. Each of these concepts plays a critical role in shaping the discourse on how digital tools can enhance the management and operations of universities.

Institutional Leadership

Institutional leadership in higher education refers to the strategic direction provided by university administrators, including vice-chancellors, deans, and ICT directors, in fostering innovation, policy implementation, and resource management (Bryman, 2007). Effective institutional leadership is characterized by visionary planning, participatory decision-making, and adaptability to technological advancements. Different leadership styles influence the success of digital transformation efforts (Ololube, 2024). Transformational leadership, for example, fosters an environment of innovation and motivates staff and students to embrace new technologies (Burns, 1978; Bass, 1985). Strategic leadership, on the other hand, aligns digital initiatives with the institution's long-term objectives, ensuring that digital tools are effectively integrated into academic and administrative processes (Boal & Hooijberg, 2001). Additionally, distributed leadership encourages collaboration among faculty, IT staff, and university administrators, creating a collective approach to managing digital resources (Spillane, 2005).

In the context of digital transformation, university administrators play a crucial role in setting policies that facilitate ICT adoption, allocating financial resources for technological advancements, and addressing resistance to digital change. Leadership in this area is vital for ensuring that the university community effectively transitions to digital platforms that enhance learning and institutional governance.

Digital Transformation

Digital transformation refers to the integration of digital technologies into all aspects of a university's operations, fundamentally altering how it functions and delivers value to stakeholders. It involves leveraging technologies such as artificial intelligence (AI), cloud computing, big data analytics, and blockchain to improve administrative efficiency, decision-making, and academic service delivery (Henriette, Feki, &Boughzala, 2016). Universities undergoing digital transformation adopt learning management systems (LMS) like Moodle and Blackboard to facilitate online learning and automate administrative processes, ensuring greater accessibility and engagement.

Beyond academic functions, digital transformation also enhances operational efficiency through the automation of student registration, examination grading, and financial transactions. By digitizing these processes, universities can reduce redundancy, minimize human errors, and accelerate service delivery. According to Zhao et al. (2022), digital transformation is not merely about incorporating new technologies but requires a comprehensive cultural and strategic shift that is driven by institutional leadership.

Public Universities

Public universities are higher education institutions that are primarily funded and regulated by the government to provide accessible and affordable education. These institutions are mandated to uphold academic excellence while catering to large and diverse student populations (Altbach, Reisberg, &Rumbley, 2009). Unlike private universities, which may have more financial flexibility, public universities often operate within strict government budget allocations, which can impact their ability to adopt digital technologies.

One of the major challenges public universities face in implementing digital transformation is bureaucratic decision-making, which can slow down the adoption of new technologies. Additionally, inadequate ICT infrastructure, poor internet connectivity, and limited funding can hinder the seamless integration of digital tools into academic and administrative functions (Okoli, 2020). Furthermore, resistance to change from faculty members, many of whom may lack digital literacy, poses a significant obstacle to digital transformation efforts (Adebayo &Salawu, 2021).

Despite these challenges, digital transformation in public universities offers numerous benefits. It improves administrative efficiency by automating tasks such as student admissions, examinations, and staff payroll management. Moreover, it enhances research capabilities by providing access to digital libraries and academic repositories, facilitating global collaboration among scholars. As universities continue to embrace digital transformation, institutional leaders must prioritize capacity-building programs to equip faculty and staff with the necessary skills to operate in a digital environment.

Efficiency

Efficiency in public universities refers to the optimization of institutional resources to enhance productivity while minimizing waste. It encompasses operational efficiency, academic efficiency, and financial efficiency, all of which contribute to the overall effectiveness of a university's functions (Barney, 1991). Operational efficiency is achieved through automation, reducing the time and effort spent on administrative tasks such as admissions processing and procurement. Academic efficiency is enhanced through the use of digital learning tools, which facilitate remote learning, online assessments, and student engagement. Financial efficiency is strengthened by digital payment systems and financial auditing software, ensuring greater accountability in university expenditures.

Digital transformation plays a pivotal role in improving efficiency by integrating data analytics and AI-driven decision-making processes. According to Brynjolfsson& McAfee (2014), digital technologies enable institutions to eliminate redundant processes, improve service delivery, and monitor performance in real time. In the context of public universities, this means adopting electronic grading systems, digitized academic records, and online portals for course registration and fee payments, all of which streamline administrative functions and enhance student experiences.

Transparency

Transparency in public universities refers to the openness and accountability of institutional processes, ensuring that stakeholders—including students, faculty, government agencies, and the public—have access to accurate information regarding governance, financial management, and decision-making (Bovens, 2007). It is a crucial aspect of university administration, as it promotes trust, reduces corruption, and enhances institutional credibility.

There are several dimensions to transparency in higher education. Administrative transparency involves the clear dissemination of policies, rules, and procedures governing university operations. Financial transparency ensures that budget allocations, expenditures, and procurement processes are made available to stakeholders, preventing financial mismanagement. Academic transparency focuses on grading systems, research integrity policies, and the publication of academic outcomes, ensuring fairness and accountability in academic evaluations. Digital transformation serves as a powerful tool for enhancing transparency in university governance. Blockchain technology, for instance, provides secure and tamper-proof academic records and financial transactions, reducing the risk of fraud (Zhang et al., 2018). E-governance systems, including online portals for publishing university policies and reports, ensure that information is easily accessible to stakeholders. Furthermore, open data platforms enable real-time tracking of university budgets and project implementation, allowing students and staff to monitor institutional financial decisions.

Piotrowicz and Cuthbertson (2014) argued that digital transparency reduces bureaucratic inefficiencies and strengthens stakeholder engagement in decision-making processes. By leveraging digital tools, public universities can create an environment of accountability, where institutional leaders are held responsible for their actions, and students and faculty have access to relevant institutional information.

Rivers State

Rivers State is one of the 36 states in Nigeria, located in the southern part of the country. It is a key economic and educational hub due to its oil-rich resources and urbanization. The state is home to several public universities, which face both common and region-specific challenges in adopting and managing e-learning technologies. These include infrastructural issues such as poor internet connectivity, power outages, and a lack of adequate technical support. At the same time, the need to improve educational quality and accessibility through the use of technology has become increasingly evident. Effective management of e-learning in Rivers State's public universities requires addressing these challenges while leveraging the opportunities that digital transformation offers to enhance instructional delivery.

UNDERSTANDING DIGITAL TRANSFORMATION IN PUBLIC UNIVERSITIES

Digital transformation within public universities is a far-reaching and dynamic process that goes beyond the simple act of digitizing documents or automating isolated administrative functions. It represents a holistic and strategic overhaul of how universities function at all levels academically, administratively, and operationally through the purposeful adoption and integration of modern digital technologies. This transformation is not merely a technological upgrade, but a cultural

and structural shift that redefines institutional processes, relationships, and outcomes in alignment with the demands and opportunities of the digital age.

At its core, digital transformation in public universities entails a fundamental reimagining of the university's mission and service delivery using advanced digital tools. Unlike digitization, which typically involves converting analog or paper-based information into digital formats (such as scanning student records or uploading syllabi online), digital transformation involves reconfiguring the entire institutional ecosystem. This includes how courses are delivered, how research is conducted, how decisions are made, and how universities interact with students, faculty, staff, and external stakeholders (Brynjolfsson& McAfee, 2014).

One of the most visible and impactful aspects of digital transformation in universities is the rise of online learning and virtual classrooms. Learning management systems (LMS) such as Moodle, Canvas, and Blackboard have become indispensable platforms for delivering lectures, assignments, and assessments. These systems offer students the flexibility to learn at their own pace and from any location, thereby widening access to education for diverse student populations, including working adults, students in rural areas, and those with physical disabilities. Digital learning tools also foster collaboration through discussion forums, peer reviews, and real-time communication with instructors, enriching the overall academic experience.

ROLE OF INSTITUTIONAL LEADERSHIP IN DRIVING DIGITAL TRANSFORMATION IN PUBLIC UNIVERSITIES

Digital transformation in public universities is an essential process that enhances institutional efficiency, service delivery, and governance. The role of institutional leadership in this transformation cannot be overemphasized, as it ensures the adoption, implementation, and sustainability of digital initiatives (Brynjolfsson & McAfee, 2014). Institutional leaders, including vice-chancellors, deans, ICT directors, and university administrators, play a critical role in formulating digital policies, allocating resources, training personnel, and ensuring smooth transitions to technologically advanced operations.

In public universities, digital transformation involves the integration of advanced technologies such as artificial intelligence (AI), cloud computing, data analytics, e-learning platforms, and automated administrative systems to improve educational outcomes and operational efficiency (Zhang, Zhang, & Li, 2020). In digital transformation, institutional leadership is responsible for creating a digital vision, fostering technological innovation, and ensuring that digital initiatives align with institutional objectives.

Digital transformation in universities is not merely about adopting new technologies but involves a fundamental shift in institutional culture, teaching methodologies, research practices, and administrative processes. It requires leaders who can inspire digital literacy, champion innovation, and create an enabling environment for technology-driven change (Henriette et al., 2016).

KEY RESPONSIBILITIES OF INSTITUTIONAL LEADERS IN DIGITAL TRANSFORMATION

Visionary Leadership and Strategic Planning

Effective digital transformation in universities requires a clear vision and strategic planning by institutional leaders (Akinkugbe, 2021). Leaders must establish a well-defined roadmap for digital adoption, outlining key milestones, resources, and expected outcomes. In Rivers State, where public universities often struggle with bureaucratic inefficiencies and slow decision-making processes, institutional leaders must proactively champion digital initiatives, ensuring alignment with national education policies and global best practices (Digitalization of School Environment, 2023).

Policy Formulation and Implementation

Policy development is a critical responsibility of institutional leadership in driving digital transformation (Ogbulogo, 2014). Leaders must establish comprehensive policies that define the integration of digital tools in academic and administrative functions. Policies should cover areas such as digital governance, cybersecurity, data privacy, and ICT resource allocation. Without proper policy frameworks, universities may face challenges related to resistance to change, inadequate digital literacy, and ineffective utilization of digital platforms (Management and Planning Strategy in Public Universities of Rivers State, 2024).

Investment in ICT Infrastructure

A major determinant of successful digital transformation is the availability of robust ICT infrastructure, including internet connectivity, learning management systems (LMS), cloud computing, and data analytics tools (Patrick, 2022). Institutional leaders must prioritize budget allocations for digital infrastructure development to enhance efficiency and service delivery. Many public universities in Rivers State experience frequent network failures and limited access to digital learning resources, hindering effective online education (Ekundayo&Ajayi, 2020). University leaders must collaborate with government agencies and private sector partners to secure funding for ICT upgrades and ensure sustainable digital transformation efforts (Digital Transformation and Effective Teaching in Public Universities in South-West Nigeria, 2023).

Capacity Building and Digital Literacy Training

One of the key challenges in digital transformation is the lack of digital literacy among university staff and students (Patrick, 2022). Institutional leaders must invest in continuous training and professional development programs to enhance digital skills among faculty members, administrative staff, and students (Ogbulogo, 2014). Training should focus on the effective use of digital tools for teaching, research, and university management. Workshops, seminars, and online training modules should be regularly organized to build digital competencies and foster a culture of technological innovation (Llopis, 2013).

Promoting Transparency and Accountability through Digitalization

Transparency in university administration is essential for accountability and good governance (Agwoje & Okeleke, 2024). Digital transformation can enhance transparency by automating financial transactions, digitizing records, and implementing e-governance platforms that track administrative decisions (Ekundayo&Ajayi, 2020). For instance, digital financial management systems can reduce corruption and fund misappropriation in public universities by ensuring that all transactions are recorded and accessible in real time (Digitalization of School Environment, 2023).

Resistance to Change and Strategies for Overcoming Challenges

Despite the benefits of digital transformation, institutional leaders often encounter resistance from university staff and faculty members due to fear of job displacement, lack of technical skills, and reluctance to adopt new technologies (Akinkugbe, 2021). To address resistance, leaders must adopt inclusive change management strategies that involve all stakeholders in the transformation process (Patrick, 2022). Strategies such as participatory decision-making, incentives for digital adoption, and mentorship programs can help ease the transition to digital university operations (Leadership and Resistance to Change in Nigerian Universities, 2021).

Case Studies: Digital Transformation in Nigerian Universities

Several Nigerian universities have successfully implemented digital transformation initiatives, serving as models for institutions in Rivers State. For example, Covenant University has leveraged digital platforms to enhance academic administration, e-learning, and student services (Digital Transformation and Effective Teaching in Public Universities in South-West Nigeria, 2023). Similarly, the University of Lagos has adopted an online portal for student registration, fee payment, and academic records management, reducing administrative delays and increasing efficiency (Ogona&Mmom, 2023). These cases highlight the importance of strong institutional leadership in driving digital initiatives and overcoming implementation challenges.

LEADERSHIP STYLES THAT SUPPORT DIGITAL TRANSFORMATION

Different leadership styles influence the success of digital transformation initiatives in universities. The three most effective leadership styles in this context are transformational, participatory, and strategic leadership:

Transformational Leadership

Transformational leaders inspire and motivate stakeholders to embrace change and innovation. This style is particularly useful in digital transformation because it promotes a vision-driven approach which includes:

- Encouraging Innovation: Transformational leaders create an environment where faculty and students are encouraged to experiment with new digital tools (Benavides et al., 2020).

- Leading by Example: Leaders who adopt new technologies themselves set a precedent for others to follow.
- Providing Resources and Support: Digital transformation requires financial and human resources, and transformational leaders ensure that these are available (Scholz, 2020).

Participatory Leadership

Participatory leadership involves collective decision-making, where leaders actively seek input from faculty, students, and administrative staff in digital transformation efforts through:

- Stakeholder Involvement: Engaging faculty and students in discussions about digital strategies increases acceptance and smoothens implementation (Oyeniran et al., 2020).
- Feedback Mechanisms: Leaders create channels for continuous feedback on digital policies and technologies.
- Collaboration with External Partners: Universities benefit from partnerships with tech companies, government agencies, and industry experts in digital transformation (Koehler, 2020).

Strategic Leadership

Strategic leaders take a long-term approach to digital transformation, ensuring that initiatives align with the university's overall mission and objectives through:

- Data-Driven Decision-Making: Leaders use analytics to assess the impact of digital tools on student performance and institutional efficiency (Ololube, 2020).
- Sustainability Planning: Strategic leaders ensure that digital transformation is not just a one-time initiative but a continuous process.
- Risk Management: Digital transformation comes with risks such as cyber threats and data breaches, which strategic leaders must mitigate (Scholz, 2020).

DIGITAL TRANSFORMATION FOR EFFICIENCY IN PUBLIC UNIVERSITIES

The rapid evolution of digital technologies has significantly transformed various sectors, including education. In public universities, digital transformation is emerging as a crucial strategy for enhancing efficiency in administrative processes, academic delivery, research activities, and student support services. Public universities, particularly in developing nations, often grapple with inefficiencies due to bureaucratic procedures, limited resources, and inadequate technological infrastructure. Digital transformation, which involves the strategic integration of digital technologies to optimize operations and improve institutional effectiveness, offers a viable solution to these challenges (Zhao et al., 2022).

Efficiency in public universities is essential for achieving quality education, fostering innovation, and ensuring institutional sustainability. The application of digital technologies facilitates process automation, real-time data management, seamless communication, and enhanced service delivery. With the increasing demand for accessible and high-quality education,

universities must adopt digital strategies to enhance operational efficiency, reduce costs, and optimize resource utilization (Henriette, Feki, &Boughzala, 2016).

KEY AREAS OF DIGITAL TRANSFORMATION FOR EFFICIENCY IN PUBLIC UNIVERSITIES

Enhancing Administrative Efficiency through Digitalization

Administrative functions in public universities are often characterized by paperwork-intensive processes that contribute to inefficiencies, delays, and errors. Digital transformation introduces automated systems that enhance efficiency and transparency in university administration. Automated Student Admissions and Registration: Traditional paper-based admission and registration processes are gradually being replaced by online platforms that allow students to submit applications, pay fees, and enroll in courses remotely. These systems eliminate delays, minimize human errors, and improve accessibility for students, especially those from remote areas (Piotrowicz& Cuthbertson, 2014):

- Financial Management and Payroll Automation: Digital financial systems help universities manage budgets, track expenses, and process staff salaries efficiently. Automated payroll systems reduce processing time, ensure timely payments, and enhance transparency in financial transactions.
- E-Governance Platforms for Decision-Making: Universities adopting digital governance frameworks benefit from real-time data access, enabling evidence-based decision-making. Digital dashboards provide university administrators with insights into student performance, faculty workloads, and institutional financial health, leading to informed policy decisions.

Digital Learning and Academic Efficiency

The traditional lecture-based teaching model is evolving with the integration of digital learning technologies. Public universities are leveraging digital tools to enhance instructional delivery, improve student engagement, and facilitate lifelong learning:

- Learning Management Systems (LMS): Platforms such as Moodle, Blackboard, and Google Classroom enable faculty to distribute course materials, conduct assessments, and interact with students remotely. These systems support blended learning models that combine face-to-face and online instruction, improving flexibility and accessibility (Okoli, 2020).
- Virtual Laboratories and Simulations: Digital labs and simulations enhance practical learning, particularly in science, engineering, and medical disciplines. These technologies allow students to conduct experiments in a virtual environment, reducing costs associated with physical laboratory setups while maintaining learning quality.
- Artificial Intelligence-Powered Assessment Tools: AI-driven grading systems automate student assessments, ensuring timely and unbiased feedback. These tools reduce faculty workload and enhance the accuracy of student evaluations.

Digital Transformation in Research and Knowledge Management

Public universities are at the forefront of research and innovation. Digital transformation has revolutionized research methodologies, data analysis, and scholarly communication:

- Open Access Digital Libraries and Repositories: Universities are investing in digital libraries that provide researchers with access to scholarly publications, datasets, and institutional research outputs. Platforms such as Google Scholar, ResearchGate, and institutional repositories have facilitated knowledge sharing and collaboration (Adebayo &Salawu, 2021).
- Big Data and AI for Research Analysis: The integration of AI and data analytics in research has improved efficiency in data processing, trend identification, and predictive modeling. These technologies enable researchers to analyze large datasets in various fields, from social sciences to biomedical research.
- Digital Research Collaboration Tools: Online collaboration platforms such as Zoom, Microsoft Teams, and Google Meet have enabled researchers from different institutions to work together, exchange ideas, and publish findings in real time.

Digital Student Support Services for Institutional Efficiency

Student support services play a critical role in ensuring academic success and well-being. Digital transformation enhances these services through automation and personalized support systems:

- AI Chatbots and Virtual Assistants: Universities are deploying AI-powered chatbots to provide instant responses to student inquiries regarding course registration, examination schedules, and university policies. These systems reduce the administrative burden on university staff and enhance service delivery.
- Online Counseling and Mental Health Support: Digital counseling platforms offer students access to psychological and academic support, addressing challenges such as stress, anxiety, and career guidance.
- Biometric-Based Student Identification and Attendance Tracking: Smart ID systems integrated with biometrics and RFID technology enable efficient student identification, attendance monitoring, and campus security management.

DIGITAL TRANSFORMATION FOR TRANSPARENCY IN PUBLIC UNIVERSITIES

In recent years, the adoption of digital technologies has gained increasing importance in various sectors, with higher education being no exception. Public universities are under growing pressure to enhance their operational transparency, improve governance, and promote accountability. One of the most effective ways to achieve this goal is through digital transformation—an integrative process that utilizes technology to improve university functions and services (Zhang et al., 2020). Digital transformation, in the context of higher education, involves the adoption of digital tools,

systems, and practices aimed at improving institutional efficiency, reducing administrative burdens, and making university operations more transparent and accessible to stakeholders (Bollier, 2020).

Transparency in public universities is vital for fostering trust among students, faculty, staff, and the general public. Digital tools can help achieve this by facilitating open communication, enabling real-time access to important information, and ensuring accountability in decision-making processes (Henriette et al., 2016).

KEY AREAS OF DIGITAL TRANSFORMATION FOR TRANSPARENCY IN PUBLIC UNIVERSITIES

Digital Governance and Decision-Making:

Governance in public universities is often marked by complex structures, where decision-making processes may be opaque or slow, potentially eroding trust among stakeholders. Digital governance systems, such as online platforms for faculty meetings, automated decision-making tools, and transparent reporting systems, can greatly enhance the accountability and transparency of university management. These systems allow stakeholders to access decision-making processes and outcomes in real time:

- Online Platforms for Governance: By utilizing online platforms to organize meetings, publish agendas, and document decisions, universities can make governance processes more transparent and accessible (Piotrowicz& Cuthbertson, 2014). Stakeholders can track decisions and understand the rationale behind them, promoting greater engagement and reducing perceptions of opacity in university administration.
- Digital Policy and Performance Tracking: Public universities can implement systems that track the progress of university policies, strategic plans, and development goals. For example, online dashboards can provide real-time data on the implementation of university policies, enabling administrators, faculty, and students to monitor progress (Henriette et al., 2016).

Financial Transparency and Management

Financial transparency is one of the key concerns for public universities, particularly in developing regions where budget allocation and utilization are often scrutinized. Digital transformation can help address these concerns by enabling the creation of open financial systems that allow stakeholders to view budget details, expenditure reports, and financial forecasts in real-time:

- Digital Financial Systems: Universities can implement enterprise resource planning (ERP) systems to manage financial data, automate accounting functions, and generate reports on income, expenditure, and funding allocation. Such systems ensure that financial operations are transparent and that funds are used appropriately. These systems also provide administrators with real-time insights into financial performance, facilitating quicker decision-making (Altbach et al., 2009).

- Online Publication of Financial Records: Public universities can establish platforms to publish their financial reports and audit outcomes, allowing students, faculty, and the general public to access important financial information. This transparency helps ensure that the university's financial resources are managed responsibly and that there is public accountability for how funds are used (Henriette et al., 2016).

Transparency in Academic and Student Services

Student services, such as admission processes, grading, academic advising, and feedback, are often areas where transparency is crucial. Digital transformation can improve transparency in these services by providing real-time access to student records, reducing delays in administrative processes, and enabling open communication between students and staff.

- Online Admission and Registration Systems: Digital tools allow students to apply, register, and access their academic records online. These platforms reduce confusion and streamline administrative processes, making the university more efficient and transparent (Zhang et al., 2018). Students can track their applications, review their academic performance, and monitor registration processes in real time.
- Digital Grading and Feedback Systems: **U**sing learning management systems (LMS) such as Moodle or Blackboard, universities can provide students with immediate access to their grades and feedback on assignments and exams. This enhances transparency by allowing students to see how their grades are derived and to track their progress throughout the semester (Okoli, 2020). Furthermore, digital grading systems help eliminate human errors, ensuring a fair and transparent assessment process.

Open Access and Public Accountability

Public universities, particularly those funded by the government, are accountable to the public, and transparency plays a critical role in fostering public trust. Digital transformation enables public universities to promote open access to institutional data, research outputs, and strategic plans.

- Open-Access Research Repositories: Universities can use digital platforms to provide open access to academic publications, research findings, and other intellectual outputs. By making research accessible to the public, universities contribute to the knowledge economy and foster a culture of transparency in scholarly work (Adebayo & Salawu, 2021).
- Public Reporting on University Performance: Digital platforms allow universities to create and publish reports on institutional performance, including academic achievements, research output, and service delivery metrics. Such public reports help stakeholders assess the university's effectiveness, driving accountability and informed decision-making (Zhao et al., 2022).

Enhancing Communication and Stakeholder Engagement

Effective communication is essential for maintaining transparency within a university. Digital tools enable better communication between university administration, faculty, staff, and students. These tools can also facilitate interactions with external stakeholders, such as government bodies, alumni, and the local community:

- Student and Faculty Portals: University portals allow students and faculty to communicate directly with administration, submit feedback, and address concerns. Transparent communication through these portals fosters trust and ensures that stakeholders are kept informed about university developments and decisions (Bollier, 2020).
- Public Feedback Mechanisms: Digital tools such as online surveys, discussion forums, and social media platforms allow students and faculty to provide feedback on university policies, teaching methods, and administrative services. This feedback loop ensures that university management remains responsive to stakeholder needs and that concerns are addressed promptly (Zhao et al., 2022).

CHALLENGES TO DIGITAL TRANSFORMATION IN PUBLIC UNIVERSITIES

Digital transformation in schools presents significant challenges that hinder its full implementation. Despite its potential to revolutionize education, various obstacles must be addressed to ensure a smooth transition to digital learning environments:

Resistance to Change

Many educators and stakeholders resist digital transformation due to a lack of familiarity with new technologies, fear of job displacement, and concerns over the effectiveness of digital learning compared to traditional methods (Siemens et al., 2022). In Nigeria, many teachers are hesitant to adopt e-learning platforms due to inadequate training and limited exposure to digital tools (Adeosun & Owolabi, 2023). Globally, studies have shown that institutional inertia and reluctance to embrace change are major obstacles to digital adoption (Selwyn, 2021).

Infrastructure Limitations

Inadequate infrastructure, including poor internet connectivity, outdated computers, and a lack of digital tools, remains a critical barrier, particularly in developing countries (World Bank, 2021). In Nigeria, many rural schools struggle with unreliable electricity and limited access to internet services, making digital learning challenging (Edeh, 2023). Similarly, studies in Asia and Africa highlighted that underfunded schools cannot afford the necessary technological upgrades to support digital learning (Heikkilä et al., 2022).

Lack of a Clear Digital Strategy

Many schools fail to establish clear digital transformation roadmaps due to a lack of expertise, funding, or policy direction. Without well-defined goals, digital initiatives remain fragmented and ineffective (Picciano, 2022). In Nigeria, educational policymakers have struggled to integrate digital strategies into the national curriculum, leading to inconsistent implementation across institutions (Adetunji, 2023). Internationally, universities that lack a structured approach to digital adoption face challenges in sustaining technological advancements (Li &Lalani, 2022).

Data Privacy and Security Concerns

With increased reliance on digital platforms, schools face risks related to cyber threats, data breaches, and hacking attempts (D'Agostino, 2022). Student records, financial transactions, and sensitive information are often stored online, making them vulnerable to cyberattacks. In Nigeria, concerns over data security have limited the adoption of cloud-based learning management systems (Owolabi & Adeosun, 2023). Globally, institutions are investing in cybersecurity measures to protect digital infrastructure, yet threats continue to evolve (Wang et al., 2021).

Compatibility and Integration Issues

Many schools use outdated or fragmented digital systems that are difficult to integrate with modern educational technologies (Burgstahler, 2021). In Nigeria, a lack of standardized platforms across universities has led to inconsistencies in digital education implementation (Uwah&Omojuwa, 2022). Internationally, institutions that rely on legacy systems struggle with interoperability challenges, making it difficult to transition fully to digital models (Molnár, 2023).

Skill Deficits among Educators

Teachers often lack the necessary digital skills to effectively utilize technology in teaching and administration. Digital literacy training is essential, yet many educators do not receive sufficient support to develop these competencies (Al-Emran et al., 2021). In Nigeria, a shortage of well-trained ICT instructors has slowed digital transformation efforts in schools (Adebayo, 2023). In developed nations, ongoing professional development programs have been introduced to address skill gaps, though adoption varies (Marginson, 2022).

Weak Organizational Culture and Leadership Support

A lack of leadership commitment to digital transformation can hinder progress. School administrators play a crucial role in fostering a culture that embraces innovation and technology (Siemens et al., 2022). In Nigeria, weak institutional leadership has been identified as a challenge in sustaining digital transformation efforts in universities (Edeh, 2023). Globally, institutions that prioritize digital literacy, strategic planning, and change management tend to experience smoother transitions to digital education (Selwyn, 2021).

STRATEGIES FOR EFFECTIVE LEADERSHIP IN DIGITAL TRANSFORMATION

Digital transformation in public universities is a complex and multifaceted process that requires visionary and strategic leadership to succeed. It is not simply about adopting new technologies, but about leading a cultural and organizational change that aligns people, processes, and technology toward a shared vision of institutional modernization. Effective leadership is, therefore, central to navigating the challenges, managing the resistance, and ensuring sustainable digital integration. Below are key strategies for effective leadership in driving digital transformation:

Strengthening Collaboration between Government, Universities, and Private Sector:

Institutional leadership in public universities in Rivers State must actively engage with government agencies, international organizations, and private sector stakeholders to drive sustainable digital transformation. Government support is crucial in formulating policies that prioritize ICT funding, while partnerships with technology companies can provide the necessary expertise and infrastructure (Agwoje & Okeleke, 2024). For instance, universities can collaborate with software developers to build customized learning management systems, financial management platforms, and digital libraries (Ekundayo & Ajayi, 2020).

Furthermore, the National Universities Commission (NUC) and the Tertiary Education Trust Fund (TETFund) can play key roles in financing ICT projects and ensuring the standardization of digital education frameworks across institutions (Patrick, 2022). Universities should also explore public-private partnerships (PPPs) to reduce reliance on limited government funding and attract investments in digital learning tools and research facilities (Llopis, 2013).

Adoption of Emerging Technologies for University Administration and Learning:

Digital transformation in universities should go beyond basic ICT infrastructure and embrace advanced technologies such as artificial intelligence (AI), blockchain, big data analytics, and cloud computing. These technologies can revolutionize administrative processes and improve learning outcomes (Digital Transformation and Effective Teaching in Public Universities in South-West Nigeria, 2023).

Artificial Intelligence (AI) can automate administrative tasks, such as admissions processing, grading, and academic advising, thereby reducing human error and workload (Ogbulogo, 2014). Blockchain technology can be used to secure student records, prevent certificate fraud, and enhance data integrity in university administration (Akinkugbe, 2021). Big Data Analytics can provide insights into student performance, retention rates, and faculty effectiveness, helping leaders make data-driven decisions (Patrick, 2022). Cloud Computing enables universities to store and access educational resources remotely, facilitating flexible learning and research collaboration (Ekundayo&Ajayi, 2020). Through the integration of these advanced digital solutions, institutional leaders in Rivers State can significantly enhance efficiency and transparency in their universities.

Expanding E-Governance and Digital Accountability Mechanisms

To improve transparency, universities in Rivers State should implement comprehensive e-governance frameworks that ensure real-time monitoring of financial transactions, academic activities, and administrative operations. E-governance platforms can include:

- E-Procurement Systems to track purchases, contracts, and budget allocations, reducing corruption and financial mismanagement (Management and Planning Strategy in Public Universities of Rivers State, 2024).
- Digital Complaint and Feedback Systems where students and staff can report grievances and receive prompt responses from university authorities (Patrick, 2022).
- Open Access Digital Portals that publish university financial reports, admission lists, and staff recruitment processes to promote transparency and accountability (Ogbulogo, 2014).

Strengthening Cybersecurity Measures in Digital University Governance

As public universities in Rivers State undergo digital transformation, it is critical to implement robust cybersecurity policies to protect sensitive data and prevent cyber threats (Agwoje & Okeleke, 2024). Leadership must establish:

- Strong Data Encryption Policies to secure students' academic records, financial transactions, and research data.
- Regular Cybersecurity Audits to identify vulnerabilities and ensure compliance with global ICT security standards.
- Cybersecurity Awareness Programs for staff and students to mitigate risks associated with phishing attacks, data breaches, and hacking incidents (Digital Transformation and Effective Teaching in Public Universities in South-West Nigeria, 2023).

Enhancing Digital Inclusion for Students and Staff

Digital transformation must be inclusive to ensure equitable access to technology for all students and staff, regardless of socioeconomic background (Ekundayo & Ajayi, 2020). Leadership should work towards:

- Providing affordable internet access and laptops for students, especially those from disadvantaged communities.
- Developing mobile-friendly learning platforms to ensure that students can access educational resources even in areas with limited electricity and internet connectivity.
- Special training for lecturers and non-teaching staff to ensure that all employees are proficient in using digital tools for teaching and administration (Patrick, 2022).

Building a Culture of Innovation and Digital Leadership

For digital transformation to be sustainable, university leadership must cultivate a culture of innovation and digital adaptability. Leaders should:

- Encourage Research in Educational Technology by providing grants for studies on digital education models and technology-driven learning methods.
- Recognize and Reward Digital Innovators among faculty members and students who develop creative solutions to educational challenges.
- Establish Digital Innovation Hubs where students and lecturers can experiment with new digital tools and collaborate on technology-driven projects (Akinkugbe, 2021).
- A proactive approach to digital leadership will ensure that universities in Rivers State remain competitive in the global higher education landscape.

CONCLUSION

In conclusion, the role of institutional leadership in driving digital transformation for efficiency and transparency in public universities in Rivers State is profoundly important. Effective leaders serve as the catalysts for change, setting the vision and direction that guides the integration of technology into every facet of university operations. They envision a future where technology seamlessly enhances teaching, research, and administrative processes, inspiring a shared commitment to digital transformation among all stakeholders.

Leaders must also develop and implement strategic plans that prioritize digital transformation, allocating necessary resources to support this integration. This ensures that digital initiatives align with the university's mission and objectives, maximizing their impact on efficiency and transparency. Moreover, they foster a culture that embraces change and innovation, promoting digital literacy and capacity building among faculty and staff. This cultural shift is crucial for overcoming resistance to change and ensuring that everyone is equipped to leverage technology effectively.

Furthermore, effective leaders establish governance structures that facilitate cross-departmental collaboration and ensure that digital projects are aligned with institutional goals. They also prioritize transparency and accountability by designing digital systems that provide real-time data, enabling informed decision-making and building trust among stakeholders.

Ultimately, the adaptability and innovative spirit of leaders are essential in driving continuous improvement. By fostering an environment of innovation, they encourage the exploration of new digital tools and methodologies that can further enhance efficiency and transparency. Through these efforts, institutional leaders can ensure that digital transformation is successful, sustainable, and aligns with the broader goals of improving public universities in Rivers State.

Suggestions

Suggestions for Enhancing Institutional Leadership in Driving Digital Transformation for Efficiency and Transparency in Public Universities in Rivers State. To effectively drive digital transformation in public universities in Rivers State, institutional leadership should consider the following suggestions:

- Establish a well-defined policy that outlines the strategic vision, objectives, and implementation roadmap for digital transformation.

- Create dedicated committees or units responsible for overseeing digital initiatives, ensuring accountability, and monitoring progress.
- Organize training and professional development programs for university leaders to improve their understanding of digital technologies and management.
- Upgrade university digital infrastructure, including high-speed internet, cloud computing, smart classrooms, and e-administration systems.
- Implement regular workshops and training programs to equip faculty, staff, and students with the necessary digital skills.
- Use digital tools such as learning management systems (LMS), artificial intelligence (AI), and analytics to inform academic and administrative decisions.
- Introduce digital platforms for student admissions, financial management, faculty evaluations, and other administrative functions to reduce inefficiencies.
- Implement digital reporting and monitoring systems that allow stakeholders to track university finances, academic performance, and resource allocations.
- Foster partnerships between university departments and external stakeholders, such as technology firms, to enhance innovation in digital transformation.
- University leaders should embrace transformational and participatory leadership styles to drive change effectively and ensure stakeholder buy-in.
- Develop and enforce strong cybersecurity measures to protect sensitive academic and administrative data from breaches.
- Establish performance indicators and feedback mechanisms to continuously assess and improve digital transformation efforts.

ABSTRACT

This study was undertaken to investigate the extent to which the political interferes influence Educational Leadership Effectiveness in Public junior Secondary Schools in Rivers West, Rivers State. The study adopted a Descriptive research design. The population comprised 234 respondents (Principals, Vice Principal Administration, and Academics). Census was used to select the population. The questionnaire was used for data collection. The reliability of the instrument was obtained using test-retest method statistics. Twenty senior secondary school principals were administered the questionnaire, and a reliability index of .739 and .810 was obtained through Pearson Product Moment Correlation statistics. Mean and standard deviation were used to answer research questions 1-4, while an independent t-test was used to test the hypotheses at a 0.05 alpha significance level. The findings showed no significant difference between the mean ratings of principals and vice principals in the interference of politics on the appointment, promotion, posting of staff personnel, etc. From the findings, the study concludes that government should come up with acceptable criteria for appointing principals to ensure proper management of the schools, and the government should support the in-service training of staff to ensure teacher competency.

Keywords: Political Interference, Educational Leadership, Effectiveness, Public, Junior, Secondary Schools, Rivers State.

INTRODUCTION

Rivers State is highly politicized with diverse ethnic, geographical, and political interests. Consequently, the political class in the state interferes in leadership positions within areas of interest, including educational institutions. This is largely due to the government's involvement in running public schools. Politics is not confined to political parties; it permeates schools, markets, churches, banks, social establishments, and both commercial and industrial sectors of our economy. Where there are people, there is politics, driven by various interests.

Different researchers have attempted to define politics in various ways. According to Ogbonnaya (2019), politics focuses on attracting, securing, and maintaining the well-being of a community, state, or nation. Okeke (2017) views it as a means of addressing social, economic, political, and educational issues through political channels. Therefore, politics involves establishing general principles and applying them to specific problems, aiming for the temporal well-being of the community as a whole. These definitions suggest that politics is intrinsically linked to the well-being of a community, making it an inevitable part of every society. Politics encompasses power, which includes decision-making, resource allocation, conflict resolution, provision of social amenities, and management of education. Hence, no society can contemplate having an established government without politics. This study examines the interference of stakeholders, including the government, local politicians, pressure groups, community leaders, members of the post-primary schools' board, and the Parent-Teacher Association (PTA) in the appointment of leaders in public junior secondary schools in the Rivers West Senatorial District of Rivers State, Nigeria.

Politics and leadership in the secondary school system are inseparable. The establishment of many secondary schools in the local government area stemmed from increased political awareness and demands for the rights of the local populace. For example, during Mrs. Sarah Ntor-ue's tenure as Commissioner of Education in Rivers State, she facilitated the establishment of Community Secondary School (CSS) in Bori in 2007, raising the number of public secondary schools in Bori, the local government headquarters, to two. Okeke (2017) asserted that politics significantly influences decision-making, control, and governance in secondary schools. He further argued that politics in education involves processes of control, decision-making, implementation, management, and governance, as well as the allocation of resources to various ethnic groups to achieve their objectives. The role of politics is crucial because educational systems have political goals that justify their existence and the political order of society.

It has been observed that politics can influence the management and policies guiding education, including funding, staff administration, provision of basic infrastructure, and school-community relations (Ogbonnaya, 2019). When political influence supports the existing leadership structure, it is seen as positive and effective. However, when political interference disrupts school rules and regulations, it becomes detrimental, preventing the achievement of secondary school education objectives and hindering effective teaching and learning.

In this regard, politics refers to prioritizing political considerations over due process, where the operation of a school is dictated by those in power rather than established guidelines. This undue influence leads to deviations from standard administrative principles and guidelines, thereby affecting the leadership structure in public secondary schools. At this point, it is essential to explore the concept of educational leadership, which can be interpreted in various ways.

In Adiele (2020), the term describes all those who occupy one leadership position or another in an educational setting. Secondly, it is seen as a process; thirdly, it is seen as a specialized field of academic study. There are several reasons why leadership is essential in every educational institution. The first among these reasons is to direct educational actions toward goals. Educational leaders ensure that members' actions are geared towards attaining educational goals. Educational leadership is also essential because it is used to maximize the use of resources, coordinate educational activities, facilitate the evaluation process, and help

set educational targets, amongst others. All these are towards the achievement of the goals and objectives of the school. Leadership generally can be seen as influencing by guiding, leading, and controlling a group of people's efforts toward realizing their shared goals and objectives. Different types of educational leadership can be identified using different classificatory approaches. There is educational leadership by the level of operation, where the leader is classified based on his level of operation, the macro and micro-level leadership. At the macro level are the Ministers of Education, commissioners of education, National Universities Commission, Universal Basic Education Authority, National Board for Technical Education, etc., at the micro level are the vice-chancellors, principals, headmasters, etc. (Adiele, 2020)

In addition, educational leadership at the decision-making level is classified into strategic and management educational leadership. Examples at the strategic level include the Joint Admission and Matriculation Board (JAMB), West African Examination Council (WAEC), etc. At the same time, educational leadership management refers to a group or team of educational leaders who, by law, are involved in the leadership of educational institutions or agencies.

Statement of the Problem

The political class plays a crucial role in every society and often interferes in matters of interest, including the educational sector. Because secondary education is closely tied to society, political figures tend to meddle in the leadership and administration of public schools. This interference can manifest in various ways, such as the appointment, posting, or transfer of principals and vice principals, as well as the provision of infrastructure to select schools within the state. It is widely believed among the state's residents that the political class exerts influence over these appointments and postings.

The interference of the political class has both positive and negative effects on teaching and learning in public schools. Secondary school management appears to be a hotspot for political maneuvering, with politicians significantly influencing school leadership. Principals, teachers, and other staff members often comply with political demands because they fear consequences such as being transferred to rural areas or demoted if they resist. This subservience prevents principals and teachers from firmly advocating for their salaries, allowances, promotions, and a conducive teaching and learning environment. Strike actions undertaken by educators frequently yield minimal results.

Teachers, principals, and community members observe that the political class influences secondary school leadership in areas such as the transfer and promotion of principals, the distribution of facilities, and the upgrading of schools. However, these observations lack empirical evidence. Some public secondary schools in the state are known to be well-equipped with good facilities and infrastructure, while others suffer significant deprivation.

Aims and Objectives

The main aim of this study is to investigate the extent to which the political class interferes influence Educational Leadership Effectiveness in Public junior Secondary Schools in Rivers West, Rivers State. Specifically, the study seeks to:

- To ascertain the extent to which the political class interferes in appointing, promoting, and posting staff personnel in public junior secondary schools in Rivers West, Rivers State
- To ascertain how much the political class interferes in providing basic infrastructures and equipment in public junior secondary schools in Rivers West, Rivers State.

Research Questions

The research questions guide the study:

- To what extent does the school leadership perceive the political class's interference in appointing, promoting, and posting staff personnel in public junior secondary schools in Rivers West, Rivers State?
- To what extent does the school leadership perceive the political class's interference in providing basic infrastructure and equipment in public junior secondary schools in Rivers West, Rivers State?

Hypotheses

The under listed hypotheses further guided the study:

- There is no significant difference in the interference of the political class in the appointment, promotion, and posting of staff personnel in public junior secondary schools in Rivers West, Rivers State.
- There is no significant difference in the political class's interference in providing basic infrastructures and equipment to public junior secondary schools in Rivers West, Rivers State.

CONCEPTUAL REVIEW

The Concept of Leadership

Good leaders develop through an ongoing process of self-study, education, training, and experience. To understand leadership, one must grasp the behaviors and characteristics that leaders display. To be a leader, you must embody certain qualities, possess specific knowledge, and take decisive actions. These attributes are not innate but are acquired through continuous effort and learning. Effective leaders are always striving to improve their skills; they do not rest on their past achievements. Respected leaders focus on who they are (their beliefs and character), what they know (their job, tasks, and human nature), and what they do (implementing, motivating, and providing direction). They have a clear sense of direction and must be ethical to gain respect. A sense of direction is achieved by articulating a strong vision for the future.

It is usually very tempting to begin a discussion of a topic like this by formulating their definition. In philosophy, particularly the period between Socrates and G. E. Moore, the procedure was to start with the definition of the concept. However, to proceed this way in the

21st century is to reveal certain insensitivity to one of main contentions of the recent revolution in philosophy, for these concepts have seldom been consciously erected to perform limited function in a confined system. They have all developed a rich life of their own and the concept of education is of this sort. Education is one of the concepts that is very difficult to understand fully even among philosophers of education. Hospers (1972) put it, the more we come to know or understand a particular concept, the richer our facts of the concept becomes, hence our facts about the concept of education are in no doubt richer now than they possibly were some hundred years ago. Hence we are in better position to discuss the concept much better than we could have done to century back.

It is vital for every society to develop a system of education through which it can inculcate to the young these vital things necessary for the survival of the society and the individual in particular. Hence a discussion of the concept of education cannot be anything meaningful without reference to the society. Peters in Asemah (2010) sees education as a process whereby society inculcates the worthwhile things of the society into its people to be better able to cope with the problems of the society and contribute meaningfully to its well-being and development. Ajaegbo and Ibezim (2001) defined education as the training of the mind and character for effective performance. Ortyoyande (2005) viewed education to include all experiences and knowledge, acquired through formal (Schooling) or informal (fork stones) settings.

According to Aliu (2001), education is said to be the method by which a society transmits from one generation to the next its knowledge, culture and values. He further stressed that education, in the eye of an individual, is the process by which a person learn facts, acquires skills and develop abilities and attitudes necessary for the work place and survival. According to Olayiwola (2001) educational programmes could be said to be functional if it consistently justifies that purpose for which it was adopted, dispite all odds. Emayo and Eligie (2001) posits that education is a powerful agent of progress and development. Fafunwa (2004) has efined education as the aggregate of all the processes by which a child or young adult develops the abilities, attitudes and other forms of behaviour which are of positive value to the society in which he lives. From the foregoing, it can be inferred that education is necessary for economic and social development.

There is no single definition of leadership, as various authors and scholars have provided multiple interpretations. Kasi, as cited in Nwiyi (2019), defines leadership as the ability of an individual or group to guide others on how and what to do. Tracy, as cited in Adiele (2020), describes leadership as the ability to draw out extraordinary performance from ordinary people. Stogdill, also in Nwiyi (2019), views leadership as the process of influencing an organized group's activities toward setting and achieving goals. Overall, leadership is the process by which an individual influences others to accomplish a shared goal or task, directing the organization or people in a way that enhances organization, cohesion, and coherence. It involves convincing and inspiring others to believe in your ideas and suggestions to the extent that followers are willing to make significant sacrifices to achieve goals, visions, and objectives.

A leader that has the desire and willpower can become an effective leader. Influential leaders develop through a never-ending process of self-study, education, training, and experience. A dedicated leader inspires his workers into higher levels of teamwork; there are certain things that an effective and dedicated leader must be, know, and do. These do not come naturally but are acquired through continual work and study. Influential and dedicated

leaders continually work and study to improve their leadership skills, meaning they are not resting on their success. While leadership is learned, the skills and knowledge processed by the leader can be influenced by his or her attributes or traits, such as beliefs, values, ethics, and character. Knowledge and skills contribute directly to the process of leadership. At the same time, the other attributes give the leader specific characteristics that make them unique, meaning skills, knowledge, and attributes make the Leader more effective and dedicated.

In a profession of administration based upon organizational science, the task of a leader is to bring people and organizations together in a fruitful and satisfying union. In so doing, the work of a school leader is to oversee day – to day activities in the school. In senior secondary schools, the leadership may be the principal or Vice Principal, year head, or class head. The school's leadership requires one to have the requisite knowledge to help them mobilize group effort toward achieving school goals. The leader must be conversant with relevant administrative rules and procedures in line with fundamental theories of school management in general. The school leader must exert intelligent leadership, which calls for grounding in the job's demands.

Present-day hardship in our schools demands knowledgeable leadership that can apply administrative processes to effective school management. Three factors are responsible for effective leadership to take place in any school:

- Knowledge and understanding of the job;
- Administrative preparation and experience; and
- Demand on time from constituents (Koko & Nwiyi, 2019).

A school leader should possess adequate administration knowledge to become efficient and effective. They should be able to study leadership and administrative theories adaptable to situations and environments.

Concept of Politics

Educators and social scientists have extensively discussed the term politics, agreeing that it extends beyond political parties to encompass Nigerian banks, markets, educational institutions, churches, sports, businesses, military establishments, and various sectors of the economy. American political scientist Harold Lasswell defined politics as "who gets what, when, and how," a memorable slogan that captures the essence of politics, especially in Africa. Politics involves the distribution of scarce social, economic, and cultural resources among individuals, groups, regions, and classes. The term politics has been well articulated by educators and social scientists on the subject. They have both agreed that politics is not just restricted to political parties but it is also there in the Nigerian banks, markets, educational institutions, churches, sports, business, military establishment commercial and industrial factors of our economy. According to the American political scientist, Harold Lasswell, politics is defined as who gets what, when and ho. This definition can easily be remembered because it is in the form of a slogan. Furthermore, it represents reality to a good extent especially in Africa. Politics involves the allocation of scarce social, economic and cultural resources to individuals, groups, regions and classes.

Politics has also been defined as the governing of men/women. In his book The Governing of man, the American political scientist Austin Ranney, discusses the relationship

between those who govern and those who are governed, between ruler and the ruled. He argues that this relationship is central to political life (Nnoli, 2003).Among academics, politics is often defined as the authoritative allocation of values. Emphasis is put on how resources are allocated by the system of authorities in society. Pioneered by the American political scientist David Easton, it has an abstract and comprehensive scope that makes it attractive as a possible source of laws of social life which some believe to be as unchanging as the laws of physical life. Politics could also be defined as all activities that are directly or indirectly associated with the emergence, consolidation and use of state power. Okeke (2007) saw politics as a civilizing agent and a way of ruling in divided society without violence. Therefore, whether defined in terms of man being a political animal; the art of the possible who gets what, where and how' the struggle for power; or the authoritative allocation of resources and values, politics has the state as its centerpiece.

Okeke (2007) views politics as a civilizing force and a method of governing a divided society without resorting to violence. Whether defined as humans being political animals, the art of the possible, the struggle for power, or the authoritative allocation of resources and values, politics centers on the state. The political class decides the distribution of resources and values and focuses on how authorities allocate these resources within society. The political class includes individuals associated with political parties who engage in activities related to gaining, consolidating, and using state power.

The term "politics" carries different meanings for different people. Many citizens in developing countries, and even some developed ones, associate politics with an uncontrolled struggle for power and a lack of integrity. To some, politics is seen as a "dirty game," while others view it as a quick path to wealth and comfort. Consequently, politics is often considered too "dirty" to be linked with education, traditionally seen as a beacon of hope for humanity.

However, it is essential to explore more accepted definitions of politics to understand its relationship with education. Politics and education are deeply interconnected. Governments typically formulate educational policies, recognizing that schools must promote the interests of the governed to ensure political, social, and economic success. Educators, in turn, need the support of the ruling power, the public, and other governments to fulfill their roles effectively. Ikegbusi (2016) stated that no educational system could survive without the financial support and protection of the government in power. In Nigeria, the educational policies of successive governments reflect the political and social views of those in power at both state and federal levels. Education contributes to politics by serving as a fundamental form of political socialization.

Political Class Interference on Educational Leadership Effectiveness in Public Junior Secondary Schools

Education is a critical pillar in national development, and the effectiveness of educational leadership plays a vital role in shaping the quality of education delivered to students. In the context of Nigeria, particularly in Rivers West Senatorial District of Rivers State, the effectiveness of educational leadership in public junior secondary schools is frequently challenged by the influence of the political class. The involvement of political actors in school administration, leadership appointments, and policy implementation often undermines

professional educational standards, impeding the realization of educational objectives (Adeyemi, 2016).

Educational leadership involves guiding and managing educational institutions to ensure effective teaching and learning (Bush, 2008). In the Nigerian context, school leadership encompasses the roles of principals, vice principals, head teachers, and education administrators. Effective leadership is often characterized by strategic vision, resource management, decision-making skills, and the ability to foster academic excellence (Okendu, 2012). Political interference refers to the undue involvement of political actors in the internal affairs of educational institutions, particularly in areas such as leadership appointments, budgeting, curriculum implementation, and disciplinary actions. This interference often results in a conflict between educational objectives and political agendas, leading to dysfunction in school leadership (Akomolafe & Ibijola, 2011).

Evidence from various LGAs within Rivers West highlights the detrimental effects of political interference. In Ahoada West, the appointment of a principal based on political affiliation led to internal conflicts among staff and poor examination results over a three-year period (Nduka, 2021). Similarly, in Ogba/Egbema/Ndoni, a politically motivated reassignment of a well-performing principal disrupted school programs and led to a decline in student discipline and staff cooperation. Interviews with teachers, parents, and education officials reveal a consensus on the negative impact of political interference. Teachers express frustration over being sidelined for promotions. Parents lament the declining quality of education, and education officials acknowledge the challenges of enforcing policies without political repercussions (Adeogun, 2002).

In the past, politicians and educators perceived their roles as completely separate and independent. The mythhad been propagated that politics and education do not mix. The reality however, is that there is no apolitical education system and, no educational system can be separated from political system that engenders and supports it. The proposition here is that considering their societal responsibilities and objectives, education and politics are inextricably related (Nwankwo, 2014).

The politics adopted by any educational system are essentially drawn by the government in power (the political system). Educational policies are therefore those guidelines expedient both for political socialization and for national socio-economic and cultural development. Every government or political party is conscious that to ensure its political, social and economic success, the schools must be involved in the promotion of the interests of the governing power. Some handy examples of how the political system used the education system to promote the political programmers may be drawn Hitler's Germany, Lenin's Russia Victorian England, the Mao-Tse Tong China, the French Revolution and some Military Governments in Africa. On the other hand, the education system and educators need the support and patronage of the ruling political system, the public and other governmental agencies in order to carry out their functions of socialization and training of the people. No educational system can survive without the financial support and protection of the government in power. Therefore, by having to unavoidably depend on successive governmental support and protection, education finds itself used for the promotion of political creeds and social views of successive government and political leaders (Nwankwo, 2014).

According to Ogbonnaya (2009), politics has always been at the forefront of education in Nigeria. For instance, there was a partnership arrangement between church and

state in education. Under the partnership arrangement, the missionary societies used the establishment of schools for purposes of conversion, the production of lay readers, catechists, teachers and literate personnel for commercial houses. When the British colonial government became involved in education, its own purpose was mainly to produce literate and clerical staff who would keep the colony in a subordinate position for continued exploitation.

The Nigerian government believed very much in the education of her citizens. This can be illustrated from her use of education for social, economic and political development, for equalization of educational opportunities and for ethnic harmony. Another way of perceiving the education politics relationship is by arguing that while each government uses the educational system to achieve its mission, the educational system tends to replicate the political structures and creeds within its structures, programs and management. It seems that those who tended to separate education from politics have tended to take a restricted definition of politics.

Nwankwo (1984) has deposed that education itself is the means by which values, customs, beliefs, traditions and culture of the society are transmitted to the young. The educational system therefore, provides all the procedures and methods whereby the larger society (the socio-political system) gives its members organized and controlled socialization in the various field and institutions of human endeavors. This is done for the purpose of the maintenance (functional and technical) and acceptance (ethical) of the social structure and the values which justify them. In line with this thinking, Okunamiri (2005:7) quoting Richard (1968) asserts that:

There is no such thing as neutral educational process. Education either functions as an instrument which is used to facilitate the integration of the youngest generation into the logic of the present system and bring about conformity to it, or it becomes "the practice of freedom" the means by which men and women deal critically with reality and discover how to participate in the transformation of their world. Education there is socialization.

The political functions of determination and allocation of values (materials or symbolic) in the society is carried out by the political system through the several social institutions and agencies in the society, one of which is the educational system. Every political system assumes the functions of perpetuating its cultures and institutional structures through time. This is mainly done by means of socializing influences of the primary group (informal groups) and secondary (formal groups) structures through which the young of the society pass in the process of maturation (Almond and Coleman in Okunamiri, 2005). In their submission, Almond and Coleman in Okunamiri (2005) saw political socialization as the process of induction into the political culture. Its end product is a set of attitudes towards the political system, its various roles, and role incumbents. It also includes knowledge of values affecting, and feeling towards the inputs of demands and claims into the system and its authoritative output. Thus, the symbolic relationship between politics and education can be seen from the following areas. Formal education plays the role of political socialization, selection and classification of citizens.

According to Almond and Coleman in Okwori and Ede (2012), the family, the church, community, school, work groups, voluntary organizations, media of communication, political parties and government institutions are among the agents of socialization within the primary and secondary structures, through later or manifest procedures that give the individual the pre-political citizenship education or experience. In addition to its functions of political socialization of the young, the educational system through its merit system or accreditation

processes performs the role of political selection and classification of the individuals in the society. The schools do this by determining who "passed" or "failed" in examinations for the award of certificates or who will become artisans, engineers, teachers, lawyers, doctors, and leaders through definitions of passes or failures in such socio-economic or political groups.

In terms of merit, and in fact academic qualification, the educational system becomes a strong form for political selection where those who will rule and those who will be ruled are branded. The educational system does this in accordance with the tenets or creeds of the particular political-structure and societal expectations. Symbolically, the educational system relies on the political system for its fiscal support and definitions. The political leaders determine, especially in the developing societies, the direction, type, location and process of education. It cannot generate enough funds for itself and any attempt to do so through payment of fees and other charges will penalize the economically disadvantaged (Okwori & Ede, 2012).

Forms of Political Interference in Educational Leadership

Appointment and Promotion of School Leaders: Political patronage heavily influences the appointment and promotion of school principals and administrators. Rather than selecting leaders based on merit and professional qualifications, political affiliations and loyalty often dictate leadership appointments. This undermines the professionalism and competence of school leadership (Aina, 2013).

Resource Allocation and Budgeting: Allocation of educational resources in Rivers West is often subject to political interests. Schools in areas with political clout may receive more funding and infrastructural support compared to those in marginalized communities. This inequitable distribution affects the capacity of school leaders to manage and improve school facilities (Ejiogu, 2019).

Curriculum and Policy Implementation: Political actors sometimes impose policies and programs that may not align with the educational needs of the region. For example, politically motivated curriculum changes or the introduction of non-educational programs disrupt the standardization of education and hinder the ability of school leaders to maintain academic focus (Ogbonnaya, 2010).

Interference in Disciplinary Matters: School administrators often face challenges in enforcing discipline due to political interference. Politicians may intervene to protect students or staff who are politically connected, undermining the authority of educational leaders and compromising discipline standards (Onuka, 2015).

Consequences of Political Interference on Educational Leadership Effectiveness

Erosion of Professional Autonomy: Political interference erodes the professional autonomy of educational leaders. When leaders are appointed based on political loyalty rather than competence, they become beholden to political figures, limiting their ability to make independent decisions in the best interest of the school (Ige, 2011).

Low Morale Among Staff: Unfair appointments and promotions resulting from political interference demoralize dedicated educators who are overlooked despite their qualifications and experience. This affects staff commitment and overall school performance (Ajayi & Ekundayo, 2010).

Ineffective Leadership and Management Leaders who lack the requisite skills and experience struggle to manage schools effectively. Political appointees may lack understanding of pedagogical principles, financial management, or conflict resolution, leading to poor leadership outcomes (Ukeje, 2002).

Student Performance and Learning Outcomes Ultimately, students suffer the most from poor leadership. The lack of instructional supervision, inadequate facilities, and inconsistent policies lead to low academic performance, high dropout rates, and poor learning outcomes (Okorie, 2001).

Strategies for Mitigating Political Interference

Institutional Reforms There is a need for institutional reforms that insulate educational leadership from political influence. Clear guidelines for merit-based appointments, promotions, and policy implementation should be established and enforced (Oyetakin, 2014).

Capacity Building for Educational Leaders Continuous professional development should be prioritized to equip educational leaders with the skills necessary for effective administration. Training programs should emphasize leadership, conflict resolution, financial management, and instructional supervision (Ololube, 2006).

Strengthening Oversight Mechanisms Independent oversight bodies should be empowered to monitor leadership appointments and policy implementation in schools. This will ensure accountability and reduce the likelihood of political manipulation (Fafunwa, 2004).

Community Engagement Active participation of parents and community members in school governance can serve as a check against political interference. School-based management committees (SBMCs) should be revitalized and empowered to hold leaders accountable (Umezinwa, 2010).

Legislative Backing Legislation should be enacted to limit political involvement in educational matters. Policies that protect the independence of school leadership and promote professional standards must be upheld (Taiwo, 1980).

The interference of the political class in educational leadership significantly hampers the effectiveness of school administration in public junior secondary schools in Rivers West. It undermines meritocracy, erodes professional autonomy, and leads to poor educational outcomes. Addressing this issue requires concerted efforts from government, education stakeholders, and civil society to reform the system, promote professionalism, and safeguard the integrity of educational leadership. Only through such coordinated efforts can the educational sector in Rivers West and indeed Nigeria realize its full potential.

Theoretical Framework

This study is also anchored on the situational theory of leadership or the Situational Leadership Model propounded by Paul Hersey and Ken Blanchard (1969). The theory was formulated during the work on "Management of Organizational Behavior" (Rabarison K. et al., 2013). Cherry K. (2020) argues that there is no universally best leadership style; instead, the effectiveness of a leadership style depends on its suitability for the specific task at hand. According to this theory, the most effective leaders are those who can adapt their style to the situation, considering factors such as the type of task, the nature of the group, and other elements that contribute to task completion. This theory is pertinent to the present study as it demonstrates how leaders can be flexible in assessing situations and adopting the most appropriate leadership style.

A situational leader should evaluate team performance by inquiring about the current situation, which will guide them in choosing the appropriate approach or model. The skills and principles of situational leadership are effective for understanding the leadership necessary to guide public senior secondary school leaders in managing external interference. This leadership theory is suitable for leaders in such contexts due to its flexibility, which is crucial given the novelty and complexity of the situation. By employing situational leadership, leaders in public senior secondary schools can successfully develop ongoing improvement plans and performance standards to prepare for and counteract external interference.

METHODOLOGY

The study adopted a descriptive survey design. The study population comprised two hundred and thirty-four (234) staff (78 each of principals, vice principals administration, and principal vice academics) drawn from all the public senior secondary schools in the senatorial district. Census was used to select the population.

The instrument for data collection was a questionnaire titled; “Interference of Politics on School Leadership scale” (IPSLs). The researcher developed the items. It was a structured self-reporting questionnaire consisting of section (A) personal data and section (B) a four-point scale response format of Very High Extent (VHE), High Extent (HE), Low Extent (LE), and Very Low Extent (VLE) for indicating the perceived interference of politics on the educational leadership in public senior secondary schools in the area under study. To ascertain the validity of the Questionnaire, the items were given to three experts from the department of Educational Management. The study's title, purpose, research questions, and hypotheses were attached to the instrument to guide the evaluators. To determine the instrument's internal consistency, the test-retest method was carried out using 20 respondents (10 Principals and 10 Teachers) outside the population within two (2) weeks and scored. Pearson Product Moment Correlation Statistics was used to determine the internal consistency of the items. The overall reliability index was .739 and .810, indicating the instrument’s reliability.

The instrument was administered to the respondents through hand delivery, personally by the researcher**.** Mean, and standard deviation was used to answer the three research questions. Based on the response format of the four-point Likert scale, mean scores of 3.50-4.49 was taken as VHE, 2.50-3.49 was taken as HE, 1.50-2.49 was taken as LE, and 0.50-

1.49 was taken as VLE. The independent sample t-test was used at a 0.05 level of significance in testing the null hypothesis.

RESULTS

Research question 1: To what extent does school leadership perceive that there is the interference of the political class in the appointment, promotion, and posting of staff personnel?

Table 1: Mean rating(x) and Standard deviation (SD) of the respondents on the perceived interference of politics on appointment, promotion, and posting of staff personnel

S/N	Appointment, Promotion and Posting of Staff Personnel	Mean	SD.	Remark
1.	Political interference in appointing public secondary school principals generates conflict. It causes bitterness among colleagues	2.89	0.96	High Extent
2.	Political interference in the appointment of public secondary	3.01	0.91	High Extent
3.	Appointment of under-qualified principals as school head show bias in favour of relations of politicians leading to inefficiency and mismanagement of school affairs.	2.95	0.92	High Extent
4.	Favouritism employed in the promotion of staff leads to mediocrity	3.01	0.93	High Extent
5.	The inability of the government to support in-service training of staff affects the competency of such staff	3.08	0.90	High Extent

Table 1 shows the mean ratings and standard deviation of principals' opinions on how much they perceived the political class's interference in appointing, promoting, and posting staff personnel in public secondary schools. The table shows that the principals in the senatorial district gave a high rating to items 1, 2, 3, a, and 5 with mean scores of 2.89, 3.01, 2.95, 3.01, and 3.08 as representing their opinion on the interference of the political class in appointment, promotion, and posting of staff personnel in public senior secondary schools. It is because all the mean scores exceed the criterion mean of 2.5. The items in the cluster had a grand mean of 2.98, rated above the criterion mean. Therefore it can be concluded that the principals agreed that the political class has a high interference in the appointment, promotion, and posting of staff personnel in public Secondary senior schools in Rivers State. In answer to research question one, it can be deduced that: Interference in the appointment of public secondary school leadership generates conflict and causes bitterness among colleagues. Political interference in appointing public secondary school principals makes some principals autocratic. Appointment of under-qualified principals as school head show bias in favor of relations of politicians leading to inefficiency and mismanagement of school affairs. Favoritism employed in the promotion of staff leads to mediocrity, and inability of the government to support in-service training of staff affects the competency of such staff.

Research question 2: To what extent does school leadership perceive that the political class is interfering in the provision of basic infrastructure and equipment?

Table 2: Mean and standard deviation on the extent of political class's interference in providing basic infrastructure and equipment

S/N	Appointment, Promotion and Posting of Staff Personnel	Mean	SD.	Remark
1.	The political class in government determines where public secondary schools are sited	2.97	0.91	High Extent
2.	Public secondary schools are rehabilitated only in communities where the politicians are in government	3.01	0.91	High Extent
3.	Public senior secondary schools located in communities where the politicians are not in government suffer from the decay of dilapidated structures	2.95	0.97	High Extent
4.	Laboratory equipment, computers, and other stationeries are distributed to public senior secondary schools located in the communities where politicians are in government	3.23	0.91	High Extent
5.	The political class influences the distribution of science laboratory equipment to public senior secondary schools leading to poor academic performance.	3.18	0.80	High Extent

Table 2 shows the mean ratings and standard deviation of vice principals' opinions on the extent of interference of the political class in the provision of basic infrastructure in public secondary schools in Rivers State. The table shows that the principals gave a high rating to items 5, 6, 7,8,9, and 10 with mean scores of 2.97, 3.01, 2.92, 3.23, and 3.18 as representing their opinion on the interference of the political class in the provision of basic infrastructure and equipment in public senior secondary schools. It is because all the mean scores exceed the criterion mean of 2.5. The items had a grand mean of 3.09, above the 2.50 criterion mean. Therefore, it can be concluded that the principals agreed that there is a high interference of the political class in providing basic infrastructure and equipment in Rivers State. In answer to research question two, it can be deduced that: Political class in government determines where public secondary schools are sited. Public senior secondary schools are rehabilitated only in communities where the politicians are in government. Public senior secondary schools located in communities where the politicians are not in government suffer from the decay of dilapidated structures. Laboratory equipment, computers, and other stationeries are distributed to public secondary schools located in the communities where politicians are in government, and the political class influences the distribution of science laboratory equipment to public senior secondary schools leading to poor academic performance. Thus, to a large extent, secondary school leadership perceives political interference.

Test of Hypotheses

Hypothesis 1: There is no significant difference in the interference of the political class in the appointment, promotion, and posting of staff personnel in public junior secondary schools in Rivers West, Rivers State.

Table 3: Summary of t-test of the mean and standard deviation of principals and vice principals on the interference of the political class in the appointment, promotion, and posting of staff personnel in the public senior secondary schools in Rivers West Senatorial District of Rivers State

Variable	Status	N	Mea	SD	Std. E.	df	T	Sig.
Appointment, promotion, posting of staff	Principal	78	3.230	.149	.028	232	.109	.914
	V. Principal	156	3.227	.220	.24			
Grand Mean			**3.23**	**.18**				

Table 3 above revealed that t-test the mean and standard deviation of principals and teachers on the interference of the political class in the appointment, promotion, and posting of staff personnel in the public junior secondary schools in Rivers West Senatorial District, Rivers State was 3.23 and 0.18, correspondingly. From the above Table, the t-test calculated value was 3.651($p>0.05$). Hence, there is no significant difference between the mean ratings of principals and vice principals on the interference of the political class in the appointment, promotion, and posting of staff personnel in the public junior secondary schools in Rivers West Senatorial District, Rivers State. The null hypothesis was retained at a 0.05 level of significance.

Hypothesis 2: There is no significant difference between the mean ratings of principals and teachers on the political class's interference in providing basic infrastructure and equipment of public junior secondary schools in Rivers West Senatorial District, Rivers State.

Table 4: Summary of t-test of the mean and standard deviation of principals and teachers on the political class interference in providing basic infrastructure and equipment of public junior secondary schools in Rivers West Senatorial District, Rivers State

Variable	Status	N	Mea	SD	Std. E.	df	T	Sig.
Basic infrastructure and equipment	Principal	78	3.16	.24	.032	232	.927	.355
	V. Principal	156	3.19	.23	.033			
Grand Mean			**3.18**	**.24**				

Table 4 shows that the t-test of the mean and standard deviation of principals and vice principals on the interference of the political class in the provision of basic infrastructure and equipment of public junior secondary schools in Rivers West Senatorial District, Rivers State was 3.16 and .24, respectively. In the above Table, it can be observed that the t-test calculated value was .927 ($p > .05$). Therefore, there is no significant difference between the mean ratings of principals and teachers on the interference of the political class in the appointment, promotion, and posting of staff personnel in the public junior secondary schools in Rivers West Senatorial District, Rivers State. The null hypothesis was retained at a .05 level of significance.

DISCUSSION

Interference of the political class in the appointment, promotion, and posting of staff personnel in public secondary schools

Based on the findings from this work, the result revealed that the interference of the political class in appointing public secondary school principals causes bitterness among colleagues. The principals' appointment, promotion, and posting have been governed by politicians (godfathers). The study's finding aligns with Ogunnu's (2006) idea that policies influence appointment, promotion, transfers, and principals. Oboegulem (2003) also highlighted the interference of politics in teachers' promotion. This has led to bad leadership in the school administration, preventing educational achievement.

Interference of the political class in the provision of the basic infrastructure of public secondary schools

The findings show that the political class in government determines where public secondary schools are situated. Books, laboratory equipment, and other facilities are distributed to schools in communities where politicians are in government. This study agrees with Okeke (2017), who opined that politics influence the provision of basic infrastructure. He further asserted that schools are rehabilitated only in communities where politicians are in government.

CONCLUSION

Education is essential for any nation's social, economic, and political advancement. Its importance cannot be over-emphasized as it is the backbone of human capital development, a role of practical education, including secondary school. Despite the importance of education, political interference in public secondary school administration has led to the poor management of secondary schools across the state. Politics is part and parcel of human endeavors as it proffers solutions to a nation's social, economic, scientific, technological, and educational problems. The public secondary school management structure consists of principals and vice principals. Conversely, the administration of the school is carried out by politicians. The continuous intruding into secondary school affairs regarding controlling, making decisions, using powers, and implementing policies have caused more harm than good in the school administration. There is a need for government to check the activities of politicians in appointing principals, provision of infrastructure/equipment, and student enrolment to ensure equal distribution of all the necessary materials needed to achieve the educational purpose.

Recommendations

The following recommendations are made based on the findings of this study:

- Government should state acceptable criteria for appointing principals to ensure transparency and fairness.

- Government should ensure that all the public secondary schools in the senatorial district receive equal attention regarding dilapidated structures.

ADMINISTRATIVE STRATEGIES FOR IMPROVED TEACHER JOB PERFORMANCE IN PUBLIC SENIOR SECONDARY SCHOOLS IN RIVERS STATE

Priscilla Chioma ONYEKWUM
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

This paper discussed administrative strategies for improved teacher job performance in public senior secondary schools in Rivers State. Teachers play a crucial role in shaping educational outcomes in public senior secondary schools. In Rivers State, their performance directly affects student achievement and overall success. However, various challenges, such as lack of resources, limited professional development, heavy workloads, and low morale, hinder teacher effectiveness. These issues often lead to poor teaching quality, which in turn impacts student performance. The real problem is not the shortage of qualified teachers, but the ineffective administrative structures that fail to support and motivate them. Administrative strategies are actions and policies used by school leaders to manage and improve the school. These strategies aim to create a better work environment, improve teaching, boost efficiency, and enhance student outcomes. The paper was supported by the Herzberg's Two-Factor Theory of Motivation, developed by Frederick Herzberg**,** which suggests that job satisfaction and performance are influenced by two types of factors: hygiene factors and motivators. Hygiene factors, like salary and working conditions, prevent dissatisfaction but don't motivate. Motivators, like achievement and recognition, drive job satisfaction and improve performance. The paper identified effective administrative strategies for improved teacher job performance to include; professional development programs, provision of teaching materials/resources, effective supervision and feedback, incentive programs, collaborative networks, balanced workloads, promoting autonomy, recognition and career advancement opportunities, improving school infrastructure and support services. It therefore concluded that the implementation of effective administrative strategies is crucial for enhancing teacher job performance in public senior secondary schools in Rivers State. The paper therefore suggested that principals should ensure regular professional development programs are organized for teachers to enhance their teaching skills and knowledge.

Keywords: Administrative Strategies, Improved, Teacher Job Performance, Public, Senior, Secondary Schools, Rivers State.

INTRODUCTION

The importance of teachers in shaping educational outcomes in public senior secondary schools is indisputable. Teachers are central to the learning process, influencing student achievement, engagement, and overall educational success. In Rivers State, the performance of teachers significantly influences student outcomes; however, various challenges persist in the educational system, preventing optimal teacher effectiveness. The teaching profession in public schools in Rivers State faces numerous barriers, including inadequate resources, insufficient professional development opportunities, heavy workloads, and poor morale. These challenges often result in suboptimal teacher performance, which directly impacts the quality of education and overall student outcomes (Agi, 2017, Owhondah, 2018, Wilson, 2023).

In Rivers State, the problem at hand is not the lack of qualified teachers, but rather the ineffective administrative structures that fail to provide the necessary support, motivation, and conducive working environments for teachers to excel. Amadi (2021) highlighted that teacher performance in Rivers State is severely hampered by the lack of adequate administrative support, poor infrastructure, and the absence of a supportive working environment. This situation is compounded by the increasing pressures placed on teachers, including overcrowded classrooms, insufficient teaching materials, and inadequate salary structures. In the face of these challenges, this paper examines the administrative strategies necessary to enhance teacher job performance in Rivers State's public senior secondary schools. Implementing effective administrative strategies that address both the intrinsic and extrinsic factors affecting teachers, significant improvements in job performance can be achieved. These strategies will not only benefit teachers but also lead to better educational outcomes for students in Rivers State.

THEORETICAL FRAMEWORK

The theory that support this paper was Herzberg's Two-Factor Theory of Motivation, developed by Herzberg in 1959 as cited in Williams (2023). The theory posited that there are two distinct sets of factors that influence an individual's job satisfaction and performance: hygiene factors and motivators**.** According to Herzberg, these factors do not function in the same way, and their impact on job performance is significantly different. The theory differentiates between hygiene factors (external factors such as working conditions, salary, and job security) and motivators (internal factors such as achievement, recognition, and personal growth).

Herzberg's Two-Factor Theory is particularly relevant to this paper as it provides a framework for understanding how administrative strategies can enhance teacher job performance. Administrative strategies that focus on improving hygiene factors such as better salaries, provision of adequate teaching materials, and the enhancement of school infrastructure are essential for reducing dissatisfaction and ensuring that teachers feel supported in their roles. These factors address the basic needs of teachers, minimizing job dissatisfaction and fostering an environment where teachers can perform their duties without unnecessary obstacles. Love-day (2018) demonstrated that Herzberg's theory is applicable in explaining how administrative strategies can motivate teachers and enhance their job performance.

According to Love-day, when school administrators focus on improving both hygiene factors and motivators, they create an environment where teachers not only avoid dissatisfaction but are also encouraged to perform at higher levels. For instance, addressing hygiene factors like adequate resources and favorable working conditions can prevent negative feelings and burnout

among teachers, while incorporating motivators such as professional development and recognition fosters greater engagement, satisfaction, and long-term commitment to the teaching profession. The relevance of this theory to the paper is that the theory underscores the need for a dual approach: addressing the basic needs of teachers through hygiene factors and further motivating them through professional growth and recognition. Herzberg's Two-Factor Theory thus serves as a guiding framework to examine how administrative strategies can improve the working conditions of teachers in Rivers State.

Administrative Strategies

Administrative strategies refer to the deliberate actions, policies, and practices implemented by school administrators or educational leaders to effectively manage and improve the functioning of an educational institution. These strategies are designed to optimize the work environment, enhance teaching quality, increase operational efficiency, and eventually improve student outcomes. Administrative strategies are used to address various aspects of school management, including resource allocation, teacher support, curriculum development, and overall leadership practices. Benjamin (2018) defined administrative strategies as the deliberate actions and policies that educational administrators implement with the purpose of optimizing the effectiveness of school operations and improving the performance of teaching staff. Further stressed that these strategies are carefully shaped to address the needs of both teachers and students, ensuring that the operational aspects of the school system are well-organized and aligned with educational goals.

Johnson (2019) viewed administrative strategies as a series of organizational decisions, interventions, and leadership practices aimed at enhancing the overall productivity of the educational system, with a particular focus on teacher satisfaction, skill development, and job performance. Further emphasized that these strategies are not merely administrative tasks, but strategic interventions that have a profound impact on the morale and effectiveness of teachers. Prioritizing teacher well-being, providing skill-building opportunities, and ensuring that teachers are recognized for their contributions, school administrators can create an environment where teachers are motivated to perform their best. This view suggested that administrative strategies are key to driving systemic improvements in the quality of education. Olawunmi (2020) described administrative strategies as systematic measures that school leaders take to create an environment conducive to teacher effectiveness and academic success. These strategies may include policy changes, the introduction of professional development programs, and careful resource management. This perspective highlighted the role of school leadership in shaping the teaching environment by providing teachers with the necessary tools, training, and professional growth opportunities to excel. Through well-planned administrative strategies, school leaders can ensure that teachers are equipped to deliver high-quality education and contribute to students' academic success.

Clement (2021) argued that administrative strategies involve the management and coordination of various school resources human, financial, and infrastructural to ensure that teachers are supported in performing their duties efficiently and effectively. This view suggested that a successful administrative strategy requires a holistic approach, in which school leaders must manage resources not only in terms of financial budgets but also by optimizing the use of human capital (teachers) and ensuring that the physical infrastructure supports teaching and learning. This includes providing teachers with adequate classrooms, teaching materials, and

technological tools, while also offering professional support and leadership. Newman (2022) defined administrative strategies as the planned set of actions taken by school administrators to improve organizational performance by addressing the needs of teachers, facilitating professional development, and ensuring that the working environment is conducive to teaching and learning. The definition emphasized the importance of proactive planning and action. The implementation of such strategies requires school administrators to be attuned to the specific needs of teachers and the broader educational context, ensuring that teachers have access to the necessary resources, skills, and support. Facilitating an environment that promotes professional growth and addresses the challenges faced by teachers, administrators can significantly improve both teacher satisfaction and job performance.

In the context of Rivers State, effective administrative strategies play a crucial role in overcoming the barriers that hinder teacher performance. These strategies encompass both the allocation of resources and the establishment of systems designed to foster teacher development and job satisfaction. This includes the following:

- Professional Development Programs: Ongoing professional development equips teachers with the latest teaching methodologies, subject matter knowledge, and classroom management skills. Akpan (2019) emphasized that professional development initiatives contribute significantly to teacher motivation and performance. In Rivers State, the implementation of well-structured training programs will improve teachers' competence and, consequently, student outcomes.
- Provision of Teaching Materials and Resources: Adequate teaching resources such as textbooks, digital tools, and classroom infrastructure are essential for effective teaching. Martins (2020) stressed that the provision of resources directly impacts the quality of teaching and student performance. Administrative strategies in Rivers State should prioritize resource allocation to schools, ensuring that teachers have the tools needed to succeed.
- Effective Supervision and Feedback: Regular supervision and constructive feedback help teachers identify areas for improvement. Harris (2018) emphasized that continuous performance monitoring and feedback as key components of an effective administrative strategy. In Rivers State, school leaders should establish systems for regular classroom observations and provide actionable feedback to support teachers' professional growth.
- Incentive Programs: Teachers should be incentivized for their hard work and dedication. Wilson (2022) suggested that rewarding teachers through bonuses, promotions, and public recognition boosts morale and encourages teachers to go above and beyond in their roles. In Rivers State, such incentive programs can enhance teacher motivation and improve performance.
- Collaborative Networks: Creating platforms for teachers to collaborate and share best practices can foster a sense of community and collective responsibility. George (2021) argued that collaborative networks lead to the exchange of ideas and experiences that improve teaching quality. Rivers State can establish teacher forums and professional learning communities to facilitate collaboration and peer support.
- Balanced Workloads: Overburdened teachers are more likely to experience burnout, which negatively impacts their job performance. Adeyinka (2022) noted that managing teacher workloads effectively ensures that teachers can maintain a healthy work-life

balance. Administrators in Rivers State should allocate teaching responsibilities fairly and ensure that teachers are not overwhelmed by excessive administrative tasks.

- Promoting Autonomy: Giving teachers more control over their teaching methods and classroom management styles can lead to increased job satisfaction and performance. Johnson (2019) highlighted the importance of teacher autonomy in fostering creativity and innovation in the classroom. Administrators in Rivers State should empower teachers by allowing them to make decisions about their teaching strategies.
- Recognition and Career Advancement Opportunities: Recognition of teachers' hard work and providing clear career advancement paths is crucial for job satisfaction. Anderson (2021) stressed public acknowledgment and the opportunity for career progression are essential motivators for teachers. Rivers State should develop recognition schemes and provide opportunities for professional growth to retain top-performing teachers.
- Improving School Infrastructure: The physical environment in which teachers work significantly impacts their job satisfaction and performance. Olawunmi (2020) noted that poor infrastructure, such as inadequate classrooms or lack of basic amenities, can hinder effective teaching. Administrative strategies in Rivers State should focus on improving school facilities to create a conducive environment for teaching and learning.
- Support Services: Teachers often face emotional and psychological stress, which can negatively affect their performance. Providing teacher support services, such as counseling and mentorship, can improve their well-being and job performance. Smith (2018) explained that schools that provide support services are more likely to retain motivated and effective teachers. Rivers State can establish teacher support programs to ensure the mental health and well-being of its educators.

Teacher Job Performance

Teacher job performance refers to how effectively a teacher carries out their professional duties and responsibilities in the educational environment. It encompasses the teacher's ability to deliver quality instruction, manage the classroom, and contribute to the overall success of students and the school. Jones (2017) defined teacher job performance as the level of effectiveness with which a teacher carries out their teaching duties, emphasizing key components such as lesson preparation, classroom management, and student assessment. The definition emphasized that quality of lesson planning directly influences a teacher's ability to engage students and achieve the desired learning outcomes.

Classroom management is equally vital, as it ensures that a conducive learning environment is maintained, minimizing disruptions. Williams (2018) argued that teacher job performance goes beyond just academic achievements. While academic success is certainly important, Williams contended that effective teacher performance also includes the teacher's ability to engage, motivate, and guide students in their personal and academic development. According to Williams, teachers who can inspire students, create a connection with them, and support their personal growth play a key role in fostering an environment where students not only perform well academically but also thrive socially and emotionally. This approach emphasizes the holistic role teachers play in shaping students' futures, both inside and outside the classroom.

Brown (2019) viewed teacher job performance as a combination of the teacher's instructional delivery, the quality of student outcomes, and the teacher's professionalism in

maintaining a positive classroom environment. The definition stressed that the effectiveness of a teacher's instructional delivery was paramount in ensuring students comprehend the material being taught. He further recognized that successful teacher performance involves more than just the delivery of lessons; it also requires maintaining high standards of professionalism, which includes fostering positive interactions with students, colleagues, and parents.

Moreover, a teacher's ability to cultivate a positive and respectful classroom environment is central to effective learning, as students are more likely to succeed in a space where they feel safe and supported. Adrian (2020) defined teacher job performance as the degree to which a teacher fulfills the duties of their role, including meeting curriculum standards, engaging students, and fostering a positive learning environment. Further emphasized that adhering to curriculum standards is foundational, as it ensures that teaching objectives are met and students receive the knowledge and skills required at each grade level. Adrian (2020) in addition stressed the importance of student engagement, arguing that effective teachers must adapt their teaching methods to keep students interested and actively involved in the learning process. Moreover, fostering a positive learning environment is a crucial aspect of teacher performance, as students are more likely to engage and succeed when they feel respected and motivated in a supportive classroom setting.

Miller (2021) described teacher job performance as the overall impact of a teacher's work on student achievement, classroom behavior, and the implementation of educational objectives. Who emphasized that teacher job performance should not only be measured by student academic results but also by the way a teacher influences classroom dynamics and contributes to the implementation of broader educational goals. The effective teachers positively impact student behavior, promoting self-discipline and a respect for learning. Further stressed that teachers should be evaluated based on their ability to implement educational objectives, which include creating and maintaining a curriculum that meets students' needs while ensuring that the educational system's goals are fulfilled.

In the context of Rivers State, administrative strategies have a direct influence on teacher job performance by addressing both intrinsic and extrinsic factors. These strategies play a crucial role in enhancing teachers' effectiveness. Implementing the administrative strategies, school administrators in Rivers State can create an environment that promotes higher teacher job performance.

Effective Administrative Strategies for Improved Teacher Job Performance

Effective administrative strategies are essential for improving teacher job performance, as they directly impact both the motivation and effectiveness of educators. Addressing key factors that influence teacher satisfaction and productivity, these strategies help create an environment that supports professional growth, enhances classroom management, and ultimately improves student outcomes. Below are several key strategies that can be implemented to foster a more effective teaching workforce.

Professional Development Programs and Teacher Job Performance

Professional development programs are vital to improving teacher performance as they provide educators with the necessary tools, knowledge, and strategies to thrive in the dynamic and ever-evolving educational landscape. These programs encompass a variety of learning activities,

ranging from workshops, seminars, and conferences to more structured approaches like advanced degree programs and online courses. The primary goal of such programs is to enhance teachers' pedagogical skills, broaden their subject knowledge, and increase their capacity to cater to the diverse learning needs of students. Smith (2016) found that teachers who actively engage in professional development are better positioned to adjust their teaching practices to meet the evolving demands of the curriculum and accommodate different learning styles.

Professional development programs play a crucial role in enhancing the quality of teaching by providing teachers with the tools and knowledge they need to continually improve their practices. Parker and Johnson (2017) argued that continuous professional development is a driving force for improving teaching practices. Teachers who commit to lifelong learning are better equipped to apply innovative techniques in their classrooms, which can result in higher student achievement. Furthermore, engaging in regular professional development programs is essential for maintaining teacher motivation and job satisfaction. These programs provide teachers with opportunities to refine their skills, learn new strategies, and stay up-to-date with educational trends, which can contribute significantly to their overall job satisfaction. Teachers who are more satisfied with their professional growth opportunities are less likely to experience burnout or turnover, which are common issues in education systems with limited support structures.

Similarly, Harris and Sayer (2019) emphasized that professional development programs tailored to the specific needs of teachers are more effective in driving positive outcomes. They noted that when professional development is customized to address regional or school-specific challenges such as unique student needs, curriculum requirements, or resource limitations teachers are more likely to see tangible improvements in their teaching effectiveness. Tailored programs allow educators to acquire skills that directly address the challenges they face in their local context, making their professional growth more impactful. Participation in professional development programs that emphasize collaboration can be particularly beneficial for teachers, as these programs create a space for sharing experiences and learning from one another. Thomas and Barker (2021) found that teachers who participate in collaborative professional learning communities, where they can share experiences, discuss challenges, and reflect on best practices, benefit from the collective wisdom of their peers.

Anderson (2022) highlighted the role of technology in modern professional development programs. They argued that online courses, webinars, and digital workshops provide teachers with flexible, accessible ways to continue their professional learning. In Rivers State, where teachers in public senior secondary schools often face barriers to professional growth, implementing robust professional development programs is essential. These programs can help bridge the gap in teachers' knowledge and skills, thereby fostering a more effective teaching workforce. Addressing the challenge of inadequate professional development through structured and region-specific training opportunities would significantly improve teacher performance.

Provision of Teaching Materials/Resources and Teacher Job Performance

The provision of adequate teaching materials and resources is an essential administrative strategy that directly influences teacher job performance and the overall quality of education. Teachers depend on a range of resources, including textbooks, teaching aids, digital tools, and classroom facilities, to effectively deliver lessons and engage students. Without adequate teaching materials, teachers are often forced to adopt less engaging, less effective instructional methods,

which can lower student interest, hinder learning, and negatively impact student outcomes. Osei and Mensah (2017) highlighted that teachers working in schools equipped with ample teaching materials were more likely to employ diverse, engaging, and interactive teaching strategies. These varied teaching methods not only enhanced the learning experience but also contributed to higher student engagement and improved academic outcomes. Teachers with access to a wide range of resources were able to make their lessons more dynamic and tailored to the needs of their students, which ultimately led to a more effective teaching environment. Similarly, Fredrick (2018) found that the lack of necessary materials and resources left teachers feeling frustrated, demotivated, and constrained in their ability to teach effectively. Teachers working in environments with limited resources struggled to engage students and address the diverse learning needs within their classrooms, which negatively impacted both student learning and teacher job satisfaction.

The provision of adequate teaching materials and resources is critical for empowering teachers to create engaging and effective learning experiences. Ayodele and Olaniyan (2019) emphasized that access to adequate teaching materials boosts teacher confidence and promotes a more productive classroom environment. Teachers who were provided with sufficient resources reported higher levels of job satisfaction and were more motivated to adopt effective teaching strategies. The provision of teaching materials also plays a crucial role in shaping the classroom environment. Green and Wilson (2020) noted that teachers who had access to modern teaching tools, such as digital technologies and multimedia resources, were able to incorporate innovative instructional techniques, leading to enhanced teacher performance. The use of technology in teaching has become increasingly important in today's education system. It allows teachers to present lessons in more interactive and engaging ways, fostering greater student participation and collaboration. Teachers who integrate digital tools into their lessons often report higher levels of student engagement, which directly correlates with improved learning outcomes. Similarly, Rivera and Zhang (2020) found that when schools invest in providing teachers with high-quality instructional materials, it not only improves teaching effectiveness but also leads to better academic performance among students.

The provision of adequate instructional materials is especially critical in ensuring that teachers can effectively apply their training and improve student learning outcomes. Johnson and Lee (2021) indicated that even when teachers were well-trained, the absence of essential teaching resources hindered their ability to effectively apply their knowledge in the classroom. Williams and Roberts (2022) found that teachers working in schools with well-stocked resource centers were more likely to collaborate with their peers, share materials, and develop best practices together. This collaborative approach contributed to a positive school culture and improved teacher performance across the board. In Rivers State, where many public senior secondary schools face resource constraints, providing teachers with the necessary materials and resources is essential. Schools in the region often struggle with outdated textbooks, limited access to digital resources, and poor infrastructure. Addressing these issues by ensuring the provision of adequate teaching materials and resources will enhance teacher performance and improve student learning outcomes.

Effective Supervision and Feedback and Teacher Job Performance

Effective supervision and feedback play a crucial role in administrative strategies aimed at improving teacher job performance. Supervision involves overseeing and supporting teachers in

their instructional duties to ensure that their practices align with both school goals and national educational standards. This process not only includes monitoring the day-to-day teaching activities but also providing guidance and direction that encourage professional growth. Feedback, which can be both formative and summative, offers teachers valuable insights into their strengths and areas that require improvement. Thomas and Hall (2017) found that teachers who regularly receive constructive feedback are more inclined to reflect on and modify their teaching practices, eventually leading to improved student performance. The study revealed that feedback focused on actionable areas allowed teachers to make specific, targeted improvements, and the adjustments they made were reflected in their students' academic outcomes. Moyo and Kalimangasi (2018) found that when teachers are properly supervised, they tend to feel more responsible for their actions and more committed to the school's goals. This sense of accountability motivates teachers to implement better classroom management strategies and improve instructional delivery.

Effective supervision and feedback are essential components of a supportive teaching environment, as they provide teachers with the guidance and encouragement needed to grow in their roles. Patton et al. (2019) indicated that teachers who are effectively supervised feel more supported in their roles, which boosts their confidence and contributes to higher levels of job satisfaction. In their findings, they noted that when teachers know their supervisors are invested in their professional growth and success, they are more likely to remain engaged and motivated in their work. Feedback that is specific and timely also plays a pivotal role in teacher development. Jones (2020) noted that providing feedback that addresses both a teacher's strengths and areas for growth creates a positive feedback loop that encourages continuous improvement.

Andersen and Marks (2021) noted that teachers who receive feedback not just from their supervisors but also from their colleagues, tend to experience a greater sense of professional camaraderie and are more likely to adopt new teaching practices. Moreover, effective supervision and feedback are crucial for improving teacher performance, especially when feedback is integrated into professional development programs. Thompson and Lim (2023) argued that feedback that is integrated into ongoing professional development sessions, rather than delivered in isolation, allows teachers to apply their learning immediately in their practice. This approach ensures that feedback is not just theoretical but is applied in the classroom setting, making it more relevant and practical. This type of feedback loop enhances teacher growth and contributes to continuous improvement in teaching practices.

In Rivers State, where many teachers face challenges in classroom management and instructional delivery, effective supervision and feedback can provide the necessary support to help teachers improve. Administrative bodies in the state should prioritize creating a supportive supervisory environment that fosters continuous professional growth through regular and constructive feedback.

Incentive Programs and Teacher Job Performance

Incentive programs represent a vital administrative strategy aimed at improving teacher job performance by fostering motivation and encouraging professional excellence. These programs are designed to reward teachers for exceptional performance, thus enhancing their commitment to the profession. Incentives can take various forms, including financial rewards, career advancement opportunities, public recognition, or access to professional development

opportunities. Gajigo et al. (2017) found that teachers who were rewarded for their efforts displayed higher levels of commitment to their work. These teachers were also more likely to adopt innovative and creative teaching methods, as they felt their contributions were valued and appreciated.

Similarly, Daniels and Clark (2018) found that when teachers felt that their work was recognized and rewarded based on their performance, they were more inclined to invest greater effort into their teaching practices. Teachers who know that their performance is linked to tangible rewards, such as salary increases, promotions, or public recognition, tend to be more engaged in their work and more committed to achieving high academic standards. Incentive programs play a key role in motivating teachers, particularly in regions where they face significant challenges, such as low salaries, inadequate resources, or poor working conditions. These programs can provide teachers with the necessary encouragement to maintain high levels of performance and job satisfaction despite difficult circumstances. Robinson et al. (2019) found that teachers who received incentives tailored to their needs were more likely to stay motivated and committed to their teaching roles, even in the face of challenging working conditions. Adams and Kumar (2020) found that incentives can not only improve individual teacher performance but can also foster a collaborative work environment. Teachers who are rewarded for their efforts are more likely to share best practices with their colleagues, engage in professional discussions, and collaborate on innovative teaching strategies.

Moreover, incentive programs that are tailored to the specific needs and aspirations of teachers are more likely to have a lasting impact on teacher motivation and performance. Lang and Hines (2021) showed that incentive programs that address teachers' professional and personal aspirations are more effective than those offering generalized rewards. Chang and Yung (2022) found that teachers who were publicly recognized for their achievements whether through awards, ceremonies, or media coverage experienced an increase in job satisfaction and motivation. Incentives can play a pivotal role in improving teacher performance in Rivers State, where teachers are often faced with low morale and limited resources. Recognizing and rewarding outstanding teaching, the state can encourage teachers to strive for excellence, thereby improving the overall quality of education in public senior secondary schools.

Collaborative Networks and Teacher Job Performance

Collaborative networks are a powerful administrative strategy aimed at improving teacher job performance by fostering professional cooperation, sharing of resources, and the exchange of best practices. These networks enable teachers to collaborate in various formats, including professional learning communities (PLCs), subject-specific groups, or informal teacher associations. Working together in these collaborative settings, teachers can support each other, solve problems collectively, and engage in continuous professional development, all of which have been shown to enhance their teaching effectiveness and job satisfaction. Watson and Davis (2016) found that teachers who actively participated in such networks were more likely to adopt innovative teaching methods and share effective strategies for classroom management. Their research highlighted the importance of collaboration in allowing teachers to engage in mutual learning. Teachers in collaborative networks were able to share resources and expertise, which improved their instructional practices and increased their confidence in the classroom. In a similar vein, Green and Andrews (2018) found that teachers who participated in collaborative

networks experienced a significant reduction in feelings of isolation and burnout, which are common issues in the teaching profession.

Collaborative networks play a significant role in enhancing teacher motivation and improving teaching practices by fostering a sense of community and shared responsibility. Malatji and Botha (2019) found that teachers who were part of collaborative networks felt a sense of ownership over their students' success, which motivated them to improve their teaching methods and support one another in achieving common educational goals. Fuchs et al. (2020) indicated that teachers who collaborated regularly were more likely to develop stronger problem-solving abilities, which allowed them to address the diverse needs of their students more effectively.

Collaborative networks, especially those focused on specific subjects, offer teachers the opportunity to deepen their expertise and stay current with the latest trends and challenges in their fields. Miller and Johnson (2021) found that teachers who participated in subject-specific networks were more likely to keep up with the latest developments in their fields, share specialized teaching materials, and discuss strategies tailored to the unique challenges of teaching their particular subject. Hernandez and Blake (2022) showed that even in the absence of formal professional learning communities, informal networks of teachers who meet to share experiences and strategies can have a positive impact on teacher performance.

In Rivers State, establishing collaborative teacher networks can provide teachers with the support and resources they need to excel in their roles. These networks can help bridge the gap between teachers in different schools, allowing them to share experiences and learn from one another. Fostering collaboration, Rivers State can enhance teacher job performance and create a more cohesive educational community.

Balanced Workloads and Teacher Job Performance

A balanced workload is crucial for maintaining the overall well-being and professional effectiveness of teachers. When teachers are burdened with excessive teaching hours, administrative duties, and other additional responsibilities, it can lead to stress, burnout, and decreased job satisfaction.

A manageable workload, on the other hand, allows teachers to focus on their core duties, such as lesson preparation, student engagement, and instructional improvement, thereby enhancing their performance and job satisfaction. Howard and Smith (2017) found that teachers who experienced a more balanced workload reported significantly higher levels of job satisfaction compared to those who were overburdened with additional tasks and responsibilities. Similarly, Clarke and James (2018) indicated that teachers who had their administrative and non-teaching duties reduced were able to dedicate more time and energy to lesson planning, instructional delivery, and student engagement. The study revealed that by lightening the load of teachers, schools allowed educators to focus on their teaching roles, which directly led to better student outcomes. Clarke and James highlighted that when teachers were not overwhelmed with tasks unrelated to their teaching responsibilities, they were better able to meet the individual needs of students, thereby fostering a more productive and responsive learning environment. A balanced workload is essential for maintaining teacher well-being and ensuring effective classroom management.

Rajput et al. (2019) found that teachers with more manageable workloads reported experiencing lower levels of stress, which in turn allowed them to focus on maintaining positive,

engaging, and supportive classroom atmospheres. Teachers with reduced stress were more effective in managing classroom behavior and were better able to engage with students on a personal level. Vickers and Williams (2020) found that when teachers' workloads were balanced and sustainable, they were less likely to experience burnout and were more likely to remain in the teaching profession. Teachers who were not overwhelmed by excessive workloads felt more supported and valued in their roles, which contributed to higher retention rates.

Furthermore, a balanced workload not only reduces teacher stress but also creates opportunities for meaningful collaboration among colleagues. Grant et al. (2021) found that when teachers were not overburdened with excessive responsibilities, they had more time and energy to collaborate with their colleagues. This collaboration led to the sharing of resources, ideas, and teaching strategies, which ultimately enhanced the quality of teaching across the school. Gonzalez and Miller (2022) found that teachers who were given the time and space to manage their workloads effectively were more motivated to pursue professional development opportunities and improve their instructional practices. Managing teachers' workloads effectively is a critical aspect of supporting teacher well-being and enhancing job satisfaction. Patel and Singh (2023) demonstrated that when school administrators took proactive steps to manage teachers' workloads, it resulted in increased job satisfaction and a greater sense of professional accomplishment.

Balanced workloads are particularly important in Rivers State, where public senior secondary schools face challenges such as overcrowded classrooms, limited staffing, and high expectations for teachers. Addressing these issues through strategies that help balance teachers' responsibilities will reduce stress and enhance their ability to perform effectively in the classroom. A more manageable workload will allow teachers to focus on enhancing their teaching practices, which is crucial for improving student performance and the overall quality of education in the state.

Promoting Autonomy and Teacher Job Performance

Promoting autonomy plays a critical role in enhancing teacher job performance by empowering educators to make decisions about their teaching methods, classroom management, and professional development. This level of control fosters a sense of ownership over their work, which has been shown to increase motivation and job satisfaction. Zhao and Wang (2016) found that teachers who had the freedom to make decisions about their teaching methods reported higher levels of satisfaction. Similarly, Goldstein and Zeira (2017) found that teacher autonomy led to a more responsive and adaptable teaching environment, where teachers could experiment with different strategies to maximize student learning.

Promoting teacher autonomy is essential for fostering an environment of continuous professional development. When teachers are given the freedom to explore different teaching methods and approaches, they are empowered to engage in reflective practices that lead to professional growth. McLellan et al. (2018) showed that when teachers were granted the freedom to experiment with various teaching methods and approaches, they were more likely to engage in reflective practices and refine their instructional techniques. This ongoing process of self-assessment and improvement, which is facilitated by autonomy, is crucial for professional growth. Lopez and Rivera (2019) found that when teachers had the freedom to establish their classroom rules and discipline strategies, they were better able to create a positive learning environment. Teachers who felt in control of their classroom management were more likely to

foster a respectful and focused atmosphere, which contributed to higher levels of student engagement and achievement.

Furthermore, promoting teacher autonomy is a key factor in fostering a strong sense of professional identity and commitment. When teachers are given the freedom to make decisions about their teaching practices and professional development, they are more likely to feel valued and respected, which contributes to their overall job satisfaction and motivation. Kim and Lee (2020) found that teachers who had a high degree of autonomy in their teaching practices were more likely to feel a strong sense of professional identity and commitment to their roles. The autonomy to make decisions about how to approach their teaching and professional development helped teachers to feel valued and respected within the educational system. This sense of ownership and control over their work is crucial for long-term teacher satisfaction and effectiveness.

In addition, Brown and Evans (2021) revealed that teachers who had greater freedom in their teaching practices were more likely to implement new and creative teaching strategies, such as project-based learning and technology integration. Promoting autonomy in professional development allows teachers to take ownership of their growth and actively seek opportunities to enhance their teaching practices. Kapoor (2022) showed that when teachers were given the freedom to make decisions about their professional development, they were more likely to seek out opportunities for collaboration with peers. These collaborations often involved sharing ideas about best practices, co-teaching, and discussing effective instructional methods. Park and Choi (2023) found that teachers who had greater autonomy in designing and delivering their lessons were more likely to create engaging and interactive learning experiences for their students. In Rivers State, where many teachers face limitations in resources and infrastructure, promoting teacher autonomy can provide an opportunity to maximize available resources and tailor teaching methods to the local context. This approach can foster creativity and innovation in teaching, allowing teachers to adapt to the diverse needs of students. Encouraging teachers to take ownership of their work can lead to increased motivation and better job satisfaction, ultimately enhancing their performance.

Recognition/Career Advancement Opportunities and Teacher Job Performance

Recognition and career advancement opportunities are essential for improving teacher job Teachers' performance and the fostering of a positive work environment are critical to maintaining high levels of motivation, productivity, and job satisfaction. Recognition plays a key role in boosting teacher morale, and teachers who feel valued for their contributions tend to be more committed and dedicated to their profession. Recognition can take various forms, such as public acknowledgment, awards, or career advancement opportunities, which signal to teachers that their hard work and achievements are appreciated. Kim and Park (2019) found that teachers who receive consistent recognition tend to demonstrate greater job satisfaction and long-term engagement in their roles. This underscores the importance of recognition in maintaining a motivated workforce.

O'Brien and Waters (2016) confirmed that teachers who received regular recognition for their efforts exhibited higher levels of job satisfaction and were more likely to remain in the profession. Such findings support the notion that recognition not only boosts morale but also encourages teachers to strive for excellence in their roles. Career advancement opportunities, such as promotions, professional development programs, and leadership roles, can provide

teachers with a clear path for growth. Pérez and García (2018) found that teachers who perceive clear opportunities for career advancement are more motivated to engage in continuous learning and refine their teaching methods. Teachers who see a clear trajectory for their career are more likely to invest in professional development and take on leadership roles, further enhancing the quality of education. Similarly, Mazzoli and Stronge's (2017) suggested that teachers who perceive opportunities for advancement are more likely to be motivated to improve their teaching practices and remain in the profession long-term. Career progression, in this context, plays a crucial role in retaining talented educators. More-so, Nguyen and Tran (2021) noted that career advancement opportunities help teachers feel valued within their organization, which can result in lower turnover rates. Teachers who see a future in their career are less likely to leave the profession, which contributes to stability and continuity in schools.

Furthermore, recognition and career advancement opportunities are powerful motivators that can significantly improve teacher performance and job satisfaction. When teachers feel acknowledged for their efforts and see a clear path for professional growth, they are more likely to remain dedicated to their roles and continue striving for excellence. Spencer and Wilson (2020) indicated that recognition, when combined with clear career advancement pathways, enhances teacher job performance by promoting a sense of professional fulfillment and long-term commitment. This combination not only boosts morale but also helps retain talented educators who are invested in their careers. In Rivers State, offering recognition and career advancement opportunities to teachers is a key strategy for enhancing performance. The state can incentivize high-performing teachers by acknowledging their efforts and providing pathways for career growth, which would contribute to teacher retention and improved educational outcomes. Such opportunities would also help alleviate some of the challenges faced by teachers, such as low morale and limited growth prospects, making teaching a more attractive and sustainable career choice in the state.

Improving School Infrastructure and Teacher Job Performance

The quality of school infrastructure and the availability of support services are fundamental to enhancing teacher job performance. Teachers require a well-maintained and adequately resourced environment to effectively teach and engage with students. Poor infrastructure, such as outdated facilities, lack of basic amenities, and overcrowded classrooms, can significantly hinder a teacher’s ability to deliver quality instruction. García and Hernández (2019) noted that schools with modern infrastructure and well-maintained facilities provide a more conducive learning environment, which, in turn, enhances teacher performance and student outcomes. The presence of adequate classroom space and updated amenities not only reduces distractions but also promotes a sense of professionalism and pride among teachers, which reflects positively in their teaching quality. Kibe and Kamau (2016) found that schools equipped with modern infrastructure and adequate facilities foster a more supportive environment, leading to higher teacher satisfaction and improved student achievement. This suggests that investment in school infrastructure can have far-reaching effects on the quality of education provided.

Improving school infrastructure, particularly through the provision of adequate resources, plays a pivotal role in enhancing teacher job satisfaction and retention. Evans and Lopez (2017) demonstrated that teachers who work in schools with adequate resources, including up-to-date technology, functional classrooms, and supportive teaching tools, experience higher levels of job satisfaction and are more likely to stay in the profession. They argue that the physical

environment plays a significant role in teacher morale, which directly affects job retention. Teachers who feel supported by their school environment are less likely to experience burnout and more likely to invest in their professional growth.

Harris (2020) found that modernized schools with well-equipped classrooms and technology foster a culture of ongoing improvement, where teachers feel empowered to experiment with new teaching strategies and adapt to changing educational demands. Improving school infrastructure is essential not only for the physical well-being of the learning environment but also for supporting teachers in managing their workload and maintaining a healthy work-life balance. Wilson and Chang (2021) found that teachers who worked in schools with well-maintained facilities and adequate resources reported lower levels of stress and burnout. This is because the physical environment of the school directly influences teachers' ability to manage their workload effectively and create positive learning experiences. When teachers are not distracted or hindered by poor infrastructure, they can focus on teaching, building relationships with students, and engaging in professional development.

Improving school infrastructure and support services in Rivers State is vital for creating an environment that fosters effective teaching and learning. Many public senior secondary schools in the state face challenges related to inadequate facilities and support, which can negatively impact teacher performance. Addressing these infrastructural challenges and providing teachers with the necessary resources and administrative support will enhance their ability to perform their duties effectively and improve student outcomes.

Support Services and Teacher Job Performance

Support services are an essential component of administrative strategies aimed at improving teacher job performance. These services encompass a wide range of practices and resources provided by school administrations to ensure that teachers have the necessary tools, guidance, and environment to perform effectively in their roles. In the context of public senior secondary schools, support services often include administrative assistance, access to teaching materials, professional development opportunities, mentorship programs, and emotional support, all of which play a vital role in enhancing teacher effectiveness. Ndlovu and Moyo (2017) revealed that schools with effective administrative systems saw an increase in teacher satisfaction because teachers could focus on teaching rather than dealing with the administrative and organizational challenges that can often arise in school settings. This administrative support not only reduces teacher workload but also allows for more efficient school operations, leading to improved student learning outcomes.

Access to relevant and up-to-date teaching materials is another crucial element of support services. Teachers who have the resources they need to teach their subjects are more likely to engage students effectively and improve their instructional practices. Choi and Zhang (2020) found that teachers who are provided with high-quality teaching materials, including digital resources, textbooks, and classroom supplies, are better able to adapt their lessons to meet students' diverse needs. This access to resources not only improves the quality of teaching but also reduces teacher frustration and enhances job satisfaction.

Another important aspect of support services is professional development programs. These programs, which can take the form of workshops, conferences, or in-house training sessions, are designed to help teachers build new skills, improve their teaching strategies, and stay informed about educational trends and research. Martin and Brooks (2019) found that

teachers who participated in regular professional development programs reported higher levels of motivation and improved performance in the classroom. These programs are particularly vital in a rapidly changing educational landscape, where teachers must constantly adapt to new methods, technologies, and curriculum changes. The opportunity to grow professionally leads to greater teacher engagement and a deeper commitment to their roles. Emotional support is also an integral component of support services that can significantly impact teacher job performance.

The teaching profession can be emotionally taxing, and teachers who feel supported emotionally are more likely to remain in the profession and deliver high-quality education. Silva and Gonzalez (2021) highlighted the positive effects of emotional support in the workplace, noting that teachers who felt valued and emotionally supported by their school leaders reported greater job satisfaction and less burnout. This emotional backing from administrators and colleagues helps teachers to cope with the pressures of their job, ensuring that they remain focused and motivated to perform well in their teaching roles. Mentorship programs also play a critical role in supporting teachers, particularly those who are new to the profession. These programs connect novice teachers with experienced educators who provide guidance, share teaching strategies, and help them navigate the challenges of the classroom. Williams and Santos (2022) stressed that teachers involved in mentorship programs felt more confident in their abilities and more connected to their school community. This sense of belonging and support not only fosters personal growth but also enhances the quality of instruction across the school. Fostering a collaborative environment among teachers is another key element of support services. Kelvin (2023) showed that when teachers collaborate, share ideas, and reflect together on their teaching practices, they experience greater job satisfaction and improved teaching performance. Collaborative environments enable teachers to exchange best practices, solve common challenges, and provide mutual support, all of which contribute to professional growth and better outcomes for students.

The importance of these support services cannot be overstated, particularly in the context of public senior secondary schools in Rivers State. Teachers in this region face numerous challenges, including overcrowded classrooms, limited resources, and a lack of sufficient professional development opportunities. These challenges can hinder teacher performance, job satisfaction, and retention, eventually affecting the quality of education provided to students. However, implementing a robust system of support services, such as administrative assistance, access to teaching materials, professional development, emotional support, mentorship programs, and collaborative networks, can serve as an effective strategy to address these issues.

CONCLUSION

The implementation of effective administrative strategies is crucial for enhancing teacher job performance in public senior secondary schools in Rivers State. Addressing the challenges teachers face such as inadequate resources, overcrowded classrooms, and insufficient professional development opportunities administrative strategies can significantly improve the working conditions for educators. The provision of robust support services, including access to teaching materials, administrative assistance, professional development programs, and emotional support, is essential in ensuring that teachers are equipped to perform at their best. Similarly, fostering a collaborative environment and recognizing teachers' efforts can boost morale and enhance job satisfaction, further contributing to improved performance in the classroom.

Moreover, the role of school leaders and policymakers in Rivers State is paramount in driving these changes, as their commitment to addressing teachers' needs and creating a supportive school culture will directly impact both teacher retention and student achievement. The adoption of these strategies will not only address existing challenges but also create a sustainable foundation for educational success, ensuring that teachers are motivated, equipped, and supported in their roles. Therefore, the proactive implementation of administrative strategies represents a vital step toward improving the quality of education and the overall educational landscape in Rivers State

Suggestions

To improve the quality of education and create a more effective learning environment, several key actions can be taken. These suggestions aim to address critical areas that can directly impact teaching quality, student learning outcomes, and overall school performance. Here are some important measures to consider:

- Principals should ensure regular professional development programs are organized for teachers to enhance their teaching skills and knowledge.
- Government should allocate more resources to public schools to ensure that teaching materials are readily available for teachers.
- School Administrators should create systems for continuous monitoring and feedback on teacher performance.
- Education Ministry should introduce incentive programs that reward teachers for their exceptional performance.
- School Leaders should encourage collaborative teacher networks to promote the exchange of best practices.
- Principals should ensure workloads are balanced to prevent teacher burnout and stress.
- Educational Administrators should promote teacher autonomy in the classroom to foster creativity and innovation.
- Government should implement recognition schemes to celebrate the achievements of outstanding teachers.
- School Administrators should prioritize infrastructure development to ensure that schools provide a conducive learning environment.
- Principals should provide mental health and support services to teachers to promote their well-being.

CONFLICT MANAGEMENT FOR EFFECTIVE ADMINISTRATION IN NIGERIAN UNIVERSITY

Authur Paul WHYTE
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

Conflict is a natural phenomenon that occurs in all organizations, including University, the high economic recession that gives no hope of good standard of living, is prone to various conflicts among the staff, students, university authority, government and the society at large, it could be observed also that the quality of education in our society depend upon the effectiveness of administrators educational system and effective conflict management as critical for maintaining a peaceful and productive academic environment. The above background therefore prompted this study to perceive conflict as concepts and phenomenon that must be given the needed attention of peace, harmony and smooth management of Nigerian Universities were to be experienced. The article further ex-rayed the different conflict management strategies including avoidance, accommodation, competition, collaboration and compromise. However, the study finds that these strategies are not always effective in managing conflict, leading to negative consequences on University administration. The study recommends that Nigerian Universities adopt a more proactive and inclusive approach to conflict management, involving all stakeholders in the conflict resolution process.

Keywords: Conflict Management Strategies, Effective Conflict Management, Nigerian Universities, Leadership, Organizational Behaviour, Conflict Management Strategies, University Staff Students.

INTRODUCTION

Universities are complex organizations with diverse stakeholders, including students, faculty and staff, each with their own interest and goals. These diverse interest and goals can sometimes lead to conflicts which can negatively impact University administration if not effectively managed. Since the inception of higher institution in Nigeria, they had to cope with one form of crisis or the other ranging from students authority conflicts among others. Currently, the wave of conflict behavior has assumed such a dimension and magnitude that it has become necessary and urgent for educators, researchers, authorities and government to explain ways of understanding, interpreting and managing the problems of conflict in our nipped Nigerian educational system,

though an uneasy task but can be reduced or nipped down with the appropriate management strategies.

These chains of conflicts within the Nigerian Universities have led to gradual but steady disruption and sometimes eventual paralysis of academic activities on campuses. Since Ali Must Go in 1977, virtually every academic session has been disrupted by conflicts, currently, the Universities are yet to have the same resumption date for academic session. In 2003, there was ASUU strike for six months (January–June) that disrupted and wasted two semesters, which did not augur well for the students. Esero (1991) identified unhealthy conflicts between and among members of the Universities as one of the prominent problems militating against the progress of the Nigerian Universities System. Thomas and John (2001) stated that conflict is a part of life in any organization and managers must deal with it as it arises. They further explained that it is natural in any system whenever people must work together, different information and opinions are bound to arise.

Coserl (2000) describe conflict as a struggle over values and claims to scarce resources, power and status in which the aims of the opponent are to neutralize, injure and eliminate their rivals. Coffey and Raynold (2001) viewed conflict as the tension and energy including the achievement of goals. And for one to achieve his goals, there must be conflict, it can be good or bad, functional or non-functional for a person, group or organization who interact aggressively on a negative attitude to achieve their goals.

However, instead of the manager avoiding conflict or trying to eliminate them, they should learn how to manage them, therefore, the problem of this study emanated from an observation of high prevalent rate of conflict in Nigerian higher institution and the assumption that appropriate conflict management strategies and a better understanding of this issue could be effective in assisting the higher institution to face the challenges.

There are many factors that can cause conflict between University staff and students, University staff in this paper includes academic and non-academic staff. A conflict may arise because of personality clash, poor communication, change of responsibilities and change of leadership, dissatisfaction, disagreements and poor management style. This implies that conflict may arise between academic staff and students and conflict may also arise between non-academic staff and students (Ololube, 2017). Although it is best to avoid and prevent conflicts, conflicts however is something that is considered inevitable especially in environments where two or more people are working together to achieve University pre-set goals. Hence, there is the need for effective conflict management in the University among staff and students. Conflict can be very difficult to deal with, especially if University staff and students do not have sufficient experience in managing people and in managing self. It is not rate for University staff and students to get into a conflict or a disagreement. Research shows that conflicts occur as the normal part of university business operations progress and these are bound to happen sooner or later (Fatile & Adejuwon 2011). This paper on conflict management in the University among staff and students contains a multitude of information regarding conflict management, particularly on how to resolve conflict, how to mediate, how to manage team conflict and essentially, how to possess the skill needed to resolve and manage conflicts.

LITERATURE REVIEW

Conflict Management is a critical aspect of organizational behavior and various strategies have been employed by organizations to manage conflicts. The strategies include avoidance,

accommodation, competition, collaboration and compromise, Thomas (2011). Avoidance involve ignoring or avoiding conflict, while accommodation involve giving in to one party demands, competition involve using power to win conflicts, while collaboration involve working together to find a mutually beneficial solution. Compromise involves finding a middle ground that satisfies both parties (Brewer, 1999).

In the context of University administration, conflict management is critical for maintaining a peaceful and productive academic environment, conflict can arise between students, faculty and staff, as well as between different departments and faculties. Effective conflict management can help to resolve the conflicts and prevent them from escalating into more serious problem (Deutsch, 2000)

Conflict Management

In the school system like other organizations, conflict in the school system are regular occurrence with continuing cycles of funding different styles to manage them. Hence (Coser, 2000) maintained that conflict is a form of socialization. People in organizations have both personal and role preference about the organization actions and policies, thus the presence of conflicts is not necessarily a sign of trouble, it may be functional for the organizations as well as conflict may lead to a more intensive search for ways of doing things. The best or most efficient, most creative institution is not necessarily the one that is conflict free, it is most likely to be the one which is characterized by some "optional" level of conflict. However, a conflict exist whenever incompatible activities occur and action that is incompatible with another action prevents, obstruct, interferes with injuries, or in some ways make that action less effective or make it impossible for others to carry out his desired action. a conflict situation therefore, is one in which the parties involved are unable to iron out their differences.

Oyedabe (2005) defined conflict as partly inevitable and endemic form of sickness in the body social. Whereas (Pomdy 2021) viewed conflict as a source of tension that occurs at the early stage of any organization where there is group development with high level of disagreement over goals planned and members roles. Conflict management on the other hand can be defined as a process of finding solution to any form of strive, controversy and antagonizing so as to bring about co-operation among members of staff and students in the pursuance of the goal of the institution. Conflict can lead to more effective and appropriate adjustments.

Conflict management recognizes that executive have aggression to expand, to withstand a fair amount of anxiety, hence, the way conflict is managed rather than suppressed, ignored or avoided contributes significantly to an institution's effectiveness and individual satisfaction. Therefore, conflict is a reality in any social system, it is not avoidable. The adaptive method must be adopted in the management of conflict since it is impossible for all members of any organization to perceive the goals and aspiration in the same way. However, the astute administrator should be able to distinguish between functional conflict in which confrontation and disagreements are geared towards achieving the goals of the institution and the undesirable rather than dysfunctional conflict which should be eradicated. Therefore, according to Ibukon (1997) no worthy leadership accepts conflict as its face value without first analyzing it to distinguish between healthy disagreements and crippling unacceptable one. Where conflict is supportive to the goals and yearning of the institution, it should be considered, directed, resolved and encouraged, otherwise, it should be nipped. However, this article resists its definition to those disruptive and non-conforming action among members of the Nigerian Universities.

Conflict management is not identified on the loudness or intensity of people's voices when arguing or on the glaring look of people's faces. Conflict itself already means a clash or a disagreement so you cannot expect people in a conflict to be smiling at each other and showing pleased, blissful dispositions. Even with the level of intensity of the conflict, the a continuing need to negotiate and compromise in the long run between make the parties involved comfortable and do not feel that it is intimidation or coercion. The use of strong words and heavy statements may be present but the purpose is to persuade and influence and not to intimidate or impose harm. And because it is constructive, communication is a two-way street between both parties (Agbonna et al., 2010). There is openness to change and manifests a rational approach. When people employ attitude of curiosity, humility, and respect, conflict in the university between staff and students are largely managed. The conflict itself is also based mainly on clear ground rules and processes.

According to Adeyemi et al., (2010) it is not difficult to achieve conflict management and get the disagreement resolved in no time. It is vital for staff and students to refrain from being aggressive and unforgiving. Instead, be compassionate and understand that people make mistakes. Let the other party speak for what they think is right. Do not attempt to monopolize the conversation, but allow a give and take process in the exchange of ideas. Furthermore, the choice of carefully choosing the words used and make sure that idea is rightly conveyed is vital and that intentions are well meant (Oladele, 2011). Rude behaviour and condescending remarks in order to gain mutual respect tend to agitate and promote conflict. If the situation is becoming negatively intense, it is expected that parties should drop the argument and set another time to discuss the problem instead.

Conflict management generates high-quality decisions in the institution. With respect to viewpoints, everyone feels heard and respected (Albert, 2010). This promotes a diplomatic environment among university staff and students. When university staff and students are exposed to a healthy kind of work and study environment, they learn to become more mature and co-exist especially in dealing with problems achievement, performance and adeptness. A healthy and productive work and study environment is then created. Staff and students build good work relationships with each other. Commitment and collaboration are fostered towards each other. To the institutions, conflict management results in significant productivity from the people and a considerable savings in time, effort and effective management of resources (Adesina, 2010). Potentials for conflicts between university staff and students are multifaceted within the university system. Some of these are indicated below.

Continuous Competition for Scarce Resources

Research, administration, teaching, student amenities, staff pay and other welfare services all have their claims on the limited resources at the disposal of the university. Hence, there is deprivation (relative or absolute) of the needs of all the groups within the system. The consequences of inadequate provision of financial resources to the university system are the decay of structures and the decline in services and functions. According to Enyi, (2001), there is direct connection between deprivation which leads to frustration, and conflict in the university. The conflicts which result from the frustrated are often directed against the defined aggressors or perpetrators of the undesirable state of affairs. Gross mismanagement of available resources could also result in conflicts. These conflicts could take the form of strikes, demonstration, boycott of lectures and violent riots (Hart, 2000).

Perceived Goal Incompatibility

The potential for university staff and student conflict is likely to be high where groups or individuals perceive and interpret the same phenomenon differently. In the university system, attention needs to be focused on the critical point of contact between the staff and the student. The psychology of learning suggests that students will not learn well unless they are actively involved in the process, and consequently accept responsibility for their learning activities. So, if students do really feel that they are learning, much else will be forgiven. If not, they need to be listened to; otherwise, they might engage themselves in other activities they consider worthwhile which could result to conflict (Lagat, 2013).

Autonomy and Academic Freedom

Autonomy drives are those when one group either seeks to exercise control over some activity that another party regards as its own domain or seeks to encapsulate itself from such control (Kingala, (2000). Academic freedom, according to Lagat (2013) connotes freedom to organize the university, design and teach courses, associate with others, project, imbibe, exchange and hold ideas without any fear of harassment or victimization, and challenge established orthodoxies without any fear of contradiction, all in the pursuit of truth. However, events such as outright ban of university staff and students' associations fear of premature retirement, or rationalization of programmes as a result of government overregulation all result in decreasing autonomy, decline in morale, goal displacement and ultimately results to staff and student conflicts.

Management Style of Universities

Though a university is an academic enterprise, a lot of academic effectiveness rests on administrative support machinery, thus, the management competencies of university managers determine to a large extent, the dimension and severity of conflicts within the university, irrespective of the origin of the conflict (internal or external). University staff who have tendencies to authoritarianism and dogmatism are particularly conflict-prone. In university management, eight areas are identified for the goal of quality education to be attained (Mohamad, & Raman, 2011). These areas are finances, students, academic programme, committee system, personnel, welfare, reward system and physical facilities. Any significant lapse (s) in any of these areas might lead to a university conflict between staff and students.

Role Ambiguity/Role Dissatisfaction

Staff and student university conflicts occur when the role prescriptions are vague and uncertain resulting from differences in values and lifestyles. Because of the concentration of young adolescents, possibly experiencing freedom and independence for the first time, the university campuses are filled with and threatened by, noise, aggressive styles of dress, sexual behaviours, aesthetics, secret peer associations and cultism (Msila, 2012).

The imposition of rules and regulations trigger the young to answer back by demanding for, and claiming, their democratic rights, culminating in minor conflicts or even ghastly conflict between

the students and the university staff. Moreover, national issues, especially with political undertones, do bring about conflict. Policies such as privatization, university autonomy and democratization of university management usually spark off controversies. Politics especially on campus relating to appointment of key officers such as Vice Chancellor appointment also result into university staff and student conflicts (Nkwonta, 2014). These conflicts often lead to disruptions of academic activities and university calendars. Similarly, causes of role conflict in the university includes work interdependence, differences in performance criteria and reward systems, differences in units and subunits orientation and goals and differences in status and jurisdictional ambiguities.

Conflicts Management in Nigerian Universities

Efficient and effective management of conflicts is fundamental to the development of any society, but the prevailing situations in Nigeria constitute a reversal of this reality. Managing university conflict between staff and students towards proactive and constructive action is the best approach in resolving conflict in the university. When staff and students conflict arises, we need to be able to manage them properly, so that it becomes a positive force, rather than a negative one, which would threaten the individual or group (Uwa, 2014). If staff and students conflicts arise and are not managed properly, it will lead to delays of work, disinterest and lack of action and in extreme cases, it might lead to complete breakdown of the system. In resolving university conflict, developing a constructive communication process and influential conflict negotiator's personality are very important. No doubt, schools cannot avoid experiencing one conflict or the other but a great deal of such conflict can be managed and be guided from disrupting university's efforts towards attaining its manifest and latent goals if the conflicting parties are systematic in the way they communicate their grievances, situation of the conflict and their readiness to negotiate for peace and if the negotiator mediating the resolution process is of good personality (Omboko, 2010). University staff and students conflict management in schools demands appropriate leadership style of the school administrator or chief executive.

University leadership and administrative expertise remains central. A more participatory and supportive style of leadership and management behaviour is likely to assist in conflict management (Ebong, 2013). Ebong (2013) articulated three strategies of peaceful crisis resolution between and among warring parties; mediation, arbitration and reconciliation. See figure 1.

Figure 1: Conflict Management Strategies

Adaeze (2014) also argued that each of the approaches of the above mentioned strategies could be used by universities to resolve crisis among and between aggrieved parties. Clarification of goals and objectives is also vital. The clarification and continual refinement of goals and objectives, role definitions and performance standards help to avoid misunderstanding and conflicts. Focusing attention on super-ordinate goals that are shared by staff and students in conflicts may also help to defuse hostility and lead to more cooperative behaviour. Providing valid information and avenue for expression of views Information is needed to avoid blocking of communication flow that may lead to differences in perceptions (Agbonna, Abdulraheem, & Olayinka, 2010). Effective information management system (IMS) is essential to provide requisite information which minimizes delays and ensures maximum utilization of resources. Most Nigerian universities lack effective computerized management information system for capturing, processing, storing, retrieving and disseminating relevant information (Ezegbe, 1997).

There is need for better understanding and cooperation between the University system as a whole and the government. The decision-makers and their advisers need to be better informed on how the universities operate, while the university community needs to acquaint itself with the ways of the government, generally. Invariably, the universities will neither develop attitudes of hostility or servility towards the government, nor the government intolerant of the universities. Beggy, (2003) highlighted some conflict resolution measures such as the use of authority, and command, problem solving, appeal to superior organisation goals, changing the structure of the organisation, prevention and avoidance, expansion of opportunities and resources, conciliation and agreement and changing the behaviour of people involved in conflict through dialogue.

Conflict management between university staff and students shows that all conflict cannot be completely eliminated, but could be managed and its adversity reduced. It involves acquiring the technical skills of conflict resolution which includes avoidance, accommodating, compromising, collaboration, and effective communication (Digvijaysinh, 2013). Effective conflict management strategy of the key people of a conflict enables him to resolve conflict by involving staff and students affected by the conflict to change their view, gain from the conflict and be effective in their job performance in terms of their communication, maintenance of classroom discipline and supervision of students' academic activities (Katumanga, 2000).

In the university, effective communication is a strategy which allows free flow of information between staff and students. It entails providing necessary and timely information to staff and student on issues, administrators adopting the right communication skill, not using abusive words, not attacking, not threatening or making accusation. Avoidance is a strategy in which one tries to avoid conflict; it entails allowing the conflicting issues to end on its own in order to avert the challenges that may arise when the conflict is confronted. Accommodating strategy involves one accepting the demand of others (Bodtker & Jameson, 2001). It entails overlooking some issues so as to maintain good relationship with subordinates in future. Here, issues are accommodated in order to resolve or manage conflict. Compromising is a strategy that involves negotiation. It has to do with pleading with parties involved in conflict to shift grounds in order to reach or establish common grounds or trade off that will be acceptable by both parties. Collaboration is a strategy used to manage conflict. It entails conflicting parties working together and conflating ideas to ascertain the result or outcome that is good for them. Here conflicting issues are confronted; it is important when the bone of contention cannot be compromised (Boma, 2018). See figure 2.

Figure 2: Conflict Resolution

Stages of Conflict

- Latent conflict exists is almost "every department in every college and university in the country." The reasons that could lead to conflict (competition for scarce resources, desires for autonomy and independence, inequitable work load, etc.) exist but are suppressed.
- Perceived conflict exists when there is a perception of conflict, but it is based on incorrect or incomplete information. Improved communications can nip this kind of conflict rather easily.
- Manifest conflict, or open conflict, is marked by open aggression, generally verbally though on rare occasion, there have been physical altercations.
- Conflict aftermath occurs when hostilities cease. Sometimes, one side is victorious; other times, there has been an outside intervener; and at times, there is a genuine resolution.

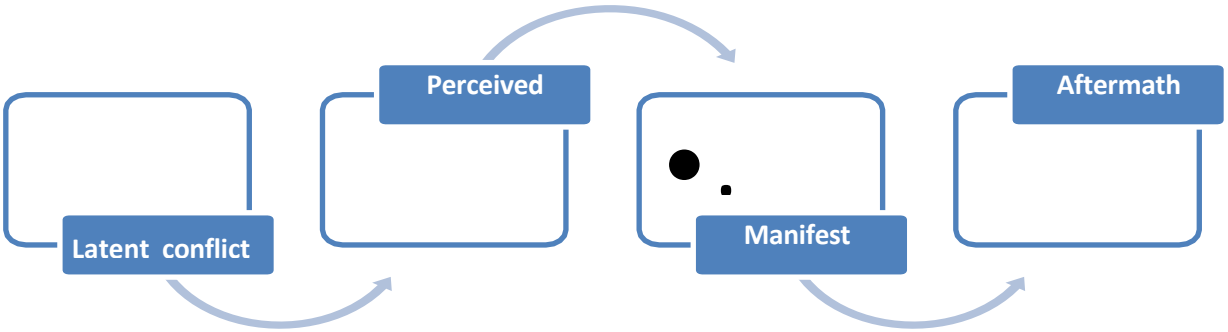

Figure 3: Stages of Conflict

Cognitive discrepancy of Conflict

Cognitive discrepancy is a condition that occurs when each conflicting group develops totally opposite explanation for the causes and situation of the conflict. Messages of the situation of conflict when developed on propaganda and cognitive discrepancy tends to breed rumour, it distort third party's understanding of the conflict and may hamper its involvement in there solution of the conflict. Communicators in school crisis management needs not conceal the truth. Their messages for peace, their assurance of restoring power and their promise of cooperation towards developing the school should be sincerely communicated (Bass, 2003). The conflict negotiator in school conflict and insecurity situations should be of personality that can convince and assure the conflicting parties of the sincerity of the conflict resolution process and that of his involvement in the resolution. Messages of resolution and peace in school conflict management need to be timely delivered. This is necessary to give a clear stance of the conflict management team and the progress made so far in resolving the conflict (Nnam, 2013).

Delivering the message early can help third party peace negotiators to project where to direct their intervention. Such timely communication, most especially when it is positive and reveals that the stronger of the conflicting parties will work for peace and for the interest of all, alleviate fear and hinder the spread of rumour or fear of victimization, it reduces tension in conflict situation (Bloomfield & Reilly, 2001). Also, in school crisis situation, school authorities can work on communicating, quickly enough, their effort to return peace into the school and to meet the demand of the opposing group where necessary. Delivering the message first and earlier than that of the opposing group could make the first communicator's message have more impact than that of the opposing group would latter.

School authorities should be more democratic in handling students' affair; involve student in indecision-making process especially on issues that borders on them. Another effective way of curbing students' crisis is calling students for dialogue. A study carried out by Folger, Marshall and Randall (2012) revealed that maintaining a very cordial relationship between the school authorities and the students as well as involving students indecision making process have been the most effective strategies of curbing students' crisis. Also, Msila, (2012) posited among other things, greater involvement of students indecision-making processes as a way of reducing campus unrest. In order to stamp out crisis from schools, Uwa (2014) posited that there should be effective leadership among school authorities. Nigerian leaders as well as management of tertiary institutions in the country also need to create avenues for discussing and designing popularly accepted non-violent strategy for managing conflicts in the tertiary institutions in the country. Again, it is recommended that authorities of tertiary institutions should always embark or focus more on preventive strategies in order to reduce crisis in schools rather than curative measures.

Also the school conflict manager must value peace and the spirit to promote co-existence before he can successfully persuade the conflicting parties' to work towards resolving the conflict. A school conflict manager that values peace probably would see conflict resolution as a give-and-take exercise. Though, valuing peace does not mean to compromise school objectives or compromise the exclusive right of the school authority to be the custodian of the utmost power in the administration of the school, yet, the utmost power can be judiciously be applied when the holder of the power values peace and has the personality of compromising a little to be able to retain peace, knowing full well that there is conflict resolution (Oladele, 2011).

The arbitrator should be able to display rich experience and sound judgment of conflict situation before his intervention can be effective. These is why it is important that the conflict managers be a person that has been involved in resolving school conflict and a person that may have been personally trained in the area of human management. In the work of Bercovitch, (2011), he recommended that universities can offer standalone courses on conflict management and resolution, peace education, civic education, good governance, basic and human rights, separation of powers of government, the legislature, and the judiciary, bill of rights, social justice, respect and the rule of law, and virtues of peace, tolerance, patience and respect for life etc for all members of society. Alternatively this paper recommends teaching peace as a General Nigerian Studies (GNS) course, with a view to making Nigerian universities a location for the promotion of dialogue, understanding and tolerance.

Effective Communication Strategy

Effective communication strategy is one of the university staff and students conflict management strategies in the university. Ogbona, Yusuf, and Onifdade (2013) posited that institutions have to employ communication strategy to resolve conflict, this is actualized or achieved by breaking down barriers or resistance among workers and promoting their trust. Communication is a rational process which involves initiating messages using symbols, signs to express meaning, create similar understanding and influence actions. It is a process or means by which information is shared among individuals through a common system of symbols, signs or behavior (Ekundayo, 2012). Ndum and Stella (2013) posited that groups in trying to actualize a common goal encounter internal and external problems, and one way to resolve or ameliorate the challenge is via communication. It is necessary to state that no positive action can occur in organization in the absence of effective communication. University managers must develop the right channel that will aid effective communication for efficient functioning of the school.

Albert (2010) describes effective communication as the best strategy by which conflict can be resolve, because it makes every member understand the kind of communication that could result to problem solving. Communication as an effective conflict management strategy is important in the daily routine or activities of the university, hence university manages conflict in the university by providing the right and adequate information to both staff and students in the school. It is imperative to say that the dissemination of accurate and timely information in time of conflict is a veritable tool for conflict management in the school. Effective communication strategy also involves negotiation between two parties involved in a conflict. It could also be a mediatory role undertaken to resolve conflicts situation. In effective communication, there is a promotion of an interaction-based approach through negotiation, enabling the negotiators to see the connection between the situation and the outcome (Adesina, 2010). When negotiations have integrative possibilities, when the negotiators tend to look for as much of the share of the outcome as possible; this enhances the creativity of the negotiators. Furthermore, Idowu and Olugbemiga (2018) claims that cognitive ability is an essential ability to hold as a negotiator and defines it as the ability to predict behaviour and outcomes.

Confrontation Strategy

Confrontation techniques aim at finding a mutually acceptable and enduring solution through collaboration and compromise. It is done in the hope that conflicting parties are ready to face

each other amicably, and entails intercession, bargaining, negotiation, mediation, attribution and application of the integrative decision method, which is a collaborative style based on the premise that there is a solution which can be accepted by both parties. It involves a process of defining the problem, searching for alternatives and their evaluation, and deciding by consensus Ezegbe, C. (1997). From this insight, the university and institutions stake holders should be well equipped with various methods and strategies for conflict management in their bid to solve conflicts in schools. Whenever conflicts occur, conflict management strategies should be utilized to avoid supplementary damages.

Causes of Conflict in Higher Institution

In any organization, there are many causes of conflicts. Henry (2009) observes that conflicts within an individual usually arise when a person is uncertain about what task is expected to do, if not clearly defined by the supervisor or the person in charge. Furthermore, if the task of individuals working as a group is not clearly defined by the management, they will lead to more conflicts. Conflict between individuals may results from role-related pressures. Conflicts would arise between individuals and groups if the goals were not specified for individuals within the group. Additionally, according to the literature, there are innumerable origins of industrial dispute and each produces its own variety of effects. In general, Duke (1999) identifies six major sources of industrial conflict and they include:

- The interpersonal disagreements that arise when one person is experiencing individual stress.
- The problems resulting from role conflict, a condition that occurs when there is a clash over one's role in the organization.
- The power struggle that puts groups against one another to achieve their own selfish objectives.
- The misunderstanding and disagreements from differentiation, i.e. the case that arise because people approach common problems from very different orientations.
- The interdependence requirements for collaboration which if not extensive and balanced between the parties cause communication and interaction breakdowns which in turn, if critical, lead to more intensive conflicts.
- The external pressures from forces outside the enterprise that breed internal pressure as the system seeks to adapt but not to disrupt its internal orders.

There is a need to look at the causes of conflict so that they can be better understood, controlled and managed. Conflict is seen as part of the University experience, Corwin (2002) saw the complexity of the Universities as a source of conflict. He said the existence of different forms of governance either political, professional or bureaucratic promote role conflicts and tensions within Universities. Ogunsaju (1999) attributed some of the causes of the crisis to the use of drugs in schools, teachers, militancy, fallen academic standard, student unrest, unnecessary increase in students population, financial instability, as well as incessant closure of our tertiary institutions by the government. Erero (1999) identified internal and external politics, ethnicity and what he called the "mafia syndrome", leadership styles of heads and the management in which they got to office as important sources of conflicts in Nigerian Universities.

Sandu (1992) listed infrastructure inadequacies, presence of the public on campuses, the management style of University authorities, national issues and government responses as manifest causes in the Universities. Oyebade (1995) asserted that conflicts generally occurs when two or more opposing goals oppose each other by vying for support or resources to ensure that the positions prevail. Other causes include change in delegation, change in status and change in goals. Conflict can be brought about by an organizational system that does not allow enough freedom or by a class of value caused by job requirement. Aminu (2000) identified poor financial management of the University administrators as a source of conflict between the University management and academic staff union.

There had been conflict between academic staff and university authorities over teaching and learning activities of lecturers and students. The union stated that the academic environment of the University Lecturer was inimical to teaching and research work, this situation brought about the lackadaisical attitude of some lecturers to their work and some even seek greener pasture in other countries.

The most sensitive of these factors mentioned was the non-implementation of favourable government circulars and non-payment of salaries and other entitlements, this seems to agree with the view of (Alaro, 1994) who asserted that the present crisis in higher education has more to do with finance than with management. Conflict do occur on the way and manner some vice-chancellors were appointed into offices as against the traits cherished by the academic culture. However, conflict seems to be a concurrent issues in the University system but the paper delved into the ways of proffering effective resolution of management to this distractor syndrome "conflict".

Conflict resolution strategies

Conflict resolution according to Alper, Tjosvold & Law (2000) involve implementation of strategies to limit the negative aspects of conflicts and increase the positive aspects of conflict at a level equal to or higher where the conflict is taking place. The aim of conflict management is to enhance learning and group outcomes, that is, effectiveness of performance in organizational setting. It is not concerned with eliminating all conflicts or avoiding conflict. Rahim (2001) says that conflict resolution strategy is conceptualized as the methods and processes involved in facilitating the peaceful ending of conflict and retribution. He added that committed group members attempt to resolve group conflicts by actively communicating information about their conflicting motives or ideologies to the rest of the group (e.g., intentions; reasons for holding certain beliefs) and by engaging in collective negotiation. He also identified conflict resolution strategies and explained them as follows:

- Accommodating: The accommodating strategy essentially entails giving the opposing side what it wants. The use of accommodation often occurs when one of the parties wishes to keep the peace or perceives the issue as minor. For example, a business that requires formal dress may institute a "casual Friday" policy as a low-stakes means of keeping the peace with the rank and file. Employees who use accommodation as a primary conflict management strategy, however, may keep track and develop resentment.
- Avoiding: The avoidance strategy seeks to put off conflict indefinitely. By delaying or ignoring the conflict, the avoider hopes the problem resolves itself without a confrontation. Those who actively avoid conflict frequently have low esteem or hold a

position of low power. In some circumstances, avoidance strategy can serve as a profitable conflict management strategy, such as after the dismissal of a popular but unproductive employee. The hiring of a more productive replacement for the position soothes much of the conflict.

- Collaborating: Collaboration works by integrating ideas set out by multiple people. The object is to find a creative solution acceptable to everyone. Collaboration, though useful, calls for a significant time commitment not appropriate to all conflicts. For example, a business owner should work collaboratively with the manager to establish policies, but collaborative decision making regarding office supplies wastes time better spent on other activities.
- Compromising: The compromising strategy typically calls for both sides of a conflict to give up elements of their position in order to establish an acceptable, if not agreeable, solution. This strategy prevails most often in conflicts where the parties hold approximately equivalent power. Business owners frequently employ compromise during contract negotiations with other businesses when each party stands to lose something valuable, such as a customer or necessary service.
- Competing: Competition operates as a zero-sum game, in which one side wins and other loses. Highly assertive personalities often fall back on competition as a conflict management strategy. The competitive strategy works best in a limited number of conflicts, such as emergency situations. In general, business owners benefit from holding the competitive strategy in reserve for crisis situations and decisions that generate ill-will, such as pay cuts or layoffs.

Sources of Conflict

Fajana (2000) identifies two sources of conflict and they include:

- Internal Sources: This is so called because they refer to factors which are inherent within the framework of an organization. Fajana (2000) states that the major prime factor of internal sources of conflict is the "Opposing interests" of industrial actors. These "divergent interests" will bring about conflict in attempts by the two parties in organizations to try to share what Ajibade (2004) calls "industrial cake". Apart from the above, it is another statement of fact that there is usually "power relationship" between the two actors in an industry which no doubt produce conflict and make such inevitable.
- The External Sources: These are so called because they are outside the four walls of an organization. It may occur when the third party intervention to industrial dispute becomes one sided or biased. A good example is where government as the third and regulatory party tries to formulate policy or enact laws that favour one party at the detriment of the other. Such may generate conflict.

Process of Conflict

Conflict is a process in which one party suggests that its interest is being opposed by another party. As a role, people see only the observable part of conflict - angry words and actions of opposition. But this is only a small part of the conflict process (Mcshane & Glinow, 2008).
The conflict process consists of five stages (Robbins & Judge, 2007):

- Potential opposition or incompatibility;
- Cognition and personalization;
- Intentions;
- Behaviours; and
- Outcome.

Influences of Conflict on the Goals of Higher Institution

Conflict stir creativity and stimulate invention and even leads to improved decision making , Ibukun (1997). This confirmed the view that conflict today is not only unavoidable, but sometime desirable. This is to re-affirm that conflict can be functional to the organization if not carried to an extreme. Conflict can also be dysfunctional which can lead to loss of lectures and eventual partial completion of programmes, all of which work against the goals and functions of the institutions. The goal of higher institution as stipulated by National Policy on Education (NPE) 1984:14 revised are pursuance of teaching, research, dissemination of existing and new information and service to humanity.

Institutions are closed down occasionally where academic activities were paralyzed for a whole year or semester, this affects the students level of gradual development since most of them must have forgotten what they were taught before resumption, hence defeating the goal of higher attainment. Convocation and other institution functions are sometime disrupted or postponed in extreme workers demonstration, causes of threats to life has been reported as stated by Ojo (1995), while destruction of lives and property were common with the students crisis (Aina, 1998). However, dismissal or suspension of staff are unusual, tough it could occur occasionally by the order of the management or government as in the case of May, 1999 where most of the staff members that had conflict with the institution authorities at one time or the other were dismissed or suspended, in some cases of the Nigeria universities.

Conflict Management Strategies

In the early years of existence of higher institutions in this country, there was little or no known crisis (Ladipo, 1997). University environment was fairly placid, calm, predictable, untroubled and relatively peaceful. Today, the environment is tensile and turbulent due to so many extraneous variable such as power tussle and poorly managed conflicts among others, hence to address this issue it requires principles, strategies and tactics.

Different management strategies have been identified by different researchers. Blak & Monton (1998) identified conflict management strategies of forcing, structural changes, avoidance, compromise and smoothing, while Dunharm (1984) identified conflict management strategies suppression, smoothing, avoiding compromise, third party intervention, cooperation, democratic process, job rotation and confrontation. Meyer (1994) identified that effective communication was the best, since it would make the group aware of the kind of communication that lead to problem solving. However, Ibukun (1997) identified problem solving, appeal to superior organizational goals, prevention and avoidance, expression of opportunities and resources, use of authority and command, changing the structure of the organization, compromise and agreement as the management strategies for conflict resolution. This article

identified management strategies under two broad categories for conflict resolutions, there are: (i) preventive and (i) curative.

Preventive involve deliberate and careful monitoring of events and situations and staking steps to avert situations that could lead to conflict through dialogue, while the curative strategy involve finding solutions to conflict when they inevitably occur using force, emergency and delay approaches. Burnel et al (1990) found that the preventive strategies (dialogue) are used by administrators of organization in studies done in advanced countries, while Oyebade (1995) found out the autocratic approach mixed with dialogue were used if the Universities studied to maintain the policies and regulations from government and national university commission. Though the purpose of leading seems to be a common element, but the process and conflict strategies applied to resolve crisis vary from one institution to another hence the need to apply the most workable conflict management strategy.

CONCLUSION

The institution of higher learning like any formal organizations have no antidote for conflict. They have experienced more conflict than other organizations because of their peculiar nature. A conflict free organization is likely to be static without much challenges for group members, however, healthy conflicts such as common concern for goals attainment of a system, willingness to see other viewpoint, conflict centres on issues and increase in communication should be encouraged. Unhealthy conflict such as selfish concern to win own points, closed mind to others, conflicts that centred on personal and decrease in communication should be discouraged for effective management.

Since conflict is an inevitable syndrome in Nigerian higher institutions the following recommendations would be useful hints to the entire university system. A well organised and comprehensive conflict management programmes or training should be incorporated into a leadership training package for all appointed heads of tertiary institutions by the National Universities Commission. The leaders need to be well versed in the various techniques of managing conflicts and fostering peace. Few of the tertiary institutions administrators interviewed claimed not to have received any previous training in conflict management when researchers such as Oyebade (1995), Ibukun (1997), and Ladipo (1997) emphasized the positive influences of training in conflict resolutions and management. It could be concluded that the authorities are allowed to learn on the job during which they would have made some errors that could be very costly. The Nigerian higher institutions are too sensitive for a trial and error approach.

However, the article is of the view that no single strategy is always best, the authorities should be trained to know when to apply a particular strategy. Strategies such as preventive (dialogue), curative (emergency, force, delaying) could be built in the systems to forestall conflict. Authorities should see to the proper maintenance of the available facilities. All the sub-groups in the institutions should be involved in making policies that affect them since higher institutions are run by committee system. Greater flow of information and dialogue that can create a sense of collective responsibility between the various groups should be promoted. Quarterly meetings between the authorities and staff can go a long way in anticipating crisis and in coming with early solutions.

Authorities should play their supporting role as objectively as they can without appearing to be defenders of government as opposed to the institutions interest, and ensure that those

employed to work in the higher institutions are matured. The Federal Ministry of Education and national Universities Commission (NUC) should organize conferences for the heads of institutions to rub minds the heads of institutions that experience less conflict to share from the techniques adopted. The higher institutions should be well equipped in terms of facilities and human resources by the government and management so as to compare favourably with their counterparts all over the world. Government pronouncement on welfare schemes should be backed up with the financial requirements.

National Universities Commission should promulgate a law binding incentives strike by the universities staff for example strike that exceed a month should carry a penalty of no work, no pay. NUC should equally encourage every department of each institution towards the strategic planning approach to keep all the sub-groups within the institution constructively busy. For example at Federal University of Technology Akure, a department produced fuel through the use of sawdust which were regarded as waste from the sawmills. According to Ndayako (1997), Oyebade (2000), and Adebayo (2003),authorities of the institutions should generate more funds through ventures such as transport business, commercial farming, consultancy services, blocks making, food drink production, computer centres, bread making as courses dictate to supplement government grants in order to meet the institutions expenses. Above all, the staff and the authorities should maintain a cordial relationship to avoid conflict occurrence. Staff should not view the authorities as buffer between themselves and government but show patience, trust and understanding to challenges at hand.

Suggestions

From this paper, the following suggestions have been put forward for conflict management between university staff and students in Nigerian Universities:

- Actual causes and nature of conflict between university staff and students should be identified before applying the available conflict techniques, strategies and methods at their disposals.
- University managers and administrators should endeavour to meet with the parties involved in the conflict situation at the different point in time and thereafter bring the parties together for the full reconciliations.
- University managers and administrators should be very careful while reconciling the conflicting parties, so that their actions may not be seen to be biased in their judgments.
- In the conflict management of university staff and student's managers and administrators of the university should always endeavour to avoid ambiguity while communicating with staff and students during briefing and management of conflicts.
- University managers/administrators should display good sense of leadership spirit and styles among the entire staff of the school at all times.
- The management of the university should give room for bargaining rather than using coercion.
- Conditions that promote effective conflict management should include consideration of a wide range of alternative solutions, a cooperative climate, an organized and orderly process, and avoidance of artificial conflict-reducing devices such as voting or relying on a leader to make the final decision.

- Conflict management should not be seen to connote a rigid approach that suits all situations, rather, it should involve a series of concerted efforts to prevent and or arrest a seemingly serious crisis

THE BURDEN OF LEADING SCHOOLS IN TIMES OF CRISIS: A CRITICAL ANALYSIS

Awajimokpom Godspower EBOH
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

Leading schools during times of crisis presents an immense and multifaceted challenge, requiring resilience, adaptability, and visionary decision-making. This paper explores the emotional, administrative, and pedagogical burdens shouldered by school leaders amid crises whether pandemics, natural disasters, or socio-political upheavals. It examines how crises amplify existing systemic inequities, intensify workload pressures, and demand rapid policy responses while maintaining educational continuity. School leaders navigate conflicting stakeholder expectations, resource shortages, and heightened emotional distress among staff and students, often with limited support. The analysis highlights the paradoxical role of leadership in crisis: while expected to be stabilizing forces, principals and administrators frequently operate in environments of uncertainty, where traditional leadership models may prove inadequate. Through a review of global case studies, this paper identifies key strategies employed by effective leaders, including distributed leadership, trauma-informed practices, and adaptive communication. However, it also critiques systemic failures that exacerbate leader burnout, such as inadequate training, insufficient funding, and bureaucratic constraints. Conclusively, this study calls for a reimagining of crisis leadership in education, emphasizing sustainable support structures, mental health prioritization, and policy reforms to empower school leaders as catalysts for resilience.

Keywords: Crisis Leadership, School Administration, Educational Equity, Resilience, Trauma-Informed Practices, Distributed Leadership, Policy Reform, Burnout, Pandemic Response, Systemic Challenges.

INTRODUCTION

Imagine being tasked with steering a ship through a hurricane while simultaneously comforting terrified passengers, repairing a broken engine, and charting a new course - all without a map. This is the reality school leaders' face during times of crisis. Whether navigating global pandemics, natural disasters, social upheavals, or acts of violence, principals and administrators become the linchpins holding fragile education systems together, often at tremendous personal

and professional cost. The COVID-19 pandemic laid bare this harsh truth, transforming school leadership overnight from routine administration to high-stakes crisis management (Harris & Jones, 2020; Netolicky, 2020). Yet crises in education are not novel phenomena - from the 2008 financial crisis that decimated school budgets to recurring school shootings that force leaders into unwanted roles as security experts, the 21st century has demanded unprecedented resilience from those guiding our schools (Smith & Riley, 2012; Wang et al., 2023). This critical analysis pulls back the curtain on the invisible burdens shouldered by school leaders during these defining moments, revealing a complex interplay of heroic adaptability and systemic failure that demands urgent attention.

The emotional labor of crisis leadership remains one of its most overlooked dimensions. School principals during COVID-19 became de facto mental health counselors for traumatized staff, surrogate parents for anxious students, and public lightning rods for frustrated communities; all while processing their own pandemic-related stresses (Mahfouz et al., 2021; Pollock, 2022). A 2023 study found that 68% of school leaders reported clinical levels of anxiety during the pandemic's peak, with many describing the experience as "leading while drowning" (Kim & Asbury, 2020; Wang & Hofkens, 2024). The psychological toll extends beyond health crises; principals in communities affected by school shootings describe years of compounded trauma from managing grief while maintaining normal operations (Lowe & Gale, 2022). This emotional taxation occurs alongside the cognitive burden of making impossible decisions with incomplete information whether to keep schools open during a public health crisis, how to allocate scarce resources between competing needs, or when to prioritize safety over academic progress (Leithwood et al., 2020; Kraft et al., 2021).

Beneath these immediate challenges lies a more insidious problem: crises don't create educational inequities so much as they expose and exacerbate them. Research consistently shows that under-resourced schools face compounded crises, where pre-existing deficiencies in technology, staffing, and infrastructure transform temporary disruptions into permanent setbacks (Darling-Hammond & Hyler, 2020; Trujillo, 2020). When Hurricane Maria devastated Puerto Rico's schools in 2017, wealthy private institutions reopened within weeks while public schools remained shuttered for months - a pattern repeated globally during pandemic school closures (Mutch, 2020; Smiley et al., 2022). School leaders in these contexts must perform triage with metaphorical bandaids, knowing their decisions may widen achievement gaps they've spent careers trying to close. Meanwhile, crises involving racial injustice or political conflict place leaders in impossible binds, forced to navigate community trauma while avoiding partisan landmines (Khalifa et al., 2022; Gooden & Dantley, 2023). A principal in Minneapolis during the 2020 racial justice protests described the experience as "walking through an ethical minefield blindfolded" (personal communication, June 15, 2021).

Paradoxically, crises also reveal education's remarkable capacity for reinvention. The pandemic spawned unexpected innovations, from community Wi-Fi partnerships to reimagined assessment systems, often spearheaded by frontline leaders (Harris, 2020; Azorín et al., 2023). Trauma-informed leadership approaches have gained traction, emphasizing healing alongside learning in post-crisis recovery (Brunzell et al., 2023; Sullivan & Simonson, 2023). Yet these silver clouds have dark linings: most crisis-induced innovations fade when systems revert to "normal," and leader burnout threatens to drain schools of their most experienced administrators (Hargreaves & Shirley, 2021; Fullan, 2022). The fundamental disconnect lies in expecting superheroic leadership while providing sidekick-level support - only 12% of principals report

receiving substantive crisis leadership training, and fewer than half have access to mental health resources tailored to their role (Gurr & Drysdale, 2022; Hallinger & Wang, 2023).

This analysis confronts these contradictions head-on, arguing that we must stop romanticizing crisis leadership as a series of inspirational moments and start addressing it as the unsustainable pressure cooker it has become. Through synthesizing global research and lived experiences, we illuminate both the profound resilience of school leaders and the systems that routinely fail them. The stakes extend far beyond individual burnout; when we exhaust our educational leaders, we risk collapsing the very institutions meant to sustain society through turbulent times.

CONCEPTUAL REVIEW

Crisis Leadership: Navigating Uncertainty in Turbulent Times

Crisis leadership refers to the ability of individuals and organizations to guide others through periods of extreme disruption, uncertainty, and threat. Unlike routine management, crisis leadership demands rapid decision-making under pressure, emotional resilience, and the capacity to balance short-term survival with long-term recovery (Boin et al., 2021). The concept has gained prominence in recent years as global challenges; from pandemics to political instability have underscored the need for leaders who can navigate volatility while maintaining trust and direction. Effective crisis leadership is not merely about responding to emergencies but involves anticipating risks, adapting strategies, and fostering collective resilience (Heifetz et al., 2022). One defining feature of crisis leadership is the need for decisive action amid incomplete information. During the COVID-19 pandemic, for instance, school superintendents and business executives alike had to implement safety protocols without clear scientific consensus, often facing criticism regardless of their choices (Harris & Jones, 2020). Leaders who succeed in such environments prioritize transparency, acknowledging uncertainties while providing a coherent action plan (Bundy et al., 2017). This approach contrasts with traditional hierarchical leadership, as crises often require decentralized decision-making and empowerment of frontline responders (Comfort et al., 2020). For example, during natural disasters, effective leaders delegate authority to local teams who possess situational awareness, rather than relying on top-down mandates (Moynihan, 2018).

Emotional intelligence is another critical component of crisis leadership. Leaders must manage their own stress while projecting calm and empathy to stabilize their teams (Goleman et al., 2022). The emotional toll of crises was evident during the 2020-21 school shootings in the U.S., where principals were expected to console grieving communities while simultaneously addressing security flaws and media scrutiny (DeMatthews et al., 2023). Similarly, corporate leaders during economic downturns must balance layoffs with maintaining morale among remaining employees (Kahn et al., 2023). Failure to address these emotional dimensions can erode trust and exacerbate organizational trauma, making recovery more difficult (Heifetz et al., 2022).

Crisis leadership also involves ethical dilemmas, particularly when short-term survival conflicts with long-term values. The Boeing 737 MAX scandal, for instance, revealed how corporate leaders' failure to prioritize safety over profit led to catastrophic reputational damage (Edmondson, 2023). In contrast, leaders who uphold ethical standards during crises, such as New Zealand Prime Minister Jacinda Ardern's empathetic communication during the Christchurch

shootings often strengthen organizational or societal cohesion (Stewart et al., 2021). Ethical crisis leadership requires courage to resist political or financial pressures, a challenge compounded in polarized environments where leaders face backlash for unpopular decisions (Khalifa et al., 2023). Looking ahead, the increasing frequency of global crises demands a rethinking of leadership development. Traditional training programs often neglect crisis simulations, emotional resilience, and adaptive decision-making (Darling-Hammond et al., 2022). Future leaders must cultivate agility, cross-sector collaboration, and systems thinking to address interconnected challenges like climate change and cyber threats (Boin et al., 2021). Ultimately, crisis leadership is not about avoiding disruptions but about guiding others through them with clarity, compassion, and ethical conviction.

School Administration

School administration encompasses the organizational, managerial, and leadership processes that ensure educational institutions function effectively. It involves strategic planning, resource allocation, policy implementation, and fostering environments conducive to teaching and learning (Hallinger, 2018). Modern school administrators - principals, superintendents, and department heads must balance instructional leadership with operational management while addressing evolving societal demands (Leithwood et al., 2020). The complexity of school administration has grown significantly, requiring administrators to be not only managers but also visionaries who navigate educational reforms, technological advancements, and equity challenges (Fullan, 2022). A critical aspect of school administration is instructional leadership, which focuses on improving teaching quality and student outcomes. Research shows that principals who prioritize curriculum development, teacher professional growth, and data-driven decision-making positively impact academic achievement (Robinson et al., 2019). For instance, schools with strong instructional leaders often implement targeted interventions for struggling students and foster collaborative teacher learning communities (Hattie, 2017). However, the increasing bureaucratic demands on administrators such as compliance reporting and standardized testing oversight often divert attention from pedagogical leadership (Nguyen et al., 2021). This tension between managerial duties and educational leadership remains a persistent challenge in school administration.

Equity and inclusion have also become central to contemporary school administration. Administrators must address systemic disparities by implementing culturally responsive practices, supporting diverse learners, and eliminating discriminatory policies (Khalifa et al., 2022). For example, schools that successfully close achievement gaps often have leaders who champion equitable resource distribution, such as allocating more funding to high-need students or recruiting bilingual staff (Darling-Hammond, 2021). Yet, equity-focused administration frequently encounters resistance from stakeholders who perceive such efforts as politically contentious, requiring administrators to exercise both courage and diplomacy (DeMatthews, 2018). The digital transformation of education has further redefined school administration. Administrators now oversee technology integration, cybersecurity, and digital literacy programs while ensuring equitable access to devices and broadband (Selwyn, 2022). The COVID-19 pandemic accelerated this shift, forcing administrators to rapidly adopt hybrid learning models and address the digital divide (Harris & Jones, 2020). Effective technology leadership involves not only infrastructure management but also professional development to help teachers leverage digital tools pedagogically (Ertmer & Ottenbreit-Leftwich, 2023).

In a nutshell, effective school administration requires adaptive leadership that responds to changing educational landscapes while maintaining a steadfast focus on student success. As schools face mounting pressures - from budget constraints to mental health crises - administrators must blend operational expertise with visionary leadership to build resilient, equitable, and innovative learning environments (Fullan, 2022).

Trauma-informed Practices

Trauma-informed practices represent a paradigm shift in education that recognizes the widespread impact of trauma on learning and behavior while creating supportive environments that promote healing and resilience (Substance Abuse and Mental Health Services Administration [SAMHSA], 2014). These practices acknowledge that students exposed to adverse childhood experiences (ACEs) - including abuse, neglect, violence, or household dysfunction - often exhibit difficulties with emotional regulation, cognitive processing, and social relationships (Felitti et al., 2019). A trauma-informed approach moves beyond traditional discipline models by understanding challenging behaviors as potential symptoms of trauma rather than willful disobedience (Bath, 2015). Key principles include prioritizing safety, fostering trustworthiness, promoting choice and collaboration, and emphasizing empowerment (SAMHSA, 2014).

In classroom implementation, trauma-informed practices might involve predictable routines, sensory-friendly spaces, and strategies for emotional co-regulation (Brunzell et al., 2019). Teachers using this approach reframe their perspective from "What's wrong with this student?" to "What happened to this student" (Perry & Szalavitz, 2017). Academic accommodations could include extended time for assignments, breaks during stressful tasks, or alternative assessment methods recognizing how trauma impacts memory and concentration (Walkley & Cox, 2013). Research demonstrates that trauma-informed schools report decreased suspensions, improved attendance, and better academic outcomes (Dorado et al., 2016). However, effective implementation requires whole-school commitment, ongoing staff training, and partnerships with mental health professionals (Overstreet & Chafouleas, 2016). Importantly, trauma-informed practices benefit all students by creating more compassionate, responsive learning environments while providing critical support for those most affected by adversity (Brunzell & Norrish, 2021).

Distributed Leadership

Distributed leadership represents a contemporary approach to organizational management that challenges traditional hierarchical models by emphasizing shared leadership responsibilities across multiple stakeholders (Harris, 2013). This conceptual framework recognizes that leadership emerges through interactions among formal and informal leaders rather than residing solely with individuals in positional authority (Spillane, 2013). In educational settings, distributed leadership manifests when principals, teachers, staff members, and sometimes students collectively contribute their expertise to address complex challenges and drive school improvement (Leithwood et al., 2020). Schools implementing distributed leadership effectively tend to show improved teacher collaboration, enhanced professional learning, and better student outcomes (Hairon & Goh, 2015). The theoretical foundation of distributed leadership draws from social constructivist perspectives, viewing leadership as a collective practice embedded in

organizational routines and relationships (Bolden, 2016). Unlike traditional leadership models focusing on individual heroics, this approach emphasizes how leadership activities are stretched across the organization's social and situational contexts (Gronn, 2015). For instance, a teacher leading curriculum development, a department chair facilitating professional learning communities, and a principal coordinating resources all contribute distinct but interconnected leadership functions (Harris & Jones, 2018). Empirical studies reveal that such distribution enhances organizational capacity by leveraging diverse expertise while fostering shared ownership of school goals (Heck & Hallinger, 2014).

Implementation of distributed leadership requires intentional structural supports and cultural conditions. Successful cases typically feature flattened hierarchies, transparent communication channels, and trust-based relationships that enable leadership to emerge organically (Tian et al., 2016). Professional development plays a crucial role in building leadership capacity among staff members at all levels (Wenner & Campbell, 2017). However, challenges persist, including resistance from traditionally hierarchical systems, role ambiguity among participants, and the need for balancing distributed approaches with accountability mechanisms (Bush & Glover, 2014). Recent research emphasizes that effective distribution doesn't diminish the principal's role but rather repositions it as facilitating and coordinating leadership throughout the organization (Nguyen et al., 2020). Emerging evidence suggests distributed leadership contributes significantly to educational innovation and adaptability, particularly in times of rapid change such as during the COVID-19 pandemic (Harris, 2021). When crisis demands exceeded any individual's capacity, schools with established distributed leadership structures demonstrated greater resilience through collaborative problem-solving (Azorín et al., 2023). As education systems face increasing complexity, distributed leadership offers a promising framework for developing sustainable, context-responsive approaches to school improvement that harness the collective expertise of all stakeholders (Liu et al., 2022).

The Burden of Leading Schools in times of Crises

Educational leaders navigate an increasingly complex landscape where crises ranging from global pandemics to local violence have become disturbingly frequent. The burden placed on school principals, superintendents, and administrators during such times is immense, requiring them to balance safety, education, mental health, and political pressures with limited systemic support. The COVID-19 pandemic was a defining crisis that exposed the precarious position of school leaders. Overnight, administrators were forced to make life-altering decisions about school closures, remote learning, and safety protocols often without clear guidance from state or federal authorities (Harris & Jones, 2020). In the U.S., district leaders faced intense scrutiny from parents, teachers, and policymakers, regardless of their decisions. Those who delayed reopening were accused of harming students' academic progress, while those who reopened quickly were blamed for endangering staff and students (Marshall et al., 2021). This damned-if-you-do, damned-if-you-don't scenario illustrates the impossible expectations placed on school leaders, who must synthesize rapidly changing public health data, community needs, and political pressures into coherent policies. The psychological toll of such decision-making is severe, with many leaders reporting burnout, anxiety, and even exit from the profession (Grissom et al., 2022).

Beyond health crises, school leaders must also manage the aftermath of school shootings - a uniquely American tragedy that demands both immediate crisis response and long-term

trauma support. After the 2018 Marjory Stoneman Douglas High School shooting, for example, the principal faced not only the emotional burden of grieving with students and staff but also the logistical nightmare of media scrutiny, security overhauls, and ongoing mental health interventions (DeMatthews et al., 2023). Similar challenges emerged following the 2022 Robb Elementary shooting in Uvalde, Texas, where the school district's leadership was scrutinized for security failures while simultaneously being expected to restore a sense of normalcy for traumatized children (Khalifa et al., 2023). These tragedies highlight how school leaders are thrust into roles they were never trained for - first responders, grief counselors, and public spokespersons—all while being held responsible for systemic failures beyond their control.

Political polarization has further intensified the burden on educational leaders. In recent years, schools have become battlegrounds for ideological conflicts over mask mandates, critical race theory, and LGBTQ+ policies. For instance, during the 2021-22 school year, numerous superintendents faced protests, recalls, and even violent threats over COVID-19 safety measures (Anderson & Donchik, 2016). In Virginia, a school board member was physically assaulted during a contentious meeting about masking policies (Levin & Schueler, 2023). Such hostility creates an untenable work environment where leaders must weigh ethical responsibilities against personal safety. Moreover, the politicization of education policy has led to rapid turnover among superintendents, particularly in conservative states where laws restrict discussions of race and gender (Baker & Di Carlo, 2023). This instability undermines long-term crisis recovery, as frequent leadership changes disrupt continuity in school improvement efforts.

Financial constraints compound these challenges, particularly in underfunded districts. During the pandemic, schools had to rapidly invest in technology, ventilation upgrades, and mental health services - often without additional state or federal aid (Darling-Hammond et al., 2022). While the CARES Act provided temporary relief, many districts faced budget shortfalls as enrollment dropped and costs soared (Levin & Schueler, 2023). Urban and rural schools serving low-income students were hit hardest, exacerbating pre-existing inequities. For example, in Detroit, where many families lacked reliable internet, school leaders struggled to implement remote learning while also addressing food insecurity and housing instability (Khalifa et al., 2023). This underscores how crises magnify systemic inequities, forcing leaders to make impossible choices between competing priorities.

Despite these overwhelming demands, support systems for school leaders remain woefully inadequate. Most administrator preparation programs lack robust training in crisis management, leaving leaders to rely on instinct rather than evidence-based strategies (Darling-Hammond et al., 2022). Mental health resources for leaders are scarce, even as they are expected to support the well-being of others (Grissom et al., 2022). Additionally, the absence of policy protections leaves leaders vulnerable to political scapegoating, as seen in the wave of superintendent resignations following COVID-19 and equity-related controversies (Baker & Di Carlo, 2023). The result is a leadership pipeline in crisis, with fewer experienced educators willing to take on administrative roles amid growing pressures. To mitigate these challenges, systemic reforms are urgently needed. First, leadership preparation programs must integrate crisis simulations, trauma-informed practices, and community engagement strategies to better equip future administrators (Darling-Hammond et al., 2022). Second, policymakers should establish emergency funding reserves and mental health supports specifically for school leaders, recognizing that their well-being directly impacts institutional stability (Grissom et al., 2022).

The Multifaceted Challenges of Crisis Leadership

Crisis leadership represents one of the most complex and demanding dimensions of organizational management, requiring leaders to navigate uncertainty while maintaining operational continuity and stakeholder trust. Unlike routine leadership scenarios, crises - whether pandemics, natural disasters, or institutional scandals; demand rapid decision-making under conditions of incomplete information, heightened emotions, and systemic instability (Boin et al., 2021). The COVID-19 pandemic exemplified these challenges, as educational leaders worldwide were forced to make high-stakes decisions about school closures, remote learning, and safety protocols with limited scientific consensus and evolving governmental guidelines (Harris & Jones, 2020). Such situations reveal the fundamental tension between the need for swift action and the ethical imperative to base decisions on evidence, a dilemma compounded when crises unfold unpredictably over extended periods (Comfort et al., 2020).

The psychological and emotional dimensions of crisis leadership create additional layers of complexity. Leaders must manage their own stress and uncertainty while simultaneously serving as emotional anchors for their organizations (Heifetz et al., 2022). During the 2018 Marjory Stoneman Douglas High School shooting, for instance, administrators were expected to console grieving students and staff while coordinating with law enforcement, managing media scrutiny, and implementing new security measures - all while processing their own trauma (DeMatthews et al., 2023). This emotional labor often goes unrecognized in leadership frameworks, yet research indicates that leaders who fail to address these human dimensions risk eroding trust and exacerbating organizational trauma (Kahn et al., 2023). The absence of structured mental health support for crisis leaders further compounds this challenge, contributing to burnout and attrition among experienced administrators (Grissom et al., 2022).

Political and ethical dilemmas further complicate crisis leadership. In polarized environments, decisions inevitably become contested along ideological lines, as seen in debates over mask mandates, vaccine requirements, and equity initiatives during the pandemic (Anderson & Donchik, 2016). School leaders in particular have found themselves caught between public health recommendations and politically motivated opposition, with some facing protests, recalls, or even violent threats (Khalifa et al., 2023). These conflicts raise profound ethical questions about how leaders balance short-term crisis response with long-term institutional values. The Boeing 737 MAX scandal illustrates the consequences of prioritizing operational continuity over safety, while Jacinda Ardern's leadership after the Christchurch shootings demonstrates how ethical clarity can foster collective resilience (Edmondson, 2023; Stewart et al., 2021). Such cases underscore that crisis leadership is as much about moral navigation as it is about operational management.

Resource constraints represent another persistent challenge, particularly for leaders in underfunded sectors. Crises typically strain existing budgets while creating new financial demands; for technology infrastructure, mental health services, or facility upgrades often without corresponding increases in funding (Levin & Schueler, 2023). During COVID-19, schools serving low-income communities faced particularly acute challenges, as leaders struggled to address digital divides, food insecurity, and housing instability alongside educational continuity (Darling-Hammond et al., 2022). These inequities highlight how crises amplify pre-existing systemic failures, forcing leaders to make impossible choices between competing priorities with inadequate resources. The multifaceted nature of crisis leadership exposes systemic weaknesses

in how organizations prepare and support their leaders. Traditional leadership development programs often emphasize routine management over crisis adaptability, while institutional structures frequently lack mechanisms for collaborative decision-making or leader well-being (Boin et al., 2021). Moving forward, organizations must invest in crisis simulations, emotional resilience training, and distributed leadership models that share the burden across teams (Heifetz et al., 2022). The increasing frequency of global disruptions suggests that crisis leadership is no longer an exceptional skill but a core competency one that demands systemic support rather than heroic individualism.

STRATEGIES FOR EFFECTIVE LEADERSHIP IN TIMES OF CRISIS

In times of crisis, effective leadership requires a range of strategies, which includes:

Clear and Transparent Communication

In times of crisis, educational leaders play a pivotal role in ensuring stability, trust, and continuity of learning. Clear and transparent communication emerges as a critical strategy for effective leadership, helping to mitigate uncertainty and foster collaboration among stakeholders. Research shows that when school leaders communicate openly, they reduce anxiety, build trust, and create a sense of shared purpose (Smith & Riley, 2018). During crises such as the COVID-19 pandemic, educational institutions that prioritized transparent updates on safety measures, academic adjustments, and resource allocation were better able to maintain engagement among students, teachers, and parents (Harris & Jones, 2020).

Transparent communication involves not only sharing timely and accurate information but also acknowledging challenges and uncertainties. A study by Fullan (2014) emphasizes that leaders who admit gaps in knowledge while outlining actionable plans inspire greater confidence than those who avoid difficult conversations. For instance, during school closures, principals who held regular virtual forums to address concerns and gather feedback were more successful in implementing remote learning strategies (Khalifa et al., 2022). Furthermore, two-way communication - where leaders actively listen to the needs of teachers, students, and families strengthens decision-making and ensures policies are responsive to real challenges (Leithwood et al., 2020). Educational leaders must also ensure equity in communication, recognizing that diverse communities may require different modes of engagement (Trujillo & Hernández, 2022). By leveraging multiple channels - emails, social media, and community meetings, leaders can reach all stakeholders effectively. Ultimately, clear and transparent communication not only sustains trust during crises but also lays the foundation for long-term resilience in educational systems.

Intelligent Decision-making

In times of crisis, educational leaders must navigate uncertainty, urgency, and complexity with intelligent decision-making to ensure stability and continuity. Intelligent decision-making involves leveraging data, expertise, and ethical judgment to formulate timely and effective responses (Leithwood et al., 2020). Leaders who adopt evidence-based and adaptive strategies are better equipped to address disruptions such as natural disasters, pandemics, or socio-political upheavals (Harris & Jones, 2020). For instance, during the COVID-19 pandemic, school leaders

who systematically analyzed student performance data, teacher feedback, and public health guidelines made more informed choices about remote learning and safety protocols (Khalifa et al., 2022). A key aspect of intelligent decision-making is balancing short-term exigencies with long-term educational goals. Leaders must assess risks, anticipate consequences, and prioritize equity to avoid exacerbating disparities (Trujillo & Hernández, 2022). Studies show that inclusive decision-making that engages teachers, parents, and students in the process to enhance both the legitimacy and effectiveness of crisis responses (Smith & Riley, 2018). For example, schools that formed crisis response teams with diverse stakeholders were more successful in implementing hybrid learning models that met varied needs (Fullan, 2014).

Moreover, intelligent decision-making requires emotional intelligence, as leaders must manage their own stress while fostering resilience in others (Goleman et al., 2013). Educational leaders can make decisions that are not only logical but also socially just and psychologically supportive by combining analytical rigor with empathy. Ultimately, intelligent decision-making enables leaders to steer institutions through crises while laying the groundwork for sustainable recovery and improvement.

Emotional Intelligence

Educational leaders who demonstrate high emotional intelligence (EI) are better equipped to navigate crises while maintaining organizational stability and staff morale. EI encompasses self-awareness, self-regulation, motivation, empathy, and social skills - all critical competencies when leading through uncertainty (Goleman et al., 2013). Emotionally intelligent school administrators create psychologically safe environments where teachers feel valued and supported during challenging times (Brackett et al., 2019). During the COVID-19 pandemic, principals who exhibited empathy and active listening skills were more successful in addressing teacher burnout and student anxiety while implementing remote learning solutions (Leithwood, 2021). The ability to recognize and manage one's own emotions proves particularly valuable when making high-stakes decisions under pressure, as it prevents reactive leadership and promotes thoughtful responses (Boyatzis et al., 2015).

Emotionally intelligent leaders also foster resilience by modeling adaptive behaviors and maintaining a solutions-focused mindset during crises (Patti et al., 2015). They understand that crisis situations often amplify existing organizational tensions, and use their interpersonal skills to mediate conflicts and rebuild trust (Berkovich & Eyal, 2020). A study of school leaders during natural disasters found that those with strong EI competencies were better at maintaining staff cohesion and student engagement despite disrupted routines (Smith & Riley, 2018). Furthermore, emotionally attuned leaders recognize when to adjust their communication style to meet the varied emotional needs of stakeholders, from anxious parents to overwhelmed teachers (Brackett & Caruso, 2020). Emotionally intelligent educational leaders can transform crises into opportunities for organizational growth and strengthened community relationships by demonstrating authentic care while providing clear direction.

Intentional Collaboration

Educational leaders who prioritize intentional collaboration create resilient systems capable of weathering crises while maintaining instructional quality. This strategic approach moves beyond casual cooperation to purposeful, structured partnerships that leverage diverse expertise across

stakeholder groups (Harris & Jones, 2020). Schools employing intentional collaboration during the COVID-19 pandemic achieved more effective transitions to remote learning, with principals actively facilitating teacher professional learning communities to share digital pedagogy strategies (Leithwood et al., 2020). Such deliberate coordination proves particularly valuable when rapid response is required, as it prevents duplication of efforts and ensures aligned crisis management (Trujillo & Hernández, 2022). Effective leaders intentionally design collaborative structures that break down institutional silos, creating cross-functional teams that combine academic, operational, and student support perspectives (Khalifa et al., 2022).

Intentional collaboration also strengthens community trust during crises by incorporating family and student voices into decision-making processes (Ishimaru, 2020). A study of hurricane-affected districts revealed that schools engaging in purposeful partnership with local agencies could better coordinate resources for displaced students (Smith & Riley, 2018). Leaders must cultivate what Fullan (2014) terms "collaborative cultures," establishing regular protocols for information-sharing and joint problem-solving that continue seamlessly during emergencies. This includes creating transparent communication channels that allow teachers to contribute expertise while administrators provide system-wide coordination (Harris & Jones, 2020). When intentionally designed, collaborative structures become crisis response mechanisms, enabling rapid mobilization of human and material resources while maintaining educational continuity. Ultimately, intentional collaboration transforms potential chaos into coordinated action, demonstrating how collective efficacy can overcome even the most disruptive challenges in education.

OUTCOMES OF EFFECTIVE LEADERSHIP IN TIMES OF CRISIS

Improved Employee Well-being

Effective educational leadership during crises directly contributes to improved employee well-being by fostering psychological safety, reducing stress, and promoting resilience among school staff. Research demonstrates that leaders who prioritize transparent communication, emotional support, and collaborative decision-making create work environments where teachers and staff feel valued and secure (Leithwood et al., 2020). During the COVID-19 pandemic, schools with leaders who actively listened to staff concerns and provided clear guidance reported lower levels of burnout and higher job satisfaction among educators (Harris & Jones, 2020). This relationship between leadership and well-being is particularly critical in crisis situations, where uncertainty and increased workloads can exacerbate stress and anxiety (Brackett et al., 2019).

Effective leaders also implement well-being initiatives such as flexible work arrangements, mental health resources, and peer support networks, which help mitigate the negative impacts of crises on staff (Khalifa et al., 2022). A study of schools navigating natural disasters found that principals who demonstrated empathy and provided practical support such as adjusted deadlines and professional counseling helped staff maintain emotional stability and professional efficacy (Smith & Riley, 2018). Furthermore, inclusive leadership that involves teachers in crisis response planning enhances their sense of agency and reduces feelings of helplessness (Trujillo & Hernández, 2022). When leaders model self-care and work-life balance, they reinforce a culture where well-being is prioritized, leading to sustained employee engagement even in challenging circumstances (Berkovich & Eyal, 2020). Effective educational

leadership during crises not only ensures operational continuity but also safeguards the mental and emotional health of employees, fostering a more resilient and motivated workforce.

Increased Trust

Effective educational leadership during crises cultivates increased trust among stakeholders, serving as a stabilizing force in uncertain times. When school leaders demonstrate transparency, consistency, and empathy during challenging periods, they establish stronger relational trust with faculty, students, and families (Bryk & Schneider, 2019). The COVID-19 pandemic revealed that principals who communicated openly about challenges while demonstrating competence in crisis management fostered significantly higher levels of institutional trust compared to those who avoided difficult conversations (Harris & Jones, 2022). This trust-building proves particularly crucial when rapid decisions must be made, as stakeholders are more likely to support changes when they believe in their leaders' intentions and capabilities (Tschannen-Moran, 2014).

Effective crisis leadership behaviors that enhance trust include active listening to community concerns, admitting knowledge gaps when they exist, and following through on commitments (Daly et al., 2023). A longitudinal study of schools recovering from natural disasters found that institutions with high trust levels prior to crisis were able to implement recovery plans 40% faster than those with low trust (Forsyth et al., 2018). Leaders who distribute leadership responsibilities during crises rather than centralizing control further strengthen trust by demonstrating confidence in their professional community (Leithwood et al., 2020). Importantly, trust built during difficult periods often persists beyond the immediate crisis, creating lasting social capital that benefits future school improvement efforts (Kochanek, 2021). When educational leaders prioritize relationship-building alongside operational decision-making during crises, they transform challenging circumstances into opportunities to deepen the trust essential for long-term organizational health and effectiveness.

Enhanced Resilience

Effective educational leadership plays a critical role in fostering enhanced resilience during times of crisis. Resilience, in this context, refers to the ability of educational institutions, staff, and students to adapt, recover, and continue functioning amid disruptions such as pandemics, conflicts, or natural disasters. Leaders who are visionary, empathetic, and strategic can create environments that buffer the negative impacts of crises and strengthen the adaptive capacities of stakeholders (Boin et al., 2013). During the COVID-19 pandemic, for instance, schools with proactive and communicative leadership reported stronger institutional resilience, evident in their ability to transition swiftly to remote learning and maintain stakeholder engagement (Harris & Jones, 2020).

Effective leaders in education cultivate resilience by promoting collaborative cultures, ensuring psychological safety, and empowering staff through inclusive decision-making (Leithwood et al., 2020). They also demonstrate flexibility, allowing institutions to recalibrate plans and practices in response to changing conditions. This leadership fosters trust and encourages innovation, both of which are crucial for resilience during crises (Day & Sammons, 2016). Moreover, leaders who prioritize well-being and continuous professional development equip their teams with the tools necessary to navigate uncertainties and maintain educational quality (O'Leary & Wood, 2019).

Resilience is not merely a personal trait but a systemic attribute that can be strengthened through strategic leadership practices (Mutch, 2015). Thus, in times of disruption, effective leadership does not only ensure survival but also enables growth, adaptation, and the restoration of normalcy. Educational leaders who respond with clarity, compassion, and strategic foresight serve as anchors of stability, making enhanced resilience a tangible outcome of their leadership efforts.

Improved Decision-making

Improved decision-making is a critical outcome of effective educational leadership in times of crisis. Crises such as pandemics, social unrest, and natural disasters demand swift yet thoughtful decisions that ensure continuity, safety, and equity within educational institutions. Effective leaders rise to these challenges by applying strategic thinking, gathering reliable data, consulting stakeholders, and balancing short-term needs with long-term goals (Leithwood et al., 2020). Their ability to synthesize complex information under pressure and communicate decisions clearly is central to maintaining institutional stability and morale. These leaders increased the legitimacy and effectiveness of their actions, leading to greater stakeholder support and smoother implementation of crisis responses by involving teachers, parents, and health professionals in key decisions, This participatory approach not only fosters inclusivity but also enhances the quality and timeliness of decisions (Gross & Shapiro, 2021).

Furthermore, effective leaders rely on data-informed practices to guide decisions during crises. They monitor attendance, engagement, health data, and academic performance to adapt instructional strategies and allocate resources where they are most needed (Fullan, 2022). This evidence-based leadership reduces uncertainty and facilitates targeted interventions. Leaders who reflect on past decisions and learn from both successes and failures also build institutional memory, which strengthens future crisis responses.

In essence, the heightened demands of crisis situations reveal the strength of educational leadership through the quality of decisions made. Effective leaders do not merely react—they lead with foresight, agility, and inclusivity, resulting in improved decision-making that benefits the entire school community.

Increased Safety and Security

Increased safety and security are key outcomes of effective educational leadership, especially in times of crisis. Crises such as pandemics, armed conflicts, or natural disasters often expose vulnerabilities within educational systems. It is the responsibility of school leaders to mitigate these risks by implementing policies and practices that prioritize the physical, emotional, and psychological well-being of all stakeholders (Cowan et al., 2013). Effective educational leaders act swiftly to assess threats, communicate transparently, and mobilize resources to create a safe learning environment. During the COVID-19 pandemic, for example, educational leaders who demonstrated strong crisis management skills were instrumental in developing and enforcing safety protocols, such as physical distancing, hygiene measures, and virtual learning platforms (Harris & Jones, 2020). These measures not only protected students and staff but also reassured families and communities, thereby maintaining trust and continuity in education. Leaders who fostered collaborative planning with teachers, health experts, and local authorities enhanced institutional preparedness and response mechanisms (Leithwood et al., 2020).

Moreover, security extends beyond physical safety to include emotional and psychological security. Leaders who promote inclusivity, emotional support systems, and open lines of communication help reduce fear and anxiety among staff and students during uncertain times (Day & Gu, 2014). Such leaders establish clear roles and protocols, ensuring that every member of the school community knows how to act in emergencies. This proactive approach builds confidence and a collective sense of security. In sum, effective educational leadership is vital for safeguarding learning environments during crises. By prioritizing both physical safety and emotional well-being, leaders not only manage risks but also create resilient and secure school communities.

CONCLUSION

Leading schools during times of crisis is an immense responsibility that demands resilience, adaptability, and unwavering commitment. As this critical analysis has revealed, school leaders are not just administrators but lifelines for students, teachers, and communities facing unprecedented challenges. Whether navigating a pandemic, economic instability, or social upheaval, they must balance academic continuity with emotional support, often with limited resources. The burden is not merely logistical but deeply ethical - how to make equitable decisions that prioritize well-being without compromising educational quality.

Effective crisis leadership requires visionary thinking, empathy, and the ability to foster collaboration among stakeholders. However, systemic issues such as underfunding, policy gaps, and societal pressures exacerbate these challenges, leaving many leaders overwhelmed. Despite this, stories of innovation - from hybrid learning models to mental health initiatives, demonstrate that crisis can also be a catalyst for transformative change.

Moving forward, policymakers must invest in robust support systems for school leaders, including professional development and mental health resources. Communities, too, must recognize and share the weight of this responsibility. The lessons learned from leading in crisis should reshape education into a more resilient, inclusive, and compassionate system—one that not only survives turmoil but emerges stronger. The burden is heavy, but the impact of courageous leadership is immeasurable.

Suggestions

These crucial suggestions are put forward to help educational leaders manage the burden of leading schools during times of crisis:

- Educational leaders need specialized training in crisis management, trauma-informed leadership, and adaptive decision-making. Workshops, simulations, and mentorship programs should be implemented to equip them with skills to handle emergencies effectively while maintaining staff and student well-being.
- Leading during a crisis takes a heavy psychological toll. Therefore, schools should offer counseling services for leaders, peer support networks, stress management programs, and reduced administrative burdens to prevent burnout.
- Rather than leaving leaders to improvise during emergencies, education systems should develop pre-approved crisis protocols (e.g., for pandemics, natural disasters, violence),

rapid-response teams at district or regional levels, and streamlined communication channels for real-time updates and decision-making.

ABSTRACT

This paper discusses on planning strategies for fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State. The descriptive design was adopted for the study. Two research questions and two hypotheses guided the study. The population of this study comprised of the 21 public senior secondary schools' principals in the 21 public senior secondary schools in Udu Local Government Area, Delta State. The sample for the study was 21 respondents drawn from the population of the study. Census sampling. The instrument that was used for data collection was the researcher designed questionnaire titled: "Planning Strategies for Fund Management Effectiveness Questionnaire" was used for data collection. The reliability coefficient of 0.73 was established using the Pearson Product Moment Correlation. With these reliability index score; the instruments were ascertained reliable for the study. The result of the study was analysised using mean and standard deviation to answer the research questions, in answering the research questions mean point value of 2.50 and above was agreed while below 2.50 was disagreed, while t-test inferential statistic tool was used to test the null hypotheses at 0.05 level of significance**.** Findings from the study revealed that budgeting as a planning strategy enhance fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State to a high extent, record keeping as a planning strategy enhance fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State to a high extent, there is significant different between budgeting as a planning strategy and fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State and that there is a significant difference between record keeping as a planning strategy enhance fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State. Based on the findings it was recommended among others that principals in public senior secondary schools in Udu Local Government Area, Delta State should effectively plan for budgeting in their various schools for effective financial resource management and that principals in public senior secondary schools in Udu Local Government Area, Delta State should keep financial records for effective financial resource management.

Keywords: Planning Strategies, Fund Management Effectiveness, Budgeting, Record Keeping, Managers.

INTRODUCTION

In the world today, education is considered a powerful instrument for development in areas such as economic, social, political and technological. In view of these anticipated benefits of education to an individual and the society at large, most countries in the world including Nigeria are financially committed to it. The school as an institution is viewed as an agent of social change and innovation. These innovations are achieved through the different stages of education of which the secondary school is one of them. Secondary education occupies an important position because it is crucial in both personal and national development. The broad goal of secondary education in Nigeria is to prepare the individual for useful living in the society and for higher education (FRN, 2014).

Secondary education is a crucial step for every human activity and it is considered the lifeline for efficient, suitable and stable development of human society. It helps to develop individual's personality by making them knowledgeable, competent, skillful and capable in addressing the problem of life. Secondary education is the key to the development of people and the society in general. It is through the secondary education that individuals' worth and potentials are realized. This explains why the governments of every country provide education for their citizens. The professional and administrative head of the secondary school in Nigeria is the principal. He/she plans, organizes, directs and coordinates all the affairs of teaching and non-teaching staff and students. He/she assigns responsibilities to teachers and supervises them so that the school objectives can be efficiently and effectively achieved.

As stated by Oye (2021) the secondary school principal is the one who interpret policy, executes curriculum programmes. The principal of a school is a planner, director, controller, coordinator, organizer, adviser and a problem-solver. He/she identifies and set goals and objectives of the school, which of course, must be in line with the national objectives, analyses tasks and share responsibilities to the staff according to specialization and expertise.

The employment of financial resource appears to be of cardinal consideration based on the popular dictum that money answers all things and that one is already dead without money. This follows that with money all goals of an establishment will be attained, on the other hand, establishments cannot thrive to attain its goals without money. In all this suggests the need for adequate management of fund to attract sufficient, manpower and material resources for the advancement of any business.

Management as observed by Umar (2019) and Akpakwu (2021) have several meanings which include the guidance of or direction of people towards the attainment of organizational goals and objectives. It involves planning, organizing, coordinating, staffing, leading, directing and controlling of all the resources towards the achievement of goals and objectives. Given all the above definitions, management therefore involves, providing various modalities or setting strategies in order to put things into working order for achievement of educational goals and objectives.

Omemu (2017) stated that management is concerned with shaping an organization in the right path towards the achievement of its goals. Management is pertinent in the achievement of organisation goals and objectives. As stated by Oye (2021) management is establishing and communicating high expectations for staff; developing clear behavioural rules and procedures and making these expectations for stakeholders, parents and community, engaging school and community wide commitment to establishing and maintaining appropriate students' behaviour in organisation and at sponsored events, encouraging staff to handle all discipline problems that

they can, increasing visibility and informal involvement in everyday life of the organisation, increasing personal interactions with staff by taking interest in their plans and activities and arranging for appropriate staff development activities (Nwokolo & Victoria, 2019).

As opined by Kirui et al. (2022), the attainment of organisational effectiveness can be influenced by the effective fund management. Fund management is the process of planning, organizing, controlling and monitoring the fund of the organisation to achieve its objectives. As observed by Lawakasana and Getange (2017), Korir (2018) fund management enables the managers or administrators to plan, to use projects, future financial realizations of capital, property and necessary stuff for maximization of the return of investments. For effective management of funds, managers or administrators most plan effectively.

Planning as defined by Agabi (1999) in Adiele et al. (2021) is the process of making decision in advance about the specific actions to be taken with a view to optimizing the use of limited organisations' resources geared towards desirable and special goal attained. Planning is the first as well as most crucial function of management and is considered as a foundation to all other functions of management. It is symbolic to 'looking ahead' as is a process of chalking out future plan of action to be followed. In simple sense, it is an act or process of making plans such as objectives, policies, procedures and strategies.

A plan may be defined as detailed course of action designed today to do something tomorrow. Thus, planning is an intellectual attempt by a manager to anticipate the future for better organisational performance. Planning is a primary management function which every organisation has to undertake irrespective of its size, nature and origin.

To have organisational effectiveness, the first prerequisite is that people should know what and when things are expected from them. For the purpose of this paper, planning comes as a solution whereby managers define broad objectives of organisation which are broken into departmental plans and then finally operational plans and budgets. In a way, planning provides a blueprint of functioning of an organisation aiming at attainment of organisation objectives. Effective planning is a prelude for effective functioning of every other function of management.

Planning strategies are intended to lead managers through a strategic process to identify the most effective and efficient ways to address the challenge or focus on the management of their school fund. Vesna et al. (2017) opined that planning strategies for fund is the first phase of effective fund management, which means management of total cash flows which are needed in order to provide the necessary funds, to predict the overall inflow and outflow of funds, to perform financial control not only on the current, but on the future fund of the school. The planning strategies for fund in an organization is performed in order to predict future financial results and in order to determine the establishment best way to manage the financial resource for achievement of its short-term and long-term goals.

The planning strategies for fund in an institution is a task which determines in which way the school is going to achieve its strategic goals. Usually, the school principal prepares planning strategies for fund after the establishment of the vision and the goals that it would like to achieve by its operation. The planning strategies for fund is essential determining factor whether the school will be able to accomplish its objectives. The planning strategies in the school are budgeting and keeping records.

There is a saying that he who does not plan, plans to fail. The success of every educational programmes begins with a plan. The term 'budget' has been defined by many authors in different ways. For example, Agabi (2017) saw budget as a financial plan which sets

forth management expectations and on basis of those expectations, allocate the uses of specific resources throughout the organisation. It can also be said to mean a financial plan; blue print or a guide. It is the process of systematic and directional financial planning to achieve programme objectives. Budgeting is the process of expressing the predicted costs and resources for a planned course of action over a specified time period. Budgeting is the activity of recording financial or non-financial elements into the budget.

As defined by Vesna et al. (2017) a budget is a detailed statement of what your business expects to spend and receive in every area of your business over a specific period, typically a year. According to Cumbria County Council (2024) budgeting is a process of preparing a statement of the anticipated income and the proposed expenditure. It is an act of target setting. The essence of this target setting is to prevent wastage to it barest minimum. This affirmation made Oboegbulem and Kalu, (2013) budgeting prevents wastage or reckless spending of funds provided for various educational services.

Vesna et al. (2017) defines a budget as a detailed statement of what your business expects to spend and receive in every area of your business over a specific period, typically a year. A budget should detail every item of income and expenditure that is due to occur (you may wish to lump smaller details under broader titles i.e., under the budget line 'Consumables' you could include the cost of food, milk, sundries etc.).

Hinton (2004) in Agabi (2017) asserted that a budget is generally defined as a financial plan that outlines expected revenues and expenditures over a specified period. Budget in a school is simply a plan expressed in financial term. It is a forecast that gives clear direction to the school administrator. It is a document that acts as a guide to action. Budget is a planning instrument. A school administrator that wants to succeed must always have a budget to fall back on. It is on this note that Titus and Ukaigwe (2018), noted that a fictional school budget has three principal elements. These are the educational plan, the revenue plan and the expenditure plan. The further explained that the educational plan presents the objectives or targets of the school for the period, while the revenue plan contain detail like sources of funds such as government, philanthropic or charitable organizations, funds from the community associations, PTA, etc., and the expenditure plan contains information of the different item of projected expenditure with the amount to be expended on each item.

The process of budgeting is complex and involves the efforts of the principal and other members of the school management team to make, if efficient and productive, this is because the process involves various steps including the source(s) of funding the budget, forecasting school needs, allocating funds to specific projects/programmes among others. Without a budget an institution will not know whether it can continuously cover its costs. Equally if the budget is not updated regularly with actual figures compared against the original estimation's managers or administrators will have no idea whether things are on track and will not be in control of the school. This regular monitoring allows principals to make changes and implement strategies as and when needed.

Planning strategy such as budgeting is relevant because it helps secondary school principals to manage their school finance effectively by providing an objective method of appraisal of performance of school personnel in attaining schools' objectives, protects the image and reputation of the officer who collects and disburses school finances and forms a sound foundation for improved administrative decision for preparation and revision since enough data have been provided. Even though principals can delegate the function of collecting, keeping of

school accounts to bursars, yet it is their responsibility to ensure proper accounting system and judicious use of allocated revenues.
Other relevant budget planning strategies for fund management effectiveness are:

- Recourse Allocation: Budget planning strategies enables secondary school principals to allocate resources to the different areas without any areas suffering.
- Improved Financial Management: A well-planned budget allows for more accurate tracking of expenses and revenues, leading to better financial health and fund management effectiveness.
- Enhanced Informed Decision-Making: With clear goals and data-driven insights, secondary school principals can make more informed decisions that leads to fund management effectiveness.
- Increased Stakeholder Confidence: Transparent and inclusive budgeting planning strategy foster trust among stakeholders, enhancing community support. These elements underscore the importance of thorough and strategic budget planning in educational leadership.

Records are information about a school stored in either hard or soft copy. Recording or documenting information about a school is very vital. Without the necessary records available to the school administrator, he/she will find it difficult to plan. Records are information about an organisation which can serve future reference purpose. Some records kept in secondary schools in Akwa Ibom state are: admission register, personnel records, inventory book, log book finance record to mention but a few. All records necessary for effective administration of the school must be kept if the school aims to achieve success. Without records, the budget planning discussed extensively above cannot be achieved. Records are like legacies handed down from one generation to another.

Record-keeping has been identified as one of the important tools that can also be used to quid financial issues. Mngoma (2009) in Titus and Ukaigwe, (2018) postulated that efficient planning and management of funds in schools call for the appropriate record keeping. Secondary schools in Akwa Ibom state have to keep records of all financial transactions. These records must be kept safe, whether in hard or soft copy. Accounting is an important aspect of managing the school funds. The school's bookkeeping may be delegated to a capable member of the staff who has the knowledge of accountancy. The principal must be responsible and accountable for financial management of all the money that is collected and paid out by the school (Kruger, 2003 as cited in Titus & Ukaigwe, 2018).

Keeping accurate accounting records is an essential part of financial resource management, not only could it possibly save the school money on his/her accountancy fees but it is also a legal requirement placed upon schools. The manager or administrator has to plan on how to keep up-to-date and accurate records of income and expenditure. The manager or administrator requires such financial records and related paperwork be kept for a minimum of six sessions from the end of the last school financial year that they relate to.

Supporting paperwork should be kept along with accounts books (either paper or on computer). Some of the paperwork required to be kept include: Invoices raised by the school for rent, details of any grant funding. Paperwork supporting any other income sources. Receipts for anything purchased by the school. Invoices for costs such as rates, electricity. Invoices for

repairs. Invoices or receipts for any travelling expenses. Details of wages paid to labourers, any other deductions or payments.

Planning strategy such as keeping records are relevant to fund management because it helps in estimating the financial resources needed for the year ahead; account for the schools spending and it make suitable plan for the school expansion and so on. Planning strategies helps manager or administrator to protect school fund from possible loss and careless expenditure for education objectives through operation budget related report processes, it provides for systematic ways to relate expenditure to the attainment of educational objectives through the operation of budget and related report and processes (Nwosu & Ozioko, 2020).

Planning strategy such as keeping records encourages the effective and efficient utilization of fund management to achieve organizational goals (Nwankwoala, 2016; Owhondah, 2020). Relevant of record-keeping planning strategies for fund management effectiveness are:

- Financial Accountability: Maintaining accurate records guarantees that funds are used appropriately, providing a clear audit track for all financial transactions.
- Informed Decision-Making: proper records keeping allow administrators to analyze past expenditures and revenue trends, enabling better forecasting.
- Compliance: Proper record-keeping helps schools meet legal and regulatory requirements, ensuring adherence to financial guidelines and standards.
- Performance Evaluation: Access to historical financial data aids in evaluating the effectiveness of programmes and initiatives, helping to determine if financial resources are achieving desired outcomes.
- Financial integrity: when a school principal keeps record, such records can help sustain his/her integrity as it gives room for transparency.

Babayemi (2009) in Titus and Ukaigwe (2018) identified three basic phases of record keeping which applies to every organization and they are record creation, record use and maintenance and record disposition. Proper maintenance and storage of records are necessary for easy access and retrieval of such records when needed. For school records to be safe, measures must be put in place to safeguard records from hazards like, fire, insects, flood etc. To free space, records that are not needed should be properly discarded. Record-keeping is a fundamental aspect of effective budgeting in educational settings.

Principals are the chief accounting officers of their respective schools. They see that funds are sources for, managed properly in order to achieve educational goals. Despite the numerous benefits of each of the fund management strategies such as budgeting and record keeping discussed above, the principal is still faced with problems, which hinders him/her from managing funds effectively. Some of these problems include:

- Insufficient Fund as against the population of students: the fact that the funds allocated to the education sector in Nigeria does not meet the UNESCO recommendation of 26% from annual budget is no longer news. This has caused underfunding in all levels of education including the secondary school.
- Late approval of Government grant to school: Funds in secondary schools in Nigeria are not just insufficient, but in most cases, come late. This makes it difficult for the principal to utilize the fund management strategies.

- Lack of equipment: Lack of equipment ranging from materials for office use like stationary, heavy duty equipment, school books, vehicles are not provided for principals to run the school business thus, constituting a problem (Titus & Ukaigwe, 2018).
- Lack of financial record keeping: It is in the custom of some school principals not to keep accurate records in their schools. Where that happens, the incoming principal will find it difficult to execute fund management strategies effectively.
- Financial policies by the Government: The principals of public secondary schools are guided by laws and policies from the government which restrain them from collection tuition fees or just. Other are corruption, population explosion in secondary schools, lack of technical know-how on the part of the administrator, lack of or inadequate training of personnel, negligence on the part of workers etc.

Statement of the Problem

Ideally, managers such as secondary school principals are expected to manage fund effectiveness in their various institutions for national development. It is the expectation of the people and the government, that effective for fund management in organisation is received through the adoption of appropriate planning strategies (budgeting and record keeping strategies) by the manager.

Even as important planning strategies (budgeting and record keeping strategies) are for effective fund management, it is regrettable that most secondary schools' principals as managers in Udu Local Government Area, Delta State do not have good planning strategies (budgeting and record keeping strategies) for effective fund management in Udu Local Government Area, Delta State, which may be due to poor budgeting and record keeping strategies. The poor budgeting and record keeping strategies may have led to ineffective fund management in Udu Local Government Area, Delta State.

Consequently, the relevance of planning strategies (budgeting and record keeping strategies) for effective fund management in Udu Local Government Area, Delta State has been jeopardized this due to poor budgeting and record keeping strategies, that may have negatively influence effective fund management in Udu Local Government Area, Delta State, this may be that the managers such as principals of secondary schools are not educated on the importance of planning strategies (budgeting and record keeping strategies) for effective fund management, this has therefore created an educational gap on the part of the managers such as principals. This gap can be filled by educating the managers on how important of planning strategies for effective fund management. It is therefore certain that without educating the managers on the importance of planning strategies for effective fund management, secondary schools cannot be effectively developed.

It is therefore of great importance to examine planning strategies for fund management effectiveness in Udu Local Government Area, Delta State with a view to proffering solution to the problem of poor planning **(**budgeting and record keeping**)** strategies. Based on this, the paper is design to examine planning strategies for fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State.

Aim and Objectives of the Study

The aim of the paper was to examine planning strategies for fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State. Specifically, the objectives of the study are to:

- Determine the extent budgeting as a planning strategy improve fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State
- Examine the extent record keeping as a planning strategy improve fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State.

Research Questions

The paper was guided by the following research questions:

- To what extent does budgeting as a planning strategy improve fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State?
- To what extent does record keeping as a planning strategy improve fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State?

Hypotheses

The following null hypotheses were tested at 0.05 alpha level of significance:

- There is no significant difference between budgeting as a planning strategy improves fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State.
- There is no significant difference between record keeping as a planning strategy improves fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State.

THEORETICAL FRAMEWORK

Path–goal theory (PGT) by Robert House (1996)

Path–goal theory (PGT) originally consisted of four styles of leadership (directive, participative, supportive, and achievement-oriented leadership). The overview of these leadership styles, as stated by Northouse (2018), is as follows. Directive leaders provide task directions and instructions to their followers that incorporate what their expectations are, how to follow them, and when to complete them. Furthermore, he added that performance standards, rules, and regulations are outlined to followers. The directive leadership style is favorable in a high-pressure work environment where followers need to achieve challenging targets and goals. Principals must have friendly and approachable relationships with teachers while adopting a directive style of leadership. Healthy and pleasant relationships with teachers form respective and promising work environments. Such auspicious factors create more effective directive leadership.

Northouse (2018) describes supportive leadership as friendly and approachable leadership. It emphasizes followers' human needs, well-being (especially the development of pleasant working conditions), equal treatment, respect, and recognition. For this, teachers may give suggestions and ideas to principals to boost the effectiveness of their level of learning and teaching, or they may participate in major policy-making, decision-making, and execution processes. Northouse states that participative leadership empowers shared decision-making, where followers are consulted such that their ideas and suggestions are incorporated into policy-making. To obtain all or some of the required benefits from this leadership style, principals need to encourage teachers' continuous improvement. Furthermore, principals need to have confidence in the competencies of teachers so that they can achieve established challenging goals.

Achievement-oriented leaders let their followers know their expectations. They regularly set clear goals with potential high-performance standards, they trust in the capabilities of their subordinates, and they encourage continued performance improvement (Northouse, 2018). In a nutshell, directive principals generally provide task directions and do not involve teachers in policy-making or major administrative decision-making in schools. Therefore, supportive leadership effectively informs and strengthens directive leadership. Supportive leadership develops favorable work settings that foster high morale and job integrity, feelings of dignity, and more to meet ambitious objectives and goals. Thus, achievement-oriented leadership helps principals to set such objectives and goals, which make teachers active, energetic, and motivated. The participation of teachers qualifies when they successfully perform their job based on criteria. The participative leadership style amalgamates teachers' expertise and creativity to reach solutions to problems by integrating opinions, ideas, and suggestions. At the same time, principals must somehow provide relief for teachers regarding their slips, negligence, or acts concerned with the nonperformance of businesses or subjects.

Paradoxically, path–goal theory (PGT) is confusing due to the complexity of the theory itself, and it encompasses several heterogeneous aspects of leadership due to its broad scope and the interrelated set of assumptions about the leadership process (Northouse, 2018). The theory distinguishes between four leadership styles: directive, participative, supportive, and achievement-oriented, which are appropriate for standard operating procedures (SOPs), clarification of challenging goals regarding the task structure and carrying out assignments, the formal authority system, and successful job completion.

This theory relates to the present study in the sense that the choice of a principal planning strategies (budgeting and record keeping) simultaneously incorporates all of these attributes is a daunting task. The theory requires principals to be involved in budgeting and record keeping for improve fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State. When principals apply planning strategies such as budgeting and record keeping it improves fund management for effectiveness in public senior secondary schools in Udu Local Government Area, Delta State.

Theory of Planned Behaviour (TPB) by Ajzen's in 1991

The theory of planned behaviour (TPB) was propounded by Icek Ajzen in 1991. This theory is a widely accepted socio-psychological model and is used frequently by man scholars to explain human behaviours, across the various disciplines including communication. According to the theory of planned behaviour model, the most proximal determinant of a person's behaviour is

their intention to perform the behaviour. Behavioural intention then is influenced by three direct determinants; attitudes, subjective norms and perceived behavioural control.

As a general rule, the more positive the attitudes and subjective norms with respect to behaviour, and the greater the Perceived Behavioural Control (PBC), the stronger should be an individual's intention to perform the behaviour under consideration. Under conditions of volitional control, it has been found that the intention to perform is the strongest predictor of its actual performance.

This theory is related to the present study in the sense that the habit or behaviour such as budgeting and record keeping for improve fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State. Principals planning strategies such as budgeting and record keeping. can also be seen or referred to as behaviour is determined by the intention of the principal. As a general rule, the more the principal shows positive planning strategies such as budgeting and record keeping the stronger the principals' intention to improve fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State, but if a principal are involve in negatively behaviour such as non-budgeting and non-record keeping the more the principals' because ineffective in carrying in fund management.

METHODOLOGY

The descriptive design was adopted for this paper to examine planning strategies for fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State. The population of this study comprise of the 21 public senior secondary schools' principals in the 21 public senior secondary schools in Udu Local Government Area, Delta State. The sample size for the study was made of 21 respondents (principal) which is 100 % of the population for the paper. The adopted census sampling. Census method was used because the paper decided to use the entire principals. To carry out the census method, the ballot system was used with the inscription "S" for selected and "N" for not selected. A self-structured instrument titled: "Planning Strategies for Fund Management Effectiveness Questionnaire" (PSFMEQ)" was used for data collection. The instrument contained 6 items which was divided into 2 sections A and B. Section A dealt with the socio-demographic data of the respondents while section B was on the item statements for the research questions, in line with the modified 4-point Likert's scale of: (Very High Extent) = (VHE= 4 point), High Extent (HE), 3 points, Low Extent (LE) = 2 points and Very Low Extent (VLE) = 1point, respectively. The questionnaire instrument was validated by two lecturers in the Department of Educational Management, Ignatius Ajuru University of Education for face and contact validity. The reliability of the instrument was ascertained through the use of test re-test method, which involved administering 2 copies of instrument to 2 respondents outside the study area. The same instrument was readministered to the same respondents after an interval of two weeks. The scores that were generated from the two administrations. The reliability coefficient of 0.73 was established using the Pearson Product Moment Correlation. With these reliability index score; the instruments was ascertained reliable for the study. A total of 21 copies of the research instrument was administered on the entire principals' (respondents) in public senior secondary schools in Udu Local Government Area, Delta State by the researcher with the assistance of two trained Research Assistants. The researcher further calculates the return rate of the retrieval of the instrument. The data collected from the field was analysed using mean and standard deviation to answer the research questions,

in answering the research questions mean point value of 2.50 and above was agreed while below 2.50 was disagreed, while t-test inferential statistic tool was used to test the null hypotheses at 0.05 level of significance.

RESULTS

Research Question One: To what extent does budgeting as a planning strategy improves fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State?

Table 1: Mean ratings and standard deviation on the extent budgeting as a planning strategy improves fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State

		Male Principals' = 12 Female Principals'= 9					
S/N	**Variables**	$\bar{X}_1$	$S.D_1$	$\bar{X}_2$	$S.D2$	**Mean set**	**Remark**
1	Writing down budget termly helps principals' make informed decisions about how to allocate school resources	2.61	1.08	2.8	1.08	2.71	**High Extent**
2	Writing down a budget helps principals to allocate financial resources effectively	2.3	1.09	2.91	1.04	2.909	**High Extent**
3	Creating a budget, helps principals to enhance the effective administration of school	2.93	1.02	2.91	1.04	2.92	**High Extent**
Grand mean		**2.78**	**1.05**	**2.86**	**1.07**	**2.82**	**High Extent**

Data on Table 1 shows the mean ratings and standard deviation on the extent male and female principals agreed that budgeting as a planning strategy improves fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State. Table shows that both male and female principals agreed that to a high extent writing down budget termly helps principals' make informed decisions about how to allocate school resources that principals use direct face to face communication in the school, principals usually ask for teachers' opinion before taking any decision in the school, principals discusses school issues with teachers' regularly, principals' show concern to teachers' challenges in professional way and that principals encourages teachers to give feedback on policies and programs of school as seen on item 1, 2 and 3 with the mean set ratings of 2.71, 2.909 and 2.99 respectively. It therefore indicated that majority of the respondents agreed that budgeting as a planning strategy improves fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State to a high extent

Research Question Two: To what extent does record keeping as a planning strategy improves fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State?

Table 2: Mean ratings and standard deviation on the extent record keeping as a planning strategy improves fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State

		Male Principals' = 12 Female Principals'= 9					
S/N		$\bar{X}_1$	$S.D_1$	$\bar{X}_2$	$S.D2$	Mean set	Remark
4	Record keeping helps keep up-to-date and accurate records of income and expenditure	2.85	1.05	3.01	0.98	2.93	**High Extent**
5	Record keeping helps in estimating the financial resources needed for the year ahead	2.92	1.03	2.97	1.03	2.95	**High Extent**
6	Record keeping helps principals to protect school fund from possible loss and careless expenditure.	2.95	0.96	3.11	0.93	3.03	**High Extent**
	Grand Mean	**2.77**	**1.20**	**3.02**	**0.98**	**2.89**	**High Extent**

Data on Table 2 shows the mean ratings and standard deviation on the extent male and female principals agreed that principals' planning strategy improves fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State. The table shows that record keeping helps keep up-to-date and accurate records of income and expenditure, record keeping helps in estimating the financial resources needed for the year ahead and that record keeping helps principals to protect school fund from possible loss and careless expenditure to a high extent as seen on item 4, 5 and 6 with the mean set scores of 2.93, 2.95 and 3.03 respectively. The grand mean value of 2.89 indicated that male and female principals on record keeping as a principals' planning strategy enhance fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State to a high extent.

Test of Hypotheses

Hypothesis 1: There is no significant difference between budgeting as a planning strategy improves fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State.

Table 3: Independent sample t-test inferential statistic tool of the mean response of male and female principals based on planning strategy improves fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State

Gender	N	$\bar{x}$	S. D	Df	t-cal	P-value	Decision
Male Principals	12	2.78	1.05	19	6.800	.081	Rejected
Female Principals	9	2.86	1.07				
N=	**21**						

Alpha level = 0.05

Result in table 5 indicates that the calculated t-value is 6.800 while the p-value is .018 and the chosen alpha level is 0.05. This shows that, the p-value is less than the significance level ($p < .05$). Therefore, the null hypothesis is rejected. This revealed that there is significant different

between budgeting as a planning strategy and fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State.

Hypothesis 2: There is no significant difference between record keeping as a planning strategy improves fund management effectiveness in public senior secondary schools in public senior secondary schools in Udu Local Government Area, Delta State.

Table 4: Independent sample t-test inferential statistic tool of the mean response of male and female principals based on record keeping as a planning strategy improves fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State

Gender	N	$\bar{x}$	SD	Df	t-cal	P-value	Decision
Male Principals	12	2.77	1.20	19	9.435	.015	Rejected
Female Principals	9	2.02	0.98				
N=	**21**						

Alpha level = 0.05

Result in table 6 indicates that the calculated t-value is 9.435 while the p-value is .015 and the chosen alpha level is 0.05. This shows that, the p-value is less than the significance level ($p < .05$). Therefore, the null hypothesis is rejected. This revealed that there is significant different between record keeping as a planning strategy improves fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State.

DISCUSSION OF FINDINGS

Result of research question one as in analysis in table 1 shows that budgeting as a planning strategy improves fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State to a high extent that writing down budget termly helps principals' make informed decisions about how to allocate school resources, writing down a budget helps principals to allocate financial resources effectively and that creating a budget, helps principals to enhance the effective administration of school. The finding is in line with that of Vesna et al., (2017) who observed that writing down a budget helps managers to allocate financial resources effectively.

Result of research question two as in analysis in table 2 shows that record keeping as a planning strategy improves fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State to a high extent that record keeping helps keep up-to-date and accurate records of income and expenditure, record keeping helps in estimating the financial resources needed for the year ahead and that record keeping helps principals to protect school fund from possible loss and careless expenditure. The present finding is in agreement with the findings of Nwosu and Ozioko, (2020) who opined that record keeping helps managers in estimating the financial resources needed for the year ahead.

Result in hypothesis one as shown in table 3 revealed that there is significant different between budgeting as a planning strategy and fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State. The finding is in agreement with Vesna et al. (2017) who detected a significant different budgeting as a planning strategy and fund management effectiveness.

Result in hypothesis two as presented in table 4 discovered that there is a significant difference between record keeping as a planning strategy improves fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State. The finding is in line with that of Nwosu and Ozioko, (2020) who observed a significant difference between record keeping as a planning strategy and fund management effectiveness.

CONCLUSION

Education is seen in this paper as a catalyst to national development. The growth and development of any educational sector solely depends on the management of its finances. The need for adequate provision of resources for quality education delivery services underscores the importance that is associated with issue of finance. This is because among the required for the success of an educational system, finance plays a vital role. Its availability and effective management will determine the availability and utilisation of other resources.

Planning strategies are intended to lead secondary school principals through a strategic process to identify the most effective and efficient ways to address the challenge or focus on the management of their school fund. Planning strategies such as budgeting and record keeping enhances fund management effectiveness in public senior secondary schools in Udu Local Government Area, Delta State.

Recommendations

Based on the findings in this paper, the following recommendations are made:

- Principals of public senior secondary schools in Udu Local Government Area, Delta State should effectively plan for budgeting in their various schools for effective financial resource management.
- Principals in public senior secondary schools in Udu Local Government Area, Delta State should keep financial records for effective financial resource management.

ABSTRACT

This study examined strategies for improving Early Childhood Education (ECE) programmes for the long-term benefit of pupils in primary schools in Rivers State, Nigeria. Recognizing that the early years of a child's life are critical for cognitive, emotional, and social development, the study underscores the importance of high-quality ECE in laying the foundation for lifelong learning and academic success. It explored the historical context, objectives, significance, and current challenges of ECE in Nigeria, with a particular focus on the realities in Rivers State. The research identified several systemic issues undermining the effectiveness of ECE, including inadequate infrastructure, poor funding, lack of qualified educators, weak supervision, and insufficient stakeholder participation. Drawing on relevant literature and policy frameworks, the study proposed strategic interventions such as improved teacher training, curriculum reform, inclusive practices, enriched learning environments, enhanced monitoring, and stronger community engagement. The findings revealed that children who attend well-structured ECE programmes perform better in primary school, exhibit stronger emotional and social skills, and are more likely to complete their education successfully. In conclusion, the study affirmed that ECE is a critical investment for both individual development and national growth. It recommended that stakeholders including government bodies, educators, parents, communities, and NGOs play active and coordinated roles in enhancing the quality and reach of early childhood education. Specific actions such as increased funding, infrastructure development, policy enforcement, and capacity building were suggested to ensure effective and equitable ECE delivery in Rivers State and beyond.

Keywords: Early Childhood Education, Educational Development, Teacher Training, Learning Environment, Child Development, Educational Policy, Stakeholders.

INTRODUCTION

Early Childhood Education (ECE) establishes the crucial foundation upon which all future learning is based. It is during the early years particularly from birth to age five that the brain

grows most quickly, building synaptic connections that impact cognitive, emotional, social, and physical consequences throughout a person's life. Globally, ECE has received recognized as a strategic instrument for fostering inclusive, equitable, and quality education, in accordance with the Sustainable Development Goal 4 (SDG 4) which calls for universal access to excellent early childhood development and pre-primary education. Studies indicate that children who get high-quality early education are more likely to excel in primary school, less prone to grade retention, and exhibit enhanced lifetime learning outcomes (UNESCO, 2019; Britto et al., 2020). These advantages transcend the individual, contributing to a more competent, responsible, and productive society.

The significance of Early Childhood Education (ECE) in Nigeria has been officially recognized in many national policy papers, notably the National Policy on Education (2014), which stipulates one year of pre-primary education as a component of the Universal Basic Education (UBE) program. Rivers State, as a component of the Nigerian federation, has initiated the implementation of this strategy by establishing early childhood care development and education (ECCDE) facilities inside public elementary schools. Nonetheless, the actual execution has encountered some problems that diminish the programme's efficacy. A critical concern is insufficient finance. Although a regulatory framework is in place, the financial investment from both federal and state governments has been inadequate to sustain the infrastructure, educational resources, and training necessary for high-quality early childhood education. Adebayo and Ogunlade (2020) assert that financial expenditures for early childhood education in Nigeria are insufficient relative to other educational levels, hindering schools from achieving the necessary standards.

A notable difficulty is the scarcity of properly qualified educators specializing in early childhood education. Instructing young children requires particular pedagogical expertise, including an understanding of child psychology, play-based learning techniques, and age-appropriate evaluation methodologies. Regrettably, several early childhood education institutions, especially in rural and disadvantaged regions of Rivers State, are manned by unskilled or inadequately qualified workers, adversely affecting the quality of instruction and learning. Research conducted by Okafor and Onwuegbunam (2019) and Umezinwa and Ajaegbu (2021) indicates that the involvement of professionally educated educators markedly increases the learning experiences of young children and bolsters their preparedness for primary school. The absence of ongoing professional development opportunities exacerbates the problem, leaving many educators ill-prepared to address the distinct requirements of early learners.

Moreover, the learning environment in the majority of ECE centers in Rivers State is substandard and detrimental to successful learning. Numerous classrooms are congested, inadequately ventilated, and deficient in age-appropriate furnishings and teaching materials. The significance of a stimulating and secure learning environment is paramount, particularly for young children who acquire knowledge most effectively via sensory exploration, interaction, and play. Oduolowu and Ige (2020) assert that the lack of organized play spaces, educational corners, and appropriate instructional resources constrains the comprehensive development of children and obstructs the fulfillment of early childhood education goals. Furthermore, the curriculum used at several centers is either antiquated or inadequately executed. The National Curriculum for ECCDE offers a thorough framework for enhancing literacy, numeracy, health, and social skills; however, its effective execution is obstructed by inadequate teacher comprehension and insufficient oversight.

These systemic difficulties have enduring consequences for the academic and social development of children in Rivers State. When children lack a robust educational foundation, they often have difficulties with reading and numeracy in primary school, suffer from diminished self-esteem, and are more prone to disengagement from formal education. This initial disadvantage compounds over time, leading to elevated dropout rates, subpar performance on standardized tests, and ultimately, diminished opportunities in adulthood. Research conducted by Eze and Maduewesi (2022) revealed that children in southern Nigeria without access to excellent early childhood education had markedly worse performance in fundamental literacy and numeracy assessments in primary schools relative to their counterparts enrolled in organized ECE programs. The shortcomings in the existing early childhood education program adversely impact individual learners, while also perpetuating wider educational disparities and limiting the state's potential for human capital development.

To address these deficiencies and guarantee the long-term advantages of early childhood education, it is imperative to implement strategic enhancement measures that conform to global best practices in early childhood development. These methods must be evidence-based, context-specific, and inclusive, addressing all facets of the ECE ecosystem, including policy implementation, educator training, infrastructure enhancement, curriculum assessment, and stakeholder involvement. Adedokun et al. (2021) assert that effective early childhood education reform requires robust political commitment, intersectoral cooperation, and enduring financial strategies. Rivers State, due to its resource endowment and strategic location in the Niger Delta, have the capacity to excel in providing excellent early childhood education, provided that concerted efforts are undertaken to enhance current frameworks and implement novel methodologies.

Early Childhood Education

Early Childhood Education (ECE) includes both official and informal learning experiences offered to children from birth to five years old, before they begin primary school. This is a pivotal phase marked by accelerated brain growth and the establishment of cognitive, emotional, and social skills that provide the foundation for lifetime learning and behavior. UNESCO (2019) asserts that high-quality early childhood education establishes a robust basis for academic achievement, health, and production, making it a strategic investment for individual and social advancement. The early years constitute a critical period during which children's brains exhibit significant plasticity and responsiveness to beneficial stimuli. During this period, learning settings, caregiver-child interactions, and exposure to developmentally suitable educational activities profoundly impact brain architecture and neural connections (Britto, Lye & Proulx, 2020). When children get enough attention and stimulation throughout these years, they are more likely to develop enhanced language skills, numerical comprehension, critical thinking, and emotional control, all of which are vital for future academic and life success.

Furthermore, early childhood education offers children their initial encounters with organized learning and social engagement beyond the home environment. These experiences are vital for developing fundamental pre-academic abilities, including letter and number identification, phonemic awareness, counting, and pattern recognition, as well as interpersonal skills like as collaboration, empathy, and communication. Adedokun, Oloyede, and Lawal (2021) assert that involvement in organized early childhood education programs is positively associated with enhanced cognitive development, improved health outcomes, and increased school

completion rates. Children who experience early education are much more likely to transfer seamlessly into primary school and are less prone to grade repetition or dropout. Well-designed ECE programs promote fairness by reducing developmental inequities that often stem from socio-economic differences. Early learning opportunities for children from disadvantaged homes may provide compensating experiences that alleviate the impacts of poverty, inadequate nutrition, and insufficient parental support (UNICEF, 2020).

The importance of Early Childhood Education (ECE) is progressively recognized within Nigeria's national educational policies. The National Policy on Education (2014) acknowledges early childhood care and education as a fundamental element of the universal basic education framework, advocating for the creation of Early Childhood Care Development and Education (ECCDE) centers nationwide. Nonetheless, the execution of this strategy is inconsistent across several jurisdictions, including Rivers State, attributable to structural challenges like as inadequate finance, a shortage of qualified instructors, and ineffective oversight. These challenges have resulted in inequalities in access to and quality of early childhood education services, especially between urban and rural regions. Research conducted by Eze and Maduewesi (2022) indicated that children participating in organized early childhood programs in urban areas had much superior performance in literacy and numeracy evaluations relative to their rural peers who did not have access to these services. This discovery underscores the pressing need to enhance access, equality, and quality in early childhood education.

It is essential to emphasize that early childhood education (ECE) not only enhances children's academic performance but also fosters holistic development including moral, physical, and emotional well-being. Structured early childhood education programs often include elements of health education, nutrition, cleanliness, and physical exercise, all of which enhance a child's whole development. Children exposed to organized early learning settings often exhibit improved physical coordination, healthier lives, and enhanced resilience. Okonkwo and Ogbonna (2020) assert that the incorporation of play-based learning, storytelling, music, and creative arts into early childhood education curriculum augments children's imaginative and problem-solving abilities, hence nurturing enduring creativity and innovation. These formative events influence not just children's knowledge but also their attitude to learning throughout their lives.

There is a growing global agreement that investing in early childhood education provides the greatest returns on educational expenditures, particularly when initiatives are directed towards the most disadvantaged communities. Consequently, several international organizations, like as the World Bank, UNICEF, and UNESCO, have urged national governments to promote early learning in their educational reform initiatives. In Nigeria, enhancing early childhood education interventions—especially in underprivileged regions such as some portions of Rivers State—necessitates a coordinated strategy that includes policy implementation, community engagement, comprehensive teacher training, and continuous financial support. With such policies in place, the long-term developmental and educational results of children may be considerably enhanced, contributing to the general human capital development of the country.

Historical Context of Early Childhood Education in Nigeria

Nigeria’s approach to early childhood education has evolved significantly over the centuries, shaped by cultural traditions, colonial influence, political transitions, and ongoing educational reforms. Understanding this historical trajectory helps to appreciate the current state and challenges of early childhood education in Nigeria.

Pre-Colonial Era (Before the 1800s): Informal and Culturally-Based Learning

Before the advent of Western influence, Nigerian societies operated on deeply ingrained systems of informal education that were tailored to cultural values, communal living, and the immediate environment. Early childhood education during this period was not structured in classrooms but was embedded in everyday life. Children acquired knowledge and skills through observation, participation, and imitation of adults. Storytelling was a primary method through which moral values, history, customs, and social expectations were passed down. These stories, often told by elders, were rich in cultural symbolism and carried moral lessons designed to instill discipline, honesty, and respect for elders.

Different ethnic groups had unique educational goals and methods. Among the Yoruba people, boys learned farming, hunting, and trade skills, while girls were taught household management, childcare, and traditional crafts. The Igbo, on the other hand, emphasized community cooperation and entrepreneurial skills. The Hausas, with their strong Islamic influence, often introduced children to Quranic education early in life, where they learned to recite and memorize verses from the Quran, alongside receiving moral instruction. In all these societies, education was communal, practical, and geared towards preparing children to function effectively within their specific socio-cultural environment.

Colonial Era (1800s–1960): Introduction of Western Education

The colonial era brought profound changes to the educational landscape in Nigeria. With the British colonization of Nigeria in the 19th century came the introduction of Western-style education, which significantly altered traditional methods of learning. Early childhood education, as part of formal education, began to take root during this period, albeit on a limited scale. Christian missionaries were the first to establish schools for young children, primarily to promote literacy and convert indigenous populations to Christianity. These missionary schools focused on the use of English and taught religious values, arithmetic, and basic literacy. The aim was to cultivate a class of literate individuals who could serve the colonial administration.

However, access to these educational opportunities was highly restricted. Most schools were located in urban centers and mission stations, making them inaccessible to rural populations. Furthermore, colonial education policies favored the children of the elite and those living in coastal cities like Lagos, Calabar, and Port Harcourt. Indigenous knowledge systems and local languages were disregarded in favor of Western ideals and the English language. The early childhood education system during this time was neither inclusive nor culturally relevant for the majority of Nigerian children.

Government involvement in early childhood education was minimal during the colonial period. Most of the initiatives were undertaken by religious missions, with very little oversight or support from the colonial authorities. This resulted in a fragmented system with varying standards and inconsistent curricula.

Post-Independence Era (1960–Present): National Efforts and Modern Developments

Nigeria’s independence in 1960 marked the beginning of a new phase in the development of early childhood education. The newly formed government recognized education as a tool for

nation-building and economic development. As a result, education was prioritized in national development plans. The first National Development Plan (1962–1968) emphasized the expansion of educational facilities and access to schooling. However, early childhood education still did not receive the attention it deserved. The focus was primarily on primary, secondary, and tertiary education.

The introduction of the Universal Primary Education (UPE) program in 1976 was a landmark effort aimed at expanding access to education. Although UPE was targeted at primary school-aged children, it indirectly influenced early childhood education by increasing demand for preparatory learning. Parents began to recognize the value of sending children to school earlier to better prepare them for primary education.

The 1981 National Policy on Education, which has since undergone several revisions, marked a significant turning point by officially recognizing early childhood education as part of the educational structure. The policy advocated for the establishment of pre-primary education facilities and emphasized the training of specialized teachers for young learners. The revised National Policy on Education (2013) further reinforced the government's commitment by promoting one year of pre-primary education as a requirement before entering primary school.

Key Milestones in the Development of Early Childhood Education in Nigeria

- 1955: The Nigerian government establishes the first nursery school in Lagos.
- 1960: Nigeria gains independence, and the government prioritizes education as a key area for development.
- 1970s: The Universal Primary Education (UPE) program was introduced, aiming to provide free primary education to all children.
- 1980s: The Nigerian government establishes the National Commission for Colleges of Education (NCCE) to oversee teacher education.
- 1990s: The government introduces the National Policy on Education, which emphasizes the importance of early childhood education.
- 2000s: The government launches the Universal Basic Education (UBE) program, which aims to provide free basic education to all children.
- 2013: The National Policy on Education is revised, emphasizing the importance of early childhood education in preparing children for primary school.

OBJECTIVES OF EARLY CHILDHOOD EDUCATION

The objectives of ECDE as rendered by FRN (2014) are to:

1. Facilitating Smooth Transition from Home to School

One of the core objectives of Early Childhood Education (ECE) is to create a seamless transition from the home environment to the formal school setting. At this stage, children are often leaving the protective and familiar confines of their homes for the first time. ECE programs are designed to ease this transition by creating a nurturing and responsive environment that bridges the gap between informal home-based learning and the structured routines of formal schooling. As noted by Olaleye and Omotayo (2021), a positive start in early education plays a critical role in reducing anxiety, building confidence, and helping children adapt to the more rigid structure of

primary education. The Nigerian policy emphasizes that a gradual and well-supported transition not only reduces stress but also enhances long-term school retention and academic motivation.

2. Preparation for Primary Education

ECE is tasked with laying a solid foundation for future learning by preparing children for the demands of primary education. This includes cognitive readiness, social adaptability, and physical coordination. According to Eze and Maduewesi (2022), children who go through structured early childhood programs demonstrate better performance in primary school, particularly in literacy and numeracy. These programs expose children to pre-reading and pre-mathematical concepts through storytelling, rhymes, number games, and drawing activities. Furthermore, the development of motor skills through manipulative play, music, and physical education activities equips children with the stamina and coordination necessary for effective participation in classroom activities.

3. Providing Adequate Supervision and Care

Another essential objective of ECE, especially in the Nigerian context, is to provide care and supervision for children while their parents engage in economic activities such as farming, trading, and office work. This objective is not only a social necessity but also a developmental need. The availability of safe and nurturing childcare facilities ensures that children are not left unattended or exposed to harmful environments. Akpan and Okon (2019) assert that quality childcare during the early years contributes significantly to children's emotional security and cognitive development. In Rivers State, this function becomes particularly critical in both urban and rural areas where working-class parents struggle with balancing work and childcare responsibilities.

4. Inculcation of Social Norms and Values

ECE plays a vital role in the early socialization of children by teaching them the acceptable values, attitudes, and behaviours of their society. The policy emphasizes the importance of social norms such as respect for elders, cooperation with peers, cleanliness, honesty, and obedience. Through songs, storytelling, and group play, children internalize cultural norms and begin to understand the consequences of their actions. According to Ajayi and Oyinlola (2020), early exposure to social expectations helps children develop empathy, discipline, and emotional regulation—traits that are essential for harmonious living and citizenship. Moreover, teaching social values at this stage ensures cultural continuity and national identity formation.

5. Encouraging Inquiry and Creativity

The ECE curriculum is designed to stimulate children’s curiosity, creativity, and problem-solving skills through exploration of the environment, arts, music, and play. Play-based learning allows children to ask questions, make discoveries, and engage in hands-on activities that foster imagination and innovation. As noted by UNESCO (2019), fostering creativity in the early years lays the groundwork for later innovation and critical thinking skills. In Nigeria, especially within the framework of the National Policy on Education, this objective is prioritized through

experiential learning and child-centered methods. Teachers are encouraged to create learning scenarios where children can interact with nature, use local materials for craftwork, and participate in music and dance that reflect cultural heritage.

6. Promoting Team Spirit and Cooperation

Another key objective is to instil in young learners a sense of cooperation, collaboration, and teamwork. Activities such as group games, collaborative storytelling, and role-play exercises are incorporated into the curriculum to help children develop interpersonal skills and the ability to work with others. Okonkwo and Ogbonna (2020) stress that social interaction during early childhood lays the foundation for effective communication, conflict resolution, and collaborative learning in later years. In Rivers State, promoting team spirit at an early age is vital in fostering community development and reducing the prevalence of anti-social behaviors among youths.

7. Instilling Healthy Habits

ECE also focuses on teaching children basic hygiene and healthy lifestyle habits. This includes proper handwashing, oral hygiene, nutritious eating, exercise, and personal cleanliness. These habits are often introduced through songs, routines, and storybooks that emphasize their importance. According to WHO (2020), early childhood is a critical period for developing lifelong health practices, and school-based interventions are effective in reinforcing these behaviors. In Nigeria, where public health challenges persist, ECE provides an avenue to instill preventive health measures in the population from a young age.

8. Teaching Basic Literacy and Numeracy through Play

A unique strength of ECE lies in its ability to introduce basic academic concepts through play. The National Policy emphasizes teaching letters, numbers, shapes, colors, and forms in a manner that is engaging and developmentally appropriate. Learning through play has been shown to improve attention span, memory retention, and enthusiasm for school (UNICEF, 2021). Children in Rivers State who are exposed to playful learning environments enter primary school with a stronger foundation in literacy and numeracy, which translates into better academic performance and reduced repetition rates.

IMPOTANCE OF EARLY CHILDHOOD EDUCATION

Foundation for Lifelong Learning

Early Childhood Education (ECE) serves as the cornerstone of lifelong learning and human development. The experiences children have in their early years significantly shape their cognitive, emotional, and behavioral patterns. These formative years are characterized by rapid brain development, making them a critical period for the acquisition of foundational skills such as language, numeracy, memory, and problem-solving. According to UNESCO (2019), children who participate in quality early learning programs develop stronger cognitive skills and are more likely to thrive in formal education settings. This foundation reduces learning disparities and prepares children for academic success in primary school and beyond. In the Nigerian context,

where many children begin primary school without any prior exposure to formal learning, ECE bridges this readiness gap, ensuring children acquire the basic literacy and numeracy skills needed for progression (Adedokun, Oloyede & Lawal, 2021).

Promotion of Holistic Development

ECE goes beyond academic preparation; it nurtures the total development of the child—socially, emotionally, morally, and physically. Structured play, storytelling, music, creative arts, and peer interactions help children develop communication skills, self-awareness, emotional regulation, and moral values. According to Britto, Lye, and Proulx (2020), a holistic approach to early childhood education fosters resilience, adaptability, empathy, and collaboration, which are vital skills for navigating life. In Nigeria, especially in Rivers State, where children from disadvantaged backgrounds may lack nurturing environments at home, ECE centres can serve as protective spaces that offer stimulation, nutrition, and psychosocial support. These interventions improve not only school readiness but also children's health and behavioral outcomes in later years.

Reduction of Socio-Economic Inequality

One of the most compelling arguments for the importance of ECE is its role in reducing socio-economic disparities. Children from low-income families are more likely to start school late, repeat grades, or drop out entirely. Quality ECE programmes provide an equalizing platform by equipping all children—regardless of background—with the tools to succeed in school and life. UNICEF (2020) highlights that early education is a cost-effective intervention that helps close achievement gaps between rich and poor, urban and rural, and boys and girls. In communities within Rivers State, where inequalities in education are often driven by poverty, poor infrastructure, and lack of parental education, investment in early learning can help ensure that every child, regardless of their circumstances, gets a fair start in life.

Boost to National Human Capital Development

Investing in ECE is not only a moral obligation but a strategic economic decision. A nation’s future productivity and economic competitiveness depend largely on the quality of its human capital. Early education builds the critical thinking, innovation, and interpersonal skills that modern economies require. According to the World Bank (2020), countries that invest in ECE experience higher economic returns in the long run through improved school achievement, reduced remedial education costs, and increased workforce participation. For Nigeria, where youth unemployment and skill mismatches are pressing challenges, strengthening early learning systems is a key step toward building a knowledgeable and skilled population. ECE programmes aligned with global best practices can lay the groundwork for future entrepreneurship, innovation, and national development.

Strengthening Gender Equity and Parental Involvement

ECE also contributes to gender equality and supports parental engagement in the learning process. Girls who attend early education programmes are more likely to stay in school longer,

delay early marriage, and participate actively in society. At the same time, ECE centres provide opportunities for parental sensitization, where caregivers learn about nutrition, hygiene, child rights, and developmental milestones. Okonkwo and Ogbonna (2020) argue that ECE centres in Nigeria that engage parents and communities in early learning activities foster stronger home-school partnerships and encourage lifelong learning habits within families. This dual impact on both children and parents creates a culture of education that supports positive developmental outcomes and enhances societal cohesion.

CHALLENGES OF EARLY CHILDHOOD EDUCATION IN RIVERS STATE

Despite its importance, ECE in Nigeria faces several challenges, including inadequate infrastructure, poor funding, and insufficient teacher training (Ibrahim, 2014; Bagudo, 2008). Many parents undervalue pre-primary education due to concerns about quality and cost (Ibrahim, 2014). The government has implemented policies like the National Policy on Education and the UBE program to address these issues, but more needs to be done to ensure universal access and quality (Federal Republic of Nigeria, 2013; Education for All Global Monitoring Report, 2007).

Inadequate Infrastructure and Teaching Materials

One of the most pressing challenges facing Early Childhood Education in Rivers State is the shortage of age-appropriate infrastructure and teaching materials. Many public ECE centres in the state operate in dilapidated buildings without child-friendly facilities such as low-seated furniture, colorful learning aids, functional playgrounds, and sanitary toilets. The absence of such facilities not only endangers the safety and health of children but also impedes their cognitive and physical development. According to Eze and Maduewesi (2022), many pre-primary classrooms in southern Nigeria are poorly ventilated, overcrowded, and lack stimulating environments that are essential for early learning. In several rural areas of Rivers State, children attend ECE in makeshift classrooms without visual learning tools, toys, or structured play areas, which hinders effective teaching and learning. A conducive and stimulating learning environment is vital at this stage, yet its absence continues to be a major limitation in the region.

Poor Funding of ECE Programmes

The underfunding of Early Childhood Education programmes is another critical barrier to their effectiveness in Rivers State. Despite the inclusion of ECE in Nigeria's National Policy on Education, public investment in the sector remains low compared to primary, secondary, and tertiary education. ECE is often left to private providers, religious bodies, or non-governmental organizations, which leads to disparities in access and quality. According to the Universal Basic Education Commission (UBEC) report cited by Adeyemi and Ogunode (2021), less than 10% of the basic education budget is allocated to the pre-primary subsector. In Rivers State, the situation is worsened by inconsistent financial planning and delayed disbursement of education funds, resulting in poor maintenance of facilities, lack of instructional materials, and inadequate teacher training. This chronic underfunding undermines the sustainability and equity of ECE, especially for children from low-income and rural backgrounds.

Lack of Qualified Early Childhood Educators

Another major challenge is the shortage of trained and specialized ECE teachers in public schools. Many teachers assigned to ECE classes in Rivers State have little or no formal training in early childhood pedagogy. This affects their ability to use child-centered teaching methods, manage young learners effectively, and deliver age-appropriate curriculum content. Studies have shown that the qualifications and competence of ECE teachers significantly influence learning outcomes at this critical stage (UNESCO, 2019). However, due to the neglect of pre-service and in-service training programmes, many teachers lack the professional skills to stimulate cognitive, emotional, and social development in preschool-aged children. Okonkwo and Ogbonna (2020) also note that teacher-pupil ratios in many ECE centres in the South-South region are far above recommended standards, leading to teacher burnout and reduced individual attention to learners. Without urgent investment in teacher recruitment, training, and motivation, the quality of early childhood instruction in Rivers State will remain suboptimal.

Weak Supervision and Policy Implementation

Policy implementation and supervision of ECE programmes in Rivers State are generally weak due to institutional lapses and lack of political will. Although the National Policy on Education mandates the provision of at least one-year pre-primary education, many public schools either do not implement this requirement or do so in name only. There is also limited monitoring by education authorities to ensure adherence to curriculum guidelines, teacher standards, and child protection regulations. According to UNICEF (2020), weak regulatory frameworks at the state level contribute to the proliferation of unapproved ECE centres with poor learning conditions and unqualified personnel. In Rivers State, the lack of a coordinated early childhood development policy and poor inter-agency collaboration further affect service delivery. Consequently, there is an urgent need for a robust monitoring and evaluation frame

GOVERNMENT'S COMMITMENT TO ACHIEVING ECE OBJECTIVES IN NIGERIA

To actualize the outlined objectives of Early Childhood Education (ECE) in Nigeria, the government has designed several strategic initiatives. These interventions, enshrined in national education policies, are aimed at expanding access, improving quality, and fostering sustainability in ECE delivery. However, while these strategies are commendable in theory, their implementation across states, including Rivers State, has been inconsistent. Below is a critical examination of these government initiatives and their implications.

Establishment of Pre-Primary Sections in Public Schools

The Federal Government of Nigeria has mandated the integration of pre-primary sections into all existing public primary schools. This strategy is designed to increase access to early education, especially for children from low-income families who cannot afford private nursery schools. According to Ogunyemi and Aborisade (2019), the establishment of public pre-primary sections is a step toward universalizing early childhood education and reducing disparities in access between rural and urban areas. In Rivers State, however, the actual number of public schools with functional pre-primary sections remains low, largely due to funding constraints and

infrastructure deficits. Thus, the government's encouragement of community and private sector participation in ECE provision remains crucial.

Provision for Teacher Specialization in ECE

A cornerstone of effective early childhood education is the training and deployment of qualified teachers who specialize in early learning pedagogy. The government has made provisions within teacher education programs to ensure the inclusion of ECE specialization tracks in colleges of education and universities. These specialized programs emphasize child psychology, play-based instruction, and classroom management for young learners. As noted by Adeyemi and Ogunode (2021), adequately trained teachers are essential for facilitating age-appropriate learning and achieving desired developmental outcomes. However, many ECE centers in Rivers State are still staffed by unqualified personnel or primary school teachers without ECE training, which compromises the quality of instruction and undermines policy intentions.

Promotion of Indigenous Languages as Medium of Instruction

Recognizing the cognitive and cultural advantages of learning in the mother tongue, the National Policy on Education stipulates that instruction in ECE should be conducted primarily in the local language of the child's community. This approach aligns with research indicating that children learn more effectively when taught in a familiar language (UNESCO, 2019). To support this initiative, the government has committed to developing orthographies for Nigerian languages and producing culturally relevant textbooks. However, the implementation of this policy has been slow due to the lack of standard orthographies for many local dialects and the scarcity of teaching materials in indigenous languages. In Rivers State, where multiple local languages exist, this poses a significant challenge, although efforts are ongoing to develop materials in widely spoken languages such as Ikwerre, Kalabari, and Ogoni (Okonkwo & Ogbonna, 2020).

Play-Based Learning as the Main Teaching Method

The government emphasizes that play should be the central method of instruction at the early childhood level. Play-based learning supports creativity, exploration, and social interaction—core components of holistic child development. The curriculum for teacher education is also expected to be reoriented to reflect this philosophy. According to UNICEF (2021), play is not merely a recreational activity; it is a critical learning mechanism through which children develop problem-solving skills, motor coordination, and emotional resilience. Unfortunately, many public ECE centers, particularly in Rivers State, lack the necessary learning materials and space to support effective play-based learning. There is an urgent need for investment in play equipment, teacher training, and classroom design to ensure this policy is successfully implemented.

Regulation and Monitoring of Minimum Standards

To ensure quality and accountability, the government is tasked with setting and monitoring minimum operational standards for early childcare centers. This includes enforcing a maximum teacher-pupil ratio of 1:25, ensuring the safety and hygiene of learning environments, and requiring the use of developmentally appropriate curricula. The National Early Childhood

Development Standards (NECDS) serve as a guiding framework for this purpose. However, Adepoju (2020) argues that the enforcement of these standards remains weak, especially in informal and unregistered ECE centers. In Rivers State, insufficient monitoring personnel and inadequate data on existing centers hinder effective regulation. Strengthening monitoring frameworks and involving local education authorities and communities in oversight roles could improve compliance.

Ensuring Stakeholder Participation in ECE Delivery

The success of any ECE initiative hinges on the active involvement of stakeholders—government agencies, community members, parent-teacher associations, and non-governmental organizations. The national policy rightly calls for the full participation of these groups in the establishment, management, and funding of early childhood education facilities. Community participation not only enhances ownership and accountability but also ensures that local needs and cultural values are reflected in program delivery. As reported by Eze and Maduewesi (2022), where communities are empowered to contribute land, materials, or volunteer services, ECE centers become more sustainable and responsive to the people they serve. In Rivers State, fostering partnerships between local government authorities, traditional institutions, and civil society groups is essential for bridging service delivery gaps.

STRATEGIES FOR IMPROVING EARLY CHILDHOOD EDUCATION PROGRAMS

Improving Early Childhood Education (ECE) programs requires a multifaceted approach that addresses various aspects of educational quality, accessibility, and community involvement. Here are several key strategies for enhancing ECE programs:

Teacher Training

One of the primary strategies for improving ECE programs is through comprehensive teacher training. Research indicates that well-trained teachers are better equipped to deliver high-quality instruction that is responsive to children's developmental needs (Pianta et al., 2017). Professional development programs that focus on evidence-based teaching practices, classroom management, and child development are essential for enhancing teachers' effectiveness. Studies have shown that children taught by teachers with specialized training in early childhood education exhibit better academic and social outcomes (Barnett, 2011).

Curriculum Design and Implementation

A developmentally appropriate curriculum that is both challenging and engaging is crucial for fostering children's cognitive, social, and emotional growth. Integrating play-based learning, hands-on activities, and exploratory learning opportunities can enhance children's critical thinking and problem-solving skills. Ensuring that the curriculum aligns with developmental milestones and individual learning needs is also vital (NAEYC, 2009).

Parental and Community Engagement

Engaging parents and the community in the educational process can create a supportive and enriching environment for children. Strategies include organizing parent workshops, creating volunteer opportunities, and establishing regular communication channels between teachers and families. Community partnerships can also provide additional resources and support, such as health services, nutrition programs, and extracurricular activities (Henderson & Mapp, 2002).

Inclusive Practices

Implementing inclusive practices ensures that all children, regardless of their abilities or backgrounds, have access to quality education. This involves adapting teaching methods to cater to diverse learning needs, providing specialized support where necessary, and fostering an inclusive classroom environment that celebrates diversity. Inclusion promotes empathy, respect, and social cohesion among young learners (Odom et al., 2004).

Assessment and Continuous Improvement

Regular assessment and evaluation of both student progress and program effectiveness are essential for continuous improvement. Formative assessments help educators tailor instruction to meet individual needs, while summative assessments provide insights into overall program outcomes. Using data-driven decision-making can help identify areas for improvement and ensure that ECE programs are meeting their goals (Shepard et al., 1998).

Enhanced Learning Environments

Creating stimulating and safe learning environments is fundamental to children's development. This includes both indoor and outdoor spaces that are well-organized, resource-rich, and designed to encourage exploration and learning. Providing age-appropriate materials, ensuring safety standards, and creating inviting spaces can significantly enhance children's engagement and learning experiences (Olds, 2001).

Policy and Advocacy

Advocacy for supportive policies and increased funding for ECE programs can lead to significant improvements. Policies that ensure equitable access to quality ECE, adequate teacher compensation, and comprehensive support services are critical. Advocacy efforts can also raise public awareness about the importance of early education and garner support for necessary reforms (Barnett & Masse, 2007).

Use of Technology

Integrating technology in ECE can enhance learning experiences and provide innovative educational tools. Interactive software, educational games, and online

resources can support various aspects of learning, from literacy and numeracy to social-emotional skills. However, it is important to ensure that technology is used appropriately and does not replace hands-on, play-based learning (Plowman et al., 2012).

LONG-TERM BENEFITS OF HIGH-QUALITY EARLY CHILDHOOD EDUCATION

Improved Literacy and Numeracy Skills

One of the most significant long-term benefits of quality Early Childhood Education (ECE) is the development of foundational literacy and numeracy skills. During the early years, children's brains are highly receptive to structured learning environments that expose them to phonics, language acquisition, number concepts, pattern recognition, and problem-solving activities. According to Adedokun et al. (2021), children who attend well-resourced ECE centres perform better in reading, writing, and arithmetic when they transition into primary education. This early exposure enables them to decode and process information more effectively, thus accelerating their academic growth. Moreover, UNESCO (2019) affirms that early learning builds cognitive frameworks that support more complex intellectual tasks later in life, such as logical reasoning and abstract thinking. In Nigeria, where primary education often begins with limited individualized attention, pupils with prior ECE experience are better positioned to understand classroom instructions and actively participate in learning.

Better School Readiness and Academic Performance

Early exposure to structured learning prepares children for the demands and routines of formal schooling. Children who attend ECE programmes are more likely to arrive in primary school with the behavioral and cognitive readiness needed for effective participation. School readiness includes not only pre-literacy and numeracy skills but also the ability to follow instructions, engage in group tasks, and exhibit attention control. According to Eze and Maduewesi (2022), pupils in Rivers State who had access to early childhood education demonstrated greater confidence and independence in classroom activities compared to their peers without such backgrounds. These attributes positively affect their long-term academic performance, resulting in better test scores, class participation, and continuous academic progression. In addition, a strong ECE foundation reduces the likelihood of pupils repeating grades or needing remedial support, thereby improving efficiency in the education system.

Enhanced Social Interaction and Emotional Regulation

ECE programmes also support social and emotional development by promoting interaction with peers, teachers, and caregivers in a structured environment. Through group activities, storytelling, role-play, and conflict resolution exercises, children learn to communicate their feelings, share resources, follow rules, and resolve disagreements peacefully. These experiences are crucial in fostering empathy, self-control, and cooperation—skills that are essential for life success. According to UNICEF (2020), children who develop emotional regulation and positive peer relationships during early childhood are more likely to exhibit prosocial behavior, maintain friendships, and avoid behavioral problems in later schooling. In the context of Rivers State, Okonkwo and Ogbonna (2020) emphasized that emotional and social competencies developed

through early education help children adapt better to school settings and reduce anxiety and behavioral disruptions. These skills are transferable to future contexts, including secondary schooling, the workplace, and personal relationships.

Reduced Dropout Rates and Improved Life Outcomes

Another key benefit of improved ECE is its long-term impact on school retention and life outcomes. Children who begin their educational journey with a strong foundation are less likely to drop out of school as they progress. Research shows that children who attend quality ECE programmes have higher rates of secondary school completion and are more likely to pursue higher education or vocational training (World Bank, 2020). This educational continuity contributes to better employment prospects, higher income potential, and increased civic participation in adulthood. Furthermore, ECE has been linked to reduced involvement in crime, improved health practices, and greater resilience in the face of adversity. In their longitudinal study, Britto, Lye, and Proulx (2020) found that early investment in cognitive and emotional development significantly predicts adult well-being and socio-economic mobility. Therefore, in a state like Rivers where educational inequality and youth unemployment are major concerns, strengthening early childhood education can serve as a proactive strategy for long-term social development and economic empowerment.

CONCLUSION

The findings of this study reaffirm the critical role of Early Childhood Education (ECE) as the foundation for lifelong learning, personal development, and national progress. Despite the Nigerian government's recognition of its importance—particularly through policies such as the National Policy on Education and the Universal Basic Education programme—the implementation of ECE in Rivers State continues to face substantial challenges. These include inadequate infrastructure, poor funding, lack of qualified educators, weak supervision, and uneven community engagement. Such barriers undermine the quality, accessibility, and effectiveness of early childhood education, especially in underserved and rural communities.

However, the study also identifies clear, evidence-based strategies for reversing this trend and achieving the long-term developmental benefits that quality ECE promises. Enhancing teacher training, implementing inclusive and play-based curricula, improving learning environments, ensuring robust policy enforcement, and fostering stakeholder involvement are all crucial for a functional ECE system. If effectively applied, these strategies can significantly improve school readiness, literacy and numeracy outcomes, social development, and life trajectories of children in Rivers State.

To secure the future of its young population, Rivers State must prioritize early childhood education as a strategic investment in human capital. It requires political will, sustainable funding, inter-agency collaboration, and a commitment to equity and excellence in education. By addressing the systemic deficiencies and embracing innovative, child-centered approaches, the state can harness the transformative potential of ECE and ensure that every child regardless of background has a strong start in life.

Suggestions for Relevant Stakeholders

- Federal Government should increase budgetary allocation to Early Childhood Education (ECE) to ensure sustainable funding for infrastructure, teaching materials, and capacity-building across states.
- Rivers State Government should prioritize the construction and renovation of age-appropriate, child-friendly ECE centers, especially in underserved rural areas.
- Local Government Authorities Should monitor and ensure the implementation of national ECE policies in public schools within their jurisdictions through regular inspections and reports.
- Ministry of education should organize periodic training and retraining programs for early childhood educators to improve pedagogical skills and curriculum delivery.
- Teacher Training Institutions Should incorporate specialized ECE modules into pre-service and in-service teacher education programs to produce qualified early childhood educators.
- School administrators should create inclusive, safe, and stimulating environments by integrating play-based learning, health education, and social development into daily activities.
- Parents and guardians should actively participate in their children's early learning by supporting home-based educational activities and collaborating with teachers.
- Community leaders should advocate for and support the establishment of ECE centers through community mobilization, land donations, and volunteer services.
- Private sector should partner with government and NGOs to sponsor ECE initiatives through Corporate Social Responsibility (CSR), particularly in resource-poor communities.
- Non-Governmental Organizations (NGOs) Should provide technical and material support, conduct advocacy, and implement intervention programs that address gaps in early childhood education.

CRISIS MANAGEMENT STRATEGIES IN HIGHER EDUCATION: A PANACEA FOR SUSTAINABLE DEVELOPMENT

BENIBO DUMO TONYE
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

The paper examined crisis management strategies in higher education: a panacea for sustainable development. Crisis management strategies within higher education institutions as essential tools for promoting institutional stability and achieving sustainable development. With increasing global and local disruptions ranging from pandemics, natural disasters, cyber threats, to political unrest higher education institutions, particularly in developing nations, face serious vulnerabilities. The paper explained how effective crisis management strategies can mitigate disruptions, safeguard academic continuity, and contribute to long-term educational sustainability. Key components such as institutional planning, leadership during emergencies, technological innovations, communication frameworks, and stakeholder engagement are discussed in detail. The paper draws on contingency theory to highlight the relevance of flexible and context-specific responses during crises. It further emphasized the importance of aligning crisis preparedness with the United Nations Sustainable Development Goals, particularly Goal 4 on quality education. The paper concluded that effective crisis management is an essential component of higher education institutions' ability to ensure institutional stability and promote sustainable development. Amongst others, the paper suggested that institutional administrators should prioritize the development and regular revision of comprehensive crisis management policies. These policies must clearly define roles, response protocols, and communication channels.

Keywords: Crisis Management, Higher Education, Sustainable Development, Institutional Stability, Crisis Preparedness.

INTRODUCTION

Higher education institutions are often regarded as pillars of national growth, development, and innovation. However, the increasing unpredictability of social, political, economic, and environmental conditions has exposed these institutions to diverse crises capable of disrupting their core functions. Crisis management in higher education has thus become a critical area of focus, particularly in ensuring institutional resilience and long-term sustainability. The concept of sustainable development within the higher education context encompasses the capacity of

institutions to continue delivering quality teaching, research, and community service, even in the face of adversity. Moreover, the strategic handling of crises directly influences the ability of higher education systems to maintain stability and contribute to broader developmental goals (Alfred, 2020).

Crisis management in this context refers to a systematic approach to identifying, assessing, and responding to events that threaten the functionality of academic institutions. These events may range from natural disasters, political unrest, financial mismanagement, public health emergencies, and cyber threats to campus insecurity. Furthermore, the capacity of an institution to proactively manage such disruptions is increasingly viewed as essential to its sustainability and credibility. According to Gaus and Hall (2021), without adequate crisis management strategies, institutions risk collapse, loss of stakeholder trust, and long-term developmental setbacks. Moreover, higher education institutions serve as knowledge centers that influence national development through the production of human capital, research outputs, and policy engagement. Therefore, any prolonged crisis can reverse developmental gains and weaken national progress.

In addition, the need for strategic preparedness in higher education is no longer optional but a necessary aspect of institutional planning. Sustainable development requires not only economic and environmental stability but also robust educational systems that can withstand shocks and continue to perform optimally. Crisis management becomes a tool through which educational sustainability is maintained, ensuring that disruptions do not derail the long-term objectives of academic institutions (Okeke & Ibrahim, 2022). Moreover, the COVID-19 pandemic exposed the vulnerability of higher education globally and reawakened the discourse on the importance of strategic responses in times of uncertainty. Institutions with structured crisis response systems were able to adapt, sustain academic activities, and support their communities, while others without such systems experienced prolonged closure and academic regression (Yakubu, 2021).

Additionally, effective crisis management strategies offer a preventive and responsive framework through which institutions can not only survive but also adapt and thrive in challenging contexts. It becomes evident that the integration of crisis management into higher education governance and planning is foundational to achieving sustainable development. Hence, exploring and strengthening these strategies is central to safeguarding the future of higher education and ensuring that it continues to contribute meaningfully to national and global progress.

THEORETICAL FRAMEWORK

Contingency Theory

Contingency Theory, originally developed by Fred Fiedler in 1964, and later revisited by Manuel Villoria (2023), presents a practical framework that underscores the idea that there is no universally best way to manage or lead an organization; rather, the effectiveness of leadership or management strategies depends heavily on the alignment between the leader's style and the demands of the specific situation. This theory challenges the notion of fixed or ideal models of leadership by emphasizing that situational factors such as the nature of the crisis, institutional structure, and stakeholder dynamics must be taken into account when determining an appropriate response strategy.

Fiedler's original proposition categorized leadership into task-oriented or relationship-oriented styles and argued that their effectiveness is contingent upon factors like leader-member relations, task structure, and positional power. Villoria (2023) expanded on this foundation by reinforcing its relevance in contemporary institutions where complex and variable situations demand adaptive leadership behaviors. Within the context of higher education, particularly during crises, this theory provides a foundational explanation for why some institutions manage disruptions more effectively than others. Moreover, the diverse challenges that higher education institutions face ranging from political instability, pandemics, resource scarcity, technological failures, and internal governance breakdown require flexible approaches that are context-sensitive and responsive to the conditions of the moment.

Furthermore, the application of Contingency Theory to the current study offers a theoretical base for understanding how educational leaders make strategic decisions that ensure continuity, safety, and functionality during crises. Higher education institutions function within environments that are continuously evolving; therefore, no single strategy or leadership model can be effective across all scenarios. For instance, during a pandemic, a more centralized and task-oriented leadership approach may be required to ensure rapid policy implementation and health compliance, whereas in post-conflict recovery, a relationship-oriented style might be more effective in rebuilding trust and fostering inclusive governance. In addition, this theory supports the development of flexible crisis management frameworks where institutional responses are not rigid but are tailored to fit prevailing challenges. Through this lens, sustainable development is viewed not as a static achievement but as a dynamic outcome of strategic adaptation.

Contingency Theory, as positioned in this study, thus becomes a valuable lens for evaluating how universities can develop scalable and situation-appropriate responses that support long-term stability and institutional resilience during periods of disruption. The ability to match leadership behavior with contextual variables contributes meaningfully to the sustainable functioning of higher education systems, making the theory highly relevant to the goals of this study.

CONCEPTUAL CLARIFICATIONS

Crisis Management

Crisis management is a deliberate institutional process involving the identification, assessment, response, and recovery from unforeseen events that pose serious threats to organizational stability and operations. In higher education, these threats can stem from internal or external sources, including public health emergencies, violent conflicts, natural disasters, cyber-attacks, political instability, or financial mismanagement. Moreover, crisis management requires proactive preparation to reduce vulnerability and promote resilience across all sectors of institutional life. According to Adeniran and Lawal (2020), effective crisis management begins with risk analysis, where institutions map out potential threats, evaluate their likelihood, and assess the severity of their possible impact. This enables leadership to develop realistic, resource-based strategies that are actionable and context-specific. Furthermore, a structured crisis management process typically consists of three phases: the preparedness phase, where policies and action plans are established; the response phase, where immediate actions are taken to reduce damage and protect lives; and the recovery phase, where institutions work toward restoration and normalization of academic and administrative activities.

In addition, the success of crisis management efforts often depends on leadership effectiveness and coordination across departments. Institutions that establish crisis committees and conduct periodic drills tend to experience fewer disruptions and recover faster. Gaus and Hall (2021) observed that universities with embedded crisis management units maintained a better level of operational continuity during the COVID-19 pandemic than those that responded spontaneously without prior frameworks. Moreover, communication is a critical tool in the management of crises. Higher education institutions must develop transparent and accessible communication channels that reach all stakeholders in real time. Clear messaging reduces panic, promotes compliance with safety protocols, and fosters a sense of collective responsibility. In situations where communication breaks down, confusion and misinformation can escalate the crisis.

Additionally, crisis management is not only about reacting to emergencies but also about creating an institutional culture that embraces change, prepares for uncertainty, and encourages strategic learning from past disruptions. Okafor and Sule (2019) emphasized the importance of post-crisis evaluation, where institutions review their response, document lessons learned, and update their management plans accordingly. This continuous improvement loop is vital for institutional growth and sustainability. Crisis management in higher education, therefore, goes beyond emergency handling; it functions as a necessary mechanism for institutional stability, risk reduction, and long-term development planning.

Crisis Management Strategies in Higher Education

Crisis management strategies in higher education refer to the specific set of tools, processes, and actions adopted by institutions to prevent, respond to, and recover from adverse situations that disrupt academic and administrative continuity. These strategies are not uniform across all institutions; rather, they are tailored to the institution's location, size, governance structure, and risk profile. Moreover, effective crisis management strategies must be embedded into institutional policies and routinely evaluated for relevance. Nwachukwu (2021) noted that during the global COVID-19 crisis, universities that had pre-existing digital infrastructure, virtual learning platforms, and contingency protocols were able to maintain academic operations with minimal disruption. Furthermore, higher education institutions are expected to maintain institutional calendars, protect lives and property, secure data, and preserve their public image—all of which require well-structured management strategies.

In addition, one of the key strategies used in higher education involves the formation of crisis management committees made up of senior management, health and safety officers, security personnel, and communication experts. These committees are responsible for coordinating emergency responses and ensuring that all departments work in unity. Moreover, institutions often develop crisis communication plans that outline how information is disseminated during emergencies. This includes official press releases, website updates, SMS alerts, and internal memos. Timely and accurate communication enhances trust and prevents the spread of misinformation. Another essential strategy is the integration of technology into crisis response systems. Tools such as cloud storage, e-learning platforms, surveillance systems, and emergency hotlines allow institutions to respond quickly and maintain remote operations during physical closures.

Furthermore, training and capacity-building exercises form a major component of crisis preparedness. Institutions conduct simulation exercises, fire drills, and health emergency

workshops to ensure that staff and students know how to act in times of crisis. As observed by Ibrahim and Musa (2020), institutions that routinely engage in such drills record higher levels of compliance during real emergencies. Additionally, policy frameworks must be reviewed periodically to incorporate emerging threats and changing regulatory standards. Institutions operating in regions prone to conflict or disasters must prioritize early warning systems and build partnerships with government agencies for support and intelligence. Crisis management strategies in higher education, therefore, must remain dynamic, inclusive, and responsive. They are essential tools for ensuring institutional survival and continued service delivery, even in the most challenging circumstances.

Crisis Management and Sustainable Development

Crisis management and sustainable development are closely linked concepts in the context of higher education, as the ability of institutions to survive and recover from disruptions directly impacts their long-term viability and contribution to societal progress. Sustainable development, within this scope, entails the capacity of higher education institutions to maintain inclusive, equitable, and quality education over time, regardless of environmental, political, or economic challenges. Furthermore, institutions that embed crisis management principles into their operational and strategic planning are better equipped to uphold the core values of sustainability, such as continuity, resilience, equity, and innovation. According to Okoro and Ibrahim (2022), higher education institutions that developed strong internal crisis management mechanisms were able to minimize learning interruptions, support vulnerable students, and maintain community engagement during national emergencies.

Moreover, sustainable development in education requires that institutions are not only reactive to disruptions but proactive in their preparedness. This includes investing in sustainable infrastructure, building institutional resilience, and training staff in risk reduction practices. In addition, financial sustainability is reinforced when institutions reduce losses from unplanned shutdowns and avoid reputational damage that could affect future funding or enrolment. Crisis management thus becomes a tool that protects institutional integrity, allowing education systems to adapt and evolve under pressure while still delivering on their mandate. Furthermore, in regions where education plays a central role in national development, the failure of higher education institutions to withstand crises can result in workforce disruption, reduced innovation capacity, and social instability.

Additionally, institutions that manage crises effectively tend to foster trust among stakeholders, including students, parents, staff, and policy makers. This trust contributes to social sustainability, as institutions are viewed as reliable pillars of societal advancement. As highlighted by Eze and Omotayo (2021), universities that remained functional during crises were also more likely to contribute to national recovery through research, training, and community outreach. Sustainable development in higher education is, therefore, not achievable without robust crisis management systems. The presence of such systems ensures that institutions continue to contribute to human capital development, policy innovation, and social transformation in a stable and uninterrupted manner. Crisis management serves as a protective layer that allows the pursuit of development goals even during periods of uncertainty

TYPES OF CRISES IN HIGHER EDUCATION INSTITUTIONS

Natural Crises

Natural crises refer to emergencies that originate from environmental or weather-related events such as floods, fires, storms, or disease outbreaks. These events often occur unexpectedly and can severely disrupt institutional operations. Furthermore, natural crises can damage infrastructure, displace students and staff, and force the closure of campuses for extended periods. For instance, flooding may affect libraries, laboratories, and dormitories, while a pandemic can necessitate the complete transition to remote learning. Additionally, these crises typically strain available resources, including medical services, housing, and technology. Institutions with poor environmental preparedness suffer the most during such events. In addition, response to natural crises often requires collaboration with public health or disaster management agencies. The lack of proactive planning may prolong the disruption and compromise academic calendars. Therefore, higher institutions must develop early warning systems, evacuation procedures, and digital infrastructure to ensure continuity during these types of crises.

Human-Induced Crises

Human-induced crises arise from deliberate or unintended actions by individuals or groups that threaten institutional stability. These may include student protests, staff strikes, administrative corruption, cultism, sexual harassment scandals, and acts of violence. Furthermore, such crises often result from dissatisfaction with institutional policies, delayed salaries, unfair academic practices, or governance lapses. In addition, when not properly addressed, they escalate into disruptions of academic activities, destruction of property, and threats to personal safety. According to Nwachukwu and Ojo (2023), human-induced crises tend to be prolonged when communication between management and stakeholders breaks down. Moreover, such crises can damage the reputation of the institution and erode trust among stakeholders. The consequences may include reduced student enrollment, loss of public confidence, and sanctions from regulatory bodies. Therefore, institutions must adopt preventive strategies such as conflict resolution mechanisms, open dialogue, staff welfare improvements, and ethical leadership to manage human-induced crises effectively.

Technological Crises

Technological crises in higher education refer to emergencies that arise from the failure, misuse, or breach of digital systems and infrastructure. These include cyberattacks, system crashes, data breaches, and failure of online learning platforms. Moreover, the increasing reliance on digital technologies for administration, instruction, and communication has made institutions more vulnerable to such crises. For example, a ransomware attack on an institution’s server can lead to the loss of academic records, delay in result processing, and exposure of sensitive information. In addition, unplanned system outages during online examinations or registration periods can cause academic delays and student frustration. Furthermore, inadequate cybersecurity measures, outdated software, and lack of trained IT personnel often worsen the impact of technological crises. Institutions that do not invest in technological resilience risk frequent disruptions.

Therefore, continuous system upgrades, staff training, data backups, and the use of secure platforms are essential to managing and mitigating technological crises.

Financial Crises

Financial crises occur when higher education institutions face a shortage of funds to meet operational, academic, or developmental needs. This type of crisis may result from cuts in government subvention, reduced internally generated revenue, poor financial management, or economic downturns. Furthermore, financial crises can lead to unpaid staff salaries, delayed infrastructure projects, shortage of learning materials, and reduction in research funding. In addition, prolonged financial instability may result in staff strikes, mass resignation, and loss of accreditation for certain programs. According to Adebayo and Akinlolu (2021), financial distress often undermines staff morale and leads to compromised educational quality. Moreover, institutions with weak financial planning mechanisms often find it difficult to recover from such crises. Student welfare is also affected, as financial constraints may increase tuition or limit support services. Therefore, sustainable financial planning, diversification of funding sources, and transparent accounting systems are essential for preventing and managing financial crises in higher institutions.

SOURCES OF CRISES IN HIGHER EDUCATION INSTITUTIONS

Administrative Lapses

One major source of crises in higher education is poor administration. When institutional leaders make decisions without stakeholder consultation, apply policies unfairly, or manage resources inefficiently, discontent begins to build. Furthermore, issues such as favoritism in staff promotion, delays in salary payment, mismanagement of student welfare, or lack of transparency in decision-making often result in protests and institutional unrest. In addition, ineffective communication and autocratic leadership styles contribute to misunderstandings and resistance. According to Onuoha and Eze (2022), administrative lapses often trigger long-term conflict if not addressed through inclusive governance. Moreover, when institutions fail to implement decisions consistently, stakeholders lose trust and question the legitimacy of management. These lapses create an unstable environment where academic programs cannot thrive. Therefore, higher education institutions must adopt participatory management approaches, establish checks and balances, and maintain open communication to address administrative gaps that may lead to crises.

Policy Inconsistencies

Another source of crisis is the inconsistency or frequent reversal of institutional or governmental policies affecting higher education. When institutions or education ministries implement policies without thorough consultation or adequate planning, it creates confusion and resistance. For instance, sudden increases in tuition fees, abrupt curriculum changes, or unanticipated modifications to admission requirements can provoke backlash from students and staff. Furthermore, unclear policies on academic performance, grading, or promotion often lead to disputes. In addition, lack of proper orientation or sensitization makes it difficult for stakeholders

to understand and adjust to new rules. Institutions that frequently change their policies without evaluating their impact risk creating an atmosphere of instability. According to Ibrahim and Edem (2022), sustainable crisis prevention requires consistent, fair, and well-communicated policies. Moreover, involving all affected parties in the policy-making process increases acceptance and compliance. Therefore, institutional stability depends on policy clarity, transparency, and continuity.

External Political and Social Factors

Higher education institutions are not isolated from the larger social and political environment. Crises can emerge from external political instability, ethnic conflicts, government strikes, or changes in national education policy. Furthermore, during national protests or political transitions, universities may become targets of demonstrations, attacks, or public unrest. In addition, regulatory interference, such as sudden withdrawal of accreditation, forced changes in leadership, or imposition of new funding structures, often destabilizes institutional operations. According to Adebayo and Akinlolu (2021), higher institutions located in politically volatile regions experience frequent closures and disruptions. Moreover, social issues such as community conflicts, insecurity, or youth violence can spill into the campus environment, especially when the institution is not properly secured. Therefore, proactive engagement with government agencies, local communities, and law enforcement is necessary to shield academic activities from external disturbances and maintain institutional peace.

THE ROLE OF CRISIS MANAGEMENT IN PROMOTING INSTITUTIONAL STABILITY

Crisis management plays a vital role in fostering institutional stability, especially in higher education systems vulnerable to disruptions arising from political unrest, health emergencies, cyber threats, and environmental hazards. Institutional stability in this context refers to the consistent ability of an educational institution to deliver its core functions without prolonged or permanent interruption. Furthermore, crisis management provides the structure for identifying risks, allocating responsibilities, and initiating swift, organized responses that minimize academic and administrative disorder. When institutions are equipped with a functional crisis management plan, they are better positioned to maintain essential services and protect their human and material resources from destruction or displacement. According to Yusuf and Olaniyi (2021), institutions that institutionalize risk mitigation practices within their governance processes are more likely to maintain operational consistency even in periods of uncertainty.

Moreover, stability is reinforced when institutions develop internal mechanisms for resilience, such as emergency preparedness protocols, safety audits, and recovery planning. These mechanisms reduce the likelihood that a crisis will escalate into a prolonged disruption. In addition, the psychological reassurance that comes from knowing that a management team has a concrete plan fosters confidence among staff and students, reducing anxiety and panic during emergencies. Institutions that prioritize preparedness are also able to adapt quickly to changing circumstances, implementing alternatives such as virtual learning, temporary closures, or phased reopening plans. As Adebayo and Musa (2020) noted, these quick adjustments are critical in preventing the breakdown of institutional functions during crises.

Additionally, institutional stability is not simply the absence of crisis but the ability to continue with clarity, structure, and governance even in the face of disruption. Institutions that invest in crisis simulation drills, communication systems, and staff training cultivate a culture of preparedness that strengthens institutional trust. This trust is crucial for long-term sustainability, as stakeholders—students, parents, donors, and staff—rely on institutions that show consistency. Crisis management becomes the tool through which higher education maintains structure, ensures continuity of learning, and protects its public image. As such, the role of crisis management in institutional stability cannot be overemphasized; it forms the very basis upon which recovery, adaptation, and sustained development are built in the academic sector.

Crisis Response Frameworks and Strategic Planning in Higher Education

Crisis response frameworks in higher education consist of structured plans, policies, and operational procedures that institutions put in place to address emergency situations swiftly and effectively. These frameworks are essential components of strategic planning, as they enable institutions to maintain functionality, protect stakeholders, and minimize damage during periods of crisis. Furthermore, strategic planning that incorporates crisis response acknowledges the possibility of disruption and prepares institutions for rapid decision-making, resource deployment, and coordinated communication. Institutions that embed crisis frameworks into their long-term planning demonstrate higher levels of adaptability and resilience. According to Eze and Ajayi (2022), strategic crisis planning ensures that universities do not approach emergencies from a reactive standpoint but operate from a position of informed readiness.

Moreover, a functional crisis response framework involves clearly defined roles, established command structures, emergency contact protocols, and accessible communication systems. These components enable swift activation during emergencies without the confusion that often accompanies unprepared institutions. In addition, integrating these frameworks into strategic planning ensures that budgets, personnel training, and infrastructure investments are aligned with potential crisis scenarios. Higher education institutions must also consider regional risk factors such as climate vulnerabilities, political unrest, or technological dependencies when developing their frameworks. Olabode and James (2021) emphasized that tailoring crisis strategies to local realities enhances effectiveness and reduces institutional exposure to long-term damage.

Furthermore, institutions must regularly update and test their frameworks to ensure relevance and functionality. Conducting simulations, reviewing past crisis responses, and gathering feedback are necessary components of adaptive planning. Additionally, strategic partnerships with health services, security agencies, and communication providers are vital for external support during large-scale emergencies. These partnerships expand institutional capacity and offer technical assistance during complex crises.

In addition, strategic planning and crisis frameworks must be inclusive, involving academic leadership, student representatives, administrative officers, and other stakeholders in their formulation. This inclusive approach ensures ownership and widespread understanding of procedures. Institutions that overlook the strategic integration of crisis response often face longer recovery periods and irreversible reputational damage. Crisis frameworks within strategic planning are, therefore, not optional documents but vital instruments for survival, continuity, and future institutional growth.

Leadership and Decision-Making During Crises

Leadership during crises in higher education requires timely, transparent, and firm decision-making to ensure institutional continuity and the protection of life and property. During such times, leaders are confronted with uncertainty, pressure, and limited information, yet they are expected to provide clarity, coordinate response teams, and maintain trust within the institution. Furthermore, effective crisis leadership involves understanding the severity of the crisis, evaluating available resources, and taking decisions that align with institutional values and strategic priorities. According to Okonkwo and Bello (2020), leadership effectiveness during a crisis often determines the speed and quality of institutional recovery.

Moreover, decision-making during crises must be grounded in collaboration and consultation, while also maintaining the agility needed to act swiftly. Institutions led by individuals who delay critical decisions, or those who exclude relevant stakeholders, often suffer from miscommunication, resource misallocation, and loss of public confidence. In addition, a good leader must remain visible and accessible, serving as a source of information and stability. The presence of leadership during emergencies reassures staff and students and enables coherent coordination across departments.

Furthermore, leadership in times of crisis must prioritize ethical decision-making, transparency, and accountability. Decisions such as campus closures, relocation of students, transition to online learning, or budget reallocations must be justified, clearly communicated, and implemented with compassion. Moreover, institutional leaders are expected to anticipate long-term implications of short-term decisions, ensuring that urgent actions do not undermine institutional sustainability. According to Hassan and Omole (2021), the effectiveness of crisis leadership is greatly enhanced when decisions are informed by data, risk assessments, and consultation with experts across relevant domains.

Additionally, the ability to learn from crises is a hallmark of visionary leadership. After the immediate response phase, leaders must initiate evaluation processes, gather feedback, and revise existing policies. Institutions where leaders demonstrate such commitment to institutional learning are more likely to build resilience and prepare effectively for future threats. Furthermore, leaders must cultivate trust by being honest about the challenges while also communicating hope and a path forward. In higher education, where stakeholder expectations are high and reputational risk is substantial, leadership and decision-making are central to both managing the crisis and setting a direction for post-crisis recovery and development.

Technological Innovations in Crisis Management

Technological innovations have become essential to crisis management in higher education, offering tools that enhance emergency preparedness, streamline communication, and ensure continuity of academic and administrative operations during disruptions. Institutions are increasingly recognizing the importance of integrating technology into their crisis response frameworks to build resilience and adaptability. Furthermore, technological tools allow universities to anticipate potential threats, coordinate responses in real time, and manage resources efficiently. According to Chukwu and Folarin (2022), digital transformation has allowed institutions to overcome disruptions by ensuring uninterrupted learning through virtual platforms. Moreover, tools such as real-time alert systems, cloud-based storage, and virtual conferencing have become indispensable for managing emergencies effectively.

In addition, Learning Management Systems (LMS) such as Moodle, Blackboard, and Canvas enable the seamless delivery of academic content and assessments, ensuring that students remain engaged even when physical classrooms are inaccessible. Video conferencing platforms support lectures, meetings, and counseling services, maintaining academic and emotional support structures during crises. Furthermore, institutions have adopted mobile applications and automated messaging systems to disseminate updates swiftly, thereby reducing confusion and enabling informed decision-making among stakeholders. These innovations are particularly valuable in contexts where sudden disruptions such as strikes, floods, pandemics, or cyberattacks could otherwise lead to academic paralysis.

Moreover, institutions are now using Artificial Intelligence (AI) and data analytics to assess risk patterns, predict possible disruptions, and simulate crisis scenarios. This predictive capacity enables proactive rather than reactive crisis management. Additionally, digital platforms offer universities the ability to track attendance, monitor student engagement, and evaluate learning outcomes during remote instruction. According to Ekanem and Bello (2021), institutions that invested in technology-driven education systems before the COVID-19 pandemic experienced minimal academic disruption and were better equipped to respond to uncertainties.

Furthermore, institutions are leveraging Geographic Information Systems (GIS) for environmental risk monitoring and evacuation planning. These systems provide spatial data that inform decision-making in cases of fire outbreaks, flooding, or physical security threats. In addition, digital financial platforms allow universities to process staff salaries, fees, and vendor payments remotely, ensuring that essential administrative functions continue during crises. The use of secure cloud storage protects institutional data from physical damage and facilitates remote access to critical records. Overall, technological innovations strengthen institutional agility and provide a reliable foundation for comprehensive crisis response, allowing universities to fulfill their mandate without prolonged interruption even in the face of unexpected events.

Stakeholder Engagement and Communication in Times of Crisis

Stakeholder engagement and effective communication are foundational pillars of successful crisis management in higher education. Institutions are made up of diverse stakeholders including students, lecturers, administrative staff, parents, alumni, regulatory agencies, and local communities. Each of these groups has expectations and concerns that must be addressed through consistent, transparent, and timely communication, particularly during emergencies. Furthermore, institutions that maintain active engagement with their stakeholders before, during, and after a crisis tend to foster trust, encourage cooperation, and achieve smoother recovery. According to Anya and Yusuf (2022), the presence of clear communication protocols within a university's crisis management plan reduces the likelihood of panic and ensures that all parties receive accurate information when it matters most.

Moreover, stakeholder engagement enhances the quality and implementation of crisis responses. When students, staff unions, and other interest groups are included in planning discussions, the policies that emerge are more realistic, equitable, and widely accepted. In addition, this inclusion ensures that unique challenges facing vulnerable groups such as students with disabilities or those lacking internet access are identified and addressed promptly. Institutions that fail to engage stakeholders often experience resistance, misinformation, and internal conflict, which can prolong the duration and severity of crises. Furthermore, the use of

multiple communication platforms emails, SMS, social media, websites, and public broadcasts ensures that updates reach all stakeholder categories in accessible formats.

Additionally, effective crisis communication involves two-way feedback. Institutions must not only transmit information but also receive it. Feedback mechanisms such as hotlines, surveys, and listening sessions provide management with valuable insights into the effectiveness of their strategies and the areas that require improvement. This dynamic exchange strengthens institutional unity and fosters a sense of shared responsibility. According to Uche and Nwachukwu (2021), communication that is consistent and inclusive reduces fear and misinformation, leading to more coordinated and efficient crisis resolution.

In addition, post-crisis communication plays an important role in rebuilding confidence and maintaining engagement. Institutions should inform stakeholders about recovery plans, timelines, and changes to academic or administrative policies. Such transparency ensures continuity in relationships and maintains institutional credibility. Furthermore, establishing dedicated crisis communication teams equipped with clear guidelines allows universities to respond to inquiries and disseminate verified information without delay. Through deliberate stakeholder engagement and strategic communication, higher education institutions can enhance their resilience, reduce misunderstandings, and foster stronger bonds among all parties involved during crises.

Effective Crisis Management in Higher Education

Effective crisis management in higher education involves deliberate planning, strategic coordination, and prompt action aimed at preserving academic continuity and institutional integrity during emergencies. Institutions must recognize that crises are inevitable and therefore develop frameworks that enable quick and organized responses to disruption. These frameworks should encompass risk assessment, emergency response procedures, communication protocols, and recovery strategies. Furthermore, effective management begins long before a crisis occurs, through proactive measures such as regular staff training, safety drills, resource allocation, and scenario simulations. According to Salami and Olorunfemi (2020), universities that integrated crisis management into their institutional planning were better able to withstand the shocks brought by the COVID-19 pandemic and other emergencies.

Moreover, institutions require internal coordination among all departments to achieve an effective response. Every unit, from health services and ICT departments to academic faculties and security teams, must understand their roles and collaborate seamlessly. In addition, decision-making must be centralized yet inclusive, allowing for quick approvals while ensuring that the perspectives of key stakeholders are considered. Leadership during such moments must be both visible and proactive, as delayed decisions can lead to escalation and greater harm. Furthermore, institutions should establish clearly defined crisis teams equipped with the authority and resources to manage emergencies independently and effectively.

Additionally, effective crisis management is reflected in how well institutions maintain learning processes despite disruptions. The use of digital platforms, alternative assessment methods, and flexible academic calendars enables continued delivery of education. Moreover, institutions should provide emotional and psychological support to staff and students who may experience stress or trauma during the crisis. According to Danjuma and Emeka (2021), higher education institutions that incorporated mental health services into their crisis response plans reported higher levels of stakeholder satisfaction and cooperation.

Furthermore, recovery and post-crisis evaluation are essential for strengthening future preparedness. Institutions must reflect on what worked, what failed, and what improvements are necessary. Lessons learned should inform updates to existing policies and procedures. Furthermore, institutions should maintain transparency throughout the recovery phase, providing regular updates and maintaining open channels of communication. Effective crisis management is not about avoiding disruption but about responding in a way that minimizes harm, protects institutional operations, and preserves trust among all stakeholders. Institutions that manage crises efficiently not only survive but also build stronger systems for long-term sustainability and growth.

Implications of Crisis Management for Sustainable Development Goals

Crisis management in higher education directly contributes to the realization of Sustainable Development Goals (SDGs), particularly Goal 4, which emphasizes inclusive and equitable quality education and the promotion of lifelong learning opportunities. Higher institutions play a critical role in national development through education, research, innovation, and the training of future professionals. When crises such as pandemics, natural disasters, political unrest, or financial instability disrupt these functions, the broader objectives of sustainable development are also affected. Furthermore, institutions that have integrated crisis management into their strategic frameworks are better positioned to maintain continuity in their educational mission, even under adverse conditions. According to Nwachukwu and Ojo (2023), effective crisis response mechanisms allow universities to protect academic calendars, retain staff and students, and safeguard research investments.

Moreover, resilience in the face of crisis ensures that marginalized and vulnerable groups do not lose access to educational opportunities. When institutions respond swiftly through virtual platforms, alternative learning modes, or decentralized instructional systems, they preserve inclusivity and reduce dropout rates. In addition, such efforts support lifelong learning by maintaining momentum in education irrespective of external disruptions. Furthermore, institutions that promote safe and secure learning environments through risk assessments and preparedness drills enhance the welfare of their academic communities, aligning with the targets of SDG 3, which focuses on health and well-being.

Additionally, the long-term effects of well-managed crises influence institutional contributions to other SDGs, including those related to innovation, economic growth, and reduced inequalities. For instance, when higher institutions resume operations promptly after a disruption, they continue to supply skilled graduates, conduct solution-driven research, and participate in community development. According to Ibrahim and Edem (2022), crisis preparedness enables universities to offer targeted interventions in public health, environmental protection, and economic recovery, thereby reinforcing their role in sustainable development efforts.

Besides, universities that build robust crisis management systems demonstrate accountability and governance, which are key indicators of sustainable institutions. These systems help prevent academic interruptions, protect investments in human capital, and uphold institutional credibility. In addition, crisis management practices promote resource optimization and adaptability, both of which are essential for long-term sustainability. Therefore, the implications of crisis management extend beyond institutional survival to include contributions to national and global development agendas. Institutions that strengthen their ability to manage

disruptions are not only safeguarding their future but also contributing meaningfully to the collective achievement of sustainable development goals.

Policies for Strengthening Crisis Preparedness in Higher Education

Policies designed to strengthen crisis preparedness in higher education are essential for minimizing the impact of disruptions and ensuring institutional stability. These policies serve as formal frameworks that guide decision-making, resource allocation, communication, and operational continuity in times of crisis. Furthermore, institutions that develop clear and actionable policies before a crisis occurs are more likely to respond effectively when emergencies arise. According to Adebayo and Akinlolu (2021), preparedness policies that include detailed response plans, safety protocols, and designated crisis teams result in faster and more coordinated institutional reactions.

Moreover, crisis preparedness policies should be inclusive, involving input from all relevant stakeholders such as academic staff, students, administrators, unions, and external partners. This participatory approach ensures that the policies address practical challenges and gain wide acceptance. In addition, these policies must be regularly reviewed and updated to reflect emerging threats such as cyberattacks, pandemics, or climate-related risks. Institutions that treat crisis management as a continuous process rather than a one-time event are better equipped to sustain their core functions under pressure.

Additionally, policies should establish clear lines of authority and communication during emergencies. This includes identifying individuals responsible for specific aspects of the response, creating communication templates for crisis announcements, and setting up secure channels for real-time updates. According to Onuoha and Eze (2022), ambiguity in leadership roles and delayed communication are among the most common obstacles in university crisis responses. Therefore, well-structured policies provide clarity and speed, reducing the time it takes to implement emergency measures.

Furthermore, preparedness policies should address infrastructural readiness. Institutions must ensure that facilities meet safety standards, that there are adequate health and emergency supplies, and that technological systems are resilient enough to support remote learning and administrative tasks. In addition, financial planning should be integrated into crisis policies to provide for emergency funding, insurance coverage, and the continuation of essential services. Institutions that fail to allocate funds for crisis preparedness often experience delays and inefficiencies during recovery.

Policies must also include training and awareness programs for all members of the institution. Drills, workshops, and simulations help individuals understand their roles and build confidence in the institution's crisis response strategy. Furthermore, coordination with external agencies such as health departments, security services, and emergency responders enhances institutional readiness. These partnerships ensure that higher institutions are not isolated in their efforts but are part of a broader emergency management system. Therefore, the development and implementation of robust crisis preparedness policies are essential for safeguarding institutional functions and supporting sustainable development outcomes.

CHALLENGES TO EFFECTIVE CRISIS MANAGEMENT IN DEVELOPING NATIONS

Inadequate Funding and Resource Constraints

A major challenge to effective crisis management in developing nations is insufficient funding and limited resources. Most higher education institutions in such settings operate on constrained budgets that are barely enough for routine operations, let alone crisis preparedness or emergency response. Furthermore, the absence of dedicated funds for risk management and disaster response leaves institutions vulnerable when crises occur. This lack of preparedness often results in delayed responses, poor coordination, and compromised decision-making. In addition, emergency procurement of safety materials, communication tools, and digital infrastructure becomes difficult due to financial limitations. As a result, institutions may be forced to suspend operations until external support arrives. Moreover, weak financial planning and dependence on irregular government subventions reduce institutional flexibility during emergencies. Without adequate funding, even well-intentioned crisis plans cannot be implemented, making it necessary for institutions to advocate for sustainable financial strategies and diversify their income sources for long-term resilience.

Poor Infrastructure and Technological Limitations

Technological underdevelopment and poor infrastructure hinder effective crisis management in many developing nations. Institutions often lack stable internet connectivity, backup power supply, modern communication systems, and emergency alert platforms. Furthermore, when a crisis requires a quick transition to online learning, the absence of reliable digital tools makes it difficult to maintain academic continuity. In addition, outdated buildings, inadequate health facilities, and non-functional fire and safety systems pose physical risks to both students and staff. According to Chukwu and Folarin (2022), institutions that operate without basic digital tools struggle to implement remote work or e-learning during campus closures. Moreover, even when technology is available, the lack of trained personnel to manage crisis-related systems further complicates response efforts. These limitations create delays, confusion, and prolonged recovery periods. Therefore, investment in modern infrastructure and digital capacity-building is essential for improving institutional resilience and effective crisis handling in developing contexts.

Weak Institutional Policies and Planning

Another challenge facing crisis management in developing nations is the lack of comprehensive policies and structured planning. Many institutions do not have a crisis response framework that outlines steps to take during emergencies, roles of key personnel, or methods of coordination. Furthermore, policies that do exist are often outdated, reactive, or not widely disseminated among staff and students. This creates confusion during crises, as there are no clear protocols to guide decision-making. In addition, poor policy implementation due to weak administrative capacity and lack of stakeholder engagement further reduces the effectiveness of existing plans. Institutions without strategic emergency planning are likely to be caught unprepared, resulting in disorganized responses and greater damage. Moreover, the absence of policy review mechanisms

prevents learning from past crises. For crisis management to be effective, institutions must develop detailed, inclusive, and regularly updated policies that anticipate a wide range of emergencies and promote institutional preparedness.

Leadership and Governance Challenges

Effective crisis management depends heavily on capable and transparent leadership, which is often lacking in many developing nations. In times of crisis, institutional leaders are expected to act swiftly, communicate clearly, and make informed decisions under pressure. However, leadership structures in many higher institutions are characterized by bureaucracy, delays, and internal power struggles. Furthermore, decision-making is sometimes politicized or influenced by external authorities, weakening institutional autonomy. In addition, leaders may lack the training or experience needed to manage emergencies effectively. According to Danjuma and Emeka (2021), poor leadership during crises often results in miscommunication, stakeholder mistrust, and panic. Moreover, when leaders fail to engage faculty, staff, and students in crisis response processes, morale and compliance drop significantly. Institutions in developing nations must invest in leadership development, promote ethical governance, and encourage participatory management practices to build trust and enhance crisis preparedness and responsiveness across all levels of the organization.

STRATEGIES FOR EFFECTIVE CRISIS MANAGEMENT IN HIGHER INSTITUTION

Development of Comprehensive Crisis Management Plans

The first and most crucial strategy for effective crisis management in higher education institutions is the development of comprehensive crisis management plans. Such plans should outline the specific steps the institution will take in the event of a crisis, including roles, responsibilities, and clear communication channels. A well-developed plan includes detailed procedures for managing different types of crises, such as natural disasters, pandemics, human-induced crises, and technological disruptions. These plans should be reviewed and updated regularly to ensure their relevance to emerging threats. Furthermore, a proactive approach to crisis management involves anticipating possible scenarios and creating contingency plans. Institutions that develop such plans in consultation with faculty, students, and external experts are more likely to be prepared when an actual crisis occurs. Additionally, conducting drills and simulations of various crisis situations is vital to familiarizing stakeholders with the procedures and testing the effectiveness of the plans.

Training and Capacity Building

Training and capacity building are essential strategies for ensuring that all stakeholders, including staff, students, and leadership, are equipped to respond effectively during crises. Institutions should implement regular training programs on crisis response and management. These training sessions should cover key areas such as communication during crises, first-aid procedures, emergency evacuation, and the use of technology for remote learning. Furthermore, institutions must identify crisis management teams composed of trained personnel who can quickly step into action when an emergency arises. According to Nwachukwu and Ojo (2023),

well-trained leaders and staff are critical in making informed decisions and maintaining order during crises. In addition to training staff, institutions should provide awareness programs for students so that they understand their roles and responsibilities in a crisis. Building the crisis management capacity of everyone within the institution helps to ensure a quick and coordinated response, reducing the impact of the crisis.

Robust Communication Systems

Effective communication during a crisis is key to minimizing confusion and ensuring that everyone receives timely and accurate information. Higher education institutions should establish robust communication systems that can be activated in the event of a crisis. These systems should include multiple platforms, such as social media, email, text messages, and institutional websites, to reach different stakeholders. Moreover, communication should be clear, concise, and consistent. According to Ibrahim and Edem (2022), real-time updates and clear instructions are critical in reducing anxiety and uncertainty among students and staff. Institutions must also appoint dedicated crisis communication teams responsible for disseminating information to the public, managing media relations, and ensuring that messages align with the institution's response plans. Furthermore, institutions should invest in communication technologies such as emergency alert systems, which can send out automated messages to all students and staff during an emergency. The ability to communicate effectively ensures that crises are managed more efficiently and that stakeholders stay informed.

Collaboration with External Stakeholders

Effective crisis management in higher education extends beyond the institutional level to include collaboration with external stakeholders such as government agencies, healthcare providers, emergency services, and local communities. Institutions should establish partnerships with these external bodies before a crisis occurs, ensuring that there is a clear understanding of roles and responsibilities during emergencies. According to Adebayo and Akinlolu (2021), collaboration with local emergency services, for example, enables universities to access medical assistance, security personnel, and other resources that may be required during crises. Furthermore, governments and educational regulatory bodies can provide critical support, such as funding for recovery efforts or guidance on policy changes during times of crisis. Collaboration with local communities also ensures that the university is an integral part of the emergency response system, further enhancing its ability to manage crises effectively. Building such networks of support before crises occur ensures that institutions can leverage external expertise and resources to bolster their internal efforts.

Resource Allocation and Financial Preparedness

Effective crisis management requires sufficient resources, and universities must ensure that they have allocated funds and materials for crisis response. One strategy to achieve this is to create a crisis management fund specifically dedicated to addressing unforeseen emergencies. This fund should be designed to cover expenses related to student safety, infrastructure repairs, technological upgrades, and communication tools during a crisis. In addition, financial preparedness means ensuring that the institution has adequate insurance coverage for damages

caused by natural disasters, accidents, or any unforeseen events. Moreover, institutions must invest in building digital infrastructure and backup systems that allow them to continue operations, such as remote learning platforms and cloud-based data storage. According to Onuoha and Eze (2022), financial preparedness also means having access to emergency grants and external funding sources that can help institutions recover quickly from financial setbacks caused by a crisis. Properly allocated resources not only ensure the continuity of academic functions but also support the well-being of students and staff during and after a crisis.

Continuous Evaluation and Feedback Mechanisms

Finally, crisis management in higher education requires continuous evaluation and feedback mechanisms to assess the effectiveness of the response efforts. After a crisis, institutions should conduct thorough reviews to analyze how the crisis was managed, identify areas of improvement, and update their crisis management plans accordingly. Furthermore, engaging students, staff, and faculty in these evaluations provides valuable insights into what worked well and what did not. For example, after a natural disaster or a cyberattack, feedback can be gathered through surveys, meetings, and interviews. This process ensures that lessons learned are incorporated into future preparedness efforts. Additionally, institutions should use these evaluations to strengthen their crisis management strategies by addressing weaknesses identified during previous crises. As stated by Nwachukwu and Ojo (2023), regularly updated crisis management plans based on feedback ensure that institutions are always ready for future emergencies, minimizing their impact on academic and institutional stability.

CONCLUSION

Effective crisis management is an essential component of higher education institutions' ability to ensure institutional stability and promote sustainable development. The strategies outlined, including the development of comprehensive crisis management plans, capacity building through training, robust communication systems, collaboration with external stakeholders, resource allocation, and continuous evaluation, all contribute to strengthening an institution's preparedness and response during crises. These strategies not only help mitigate the immediate impact of crises but also foster resilience, ensuring that institutions can continue to serve their academic and social functions even in the most challenging times. Higher education institutions must recognize the importance of crisis management as an ongoing process that requires constant refinement and adaptation to changing risks. Moreover, the ability to navigate crises effectively is directly tied to the institution's long-term sustainability and its contribution to the broader societal and educational development goals. As the world faces an increasing frequency of global crises, institutions that adopt proactive and collaborative crisis management approaches will be better positioned to face adversity, recover quickly, and continue to thrive.

Suggestions

Based on the literature reviewed the following suggestions were made:

- Institutional administrators should prioritize the development and regular revision of comprehensive crisis management policies. These policies must clearly define roles, response protocols, and communication channels.
- Educational Administrators should also ensure that crisis response teams are trained, equipped, and empowered to act swiftly during emergencies. Furthermore, they must allocate specific funds for crisis preparedness, invest in relevant infrastructure, and foster a culture of responsiveness and accountability.
- Government agencies should provide adequate funding, policy support, and technical assistance to higher education institutions. This includes integrating crisis management into national education policies and ensuring that institutions receive guidance and support during emergencies.
- Governments should also promote partnerships between institutions and emergency response agencies for coordinated actions.
- Non-governmental organizations (NGOs) and community leaders should collaborate with institutions to support crisis education, training, and resource mobilization. Their involvement is essential in creating a safety net of support services, particularly in times of large-scale emergencies where institutional resources may be stretched.

INSTITUTIONAL PLANNING AND LEADERSHIP APPROACHES FOR SUSTAINABLE HIGHER EDUCATION DEVELOPMENT

Angela Ndidiamaka IBENACHO
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

This paper examined Institutional Planning and Leadership Approaches for Sustainable Higher Education Development. This paper scrutinized key elements of effective institutional planning, including the strategic alignment of resources, the role of leadership in fostering innovation, and the significance of policy formulation etc. Several challenges were identified that hinders the successful implementation of these practices, such as inadequate funding, resistance to change, and leadership gaps. This paper highlighted the importance of adopting best practices in institutional planning, such as inclusive leadership strategies, stakeholder engagement, and the integration of technology, to overcome these barriers and create a robust framework for institutional development. Through an in-depth analysis of these issues, this paper proposed actionable solutions, including fostering transparent communication, leveraging public-private partnerships, and prioritizing leadership development. The paper concluded that effective institutional planning is the foundation of sustainable growth and success in higher education. Amongst others, the paper suggested education institutions should focus on building public-private partnerships (PPPs) to secure alternative funding streams for effective implementation of innovative institutional policies and programmes.

Keywords: Institutional Planning, Leadership, Higher Education, Sustainability, Educational Growth.

INTRODUCTION

The sustainable development of higher education institutions is contingent upon robust institutional planning and dynamic leadership approaches that ensure adaptability to emerging global educational demands. Institutional planning entails a systematic process of decision-making, policy formulation, and resource allocation aimed at fostering academic excellence and infrastructural expansion. Leadership in higher education, on the other hand, encompasses strategic governance, visionary administration, and the application of innovative managerial techniques to enhance institutional growth and sustainability. The convergence of these two

critical elements facilitates long-term educational development, enhances institutional efficiency, and ensures the provision of quality education in an ever-evolving academic landscape.

Institutional planning in higher education serves as a strategic framework that directs the management of academic programs, financial resources, human capital, and infrastructural development in line with national policies and global educational standards. It entails a structured approach to decision-making, emphasizing long-term objectives, quality assurance mechanisms, and adaptability to technological advancements. Oladipo (2019) noted that effective institutional planning involves proactive engagement with stakeholders, including faculty, students, government agencies, and private sector partners, to create a sustainable academic environment. The dynamic nature of higher education necessitates a forward-thinking approach to planning that integrates research advancements, curriculum development, and innovative pedagogical methodologies to meet the demands of contemporary education.

Sustainable development in higher education is intrinsically linked to institutional planning, as it ensures that academic institutions evolve in a manner that balances economic viability, social inclusivity, and environmental consciousness. This approach to planning emphasizes the efficient utilization of resources, curriculum relevance, and alignment with societal needs. Higher education institutions play a pivotal role in fostering human capital development, knowledge dissemination, and research innovation, which contribute significantly to national and global sustainability (Adegboye, 2020). Institutions that adopt sustainable planning frameworks enhance their operational efficiency, attract international collaborations, and develop policies that support long-term academic excellence.

Transformational leadership is recognized as a catalyst for institutional growth and sustainability in higher education. Transformational leaders possess the vision, strategic mindset, and innovative capabilities necessary to drive systemic changes, foster collaboration, and create an inclusive academic culture. Adebayo (2018) positd that transformational leadership in higher education fosters a culture of creativity, resilience, and excellence by encouraging faculty and students to engage in research, technology-driven learning, and knowledge creation. Effective leadership within academic institutions promotes institutional autonomy, financial sustainability, and enhanced student outcomes through the adoption of progressive educational models and policy frameworks.

Strategic leadership approaches play a crucial role in effective institutional planning by aligning institutional goals with broader national and global education priorities. Strategic leaders in higher education leverage data analytics, policy frameworks, and stakeholder partnerships to optimize institutional performance and sustainability. Chukwuemeka (2020) emphasized that strategic leadership in higher education institutions involves the implementation of long-term growth strategies, resource management policies, and adaptive governance structures to enhance institutional resilience. The dynamic nature of the education sector requires leaders to be proactive in addressing challenges, leveraging opportunities, and fostering a culture of excellence that enhances academic and research output.

According to Oluwaseun (2021), well-structured policies enhance institutional accountability, promote academic integrity, and ensure that universities and colleges align with national and international educational standards. The role of policymakers in higher education is instrumental in ensuring that institutions remain competitive, innovative, and responsive to the evolving demands of the education sector. Resource mobilization and efficient management are fundamental to ensuring institutional sustainability in higher education. Funding remains a critical challenge for many institutions, necessitating the exploration of diverse financing

models, including government allocations, private-sector partnerships, research grants, and tuition fees. Effective financial management strategies, infrastructure investment plans, and academic program funding are essential for long-term institutional sustainability.

Oladipo (2019) posited that higher education institutions that integrate sustainability metrics into their strategic planning frameworks enhance accountability, performance measurement, and institutional resilience. Evaluating these metrics, institutions can identify areas for improvement and implement targeted interventions that enhance their sustainability. The future of institutional planning and leadership in higher education is expected to be shaped by emerging trends such as digital transformation, international academic collaborations, competency-based education models, and policy reforms. Institutions that proactively embrace these trends will remain competitive, sustainable, and responsive to the evolving demands of the education sector. Oluwaseun (2021) asserted that integrating innovative leadership approaches and strategic planning mechanisms will position higher education institutions for long-term success. Leveraging technology, policy innovation, and stakeholder engagement, institutions can drive academic excellence and institutional sustainability in the future of higher education.

THEORETICAL SUPPORT

Transformational Leadership Theory (James V. Downton in 1973)

This work was theoretically supported by Transformational Leadership Theory (TLT) by James V. Downton in 1973 cited in Lizhenyu (2025). This theory emphasizes the role of leaders in inspiring and motivating followers to achieve exceptional outcomes by fostering a culture of innovation, creativity, and continuous improvement. In the context of higher education, transformational leaders are pivotal in setting a compelling vision for the institution's future, cultivating a sense of shared purpose among faculty, staff, and students, and driving change that aligns with evolving educational needs and global standards.

Transformational leadership in higher education involves not only the administration and strategic governance but also the creation of an environment where academic staff are encouraged to push the boundaries of teaching, research, and community engagement. These leaders inspire followers by articulating clear, motivating goals and demonstrating a commitment to both personal and professional growth. Through mentoring and empowering faculty members, transformational leaders encourage them to take ownership of their roles and contribute meaningfully to the institution’s long-term success. This theory suggests that effective leadership is not just about directing the institution but about engaging with all members of the academic community to shape the future collectively. It also highlights the importance of ethical leadership, where leaders model integrity and accountability, which strengthens the overall sustainability of the institution. Through a transformational leadership approach, higher education institutions can navigate complex challenges, embrace innovation, and ensure a sustainable future that enhances academic quality and institutional growth.

Transformational Leadership Theory, first propounded by James V. Downton in 1973 and later expanded upon by scholars such as Burns (1978) and Bass (1985), remains highly relevant in contemporary educational leadership discourse. This theory accentuated the capacity of leaders to transcend mere transactional exchanges and instead foster deep, intrinsic motivation within their followers. Inspiring and intellectually stimulating individuals, transformational leaders cultivate an environment where innovation, creativity, and continuous improvement are

integral to institutional culture. In the context of higher education, transformational leadership is particularly significant as it equips institutions with the strategic vision and adaptive capacity required to navigate complex educational landscapes and meet the ever-evolving demands of global academia (Lizhenyu, 2025).

Transformational leaders in higher education play a critical role in shaping institutional direction, establishing a compelling vision for academic excellence, and fostering a shared sense of purpose among faculty, administrative staff, and students. Unlike traditional leadership approaches that focus predominantly on hierarchical authority and compliance, transformational leadership prioritizes engagement, collaboration, and empowerment. This leadership style encourages faculty members to take ownership of their academic and research initiatives, inspiring them to push the boundaries of knowledge and contribute to institutional advancement. Additionally, transformational leaders drive curriculum reforms, promote interdisciplinary research, and strengthen partnerships with external stakeholders, all of which are essential for ensuring institutional sustainability and global competitiveness.

Furthermore, TLT highlighted the importance of ethical leadership as a foundation for sustainable institutional growth. Leaders who model integrity, accountability, and transparency create an institutional culture rooted in trust and shared values. By fostering a leadership environment that prioritizes ethical decision-making, inclusivity, and social responsibility, transformational leaders help safeguard the credibility and long-term viability of higher education institutions. This ethical orientation is particularly crucial in addressing contemporary challenges such as policy inconsistencies, funding constraints, and bureaucratic inefficiencies, as it ensures that institutional decisions are aligned with both national education policies and international best practices.

Another aspect of transformational leadership in higher education is its emphasis on individualized consideration and faculty development. Transformational leaders recognize that the success of an institution depends on the professional growth and well-being of its faculty members. Through mentorship programs, leadership development initiatives, and continuous professional training, these leaders create an enabling environment where educators feel valued and motivated to contribute their expertise. Moreover, transformational leadership fosters a sense of academic community where innovation is encouraged, knowledge is shared, and faculty are supported in pursuing groundbreaking research and pedagogical advancements.

Ultimately, the application of Transformational Leadership Theory in higher education serves as a catalyst for institutional resilience, adaptability, and long-term sustainability. In an era characterized by rapid technological advancements, shifting educational paradigms, and increasing globalization, institutions led by transformational leaders are better positioned to embrace change, implement forward-thinking policies, and enhance the overall quality of education. By prioritizing visionary leadership, ethical governance, and collaborative engagement, transformational leadership ensures that higher education institutions remain dynamic, student-centered, and globally competitive in the pursuit of academic excellence.

CONCEPTUAL ELUCIDATIONS

Institutional Planning

Institutional planning in higher education stands as a pivotal mechanism through which universities and other tertiary institutions establish strategic directions, allocate resources, and

ensure sustainable development in an increasingly competitive and dynamic educational environment. It is a systematic process that aligns an institution's mission, vision, and goals with actionable strategies to improve academic quality, administrative efficiency, infrastructural development, and societal relevance. According to Nwachukwu (2021), institutional planning serves as a cornerstone for maintaining academic standards and responding proactively to both internal and external challenges facing educational institutions. In this regard, higher education institutions are compelled to adopt long-term and forward-thinking approaches that not only anticipate future demands but also position the institution to deliver optimal value to students, staff, and society at large.

Effective institutional planning integrates various dimensions including academic programming, staff development, technological advancement, financial forecasting, infrastructural upgrades, and community engagement. It involves the active participation of stakeholders administrators, faculty members, students, alumni, and external partners to ensure that plans are realistic, inclusive, and reflective of shared aspirations (Oluwadare, 2020). Institutional planning provides a framework for policy formulation and implementation, thereby establishing mechanisms for accountability, quality assurance, and continuous improvement. For instance, through effective planning, universities can develop curricula that are responsive to labor market needs, promote research that addresses national development priorities, and enhance student services to improve academic outcomes and institutional reputation (Agbaje, 2019).

In the face of growing global competition and dwindling public funding, institutional planning also becomes a strategic tool for resource mobilization and management. It guides institutions in diversifying revenue streams through partnerships, grants, consultancy services, and alumni engagement. As noted by Okonkwo (2022), proper institutional planning fosters transparency and prioritization in resource allocation, ensuring that limited funds are directed toward high-impact areas such as e-learning infrastructure, staff training, research development, and strategic marketing. In addition, it provides the basis for performance evaluation, enabling leaders to assess progress, identify gaps, and recalibrate strategies in line with evolving priorities.

Moreover, institutional planning promotes resilience by helping institutions adapt to changes in government policies, technological innovations, and demographic shifts. For instance, the COVID-19 pandemic highlighted the importance of having robust contingency plans and flexible academic structures. Institutions that had integrated technology into their planning were able to transition smoothly to online learning, whereas those without such plans experienced significant disruptions. Ukiwo, U. (2007) noted that strategic institutional planning acts as a shield against systemic shocks and equips institutions to embrace change rather than react to it.

Institutional planning is not merely an administrative routine but a dynamic process that defines the trajectory of educational institutions. It fosters innovation, coherence, and strategic alignment, ensuring that institutions remain relevant, competitive, and impactful. As Nigerian higher education continues to expand in enrollment and complexity, the emphasis on planning must intensify to guarantee sustainable growth and educational excellence. Through participatory, data-informed, and visionary planning, institutions can transform aspirations into achievements and uphold their mandate of producing skilled, ethical, and globally competitive graduates.

Institutional Planning in Higher Education

Institutional planning in higher education plays a vital role in shaping the direction and sustainability of academic institutions. It is a comprehensive and systematic process that encompasses the development of policies, strategies, and actions aimed at enhancing the institution's overall performance. The ultimate goal of institutional planning is to ensure the provision of high-quality education, effective governance, and the optimal use of resources, all of which contribute to the institution's long-term success.

At its core, institutional planning in higher education is a strategic process that aligns an institution's mission, vision, and goals with both internal and external factors. It involves careful consideration of academic programs, student support services, infrastructure, faculty development, and financial management, with a focus on enhancing institutional capacity and responsiveness to evolving educational needs. Adeyemi (2004) noted that the essence of effective institutional planning is rooted in a collaborative approach, where faculty, students, administrative staff, and external stakeholders such as government bodies, industry partners, and community representatives are actively engaged in the planning process.

One of the central elements of institutional planning is aligning the academic programs with national and global educational standards. In a rapidly changing global educational landscape, higher education institutions must continuously evaluate and adapt their curricula to meet the demands of the labor market, technological advancements, and societal expectations. For example, the increasing reliance on digital technology and the expansion of online learning require higher education institutions to develop curricula that integrate digital literacy and innovative pedagogies to prepare students for the demands of the 21st-century workforce. According to Adegboye (2020), curriculum reforms are essential for ensuring that higher education institutions remain relevant in an increasingly interconnected and technology-driven world.

In addition to curriculum development, institutional planning involves the careful management of human resources. Faculty and staff are the backbone of any academic institution, and their professional development is critical to the success of the institution. Faculty development programs, which include opportunities for research, training, and career advancement, are essential components of institutional planning. Also fostering a culture of continuous learning, institutions can ensure that their faculty members remain at the forefront of educational innovation and research, thereby contributing to the institution's overall academic excellence.

Financial planning and resource allocation are also integral to institutional planning. Higher education institutions face significant financial challenges, including fluctuating government funding, increasing operational costs, and the need to invest in infrastructure. Effective resource management is essential for ensuring the sustainability and growth of the institution. Strategic financial planning involves identifying diverse revenue streams, such as tuition fees, grants, research funding, and private-sector partnerships. According to Oladipo (2019), sustainable financial planning can help institutions weather economic downturns and ensure that they can continue to invest in infrastructure, academic programs, and faculty development.

Another critical aspect of institutional planning is the development of policies that guide the governance and operational practices of the institution. These policies are designed to promote transparency, accountability, and efficiency in decision-making. Policies related to

student admissions, faculty recruitment, research funding, and quality assurance are essential for maintaining the institution's integrity and ensuring that it meets the expectations of stakeholders. Oluwaseun (2021) argued that a well-structured policies provide a clear framework for institutional governance, helping to mitigate challenges related to academic integrity and institutional autonomy.

Institutional planning also requires a focus on the physical infrastructure of the institution. As institutions grow and expand, there is a need to invest in state-of-the-art facilities that support learning, research, and community engagement. The availability of modern classrooms, laboratories, libraries, and student accommodation is essential for creating a conducive learning environment. Furthermore, institutions must ensure that their infrastructure meets the needs of a diverse student population, including those with disabilities or special learning needs. Strategic planning in this regard involves both short-term improvements and long-term infrastructure development projects that align with the institution's mission and vision. One of the significant challenges of institutional planning in higher education is the changing nature of external environments. Government policies, economic conditions, societal expectations, and technological innovations all have a direct impact on the planning process. For example, government policies on education funding, student loans, and regulatory requirements can significantly influence the financial sustainability and academic offerings of higher education institutions. The COVID-19 pandemic has demonstrated the need for institutions to be agile and flexible in their planning, as many universities worldwide had to quickly transition to online learning and develop new strategies to support remote learning. This requires leaders to anticipate change and develop adaptive strategies that allow institutions to thrive despite unforeseen challenges.

Moreover, institutional planning in higher education is increasingly focused on sustainability, with an emphasis on environmental, social, and economic factors. Institutions are increasingly adopting green practices, such as energy-efficient buildings, waste reduction programs, and sustainable campus operations. These initiatives not only contribute to the institution's environmental sustainability but also reflect a commitment to social responsibility and global citizenship. According to Chukwuemeka (2020), integrating sustainability into institutional planning can enhance the institution's reputation and appeal to prospective students, faculty, and external partners.

Institutional planning in higher education is a multifaceted and dynamic process that requires a strategic and inclusive approach. It involves the careful integration of academic, financial, human, and infrastructural resources to ensure the long-term success and sustainability of the institution. By engaging stakeholders, fostering innovation, and adapting to external changes, higher education institutions can enhance their capacity to meet the needs of students, faculty, and society at large. Effective institutional planning not only supports the achievement of academic excellence but also promotes institutional resilience, ensuring that institutions remain relevant and competitive in an ever-evolving global educational landscape.

Leadership

Leadership is a dynamic and multifaceted concept that has evolved over time, encompassing various theories and approaches aimed at understanding the process of influencing and guiding individuals or groups toward achieving common goals. At its core, leadership involves the ability to inspire, motivate, and direct people toward shared objectives, often in situations that require

vision, strategic decision-making, and the effective management of resources. The nature of leadership has been extensively studied in both theoretical and practical contexts, as it is central to organizational success, societal progress, and personal development. One of the foundational aspects of leadership is the relationship between leaders and followers. Leaders influence their followers through their actions, words, and behaviors, which serve to motivate individuals to work toward collective goals. Leaders also set the tone for organizational culture, fostering values such as trust, accountability, and collaboration. This relational aspect underscores the importance of emotional intelligence, empathy, and the ability to communicate effectively skills that enhance a leader's capacity to connect with and inspire others (Oluwaseun, 2021).

The concept of leadership extends beyond mere authority or positional power. It is not confined to those in formal leadership roles such as CEOs, principals, or managers, but can be demonstrated by anyone who influences others positively. Okonkwo (2022), This has led to the development of different leadership models, including transformational leadership, which emphasizes vision, inspiration, and change; transactional leadership, which focuses on structured tasks and reward systems; and servant leadership, which prioritizes the needs of followers and promotes community-oriented goals. Similarly, in educational settings, for example, leadership involves creating an environment conducive to learning and growth, empowering both teachers and students to realize their full potential. Educational leaders often act as visionaries, navigating complex challenges and championing initiatives that enhance teaching, learning, and institutional effectiveness. Effective educational leadership demands a blend of strategic thinking, ethical decision-making, and interpersonal acumen to address diverse challenges, from curriculum development to student engagement and organizational management.

Moreover, leadership is not a static trait but rather a continual process of growth and adaptation. Effective leaders often embrace a variety of leadership styles, depending on the situation, the needs of their followers, and the organizational context. They are not only concerned with achieving short-term goals but also with fostering long-term growth, sustainability, and resilience. Leadership in this sense is a lifelong commitment to improving oneself and the environment in which one operates. Leadership is a complex, evolving concept that requires a deep understanding of human nature, organizational dynamics, and strategic foresight. It transcends individual attributes, as it also involves a commitment to collective well-being and societal improvement. Whether in educational institutions, businesses, or communities, effective leadership plays a critical role in shaping the future and empowering others to succeed.

Strategic Leadership Approaches for Effective Institutional Planning

Strategic leadership is an essential driver for achieving effective institutional planning, particularly within higher education. The dynamic nature of the global educational environment, characterized by rapid technological advancements, shifting societal needs, and the increasing demand for accessible quality education, makes the role of strategic leadership even more crucial. Effective strategic leadership ensures that institutions not only adapt to these changes but also position themselves for long-term sustainability and success. Strategic leaders in higher education are responsible for making critical decisions that align institutional goals with national and global educational priorities, while also fostering a culture of innovation, inclusivity, and academic excellence.

Visionary Leadership

A cornerstone of strategic leadership in higher education is visionary leadership. Visionary leaders possess the foresight to anticipate future trends, challenges, and opportunities, and they communicate a compelling vision for the institution's growth and development. This vision serves as a guiding force for the entire institution, aligning faculty, students, staff, and external stakeholders around a common purpose. According to Adebayo (2018), visionary leaders have the ability to inspire and motivate others by articulating a clear vision that reflects the institution's values, goals, and aspirations. This shared vision acts as a roadmap for institutional planning, helping to ensure that all activities and resources are aligned with long-term objectives. For instance, a visionary leader in a university might prioritize the development of cutting-edge research programs and foster partnerships with global institutions. They may also push for the integration of technology into the curriculum to prepare students for a digital future. This long-term thinking ensures that the institution remains relevant, competitive, and responsive to emerging trends.

Data-Driven Decision Making

Another key strategic leadership approach for effective institutional planning is data-driven decision-making. In today's data-rich environment, higher education institutions must rely on data analytics to guide strategic planning processes. By collecting, analyzing, and interpreting data related to student performance, faculty research output, financial management, and other critical factors, strategic leaders can make informed decisions that enhance institutional efficiency and effectiveness. Chukwuemeka (2020) noted strategic leaders who use data analytics can identify patterns, track progress toward institutional goals, and make adjustments to strategies when necessary.

Collaborative Leadership and Stakeholder Engagement

Strategic leadership in higher education also involves fostering collaboration and engaging with a diverse range of stakeholders. Effective institutional planning requires the input and participation of various internal and external stakeholders, including faculty, staff, students, alumni, government agencies, and industry partners. A strategic leader recognizes the value of these diverse perspectives and works to create an inclusive decision-making process that reflects the needs and priorities of all stakeholders. Oluwaseun (2021) emphasized that collaborative leadership approaches enable leaders to build trust, enhance communication, and create a shared sense of ownership in the institution's strategic direction. Engaging faculty and staff in the planning process can lead to greater buy-in and commitment to the institution's goals. Additionally, collaboration with external partners, such as businesses and government agencies, can open up new avenues for funding, research collaborations, and internships for students, thereby enhancing the institution's reputation and resources.

Transformational Leadership for Innovation

Transformational leadership is another critical strategic approach that fosters innovation within higher education institutions. Transformational leaders inspire and motivate others to embrace

change, take risks, and explore new ideas and practices. In the context of institutional planning, transformational leadership is essential for encouraging a culture of creativity and continuous improvement.

A transformational leader in a university may push for the adoption of new teaching methods, such as blended learning or project-based learning, which enhance student engagement and learning outcomes. They may also encourage faculty to engage in interdisciplinary research and explore innovative ways to solve real-world problems. Adebayo (2018) notes that transformational leadership in higher education institutions helps to break down traditional silos, promotes interdisciplinary collaboration, and fosters a sense of shared responsibility for institutional growth.

Strategic Resource Management

Strategic leaders are also responsible for ensuring the efficient allocation and management of resources. In a time of constrained budgets and rising operational costs, effective resource management is essential for ensuring that institutions can meet their goals while maintaining financial sustainability. Strategic resource management involves identifying the most effective use of financial, human, and physical resources to support institutional priorities.

Oladipo (2019) asserted strategic leaders must be able to prioritize spending on initiatives that will have the greatest impact on the institution's success. For example, leaders may choose to invest in faculty development programs to improve teaching quality or allocate funds to infrastructure improvements that enhance the student experience. Additionally, resource management extends to human capital, where strategic leaders ensure that the institution attracts, retains, and develops top talent in both teaching and administration.

THE ROLE OF POLICY FORMULATION IN HIGHER EDUCATION SUSTAINABILITY

Policy formulation plays a pivotal role in ensuring the sustainability of higher education institutions. In an increasingly complex global landscape, higher education institutions must adapt to evolving societal, economic, and technological challenges, while remaining committed to their core mission of providing quality education, conducting impactful research, and contributing to societal development. Effective policy formulation ensures that institutions are strategically aligned with national and international educational standards, fostering an environment that is conducive to academic excellence, innovation, and long-term growth (Okoroma, 2006). The creation of sound policies is integral not only for enhancing institutional efficiency but also for ensuring that higher education institutions can navigate both current challenges and future opportunities.

Providing a Strategic Framework for Development

One of the primary roles of policy formulation in higher education is the creation of a strategic framework that guides institutional development. Policies serve as roadmaps, defining the direction for academic and administrative growth while aligning the institution's goals with national educational priorities. As highlighted by Adebayo (2018), policies are essential tools that direct the management of academic programs, research initiatives, financial resources, and

human capital. By establishing clear objectives and guidelines, policies help ensure that all institutional activities are aligned with both short-term goals and long-term sustainability. For instance, policies related to curriculum development, faculty recruitment, and research funding can directly influence the quality and relevance of the education offered by the institution. A strong policy framework also ensures that academic programs remain responsive to the needs of students and the broader society, thereby improving student outcomes and contributing to the overall development of the nation.

Ensuring Quality Assurance and Accountability

Effective policy formulation is essential for maintaining quality assurance and accountability within higher education institutions. Quality assurance policies ensure that academic programs meet established standards of excellence and that teaching and learning processes align with best practices. These policies also create mechanisms for evaluating institutional performance, identifying areas for improvement, and ensuring that academic and administrative processes remain transparent and accountable. According to Chukwuemeka (2020), policies that promote regular assessments of faculty performance, student satisfaction, and institutional effectiveness enable leaders to monitor progress and implement corrective actions where necessary. Quality assurance policies are also instrumental in fostering a culture of continuous improvement, which is crucial for institutional sustainability. Institutions that embrace robust quality assurance mechanisms can demonstrate their commitment to academic integrity, ensuring that they remain competitive and capable of attracting students, faculty, and funding.

Fostering Financial Sustainability and Resource Management

Financial sustainability is a critical aspect of higher education institutions' long-term survival and success. Policy formulation in this area involves creating frameworks that ensure the effective management of financial resources, including government funding, private-sector investments, research grants, and tuition fees. Adebayo (2018) emphasizes that financial policies that focus on revenue diversification, cost control, and financial transparency are vital for safeguarding the institution’s financial health and promoting its growth. Policies on fundraising, endowment management, and partnerships with the private sector can help institutions secure additional resources to support academic programs, faculty development, infrastructure improvements, and student services. Transparent financial policies can also help to maintain the trust of government agencies, donors, and other stakeholders, thereby ensuring continued financial support.

Promoting Access, Equity, and Inclusivity

Policies that promote access, equity, and inclusivity are essential for ensuring that higher education institutions contribute to social development and national cohesion. Formulating policies that support the inclusion of marginalized groups such as women, rural populations, and students with disabilities higher education institutions can expand access to education and foster a more equitable society. Inclusive policies help institutions to not only meet the needs of a diverse student body but also to build a more socially responsible and responsive academic environment.

As noted by Oluwaseun (2021), policies that promote diversity and inclusion can enhance the social relevance of higher education institutions by ensuring that all students, regardless of their background, have equal access to educational opportunities. Such policies contribute to the development of well-rounded graduates who are better equipped to address global challenges and contribute to the sustainable development of their communities.

Guiding Research and Innovation

Research and innovation are central to the role of higher education institutions in driving societal progress. Effective policy formulation is essential for creating an environment that encourages research excellence, promotes collaboration, and supports the translation of research findings into real-world applications. Research policies must focus on areas such as funding allocation, intellectual property rights, and the establishment of collaborative partnerships with industries, governments, and international research bodies.

Chukwuemeka (2020) asserted that research policies that prioritize interdisciplinary collaboration, technological innovation, and the commercialization of research outputs are vital for ensuring the sustainability of higher education institutions. Research-driven institutions contribute significantly to societal development by producing knowledge, advancing technologies, and fostering innovation that addresses pressing societal challenges. Policy formulation is a cornerstone of higher education sustainability. According to Babalola (2008), Well-crafted policies ensure that institutions can effectively manage their resources, maintain high standards of academic excellence, promote access and equity, and foster innovation. Furthermore, policies that align with national and global trends in education help higher education institutions remain adaptable, competitive, and socially responsible. Also embracing sound policy frameworks, higher education institutions can secure their long-term growth, enhance their reputation, and contribute meaningfully to the development of society. The future of higher education depends significantly on the effectiveness of policy formulation and its ability to guide institutions toward sustainable practices that align with both local and global educational priorities.

CHALLENGES OF INSTITUTIONAL PLANNING AND LEADERSHIP IN HIGHER EDUCATION

Institutional planning and leadership in higher education are crucial for the growth and sustainability of academic institutions. However, despite the importance of these aspects, many institutions face significant challenges in their implementation. These challenges often hinder the effectiveness of leadership and the successful execution of strategic plans. The following are five critical challenges that affect institutional planning and leadership in higher education:

Inadequate Funding and Resource Constraints

One of the most persistent challenges faced by higher education institutions is inadequate funding. Many institutions struggle with limited financial resources, which affects their ability to implement effective strategic plans. Funding shortfalls may result in inadequate infrastructure, insufficient support for academic programs, and limited opportunities for research and development.

Effective institutional planning requires substantial investment in physical infrastructure, faculty development, technology, and student support systems. However, due to economic constraints and underfunding, many institutions are unable to allocate sufficient resources to these areas. As a result, leadership must often prioritize spending, make difficult trade-offs, and seek alternative funding sources through partnerships, grants, and donations.

Chukwuemeka (2020) emphasized that inadequate financial resources can limit an institution's ability to remain competitive and meet the educational needs of a growing student population. Furthermore, the lack of stable funding affects the institution's long-term sustainability and its ability to implement innovation-driven plans that could enhance academic quality.

Resistance to Change and Organizational Inertia

Resistance to change is another major challenge in institutional planning and leadership. Higher education institutions are often characterized by deeply ingrained traditions and organizational structures that resist innovation and transformation. Faculty, staff, and even students may be reluctant to embrace new teaching methods, technologies, and leadership approaches, leading to stagnation.

The resistance to change is particularly evident when leadership attempts to implement new policies or educational reforms that challenge established practices. According to Adebayo (2018), this resistance can be attributed to fear of the unknown, concerns about job security, and discomfort with new technological tools or pedagogical strategies. Institutional leaders must, therefore, invest in change management processes, communication, and training programs to overcome these barriers and foster a culture of innovation and adaptability.

Furthermore, organizational inertia, where institutions maintain the status quo despite changing circumstances, can prevent the necessary adjustments needed to respond to global educational trends, technological advancements, or shifts in student expectations.

Bureaucratic Inefficiencies

Bureaucratic inefficiencies within higher education institutions are often a significant hindrance to effective leadership and institutional planning. Complex administrative structures, cumbersome decision-making processes, and a lack of coordination between departments can delay the implementation of strategic plans. This bureaucratic red tape can prevent timely responses to emerging challenges and opportunities, reducing the institution's ability to act quickly and effectively. Oladipo (2019) highlighted that inefficiencies in administrative procedures, such as slow approval processes for budgets or academic initiatives, can disrupt the smooth functioning of the institution. Leaders are often forced to navigate through multiple layers of decision-making, leading to delays in critical projects. Bureaucratic inefficiencies also contribute to a lack of accountability, as responsibility for tasks may be diluted across various administrative levels, resulting in suboptimal performance and resource allocation.

Leadership Gaps and Inadequate Leadership Development

The absence of effective leadership can significantly hinder the success of institutional planning efforts. Many institutions face leadership gaps, where senior academic leaders and administrators

lack the necessary skills, experience, or vision to guide the institution through complex challenges. Inadequate leadership development programs can also contribute to this issue, leaving many leaders ill-prepared to navigate the dynamic nature of the higher education landscape.

Adebayo (2018) argued that leadership gaps are particularly prevalent in settings where there is insufficient investment in training and mentoring programs for future leaders. These gaps can lead to a lack of strategic vision, poor decision-making, and an inability to adapt to changing educational trends. Effective leadership is essential for driving innovation, fostering collaboration, and ensuring that institutional planning aligns with the evolving demands of higher education. Institutions must prioritize leadership development to ensure they have leaders who are equipped to face these challenges.

Policy Inconsistencies and Government Interference

In many countries, including Nigeria, government policies and regulations surrounding higher education are often inconsistent or subject to frequent changes. These shifts in policy can create uncertainty and hinder long-term institutional planning efforts. Institutions may find it difficult to plan effectively when they are uncertain about the future direction of government funding, accreditation standards, or national educational priorities.

Chukwuemeka (2020) noted that policy instability can make it difficult for institutional leaders to develop strategic plans that are both sustainable and responsive to the needs of students, faculty, and society. Furthermore, political interference in academic decision-making can undermine institutional autonomy and compromise the quality of education. Leaders in higher education institutions must navigate these challenges by building strong relationships with policymakers and advocating for stable, transparent policies that support institutional goals and sustainability.

The challenges of institutional planning and leadership in higher education are multifaceted and complex. Inadequate funding, resistance to change, bureaucratic inefficiencies, leadership gaps, and policy inconsistencies are just some of the hurdles that higher education institutions must overcome in order to remain sustainable and effective in their mission. Addressing these challenges requires proactive leadership, strategic decision-making, and a commitment to continuous improvement. Institutions that are able to navigate these challenges effectively are better positioned to adapt to the changing landscape of higher education and contribute to the development of society.

INNOVATIVE LEADERSHIP STRATEGIES FOR OVERCOMING INSTITUTIONAL BARRIERS

The successful navigation of barriers within educational institutions demands innovative leadership strategies that foster adaptability, creativity, and resilience. Institutional barriers, such as limited resources, bureaucratic inefficiencies, resistance to change, and insufficient leadership capacity, often hinder the progress of higher education institutions. However, innovative leadership can play a pivotal role in overcoming these obstacles by introducing new methodologies, frameworks, and practices that not only address immediate challenges but also ensure long-term institutional growth and sustainability.

Participatory Leadership and Stakeholder Engagement

One of the most effective innovative leadership strategies is participatory leadership, which emphasizes the involvement of all stakeholders' faculty, students, staff, and even external partners in decision-making processes. Participatory leadership fosters collaboration and encourages a sense of shared responsibility within the institution. By involving various groups in the planning, implementation, and evaluation of policies and initiatives, institutional leaders can ensure that decisions are more widely accepted and supported, which helps reduce resistance to change.

Adebayo (2018) argues that participatory leadership cultivates an environment where different perspectives are valued, and innovative solutions can emerge from a diverse pool of ideas. Moreover, stakeholder engagement allows leaders to tap into the collective knowledge and expertise of the institution, leading to more informed and effective decision-making. It also helps build trust among faculty, staff, and students, increasing their willingness to embrace institutional reforms and new initiatives. Participatory leadership also extends beyond the internal stakeholders to include external collaborators such as industry partners, alumni, and government bodies. By building strategic alliances and partnerships, higher education institutions can overcome barriers related to resource constraints and lack of support for academic programs or research initiatives.

Transformational Leadership for Culture Change

Transformational leadership is another critical innovative strategy for overcoming institutional barriers. Transformational leaders possess a vision for the future and inspire others to work towards achieving that vision. These leaders are not merely managers but change agents who motivate and empower their followers to challenge the status quo, embrace innovation, and pursue excellence.

Oladipo (2019) noted that transformational leadership is particularly useful in fostering a culture of creativity and resilience within academic institutions. By encouraging a growth mindset and cultivating an environment where faculty and students feel valued and supported, transformational leaders can break down barriers to innovation and change. These leaders often prioritize mentoring, continuous professional development, and the creation of an inclusive academic environment that celebrates diversity and fosters a sense of belonging.

The shift from a traditional, hierarchical leadership model to a transformational approach can address bureaucratic inefficiencies and resistance to change, as it empowers individuals at all levels of the institution to take ownership of their work and contribute to the institution's success. This approach can also instill a sense of pride and purpose within the institution, encouraging greater engagement from all stakeholders.

Data-Driven Decision-Making and Evidence-Based Leadership

The use of data analytics and evidence-based decision-making is an essential strategy for overcoming institutional barriers. In the context of higher education, data-driven leadership involves collecting and analyzing a variety of data related to student performance, faculty engagement, resource allocation, and institutional effectiveness. By leveraging data, institutional

leaders can make informed decisions that are based on empirical evidence rather than assumptions or tradition.

Chukwuemeka (2020) highlighted that data-driven leadership enables institutions to identify areas where performance is lagging, assess the effectiveness of current programs, and implement targeted interventions. For example, data on student retention rates, graduation rates, and academic performance can help identify underlying issues, such as inadequate support systems, curriculum gaps, or resource shortages. With this information, leaders can formulate evidence-based policies and strategies to address these challenges and improve institutional performance.

Furthermore, the integration of data analytics allows institutions to track progress over time, assess the outcomes of different initiatives, and make adjustments as necessary. This adaptability is essential for overcoming the dynamic and often unpredictable challenges faced by higher education institutions.

Collaborative Leadership and Interdisciplinary Approaches

In a rapidly changing educational landscape, institutions must increasingly adopt collaborative leadership approaches that emphasize cooperation across disciplines and departments. Collaborative leadership breaks down silos and encourages cross-functional teams to work together towards common goals. This strategy is particularly effective in addressing the complex challenges faced by academic institutions, such as curriculum development, research collaboration, and community engagement.

Oluwaseun (2021) emphasizes that collaborative leadership fosters innovation by bringing together diverse expertise and perspectives. For example, interdisciplinary collaboration between faculty from different departments can result in the development of innovative academic programs that meet the needs of students and respond to societal challenges. Similarly, partnerships between academic institutions, industry, and government can facilitate the exchange of knowledge, resources, and expertise, thereby enhancing the institution's capacity for growth and sustainability.

Moreover, collaborative leadership promotes inclusivity, as it encourages diverse voices to be heard in the decision-making process. This approach not only fosters creativity and innovation but also strengthens institutional capacity by building a network of support and shared responsibility across different levels of the institution.

Agile Leadership and Adaptive Management

Agile leadership is an innovative approach that emphasizes flexibility, rapid decision-making, and responsiveness to change. In the context of higher education, agile leadership enables institutions to quickly adapt to shifting circumstances, whether due to changes in government policy, technological advancements, or shifts in student demands. Agile leaders prioritize continuous learning, quick iterations of strategies, and a willingness to experiment with new approaches.

Adebayo (2018) highlights that agile leadership allows institutions to respond effectively to unforeseen challenges, such as the disruption caused by the COVID-19 pandemic, which forced many institutions to shift to remote learning. Agile leaders can adapt to such challenges

by making swift, data-informed decisions, experimenting with different models of teaching and learning, and adjusting plans as necessary.

This approach is particularly valuable in higher education, where external factors—such as economic downturns, technological changes, or social movements—can significantly impact institutional operations. By fostering an agile mindset within leadership teams and throughout the institution, leaders can ensure that the institution remains resilient in the face of uncertainty and continues to pursue its long-term goals.

Innovative leadership strategies are essential for overcoming the barriers that hinder institutional progress in higher education. Participatory leadership, transformational leadership, data-driven decision-making, collaborative approaches, and agile leadership are all crucial strategies for addressing challenges related to resource constraints, resistance to change, bureaucratic inefficiencies, and leadership gaps. By adopting these strategies, institutional leaders can create an environment that fosters creativity, resilience, and adaptability, enabling their institutions to thrive in an ever-evolving educational landscape.

BEST PRACTICES IN INSTITUTIONAL PLANNING FOR LONG-TERM EDUCATIONAL GROWTH

Institutional planning in higher education is a critical process for ensuring sustainable growth and the effective delivery of quality education. As the global educational landscape evolves, institutions are faced with the challenge of responding to emerging trends, technological advancements, and the diverse needs of students and society. Best practices in institutional planning not only enable institutions to address immediate challenges but also position them for long-term success and growth. Effective planning involves setting clear goals, adopting data-driven decision-making, engaging stakeholders, ensuring resource sustainability, and fostering a culture of continuous improvement.

Strategic Visioning and Long-Term Goal Setting

A strategic vision is the cornerstone of successful institutional planning. Visioning provides a clear sense of direction for the institution and establishes the guiding principles that inform decision-making processes. The vision should reflect the institution's core values, mission, and aspirations for the future. A well-defined vision serves as a reference point for setting long-term goals that are both ambitious and achievable.

Long-term goals should be aligned with national and global educational trends, while also considering the specific needs and circumstances of the institution. Goals should be SMART (Specific, Measurable, Achievable, Relevant, and Time-bound) to ensure clear targets and trackable outcomes. Setting clear goals in key areas such as academic excellence, research productivity, student engagement, and financial sustainability ensures that the institution moves towards its vision systematically. Furthermore, it is important for the vision to be adaptable to external changes, such as shifts in technological advancements and policy reforms, to allow the institution to remain competitive in a changing world (Oluwaseun, 2021).

Data-Driven Decision Making

Effective institutional planning is built on a foundation of data-driven decision-making. Institutions must collect and analyze relevant data about academic performance, student retention, financial health, faculty productivity, and other key performance indicators (KPIs). This data can be used to identify trends, assess the institution's current standing, and project future needs.

By relying on robust data analytics, institutional leaders can make informed decisions that are grounded in evidence rather than assumptions. For example, data on student enrollment patterns can guide decisions related to program offerings, faculty hiring, and facility planning. Similarly, financial data helps in forecasting budgetary needs, evaluating cost-efficiency, and exploring new revenue streams. Data-driven decision-making enhances accountability and enables institutional leaders to adjust strategies as needed, ensuring long-term sustainability and adaptability (Oladipo, 2019).

Stakeholder Engagement and Collaboration

Engaging key stakeholders in the planning process is essential for ensuring that institutional plans are comprehensive and aligned with the needs of various groups. Stakeholders such as faculty, students, staff, alumni, government agencies, industry partners, and community representatives all have valuable insights and contributions that can shape the institution's future direction.

Collaborative planning fosters a sense of ownership and commitment among stakeholders, which can result in better implementation of strategies and initiatives. For instance, involving faculty in curriculum design and program development ensures that academic offerings are relevant and responsive to evolving industry demands. Similarly, engaging students in decisions about campus facilities and student services ensures that the institution is meeting the needs of its primary beneficiaries. Involving external stakeholders, such as industry leaders, can help in the development of internship programs, research partnerships, and other collaborations that enhance the institution's academic and research capabilities (Adegboye, 2020).

Sustainable Resource Management

Financial sustainability is a cornerstone of effective institutional planning. Institutions must ensure that their financial resources are managed efficiently and that they can sustain operations over the long term. Oladunjoye (2020) explained that this requires creating and maintaining diverse revenue streams, such as government funding, tuition fees, research grants, private sector partnerships, and alumni donations. It also involves adopting cost-efficient practices, prioritizing investments in high-impact areas, and ensuring that funds are allocated effectively across various departments and programs.

Moreover, sustainable resource management extends beyond financial planning to include the efficient use of human capital, physical infrastructure, and technology. For instance, investing in faculty development programs ensures that educators are equipped with the skills and knowledge to engage students effectively. Similarly, developing a comprehensive facilities

plan that addresses maintenance, expansion, and modernization can improve the institution's infrastructure and ensure a conducive learning environment for students.

A well-rounded approach to resource management is key to ensuring that the institution can weather financial challenges and continue to invest in its growth. Moreover, adopting green initiatives, such as reducing energy consumption and embracing sustainable building practices, can enhance the institution's reputation and contribute to global sustainability goals (Oladipo, 2019).

Continuous Quality Improvement

The pursuit of continuous improvement is a fundamental best practice in institutional planning. Higher education institutions must constantly assess and refine their academic offerings, administrative processes, and support services to ensure that they remain relevant and effective. This requires establishing mechanisms for ongoing evaluation and feedback, such as regular program reviews, faculty assessments, and student surveys.

Ajayi, (2001) noted that quality assurance practices, such as accreditation and external audits, play a vital role in maintaining high standards of academic and operational excellence. Institutions should also foster a culture of innovation that encourages faculty, staff, and students to propose new ideas and initiatives aimed at improving the learning experience and operational efficiency. Encouraging professional development opportunities for faculty and staff ensures that they stay abreast of the latest developments in their fields and pedagogical approaches.

Moreover, continuous quality improvement extends to institutional leadership. Leaders should engage in regular self-assessment, seek feedback from stakeholders, and be open to revising strategies and approaches to enhance institutional effectiveness (Adebayo, 2018). This ongoing commitment to improvement allows the institution to adapt to emerging trends, challenges, and opportunities, thereby ensuring its long-term growth. The best practices in institutional planning are crucial for ensuring the long-term educational growth of higher education institutions. Strategic visioning, data-driven decision-making, stakeholder engagement, sustainable resource management, and continuous quality improvement form the foundation of effective planning practices. By adhering to these best practices, institutions can adapt to the evolving educational landscape, meet the needs of diverse stakeholders, and ensure that they are well-positioned to thrive in the future. Implementing these best practices will help institutions achieve their mission, enhance academic quality, foster student success, and contribute to societal development on a global scale.

CONCLUSION

Effective institutional planning is the cornerstone of sustainable growth and success in higher education. Embracing best practices such as strategic visioning, data-driven decision-making, stakeholder engagement, sustainable resource management, and a commitment to continuous quality improvement, higher education institutions can navigate the complexities of an ever-evolving academic landscape. These practices ensure that institutions remain responsive to the changing needs of students, faculty, and society but also position them for long-term impact and excellence. As higher education continues to face new challenges and opportunities, adopting these best practices will empower institutions to foster innovation, enhance academic quality, and contribute meaningfully to global development.

Suggestions

The following suggestions were given based on the challenges identified in the study on institutional planning and leadership in higher education:

- Universities should cultivate a culture of transparency and continuous engagement with all stakeholders.
- Education institutions should focus on building public-private partnerships (PPPs) to secure alternative funding streams.
- Universities administrators should implement healthy leadership development programs that focus on equipping leaders with the skills necessary for strategic decision-making, innovation, and adaptability in a rapidly changing educational environment.

ABSTRACT

This paper explored effective decision making in educational systems, examining the theories, concepts, and frameworks that influence decision-making processes. The paper discusses various decision-making models, including rational, normative, and bounded rationality theories, and their applications in educational settings. It examined the various steps to make sound decision and the types of decision making It also described the role of teacher participation, collaboration, and communication in decision-making processes and it is impact on academic performance of students. The paper highlighted the importance of informed decision making and well as the characteristics of a good decision making. It provided a comprehensive and nuanced 'understanding' of the complex factors that influence effective decision making. The conceptual framework developed in this paper can inform educational leaders, policymakers, and practitioners in their efforts to improve decision making and ultimately enhance student outcome and gave a comprehensive understanding of the barriers to effective decision making, including personal biases, political factors, and religious constraints.

Keywords: Effective Decision Making, Theories, Concepts, Types, Barriers, Characteristics, Importance, Implications.

INTRODUCTION

Decision making is one of the most important activities in which school administrators engage in in a daily basis. The success of a school or school district is critically linked to effective decisions. Because decision making is so important and can have such significant effects on the operations of schools, it has been suggested that administration is decision making. It would be a mistake however to include that only administrators make decisions. Important decisions are being made by non-administrative personnel. While decision making is a crucial administrative process, it is fundamentally a people process (Lunenburg, 2010).

Decision making is considered to be very significant in educational leadership, as it directly impacts on the quality of education and the overall school environment. Just like every

other organization, whether formal or informal, schools have set goals and are faced with making choices regarding their operations and assessing means to achieve them thereby making choices that will aid them to successfully realize these objectives (Agi & Adiele, 2015).

Decision making is central to all the aspects of management which involves planning, organizing, staffing, directing, coordinating, reporting and budgeting. Every management process according to Okorie and Oluwuo (2004) cited in Agi and Adiele (2015) involves decision making to achieve a given objective. Effective decision making has to do with sampling various opinions, analyzing them, and selecting the best out of the various options. Decision making although a process is equally a means to an end but not an end in itself. Robert-Okah (2005). Decisions are made at all levels of school organization. The superintendent makes decisions concerning a school district's goals and strategies. Then principals make tactical decisions concerning those goals and strategies to accomplish them in relation to their own buildings. Department heads and team leaders then make curricular and operational decisions to carry out the day-to-day activities of a department or unit. And, finally, classroom teachers make decisions in their classrooms. Consider the following decisions that need to be made at different organizational levels:

- How much inventory should be carried in the school district warehouse?
- Where should the newly proposed elementary school be located?
- Should the school district renovate the old high school or build a new one?
- How many classes of freshman English should our department offer next?
- What textbook series should the mathematics department adopt?
- Should all of our principals attend the conference on the use of technology?
- What minimum rules should I adopt in my classroom?

THEORIES OF DECISION MAKING

The Normative Theory

The normative model is one which asks what the answer to a problem should be. A normative model answers an optimization question if you are trying to solve a problem, what is the optimal way to solve it? For example, you want to travel from one point to another, the fastest way is to take a straight line. Every normative model is an optimization under assumptions. Those assumptions are often not stated but they still pertain. This every normative model says something about the underlying process. For example: Normatively, you can ask, what is the fastest way between two points in space (a straight line) but the fastest way from earth to Pluto is not actually a straight line because it is possible to swing your spaceship around Jupiter. The process of going past Jupiter changes the normative option path to Pluto. The original straight line answer includes the hidden assumptions that there are no planets to slingshot around.

The Satisficing Model Theory

Satisficing model theory was formulated by H.A. Simon and I G. March (1963). According to the theory, there are limitations in the knowledge of alternative courses of action and of the consequences of these courses of actions. Hence the decision maker does not examine all possibilities at once but rather handles one thing at a time in peace meal manner due to

organizational and social environment in which the decision maker finds himself determines what consequences he will anticipate. It is therefore contingency and situationally oriented saves time and keeps decision within limits (Igwe 2020).

Satisficing model specified as an incidence/policy that endeavors for satisfactory decision making. This model intended to take decisions that are satisfactory enough to undertake certain circumstances, but this decision is not the best promising decision. Satisficing means, deciding on or choosing an alternative which will satisfy to achieve a particular goal with minimum requirement. This is not the optimal solution but is a good enough solution. This solution is acceptable or reasonable over optimal solutions because optimal solutions require more time, effort and capital. But the satisfactory solution is good enough to accomplish the suitable range of performance.

Satisficing is simply a strategy that represents choosing the acceptable alternative that satisfies the minimum criteria for decision making in responding to problem situation that poses danger, rather than waiting for the best decision that may be constrained by bounded rationality.

The Bounded Rationality Theory

The Bounded Rationality Model by Herbert Simon challenged the concept of rational fellow and contend that the sanity of a person is delimited by sure restrictions. Simon derives that for fixing hypothetical issues, normal thoughts, suitable reasoning, and logic are favorable. For solving practical problems this model is not suitable. Here the performance of the decision maker and his mental power, information that are accessible and the problem solving time may generate a situation where the decision making performed under the conditions of bounded rationality. In authentic scenarios, Simon argued that decisions taken by human beings are mainly based on heuristics but not by any optimization method. This model describes the situation where there are boundless alternatives required by a decision, and information that becomes difficult to assess and evaluating all. Bounded rationality theory implies that heads of organizations or schools have limited ability, limited access to information and alternatives to solving problems.

Rationality of individuals is restricted by the information they possess, the subjective constraints of their brain and the limited amount of time to take decision. Simon advocated the model of bounded rationality to clarify that within the environment of decision making, why boundaries exist to rational decision. The decision making process is described by Simon as the alternative courses of action. He states that decision making is spread through the entire organization that means each level of the organization decisions are made. Therefore, he supposed that the organization is the construction of decision makers.

Regardless of personal level of intelligence, the idea of bounded rational decision making having the following:

- Simply partial usually untrustworthy information is obtainable concerning possible alternatives and their results.
- Human brain has finite capability to estimate and process the information as per their availability.
- Time limitation is there to make any decision flop.

As a result in actuality, the person who recommend rational selection are bound to create Satisficing before overestimating or optimizing alternatives in complex conditions.

Economic Rationality Model (ERM)

In ERM, the decision maker is perfectly and totally rational in every way. This model belongs to the classical economist models. It holds the following conditions:

- The final sense that decisions must be entirely rational.
- The system of performances must be complete and consistent which permits choice among alternatives.
- Probability computations are neither terrifying nor puzzling.

To determine the best alternative, there are no boundaries for the complex computation that can be performed on the alternatives.

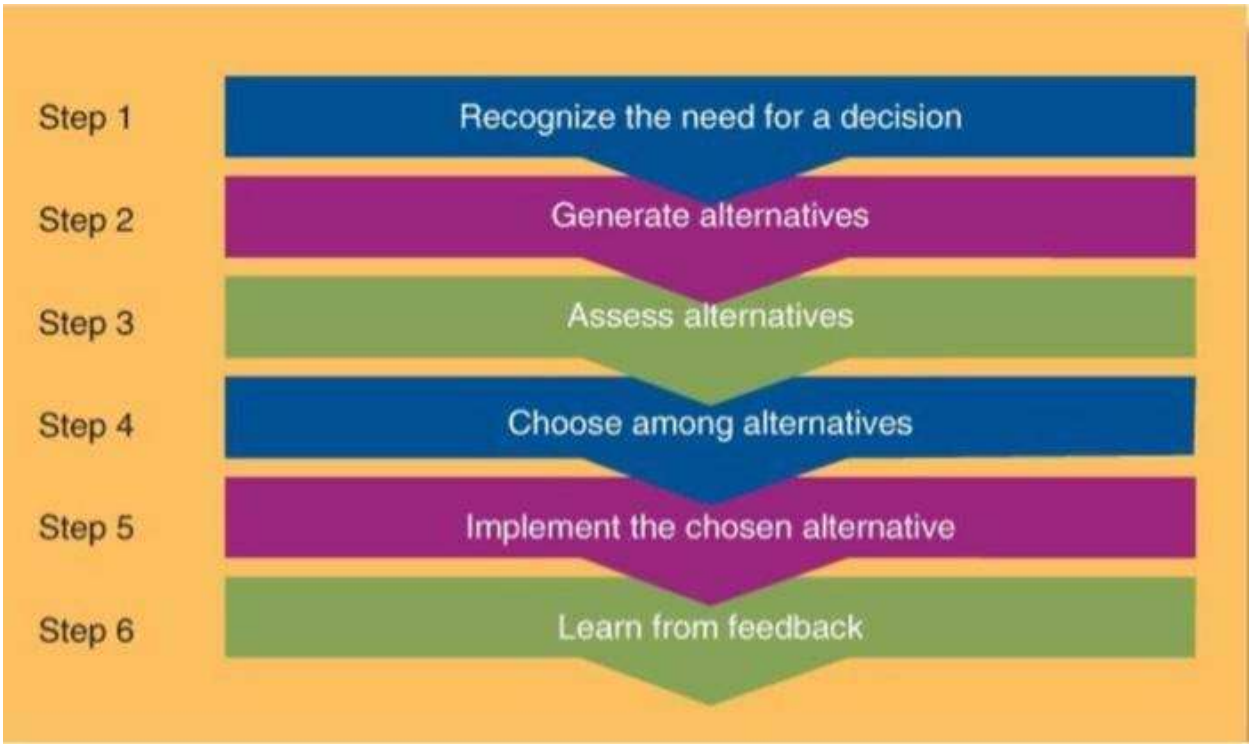
Recognition Primed Decision

Recognition Primed Decision (RPD) model describes when people encountered with action is generated by the DM; it is compared to the restrictions compelled by the difficult circumstances how they make fast, efficient decisions. Here, a possible course of situation, and among the strategies that are not rejected chooses the first strategy. RPD formerly explained in diverse groups including whitewater kayaking trauma nurses, fire ground commanders, chess players, commercial whitewater river guides and stock market traders.

It works fine in situations like time demands, and where information is incomplete and objectives are weakly described. The constraints of RPD failure and modelling in abnormal or embarrassed situations. This model emerges as a suitable model for decision making among human decision makers.

Casual Decision Making Model

Numerous theories have been proposed by philosophers that are keen to casual structure. To find out expected utilities all these theories use other suggested conditional utility. As a substitute, they take the casual consequences of option into consideration. The impact of causality has been identified in decisions of probability and has been the vital subject in applications of credits and clarification. There is some proof that people are influenced by casual thoughts in the area of decision making. People like to construct casual model to stimulate the consequences of a possible action and if the results are convincing then continue.



Studies have found that while making decisions, people have a tendency to ignore alternative casual models and occasionally trust only one. Some evidence shows that in their decisions, people move away from the favorable use of casual knowledge which misleads them. This study lodges these findings and identified boundary, condition for the use of casual models in decision making. Hagmayer and Sloman (2005) cited in Devi et al. (2020).

Group Decision Making Model

Here the decision makers are provided with dissimilar preferences and assessments due to fluctuating knowledge about the domain and cultural ethics in the group decision making

problems. A greater degree of heterogeneity is predictable when the decision makers are large which is hard to interpret the varied information into one uniform preference with no loss of context. The major challenges of group decision making model are:

- From a large number of decision makers how to generate unified heterogeneous information and based on unification method how to provide optimal solutions. So an aggregate of individual priority based aggregation mechanism is found in the new group decision making model, which is capable to utilize flexible techniques for determining individual priority of each decision maker and keep away from the information loss caused due to unified varied information which is used to combine the preferences of each individual.
- To accomplish an agreement competently, that is, to reward or penalize the supportive/ non supportive decision makers, respective various correction plans are employed. To guide the revision process, provisional group option helps very much at each round of revision which is resulted by accumulating the nonconflicting options. A position based dissimilarity measure is developed to handle the agreement in a robust manner. In processing heterogeneous information, this new model is more efficient and flexible in comparison with existing group decision making models. This method is capable of handling information of different types having dissimilar levels of granularity and also indicates that the location _based dissimilarity measure is able to beat possible deformations of the results in large scale Group Decision Making problems. Zhang et al 2015).

CONCEPTUAL FRAMEWORK

The Concept of Effective Decision Making and Policies in Educational System

Decision making as a key element of management has been defined by various authors. Decision can be known as resolution, conclusion, settlement, choice, option, selection, verdict, ruling, recommendation, judgement, pronouncement etc. A decision could be referred to as conclusion or resolution of making relevant decision. Psychologically, decision-making is regarded as the cognitive possibilities. It is the process of identifying and choosing alternatives. Decision making process enables school administrators solve problems by examining alternative choices and deciding on the best route to solving problem. Decision-making process is continuous and indispensable component of managing educational institutions. Decision-making is central and significant to all aspects of management. Decision-making comprises the selection of alternatives in order to achieve the desired result. Not the end itself. It is vital to realizing school goals and objectives.

Decision-making in schools is a panacea in the improvement of human resources management. School head must involve or inculcate the idea of the teacher's giving them the sense of belonging and thereby accelerating the efficiency of the school system. Decisions are made and implemented every day in schools. However, to ensure that rational decisions are made and double standard are not applied in decision-making, all the school stakeholders should be allowed to make decision as and when especially the teachers in the school. School as an institution has a structure. For example, in Secondary schools, the Principal is the head, followed by the Vice Principal, Administration and Vice Principal, Academics, heads of Department, teachers, non-teaching staff and students. For a free flow and streamlining of authority and duties, the principal oversees the affairs of the school, assign responsibilities to other subordinates. The students also allotted with position such as Senior Prefect, Deputy Senior Prefect, Sports, Labor, Punctuality prefects and other, this structural arrangement in a school system helps in effective decision-making and policy formulations in the system. This arrangement (structure) in a school system like Secondary School, necessitated the principle of delegation of power and authority to lowest possible always fail if it is not followed by a determine effort to improve the abilities and capabilities of local decision makers. Every institution or organization such as school has a guiding principle upon which operations are regulated and assessed. These principles are commonly regarded to as policies. Wali (2018) maintained that policy is a statement of principle(s) with supporting rules and actions, guidelines, laid down rule in general and specific terms that govern the achievement of goals to which a business is directed. This implies that policies are the machineries through which school goals and objectives are realized.

Mmejin (2018) also stipulates that a policy is a general guide to action that helps in management. That means that no decision will be made outside the stipulated policy. Policy gives birth to decision, that is, school administrator makes decision in line with the laid down policies in education, however, and school administrator sometimes makes some minor policies that guide the decision of the subordinate in case of delegation of authority. School systems are guided to enhance the realization of their set goals by policies.

Anderson (2010) opined that public policy is a purposive course of action followed by an actor or set of action in dealing with a problem or matter of concern. Policy implementation is an important and inevitable state of policy in realizing its objectives. It is the execution of the action that decisions are taken towards the actualization of the goals and objectives of the school

system. A policy can be mere statement when it is not implemented and it becomes effective statement when it is fully implemented and the objectives or achieved.

Decision Making by Various Authors

Decision making (decision from Latin decidere "to decide, determine," literally "to cut off," from de- "off" and caedere "to cut") can be regarded as the intellectual processes resulting in the selection of a course of action from among several alternative scenarios. Hoy and Miskel in Igwe 2020, defined decision making as a complete cycle of event by which an organization makes and implements decisions. Igwe in Okoroma (2007) opined that decision-making is purposive act intended to achieve a desired outcome which is usually envisaged by the decision maker. That implies that in decision-making, there is the relationship between the action and the outcome. He further opined that all other activities are subordinated to this process of administration. That means that, all other administrative jobs are dependent upon administrative decisions.

Decision making according to Nwachukwu in Robert-Okah (2014), it is the selection of alternative course of action from available alternatives in order to achieve a given goal. Decision making by Jones and George in Agi and Adiele (2015) perceived decision making as the process by which managers responds to the opportunities and threats that confronts them by analyzing the options and making determinations or decisions about specific organization goals and courses of action. James et al. (2000) defined decision making as the process of identifying and selecting a course of action to solve a specific problem. Griffin in Agi and Adiele (2015), define decision making as choosing one alternative from several. Also, Daft (2003) defined it as a process of identifying problems and opportunities and then resolving them. Decision making according to in Robert-Okah (2002), it is a process which one goes through in order to be able to pass judgement and terminate controversy. Daft described the decision as a choice among the existing alternatives. Decision-making is the process of identifying problems and opportunities and then providing solutions to them (Daft, 2008). Drucker who is regarded as the guru of management science, stated that the decision is a judgment and that in very rare cases a decision is a choice between right and wrong (Druckler, 2005). Wiig described decision making as one of the most important activities that people can engage in. According to him, decision making is the identification and determination of a given situation and what to do in this context. Wilg stated that decision making involves the following three functional tasks: (1) Simple decision making, (2) Complex decision making and (3) Specific decision making (Wiig, 2004).

Domains of Decision-Making

Domains of decision-making can be seen as the very angle in which decision-making originate from. That is, where the need originates. Therefore, Okai (2013) identified three domains of decision-making as follows:

- Institutional or Policy Domain;
- Management Domain;
- Technical or Operational Domain

Institutional or policy Domain

Basically, decisions from this domain with the objective of vis-à-vis the mission of the organization, issues such as the policy that governs the nations educational system originates from either National Assembly or House of Assembly (in the time of the military they were described as decrees and edicts) Therefore, decision that originate from the policy domain are intended to deal with issues that concern general objectives and national policies.

Managerial Domain

These are decisions that may be returned to the manager to implement, and may take the form of intermediary decisions and appellate decisions. Such decision has a short-term plan than those decisions that may originate from institution or policy domain. For instance, decision on issues such as: Motivation of subordinates; Procurement and allocation of resources; Co-ordinate or internal administrative activities.

Technical or Operational Domain

Okorie (2009) explains that technical or operational decision come form people who possess expert knowledge about organizational tasks and also the ways through the tasks are carried out in order to promote productivity, efficiency and effectiveness. In the system teacher are closer to the students so that they are in good positions to understand students problem and are best equipped to solve these problems.

DECISION MAKING PROCESS

Decision making process is an analysis of a cycle of awareness, initiatives, preferences, choices and actions. In order to manage a school effectively and efficiently, the school leader must follow the decision making process. The classical decision making approach has six major steps which includes:

Identifying and defining the Problem

Schools exist to achieve certain goals, such as educating students. Within the school, each department or subunit has goals, such as increasing test scores, reducing dropouts, and/or developing new approaches to teaching. Establishing these goals becomes the basis for identifying problem areas, deciding on courses of action, and evaluating the decision outcomes. A decision is said to be effective if it helps a school administrator to achieve a specific objective or set of goals for the school or school district. Failure to achieve a desired goal becomes a problem, and the school administrator is ultimately responsible for solving it.

Effective decision makers are keenly aware of the importance of properly identifying the problem and understanding the problem situation. Kepner and Tregoe (2005) developed a method of problem analysis that suggests that the first step in decision making, identifying the problem, is the most important step. According to these authors, providing a good definition of the problem affects the quality of the decision.

Their method suggests that it is often easier to define what the problem is not, rather than what it is. Also, the problem and its solution are prioritized with other problems, to clarify its relative importance. The final step is searching for cause-effect relationships, their method of problem analysis includes: (1) Problem identification, (2) definition of what the problem is and is not, (3) prioritizing the problem, and (4) testing for cause-effect relationships (Kepner & Tregoe).

The process of identifying problems requires surveillance of the internal and external environment for issues that merit attention (Verschaffel, 2011). School administrators scan the world around them to determine whether the school is progressing satisfactorily toward its goals. For example, school administrators survey students, teachers, parents, and community members using instruments to measure satisfaction, organizational climate, and the like. Other information may come from formal information systems, such as periodic accounting reports, Management Information System (MIS) reports, and organizational plans designed to discover problems before they become too serious. Or the information may be gathered informally by talking over the situation and by personal observation. A principal, for example, might discuss a school performance problem with teachers, the superintendent, or other principals to obtain ideas and information. The school administrator must be plugged into an information system, whether formal or informal, that gathers these data as a means of identifying problems.

In addition to identifying problems, school administrators must also define the situation, which is partly a matter of determining how a specific problem arose. This is an important stage, because the situation definition plays a major role in subsequent steps. Suppose, for example, that a school has had decreasing test scores for the last two years. One principal might define this situation as the result of a changing student population in the school attendance area and begin to search for new approaches to teaching these students, who come from lower socioeconomic backgrounds. Another principal might define the situation as a case of an inappropriate match between what is taught and what is measured that is, placing the blame on the achievement test being used. The problem declining test scores is the same in both cases, but the two different definitions of the situation call for two different solutions.

Generating Alternatives

Once the problem has been identified, the second step in the decision-making process is to generate alternatives to the problem. In developing these alternative solutions, school administrators first must specify the goals that they hope to achieve through their decision. Are they trying to reduce the dropout rate, improve the quality of instruction, increase test scores, or something else? Once school administrators have determined their goals, they can search for alternative means of reaching them. Information must be collected regarding each of the alternatives and their likely consequences. More specifically, the school administrator must seek to learn as much as possible concerning the likelihood that each alternative will result in the achievement of various outcomes, and the extent to which those outcomes will contribute to the achievement of the goals and objectives being sought.

Ideally, the school administrator should seek to generate as many alternatives as possible and should attempt to ensure that the alternatives are relatively diverse that is not highly similar to one another. The extent of the search for alternatives is limited by the importance of the decision, the cost and value of additional information needed to evaluate alternatives, and the number of people affected by the decision (Zopounidis, 2011a,b).

The more important the decision, the more attention is directed to developing alternatives. For example, if the decision involves where to build a new multimillion dollar high school, a great deal of time and effort will be devoted to identifying the best location. On the other hand, if the problem is to select a color to paint the classrooms in the new high school, less time and effort will be devoted to the activity. The length and thoroughness of the search for alternatives depends on the cost of evaluating additional alternatives (Narayanan, 2005). For example, a 2% improvement in the solution of a $10 million problem may produce a profit margin of $200,000.

However, if the cost of evaluating an additional alternative is $250,000, the evaluation costs $50,000 more than the possible savings. As a rule of thumb, the increase in the improvement of a solution should always be more than the cost of performing the additional evaluation of an alternative. Moreover, the greater the number of people affected by a problem, the more likely the organization will conduct a lengthy and thorough search for alternatives (Ehrgott, 2011). However, when dealing with complex school problems affecting numerous people, it is often necessary to compromise on some points. Human benefits cannot be measured in dollars and cents (Schoenfeld, 2011).

Evaluating Alternatives

The third step in the decision-making process is evaluating each of the alternatives generated in step 2. In evaluating an alternative, school administrators must ask the following three questions:

- Is the alternative feasible?
- Is it a satisfactory alternative?
- What impact will it have on people? (Grant, 2011).

The first question whether the alternative is feasible simply means: Can it be done? For example, if one alternative requires a general layoff of school faculty but the school district has a collective bargaining agreement that prohibits such layoffs, that alternative is not feasible. Similarly, if a school district has limited capital, alternatives that require large capital outlays are not feasible, unless funds can be borrowed to meet the capital-outlay requirements.

The second question concerns the extent to which the alternative is satisfactory that is, the extent to which it addresses the problem. For instance, suppose a principal wants to expand the curriculum by 25%. One alternative is to implement a trimester schedule. On closer examination, however, the principal may discover that the plan would expand the curriculum by only 15% and that such a modest expansion may also negatively affect the quality of the program. The principal may decide to implement the trimester plan anyway and search for other ways to achieve the remaining 10% expansion in the curriculum and find ways to maintain the quality of the program. Or he may decide to drop the alternative from consideration entirely.

The third question addresses the impact of an alternative on school personnel. The alternative that is chosen must be acceptable to those who must live with the consequences of the decision. Failure to meet this condition is the single most likely reason for failure of the decision-making process to solve problems (Hastie, 2010). For this reason, questions of acceptability of a proposed alternative should be of great concern to the principal. On the one hand, even a mediocre solution to the problem may prove effective if it is implemented with enthusiasm and

commitment. On the other hand, a technically correct alternative may fail to succeed if implementation is halfhearted.

Choosing an Alternative

Once the administrator has evaluated all of the alternatives, he attempts to choose the best alternative. The evaluation phase will have eliminated some of the alternatives, but in most cases two or more will remain. How does a school administrator decide which alternative is the best? One approach is to select the alternative that is feasible, satisfactory, and acceptable to the work group (Gilboa, 2011). Because most situations do not lend themselves to sophisticated mathematical analysis, the school administrator uses this available information in combination with judgment and intuition to make the decision (Mendel, 2011). The basis of judgment should be how close the outcomes or consequences of the alternatives come to achieving the desired goals of the school. For example, if the original goal was to decrease the dropout rate as much as possible, regardless of the costs, the school administrator might choose an alternative that will decrease the dropout rate significantly but that carries a high cost, rather than an alternative that would reduce dropouts only moderately at a minimal cost. However, if the original goal was to reduce the dropout rate by a moderate amount and if that goal is more desirable now, the second alternative might be a better choice.

The school administrator may be able to choose several alternatives simultaneously. Suppose, for example, a school principal is hiring an English teacher and has two strong candidates for the position. One strategy that is frequently used is to offer the position to one candidate and keep the other candidate on hold. Should the first offer be rejected, the principal still has an acceptable alternative to filling the position.

Implementing the Decision

After choosing an alternative, the school administrator faces the challenge of implementing the decision. A sound decision can fail if implemented poorly. It is useful, therefore, to consider some suggestions for successful implementation (Ahmed, 2011).

- School administrators need to make sure that the alternative is clearly understood. This is accomplished by communicating the decision to all involved staff. Effective communication is necessary.
- School administrators need to encourage acceptance of the alternative as a necessary course of action. Committees can help a school administrator achieve commitment. If the people who must carry out a decision participate in the process, they are more likely to endorse enthusiastically the outcome. Thus, the degree to which persons have or have not been involved in prior steps may substantially affect the success of the total decision-making process.
- School administrators need to provide enough resources to make the alternative succeed. School administrators set up budgets and schedules for the actions they have decided to undertake. Specifically, the decision may require acquiring office space, hiring staff, procuring funds, and the like.
- School administrators need to establish workable timelines. The school administrator now faces a "how much" and "how soon" decision. As part of the process of

implementation, he must ask himself whether to move forward step by step or whether to take the entire action at once.

- School administrators need to assign responsibilities clearly. In other words, what should be done by whom? Because the solution of most administrative problems requires the combined effort of many school members, each person should understand what role he or she is to play during each phase of the implementation process.

Evaluating Decision Effectiveness

The fifth and final step in the decision-making process is evaluating the effectiveness of the decision. When an implemented decision does not produce the desired results, there are probably a number of causes: incorrect definition of the problem, poor evaluation of alternatives, and/or improper implementation. Among these possible causes, the most common and serious error is an inadequate definition of the problem. When the problem is incorrectly defined, the alternative that is selected and implemented will not produce the desired result. Evaluation is important because decision making is a continuous, never-ending process. Decision making does not end when a school administrator votes yes or no. Evaluation provides school administrators with information that can precipitate a new decision cycle. The decision alternative may fail, thus generating a new analysis of the problem, evaluation of alternatives, and selection of a new alternative. Some experts suggest that many large problems are solved by attempting several alternatives in sequence, each providing a modest improvement (Hicks, 2005). Evaluation is the part of the decision-making process that assesses whether a new decision needs to be made.

Characteristics of Good Decision-making

Every decision cannot be a good one; therefore every good decision requires special efforts. In order for a decision to be good, it must possess certain attributes that can enable it stand the test of time. Such attributes include:

- A good decision must consider and confine itself to available resources. It is obvious that the essence of any good decision is to bring about development. Decision must relate and reconcile the scale and pace of the desire development with available resources. This is necessary in order to avoid non-implementation of decision in the school system.
- A good decision must be geared towards school goals and objectives. Every good decision must reflect the predetermined educational objectives.
- A good decision must be capable of identifying options. In trying to solve a problem through making a decision, it is important to note that there can be more than one way of bringing a solution. An educational administrator must be capable of identifying various possible options or alternatives through a better understanding of the issues and trends associated with the educational system.

Furthermore, Robins (2007) maintained that decision-making should demonstrate the following characteristics:

- It must focus on the vital issues;
- It must be logical and consistent;

- It should be subjective, objective and analytical with intuitive thinking;
- Decision-making requires a lot of information and analysis to solve a problem. NOUN module (2016) in Olejurulo (2018) stated thus: That a good decision-making requires the gathering of relevant information and opinions;
- It should be concerned with the morale and satisfaction of the employees and students. NOUN module (2016) explains that since decision-making is about problem solving; it therefore, requires that educational institutional leaders and mangers should make intelligent, appropriate and effective decision to achieve the set of goals of the institution.

Importance of Effective Decision-making and Policies in Educational system in Nigeria

The importance and the reason for effective Decision-making and policies in the school system are identified below (Olejurulo 2018:139):

- To achieve growth and development of the institution;
- To solve the multi-faceted problems of the institution especially manpower needs;
- To give direction to all managed activities and persons involved in the institution through the implementation of the policies;
- To achieve maximum result by making rational, informed and productive decisions in the institution without any interference of time pressure and personal emotions (Boundless Management, n.d);
- To sustain management activities and enhance institutional functions;
- It enhances the leadership skills and abilities of the institutional leader as useful decision maker;
- To reduce high risk, losses and opportunity cost in management activities due to wrong, weak, or insufficient information and creating a stable academic environment; and
- To check balance the success of all managerial activities and maintain focus in the institution.

Types of decision making

There are different types of decision-making as identified by Gatzimos in Ololube (2013) and these include:

Authoritative Decision Making

According to Ibara (2015) authoritative decision-making are decisions made in response to authoritative communication from a superior officer. This implies that the decision flows from the superior to the subordinate like the teachers and any other categories of staff are bound to follow these decisions regardless of whether it is beneficial to the organizational goals.

Consultative

This has to do with decisions that are made in consultation with subordinates. That is seeking the consent of teachers before carrying out decision. A wise leader is one who consults subordinates when he thinks that they have valuable expertise to offer (Ololube, 2013).

Delegative

Delegative decision-making has to do with delegating the responsibility of making decisions to one or more subordinates. For example, when the Principal assigns the duty of decision-making to teachers. This type of decision-making is usually adopted by a leader who is confident of the capabilities of his or her subordinates (Ololube, 2013).

Facilitative

This is when the Principal or school head collaborates with the teachers (subordinates) or work together to arrive at a viable decision. The expertise and contributions of subordinates are inculcated and regarded in decision-making. It is regarded as all-inclusive or participatory in nature. The risk of making wrong decision is often very low or minimized. Furthermore, Ololube (2013) highlighted six types of decision-making which a school head can adopt to solve management challenge in educational system or in institutions. They include:

- Programmed
- Non-programmed decisions;
- Routine and strategic decisions;
- Tactical and operational decisions;
- Organizational and personal decisions;
- Major and minor decisions.

Programmed and Non-programmed Decision

Programmed decisions are decisions that are adopted by lower echelon managers to solve routine problems or challenges which the manager (School head) had solved before using specialized or standard procedures. They are usually a structured, repetitive and routine in nature. Have a definite rules and procedures on how they can be processed and handled. It's the best type of decision for teachers and school administrators. They are guided by rules and regulations. For example, granting leave to subordinate (employees) assigning students to faculty/departments and many more. Simon in Olejurulo (2018) explained that Non-programmed decisions involve more difficult issues in management made by higher echelon manager. For instance, opening a branch business or an affiliate campus of the university, curriculum planning, budgetary planning are institutional leader's decisions. In other words, non-programmed decisions are complex and deserve a special treatment. Unlike the structured and repetitive, this is entirely new with high risk. There are no laid down procedures to handle them. It requires creativity, initiatives, tolerance and a sense of judgement.

Routine and Strategic Decision

These are decisions that are every day and often made decision in school management. These kind of decision are often repeated and sometimes delegated to the school management team or lower echelon managers to tackle within the limit and the structural arrangement of school or school policy or policies. It is strategic or basic because it has to do with the objectives and policy matters of the school, strategic decision, according to Ebrary (2018) is more difficult decision as it affects the goals and objective plan layout, production and the entire future of the organization in the school system. Strategic decision would be concerned with the admission of students, budgetary planning, and execution of educational policies for the growth and development of school. This has to do with high level institutional decisions, it requires a lot of caution, analysis and reasoning of all options before the leader of school head makes them.

Tactical (Policy) and Operational Decisions

This has to do with top echelon decisions; the reason is that it can affect the entire school system. In this kind of decisions, there must be compliance to the functional rules, policies and procedures of the school, Operational decisions involves everyday operations and function of the school decisions taken by lower or middle echelon managers, for example, calculation of teacher or staff's bonuses.

Organizational and Personal Decision

Organizational decisions are made in the official capacity. It has to do with release of money to execute a project. Personal decision is a kind of decision that has to do with the personal life of decision-maker. This is personal to the decision maker. He takes the decision for his personal purpose.

Major and Minor Decision

Major decision is a kind of decision that when made, can affect the entire school holistically. Minor decision is a kind of decision that has no much influence in the entire organization. Example of major decision for a school system is starting an affiliate campus, by university institutions.

Other styles of decision making

- Reversible decision
- Irreversible decision
- Delayed decision
- Quick decision
- Experimental decision
- Trial and error decision
- Conditional decision.

BARRIERS TO EFFECTIVE DECISION MAKING IN EDUCATIONAL SETTINGS

There are several factors that can pose as a barrier to decision making in schools. Hoy and Miskel in Agi and Adiele (2015) identified the following barriers to decision making in schools as:

- Political factor; Political consideration not only affects how decisions should be made but also what decisions are made. Take the University recruitment and admission for example, there is usually political influence. The school has no autonomy to recruit or admit the qualified candidates. Politics plays major part in these acts of decision making.
- Personal bias of decision makers; The sentiments, bias, personal consideration, cultural views are strong influenced that can also be a hindrance to effective decision making.
- Lack of consultation by school heads. Having to make decision without involving the teachers can fault an already decision made by the principal alone.
- Lack of communication; When you make decisions without having a good knowledge of the problem. In other to make appropriate and standing decisions, there must effective communication.
- Environment of the decision maker: A community with educated and rich people are likely to affect the decision making differently from a community with ignorant, illiterate and poor people.
- Ethnic and religious consideration: Greediness and selfish interest has become the order of the day making it difficult for rationale decision to stand.
- Existing laws and regulations; All organizations have existing laws so during the process of decision making, school administrators should recognize existing laws and regulations as the springboard for proper and legitimate take off.

Implications of teacher participation in decision making in schools

There has never been consensus on the specific teacher factor that influence student's academic achievement (Rivkin & Kain, 2005). Studies have shown that when teachers participate in decision making in schools, the following results:

- Teachers who participated in decision making, perform better in their job. Omobude (2012).
- Participating in decision making enable teachers to be motivated in attaining the goals of the school.
- Teacher participation in decision making have an impact on student's discipline.
- Teacher participation in decision making also helps to improve the academic performance of the students
- Participation of teachers in decision making also have impact on the drop out rate of students.

CONCLUSION

An effective decision determines the success of every educational system. Decision making is a significant activity that a school leader must be engaged in on a daily basis for the goal of education to be achieved. This paper explored the concept of effective decision making in educational systems, with a focus on the theories of decision making, the meaning of decision making, the decision making process, the types of decision making, the characteristics of a good decision making, the importance of effective decision making and the impacts of teacher participation in decision making. By examining the theories, concepts, and frameworks related to decision making, this paper has provided a comprehensive understanding of the factors (barriers) that influence effective decision making in educational settings. This paper would contribute to the development of a conceptual framework for effective decision making in educational systems. The insights gained from this study can inform educational leaders, policymakers, and practitioners in their efforts to improve decision making and ultimately enhance student outcomes.

Suggestions

- School heads ought to learn and be conversant with the processes involved in making decision to be able to arrive at effective decision making in their schools.
- Educational policy makers should be mindful of the kind of decisions they make because the success of every school depends on the quality of decision made by decision makers.
- No principal is a monopoly of wisdom. Hence the need for consultation and integration of staff in decision making. There are times you would run out on good options, this is the point you involve your teachers/staff to suggest ideas that will be effective and yield results.
- Educational decision makers should take cognizance of the factors that influences effective decision making and devise capable means to manipulate them.
- School heads should form the habit of involving their teachers in making decisions that borders on the school. It lessens the burden on the principal while giving the teachers a sense of belonging. When school heads involve their teachers in making effective decisions, it helps relieve them of the burden of bearing the problem alone.
- School heads should try to reduce the rate of drop out by allowing teachers to participate in decision making since the teachers are the ones closer to the students.
- When assigning subjects, principals should involve the teachers and not make the decision alone. If the teachers participate, it will enable them choose the right subject that they are perfect in handling to achieve better student's academic performance.

EFFECTIVE EDUCATIONAL MANAGEMENT AND ITS IMPACT ON NIGERIA'S ECONOMIC GROWTH

Elizabeth Ikefuama EMELOGU
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

The paper scrutinized the topic, Effective Educational Management and its Impact on Nigeria's Economic Growth, focusing on how effective management of the education sector contributes to national development. Effective educational management leads to smooth administration of institutions, human capital development, and workforce productivity, which are essential for economic progress. However, various challenges, including inadequate funding, poor infrastructure, policy inconsistencies, corruption, and security threats, have hindered the sector's effectiveness in driving sustainable economic growth. Furthermore, education serves as a catalyst for innovation, entrepreneurship, and poverty reduction, significantly influencing national development. Higher education institutions contribute to research, technological advancements, and industrial growth, further strengthening economic productivity. Educational management requires strategic interventions such as increased investment, curriculum reforms, teacher training, technology integration, and industry-academia collaboration. The paper concluded that a well-managed education system enhances innovation, entrepreneurship, and industrial growth, contributing to sustainable economic advancement. Amongst others, the paper suggested that Government should increase budgetary allocation to education to meet international standards and ensure proper funding of schools, teacher salaries, and infrastructure.

Keywords: Educational Management, Economic Growth, Human Capital, Development, Workforce Productivity, Innovation.

INTRODUCTION

Education serves as a foundational pillar for economic development, equipping individuals with the knowledge and skills necessary to drive innovation, productivity, and sustainable growth. In Nigeria, the management of the educational sector plays a pivotal role in shaping the nation's economic trajectory. Educational management encompasses the strategic planning, organization, coordination, and evaluation of resources and processes within the educational system to achieve optimal learning outcomes and societal advancement. Effective management in education ensures that policies are well-formulated, resources are efficiently allocated, and educational objectives align with national economic goals.

Moreover, the relationship between education and economic growth has been extensively studied, with numerous scholars highlighting the positive impact of education on a nation's economy. For instance, Abiodun and Iyiola (2011) emphasized that investments in education significantly contribute to sustainable economic development by enhancing human capital. Similarly, Ehiogu et al. (2013) argued that a well-managed educational system fosters innovation and technological advancement, which are critical drivers of economic growth. These perspectives underscore the importance of not only investing in education but also ensuring its effective management to realize its full economic benefits.

Additionally, the Nigerian context presents unique challenges and opportunities in the realm of educational management. Studies such as those by Ifionu and Nteegah (2013) have assessed the impact of education on economic growth in Nigeria, revealing that while education has the potential to drive economic development, inefficiencies and mismanagement within the educational sector can hinder this progress. Jaiyeoba (2015) further highlighted that addressing issues such as inadequate funding, poor infrastructure, and lack of qualified personnel is essential for the educational sector to effectively contribute to Nigeria's economic growth. These insights call for a comprehensive examination of the strategies and policies governing educational management in Nigeria.

Furthermore, understanding the dynamics of educational management and its impact on economic growth requires a multifaceted approach. It involves analyzing the roles of various stakeholders, including government agencies, educational institutions, and the private sector, in shaping educational policies and practices. Furthermore, it necessitates an exploration of the systemic challenges that impede effective educational management and the development of innovative solutions to overcome these obstacles. The relationship between educational management and economic growth in Nigeria is a critical area of study that holds significant implications for the nation's development. Effective educational management has the potential to transform the educational sector into a catalyst for economic prosperity, while mismanagement can stifle progress and perpetuate cycles of poverty and underdevelopment. Through a thorough examination of existing literature and empirical evidence, this study seeks to shed light on the key components of effective educational management and propose strategies to enhance its role in driving Nigeria's economic growth.

THEORETICAL FRAMEWORK

Classical Economic Growth Theory

Adam Smith’s Classical Economic Growth Theory, first introduced in *The Wealth of Nations* (1776), remains one of the most enduring frameworks for understanding the relationship between human productivity and national economic expansion. Smith argued that economic growth is driven by labor specialization, efficient resource allocation, and a free-market system that allows individuals to maximize their potential. Daron Acemoglu, Johnson, and Robinson (2024) reaffirmed Smith’s ideas by emphasizing the role of inclusive institutions in fostering sustainable development, highlighting that economies thrive when governments create policies that enhance productivity and human capital formation. In the context of educational management and economic growth in Nigeria, Smith’s principles provide a relevant foundation for analyzing how proper administration of the education sector can enhance workforce efficiency, reduce unemployment, and stimulate national development.

Smith's concept of the division of labor is directly applicable to the structure of Nigeria's education system. Specialization in various academic disciplines, vocational training, and research institutions aligns with Smith's argument that productivity improves when individuals focus on specific tasks in which they have expertise. In Nigeria, effective educational management should prioritize curriculum development that aligns with market demands, ensuring that graduates possess the necessary skills to contribute meaningfully to different sectors of the economy. Poor management, however, leads to a skills mismatch, where graduates are trained in areas that lack economic relevance, thereby contributing to high unemployment rates and underemployment. This inefficiency stagnates economic growth, as the workforce remains unproductive despite increased educational enrollment.

Moreover, Smith's advocacy for a self-regulating market through the "invisible hand" of competition can be linked to the role of private and public educational institutions in Nigeria. A well-managed education sector encourages both private and government institutions to compete in providing quality education, thereby improving learning outcomes. Acemoglu et al. (2024) expanded on this idea by asserting that economies that allow competition within structured institutional frameworks tend to experience more sustainable growth. In Nigeria, ensuring quality assurance mechanisms within the education sector will enhance efficiency, making education more responsive to labor market demands. When properly managed, the education system can serve as a driving force for industrial growth, technological advancement, and increased labor productivity, which are fundamental to Smith's economic principles.

Also, Smith emphasized the importance of capital accumulation as a driver of economic progress, which aligns with the role of investment in education. Nations that allocate sufficient resources to education experience long-term economic benefits through improved human capital. Acemoglu et al. (2024) further argued that economies with strong institutional support for education tend to outperform those that neglect investment in learning. In Nigeria, underfunding in the education sector has hindered infrastructural development, teacher training, and research activities, ultimately affecting the quality of graduates produced. Effective educational management must prioritize increased funding, efficient resource distribution, and policies that enhance accessibility and quality of education to strengthen economic growth.

The Classical Economic Growth Theory highlights the role of government policies in shaping economic prosperity. Smith asserted that while free markets drive growth, governments must establish frameworks that ensure stability and fairness. Acemoglu et al. (2024) reaffirmed this by arguing that institutions that enforce transparency, accountability, and long-term planning tend to foster economic resilience. In Nigeria, weak governance and inconsistent educational policies have led to instability in the education sector, affecting its contribution to national development. Strengthening educational management through strategic policies, improved institutional oversight, and long-term planning will ensure that education plays its rightful role in economic transformation.

CONCEPTUAL CLARIFICATIONS

Concept of Educational Management

Educational management refers to the systematic planning, organizing, directing, and controlling of educational institutions and resources to achieve predetermined objectives. It encompasses administrative and leadership functions aimed at ensuring that educational policies are

effectively implemented to enhance learning outcomes and societal development (Ofojebe & Ezugoh, 2019). The primary goal of educational management is to create an efficient system where teaching and learning processes operate seamlessly, fostering productivity within schools and higher institutions. This involves various components, including curriculum development, teacher training, financial administration, and student support services (Okeke, 2021).

Furthermore, effective educational management plays a fundamental role in maintaining discipline and order within educational institutions. It ensures that students, teachers, and administrators adhere to set guidelines that promote academic excellence. According to Aina (2020), well-structured educational management leads to improved instructional delivery, better student performance, and the overall efficiency of the education system. Additionally, educational management incorporates strategic planning, which involves setting goals and objectives that align with national and global educational policies. It also includes resource allocation to ensure that schools are adequately funded, teachers are well-remunerated, and students have access to quality learning materials (Onwuagboke & Osakwe, 2022).

Moreover, leadership in educational management is a critical factor that determines the success of educational institutions. The role of administrators, such as principals, rectors, and vice-chancellors, is to provide direction and implement policies that enhance the quality of education (Eze, 2020). Effective leaders within the education sector must possess skills in decision-making, problem-solving, and human resource management to address the challenges that arise within the system. Research has shown that institutions with strong leadership and management structures tend to produce better academic outcomes compared to those with weak administrative systems (Obi & Olaniyi, 2018).

Additionally, educational management is essential in maintaining accountability and transparency within the education sector. Educational institutions must ensure that funds allocated for learning purposes are utilized effectively to achieve the intended goals. According to Nwogu and Ekwe (2019), corruption and mismanagement of educational resources hinder the growth and development of the sector, leading to poor infrastructure, inadequate instructional materials, and a decline in educational standards. Therefore, implementing policies that promote accountability in financial and administrative matters is necessary for enhancing educational outcomes.

Technology integration has become a crucial aspect of educational management in the modern era. The adoption of digital learning tools, online education platforms, and administrative software has transformed the way education is managed (Okonkwo, 2023). These technological advancements have improved efficiency in record-keeping, student assessment, and teacher training, making education more accessible and inclusive. Effective educational management must embrace innovations that enhance teaching and learning experiences while ensuring that technological resources are adequately provided in schools and higher institutions.

Educational management is a fundamental aspect of ensuring that the education system functions effectively. It involves various administrative and leadership functions that enhance the quality of education and contribute to national development. Proper planning, accountability, leadership, and technology integration are essential components of successful educational management. When well-implemented, educational management can improve learning outcomes, enhance institutional efficiency, and contribute to overall economic growth and societal advancement.

Economic Growth

Economic growth refers to the sustained increase in the productive capacity of an economy, leading to higher levels of output, employment, and income generation. It is measured through indicators such as Gross Domestic Product (GDP), per capita income, and industrial expansion (Adebayo, 2021). A growing economy signifies an improvement in the standard of living, increased job opportunities, and enhanced infrastructural development. According to Osakwe (2020), economic growth occurs when a country effectively utilizes its human and natural resources to create wealth and improve the well-being of its citizens.

Furthermore, economic growth is influenced by several factors, including capital accumulation, technological advancements, labor productivity, and government policies. The accumulation of physical and human capital plays a crucial role in driving economic expansion. Investment in infrastructure, industries, and human capital development enhances productivity, leading to long-term economic sustainability (Eze, 2021). Additionally, technological innovation is a significant driver of economic growth. Countries that embrace advanced technologies in industrial production, agriculture, and service delivery experience higher economic progress compared to those that rely on traditional methods of production (Okafor, 2019).

Moreover, labor productivity is a key determinant of economic growth. A skilled and educated workforce contributes significantly to national productivity by improving efficiency and innovation across various sectors. According to Adegbite (2022), nations that invest in education and vocational training witness improved labor efficiency, leading to higher economic output. Policies that promote workforce training, research, and development enhance economic competitiveness and create a sustainable growth environment.

Additionally, government policies play a vital role in shaping economic growth. Fiscal policies such as taxation, public expenditure, and monetary policies influence the level of investment and consumption within an economy. According to Obi and Nwachukwu (2020), stable economic policies attract both local and foreign investments, which boost production, create employment, and generate revenue for national development. Conversely, inconsistent policies, poor governance, and corruption hinder economic progress, leading to stagnation and financial crises.

Economic growth is linked to the expansion of industries and entrepreneurship. A vibrant industrial sector contributes to wealth creation, job opportunities, and increased export revenues. Industrialization allows economies to transition from agrarian-based production to manufacturing and service-oriented activities that generate higher incomes (Onyema, 2023). Supporting small and medium enterprises (SMEs) also plays a crucial role in boosting economic growth by fostering innovation, reducing unemployment, and increasing national revenue generation.

Furthermore, globalization has influenced economic growth in modern economies. International trade, foreign direct investment, and cross-border collaborations have provided opportunities for economic expansion. Countries that integrate into the global economy through trade agreements and foreign partnerships experience faster growth due to increased market access and technological transfer (Umeh, 2022). However, economic growth must be inclusive to ensure that benefits are distributed equitably among all social classes to avoid income disparities and poverty.

Economic growth is a critical component of national development that enhances income levels, employment opportunities, and infrastructural advancements. It is driven by factors such

as capital accumulation, technological advancements, labor productivity, and effective government policies. Sustainable economic growth requires strategic planning, investment in human capital, and the adoption of innovative technologies to ensure long-term national prosperity.

Educational Management and Economic Growth in Nigeria

Educational management plays a fundamental role in the economic growth of Nigeria by ensuring the effective administration of educational institutions and the development of a skilled workforce. A well-managed education system produces graduates with the knowledge and skills necessary to contribute to national productivity, technological advancement, and industrial development (Ogunleye, 2020). The link between education and economic growth is evident in how nations that invest in education experience higher levels of innovation, improved labor efficiency, and sustainable economic expansion.

Furthermore, the education sector in Nigeria faces several challenges that affect its ability to contribute effectively to economic growth. Poor funding, inadequate infrastructure, and policy inconsistencies have hindered the proper management of educational institutions, leading to a decline in the quality of graduates produced (Obi & Okeke, 2021). The lack of investment in research and development has also affected the nation's ability to compete in the global knowledge economy. According to Eze (2019), countries that prioritize research and innovation through well-managed educational systems experience faster economic progress compared to those that neglect knowledge-driven development.

Moreover, educational management is essential for addressing unemployment in Nigeria. A structured education system that aligns with labor market demands ensures that graduates acquire relevant skills for employment and entrepreneurship (Oladipo, 2022). When educational institutions are effectively managed, students receive training that enhances their employability and productivity in various sectors of the economy. In addition, vocational education and skills acquisition programs contribute to workforce efficiency, leading to higher economic output and reduced poverty levels.

Additionally, Nigeria’s economic growth is dependent on the ability of the education sector to produce human capital that drives industrialization and technological advancements. Countries with well-managed education systems have a higher capacity to transition from resource-based economies to knowledge-based economies (Adebayo, 2023). Improving educational management through policy reforms, funding, and infrastructural development will enhance Nigeria’s economic competitiveness in the global market.

The role of educational management in Nigeria’s economic growth cannot be overlooked. A well-structured education system produces a skilled workforce, enhances industrialization, and fosters technological innovation. Addressing challenges such as poor funding, policy inconsistencies, and skills mismatch will enable the education sector to contribute effectively to national development.

Key Components of Effective Educational Management

Effective educational management ensures that schools, colleges, and universities operate efficiently to produce skilled graduates who contribute to economic growth. Key components such as leadership, resource allocation, curriculum planning, teacher development, and

stakeholder engagement play vital roles in achieving educational excellence. Below are essential components, each discussed in detail.

Strong Leadership and Governance

Leadership is fundamental to the success of any educational institution. Effective leaders create policies, set academic goals, and ensure the smooth operation of institutions. In Nigeria, weak leadership has contributed to inefficiencies in the education sector, including mismanagement of funds, poor teacher motivation, and inadequate infrastructure. School administrators must be well-trained in management practices to ensure transparency, accountability, and efficient decision-making. Moreover, leadership should encourage participatory governance, where teachers, students, and other stakeholders contribute to decision-making processes. A well-structured leadership framework fosters an environment where academic institutions can thrive, leading to better student outcomes and economic growth (Adelakun & Ogunyemi, 2024).

Efficient Resource Allocation and Funding

Proper resource allocation ensures that schools have the necessary infrastructure, teaching materials, and trained personnel to deliver quality education. Many Nigerian institutions suffer from underfunding, leading to overcrowded classrooms, outdated curricula, and poor learning conditions. A well-managed education system requires adequate government funding, supplemented by private sector investments and alternative financing mechanisms such as grants, donations, and international partnerships. Ensuring that funds are allocated transparently and used efficiently for school development, teacher salaries, and student support programs will enhance education quality. Proper financial management practices, including regular audits and oversight committees, can prevent mismanagement and corruption in education financing (Eze & Chukwu, 2023).

Comprehensive Curriculum Planning and Development

A well-structured curriculum ensures that students receive relevant knowledge and skills for both academic and professional success. In Nigeria, outdated curricula have resulted in a skills gap between graduates and labor market needs. Effective educational management requires periodic curriculum reviews to incorporate emerging technologies, economic trends, and global best practices. Curriculum development should also involve collaboration with industry experts to ensure alignment with job market demands. Additionally, integrating critical thinking, problem-solving, and entrepreneurship into the curriculum will equip students with skills necessary for innovation and self-employment. A dynamic and industry-relevant curriculum strengthens national competitiveness and enhances workforce productivity (Okafor & Nnaji, 2024).

Teacher Training and Professional Development

Teachers play a crucial role in shaping student learning outcomes. Without well-trained educators, even the best policies and curricula will fail. Many Nigerian teachers lack access to professional development opportunities, leading to outdated teaching methods and reduced

student engagement. Effective educational management prioritizes continuous teacher training programs to enhance instructional skills, digital literacy, and subject expertise. Government agencies, universities, and private institutions should collaborate to provide certification courses, workshops, and mentorship programs for educators. Incentives such as salary increments, promotion opportunities, and research grants will motivate teachers to pursue professional growth. A skilled and motivated teaching workforce improves the quality of education and contributes to national development (Eze, 2023).

Stakeholder Engagement and Community Involvement

Education is a shared responsibility among governments, educators, parents, industries, and the community. Effective educational management fosters collaboration among all stakeholders to enhance learning outcomes. In Nigeria, weak engagement between schools and local communities has contributed to low parental involvement and limited support for educational programs. Strengthening partnerships between schools and industries ensures that students gain practical experience and job placements. Additionally, involving parents in school governance through parent-teacher associations (PTAs) enhances accountability and improves student performance. Community support, including donations, volunteer teaching, and mentorship programs, can further strengthen the education system. A participatory approach to education management enhances institutional effectiveness and ensures that learning institutions meet societal needs (Balogun & Hassan, 2024).

Integration of Technology in Education Management

Digital transformation is crucial for modern education systems. Technology enhances teaching methods, improves administrative efficiency, and expands access to learning resources. Nigerian schools face challenges such as limited internet access, inadequate digital infrastructure, and low digital literacy among educators. Effective educational management requires investment in e-learning platforms, smart classrooms, and automated school management systems. Training teachers and administrators in technology use will ensure the successful integration of digital tools in education. Government support in providing affordable internet services, digital devices, and software solutions will further enhance learning. A technology-driven education system improves knowledge dissemination and prepares students for the digital economy (Ajayi & Okonkwo, 2023).

Quality Assurance and Performance Evaluation

Monitoring and evaluation are critical to maintaining education standards. In Nigeria, poor quality control mechanisms have led to inconsistent academic performance across institutions. Effective educational management involves setting clear performance indicators for schools, teachers, and students. Regular assessments, accreditation processes, and external evaluations ensure that institutions maintain high educational standards. Establishing independent quality assurance agencies will enhance accountability and promote adherence to global education benchmarks. Additionally, incorporating student feedback, teacher appraisals, and institutional rankings will help identify areas for improvement. A strong quality assurance system strengthens

education outcomes and enhances the credibility of academic qualifications (Adeboye & Yusuf, 2024).

Inclusive Education and Equal Access to Learning

Education must be accessible to all individuals, regardless of socio-economic background, gender, or disability. Many Nigerian children, particularly in rural areas, face challenges such as lack of schools, high tuition fees, and cultural barriers. Effective educational management prioritizes inclusive policies that ensure equal learning opportunities for all students. Expanding school infrastructure in underserved regions, providing scholarships for disadvantaged students, and implementing flexible learning programs can improve access. Special education programs for individuals with disabilities should also be strengthened to ensure their full participation in academic activities. An inclusive education system maximizes human capital development and contributes to long-term economic growth (Ogundele & Balogun, 2023).

CHALLENGES IN EDUCATIONAL MANAGEMENT IN NIGERIA

Educational management in Nigeria encounters numerous obstacles that hinder the effectiveness of the education system. These challenges affect school administration, teacher performance, student learning outcomes, and overall national development. Issues such as inadequate funding, poor infrastructure, shortage of qualified teachers, policy inconsistencies, corruption, and security threats have contributed to the decline in education quality. Addressing these challenges is essential for improving the education system and ensuring its contribution to economic growth.

Inadequate Funding and Resource Allocation

One of the major challenges in educational management in Nigeria is the persistent lack of adequate funding. Many schools, colleges, and universities struggle with financial constraints, leading to dilapidated infrastructure, lack of instructional materials, and poor remuneration for teachers. The budgetary allocation to education often falls below international recommendations, making it difficult for institutions to expand and upgrade facilities. Misallocation of resources and embezzlement of educational funds further worsen the financial crisis in the sector. Without adequate investment, it is difficult to provide quality education that meets global standards.

Poor Infrastructure and Learning Facilities

Many educational institutions in Nigeria lack basic infrastructure such as classrooms, libraries, laboratories, and technological equipment. Rural schools, in particular, face severe infrastructure deficits, with students often learning in overcrowded and poorly ventilated classrooms. Inadequate laboratory facilities in science-based institutions hinder practical learning, while the absence of electricity and internet connectivity limits access to digital resources. Poor learning environments discourage student engagement and contribute to low academic performance. Improving infrastructure is critical to ensuring a conducive atmosphere for learning and skill acquisition.

Shortage of Qualified Teachers and Poor Teacher Welfare

The shortage of trained and experienced teachers poses a major threat to educational quality in Nigeria. Many schools, especially in rural areas, rely on unqualified or undertrained teachers who lack the necessary skills to deliver quality instruction. The teaching profession in Nigeria is often undervalued, leading to poor remuneration, delayed salary payments, and lack of incentives for professional development. These factors result in low teacher motivation, frequent industrial actions, and high attrition rates. Ensuring adequate teacher training, fair wages, and continuous professional development is essential for enhancing educational quality.

Policy Inconsistencies and Poor Implementation

Frequent changes in education policies without proper implementation strategies create instability in the sector. Over the years, Nigeria has introduced various educational reforms, but weak enforcement mechanisms, lack of political commitment, and insufficient funding have prevented these policies from yielding the desired results. Many reforms are initiated without thorough research, leading to policies that do not address the core challenges of the education system. Effective policy formulation and consistent implementation are necessary to ensure long-term improvements in educational management.

Corruption and Mismanagement of Educational Funds

Corruption remains a significant challenge in Nigeria's education sector. Funds allocated for school projects, teacher salaries, and student support programs are often misappropriated. Bribery in admissions, examinations, and employment within educational institutions further undermines the credibility of the system. Fraudulent practices in accreditation processes result in the proliferation of substandard institutions, lowering the value of educational qualifications. Strengthening transparency, accountability, and governance structures in education management is necessary to curb corruption and ensure resources are used effectively.

HUMAN CAPITAL DEVELOPMENT AND WORKFORCE PRODUCTIVITY

Human capital development refers to the process of improving individuals' knowledge, skills, and health to enhance their productivity and economic contribution. Education, vocational training, and healthcare investments are critical components of human capital development, directly impacting workforce productivity (Afolayan, 2022). A well-educated workforce increases a country's economic output by improving efficiency, fostering innovation, and reducing dependency on low-productivity sectors. In Nigeria, limited investment in human capital has contributed to low labor productivity, high unemployment rates, and slow economic growth. Strengthening human capital development through quality education, skill acquisition, and healthcare improvements is essential for national development (Eboh, 2021).

Besides, education plays a critical role in equipping individuals with technical and cognitive skills that enhance workplace efficiency. Workers with higher educational attainment are more likely to secure well-paying jobs, contribute effectively to industries, and adapt to evolving economic conditions (Balogun & Adeyemi, 2023). Nigeria's education system must emphasize both theoretical and practical knowledge to bridge the gap between academic learning

and labor market requirements. The country must also invest in vocational and technical education to produce skilled artisans and professionals needed for economic diversification. Without structured human capital policies, Nigeria risks maintaining a workforce that lacks the competencies required for industrial and technological advancement.

Moreover, continuous professional training and skill upgrading are necessary to keep workers competitive in a rapidly changing global economy. Many developed countries have successfully implemented lifelong learning programs that allow employees to acquire new skills relevant to emerging industries (Udeh, 2023). Nigeria must adopt similar policies by encouraging companies to invest in employee training and retraining programs. These efforts will ensure that the workforce remains adaptable, reducing job redundancy caused by technological disruptions. Additionally, improved healthcare systems contribute to workforce productivity by ensuring that employees remain healthy and active, minimizing absenteeism and workplace inefficiencies.

Human capital development is essential for boosting workforce productivity and driving economic progress in Nigeria. A well-educated, skilled, and healthy labor force enhances efficiency, fosters innovation, and contributes to long-term economic stability. Nigeria must strengthen its education, vocational training, and healthcare sectors to build a resilient workforce capable of meeting the demands of the modern economy. By prioritizing human capital investments, the country can enhance labor productivity, create more employment opportunities, and achieve sustainable economic growth.

EDUCATION AS A CATALYST FOR INNOVATION AND ENTREPRENEURSHIP

Education serves as a powerful tool for fostering innovation and entrepreneurship by equipping individuals with essential knowledge, critical thinking skills, and business acumen. A well-structured education system supports creativity and technological advancement, both of which are fundamental to economic transformation (Ajibola, 2021). In Nigeria, education can play a pivotal role in developing an entrepreneurial culture that reduces unemployment and promotes wealth creation. Many developed nations have successfully integrated entrepreneurship education into their school curricula, leading to the establishment of thriving startup ecosystems and innovative industries. Nigeria must adopt similar strategies to empower students with entrepreneurial skills that drive economic progress.

Furthermore, research-driven education fosters innovation by exposing students to new ideas, technologies, and problem-solving techniques. According to Ekanem (2020), countries that prioritize science, technology, engineering, and mathematics (STEM) education witness rapid economic development due to increased technological breakthroughs. Nigeria's higher institutions must invest more in research and development, particularly in STEM fields, to produce graduates capable of driving industrial and technological advancements. Additionally, collaboration between universities and industries is crucial for ensuring that academic research translates into practical innovations that benefit society.

Moreover, entrepreneurship education reduces dependency on traditional employment by encouraging self-employment and business creation. Entrepreneurs contribute significantly to economic development by generating employment opportunities and driving economic diversification. According to Ogunyemi (2023), small and medium enterprises (SMEs) are critical engines of economic growth, particularly in developing economies like Nigeria. Providing young entrepreneurs with access to business training, financial resources, and

mentorship programs will enhance their ability to establish successful enterprises. This, in turn, will help in addressing youth unemployment and promoting economic stability.

In addition, education fosters resilience and adaptability, two essential qualities for entrepreneurial success. A strong educational foundation enables entrepreneurs to navigate business challenges, leverage opportunities, and sustain long-term growth (Okorie, 2022). To maximize the benefits of education in entrepreneurship development, Nigeria must integrate entrepreneurship courses into all levels of schooling, provide startup funding for student-led businesses, and establish innovation hubs within universities. These measures will help create an environment conducive to business growth and economic sustainability.

Education is a key driver of innovation and entrepreneurship. A well-designed education system that emphasizes research, business training, and technological advancements will foster a culture of entrepreneurship in Nigeria. Strengthening policies that support business education, startup financing, and industry collaborations will enhance entrepreneurial success, reduce unemployment, and drive national economic growth.

REDUCTION IN UNEMPLOYMENT AND POVERTY

Education plays a fundamental role in reducing unemployment and poverty by equipping individuals with relevant skills for economic participation. A well-managed education system aligns academic programs with labor market demands, ensuring that graduates possess employable skills (Bamidele, 2020). In Nigeria, unemployment remains a pressing challenge due to skill mismatches and inadequate vocational training. Reforming the education sector to focus more on practical skills will improve job creation and economic self-sufficiency (Olawale & Ibrahim, 2023).

Likewise, expanding vocational and technical education programs can provide alternative employment pathways for young people. According to Oseni (2019), nations that invest in skill-based education experience lower unemployment rates and improved job security. In Nigeria, technical training institutes must be strengthened to equip students with market-relevant skills. Additionally, policies that provide free or subsidized education to marginalized groups can help in breaking the cycle of poverty and increasing social mobility.

Moreover, entrepreneurship education enables individuals to create self-sustaining businesses, reducing dependence on government jobs. According to Falade and Olorunfemi (2023), small and medium-sized enterprises contribute significantly to poverty alleviation and economic stability. Strengthening business education, access to microfinance, and mentorship programs will enhance the success rates of entrepreneurial ventures in Nigeria.

In addition, poverty reduction efforts must include initiatives that integrate education with social welfare programs. Ensuring that every child has access to quality education, regardless of socioeconomic background, will enhance long-term national prosperity. Nigeria must prioritize investment in educational infrastructure, teacher training, and policy frameworks that promote inclusive learning. A well-educated workforce contributes to higher national productivity, increased wages, and reduced income disparities.

Education is an essential tool for reducing unemployment and poverty. Strengthening Nigeria's vocational training system, entrepreneurship education, and policy reforms will enhance workforce readiness and improve economic stability. Prioritizing education investments will create opportunities for individuals to achieve financial security and contribute to national prosperity.

STRENGTHENING INDUSTRIAL AND TECHNOLOGICAL DEVELOPMENT

Industrial and technological developments are fundamental drivers of economic progress, as they enhance productivity, promote innovation, and create employment opportunities. A well-managed education system plays a vital role in strengthening these sectors by equipping individuals with the technical knowledge and skills necessary for industrial advancement (Adebayo & Okonkwo, 2023). Nigeria's industrial sector has long suffered from a lack of adequately trained personnel, which has limited the country's ability to compete in the global market. Strengthening technical and vocational education can bridge this gap by producing a workforce capable of supporting industrial growth and technological innovation.

Also, investment in research and development (R&D) is crucial for technological progress. Advanced economies prioritize R&D funding to foster new technologies and enhance industrial efficiency (Eze, 2022). Nigeria, however, has historically underfunded research institutions, limiting the country's ability to develop homegrown technologies. A strong linkage between universities, research centers, and industries is essential for fostering innovation. Encouraging collaborations between academia and the private sector can lead to technological breakthroughs that drive industrial expansion. Moreover, establishing policies that support industrial apprenticeships and internships will ensure that students gain practical experience, making them more valuable to employers (Nwosu, 2021).

Digital transformation plays a crucial role in industrial growth. Many developing economies have leveraged digital technologies to enhance productivity, streamline manufacturing processes, and expand market reach (Obi & Lawal, 2023). Nigeria must embrace technological advancements by integrating digital literacy and information technology training into its educational curriculum. Encouraging the use of automation, artificial intelligence, and data analytics in industries will significantly improve efficiency and global competitiveness. Moreover, developing industrial hubs that specialize in emerging technologies, such as renewable energy and biotechnology, can position Nigeria as a leader in Africa's industrial transformation.

Strengthening industrial and technological development requires targeted investments in education, research, and digital transformation. Nigeria must enhance technical and vocational training, support R&D initiatives, and foster collaboration between academia and industry. By prioritizing industrial policies that encourage innovation and technological advancements, the country can achieve sustainable economic growth and global competitiveness.

THE ROLE OF HIGHER EDUCATION IN NATIONAL ECONOMIC GROWTH

Higher education is a critical component of national economic growth, as it enhances human capital development, fosters innovation, and supports research that drives industrial progress. Universities and other higher learning institutions produce highly skilled professionals who contribute to economic productivity across various sectors (Adegbite, 2022). A well-educated population attracts foreign investments, strengthens institutions, and enhances governance, all of which are essential for sustainable development. In Nigeria, higher education has the potential to address economic challenges by producing graduates with expertise in fields such as science, technology, engineering, and mathematics (STEM), which are crucial for economic diversification.

Higher education institutions play essential roles in research and technological advancements. Many developed nations have invested significantly in university-led research, leading to groundbreaking discoveries that have transformed industries (Ogunleye, 2020). In Nigeria, however, underfunding of research and poor university-industry collaboration have limited the country's capacity for innovation. To maximize the economic benefits of higher education, the government must increase funding for research programs, establish technology incubation centers, and create incentives for private sector investment in university research. Additionally, partnerships between universities and global institutions can expose students and faculty members to cutting-edge knowledge and practices that enhance national development.

Moreover, higher education fosters entrepreneurship by equipping graduates with business management skills and financial literacy. According to Bello (2021), universities that integrate entrepreneurship education into their curricula produce graduates who are more likely to establish successful businesses. In Nigeria, where unemployment remains a major challenge, strengthening entrepreneurship training within higher education institutions can help graduates create jobs rather than rely solely on traditional employment. Supporting university-based business incubators and providing access to startup funding can further enhance this impact.

In addition, higher education institutions contribute to workforce adaptability by offering professional training and certification programs that enable workers to remain competitive in an evolving labor market. The rise of automation and artificial intelligence necessitates continuous skill upgrading, and universities must play a central role in lifelong learning initiatives (Chukwuma, 2020). Investing in flexible learning programs, such as online courses and part-time education, can ensure that Nigeria's workforce remains globally competitive.

Higher education plays an indispensable role in national economic growth. Enhancing research funding, fostering industry collaborations, and integrating entrepreneurship training will ensure that universities contribute effectively to Nigeria's economic transformation. A strong higher education system will not only produce skilled professionals but also drive technological advancements and economic resilience.

STRATEGIES FOR ENHANCING EDUCATIONAL MANAGEMENT FOR ECONOMIC GROWTH

Educational management is central in the promotion of national economic growth, because it ensures that educational institutions operate efficiently and produce a skilled workforce. Strengthening governance, improving teacher quality, increasing funding, integrating technology, and enhancing research initiatives are crucial for aligning education with economic development goals. Below are key strategies:

Strengthening Education Policy Formulation and Implementation

A well-defined and efficiently implemented policy framework ensures that education remains relevant to national economic needs. Nigeria must develop and enforce policies that promote equitable access, quality assurance, and industry-driven curriculum development. Policies should be data-driven, addressing inefficiencies such as poor teacher quality, inadequate funding, and weak governance structures. Establishing independent monitoring agencies to oversee policy implementation will enhance accountability and compliance. Furthermore, stakeholder engagement in policy formulation, including input from educators, industry leaders, and

policymakers, ensures that policies align with labor market demands. Regular policy reviews and reforms will maintain the relevance of the education sector, positioning it as a driver of economic growth (Ogunyemi & Falade, 2024).

Improving Teacher Training and Professional Development

The quality of education depends largely on the competence of teachers. In Nigeria, many educators lack access to modern teaching methodologies, limiting their ability to deliver quality instruction. To address this, continuous professional development programs should be established, focusing on innovative pedagogy, digital literacy, and subject-matter expertise. Government and private institutions should provide funding for teacher training workshops, certification programs, and postgraduate studies. Additionally, exchange programs with international educational institutions can facilitate knowledge transfer and enhance teaching standards. Providing incentives such as promotions, salary increments, and research grants will encourage teachers to engage in lifelong learning. A well-trained teaching workforce improves student learning outcomes, equipping graduates with the skills necessary for economic productivity (Adebisi & Lawal, 2023).

Expanding Technical and Vocational Education and Training (TVET)

Nigeria's economy requires a workforce skilled in various sectors, including manufacturing, technology, and agriculture. However, the traditional education system emphasizes theoretical knowledge, resulting in a mismatch between graduates' skills and labor market requirements. Expanding technical and vocational education (TVET) programs will help bridge this gap by providing students with practical, hands-on experience. Establishing partnerships between technical institutions and industries will facilitate internship opportunities, apprenticeships, and job placements. Additionally, integrating entrepreneurship education into TVET curricula will equip students with business management skills, enabling them to create self-employment opportunities. Increasing investment in vocational training centers, particularly in rural areas, will further enhance access to skill-based education, reducing youth unemployment and fostering economic diversification (Eze & Nwachukwu, 2023).

Increasing Education Funding and Infrastructure Development

Inadequate funding has contributed to poor educational infrastructure, lack of learning materials, and underpaid teachers in Nigeria. Increasing financial investment in education is crucial for improving the sector's quality and efficiency. The government should allocate a higher percentage of the national budget to education, ensuring sufficient resources for classroom expansion, laboratory upgrades, and digital learning facilities. Additionally, public-private partnerships can provide supplementary funding, supporting scholarship programs, research grants, and school renovations. Alternative financing mechanisms, such as education bonds and endowment funds, can also enhance resource availability. A well-funded education sector produces graduates equipped with the necessary skills to contribute effectively to economic development (Bamidele & Yusuf, 2024).

Integrating Digital Technology in Education

Technology-driven education enhances accessibility, efficiency, and learning outcomes. Nigeria must integrate e-learning platforms, virtual classrooms, and smart management systems to modernize its education sector. Providing digital literacy training for both students and teachers will ensure effective technology adoption. Expanding internet access and providing digital devices to underprivileged students will bridge the digital divide, enabling more individuals to access quality education. Additionally, adopting artificial intelligence (AI) and data analytics in educational management can improve administrative efficiency and student performance tracking. Investing in digital education will equip students with technological skills relevant to the modern workforce, increasing national competitiveness in the global economy (Eze, 2023).

Strengthening University-Industry Collaboration

A strong link between universities and industries is essential for aligning education with economic demands. Many Nigerian graduates struggle with unemployment due to a disconnect between academic training and labor market needs. Strengthening university-industry collaboration will facilitate curriculum adjustments to match emerging job market trends. Internship programs, industry-sponsored research projects, and joint training initiatives will provide students with real-world experience, improving their employability. Additionally, establishing innovation hubs within universities will encourage research-driven entrepreneurship, fostering job creation and technological advancements. Encouraging private-sector investment in higher education will further enhance industry-academia linkages, ensuring that graduates are adequately prepared for the workforce (Okonkwo & Ajayi, 2024).

Promoting Research and Development (R&D) in Education

Investment in research and development (R&D) fosters innovation, technological progress, and economic growth. Nigerian universities should prioritize R&D by increasing funding for research projects and promoting interdisciplinary collaborations. Establishing research centers focused on solving national challenges in areas such as energy, agriculture, and healthcare will generate solutions that drive economic advancement. Government incentives, such as tax reductions for companies investing in university research, can encourage private-sector participation in knowledge creation. Additionally, integrating research training into undergraduate and postgraduate programs will cultivate a research-oriented mindset among students, enhancing innovation and problem-solving capabilities in the workforce (Adeboye & Chukwu, 2023).

Addressing Educational Disparities and Expanding Access to Learning

Equitable access to education ensures that all individuals, regardless of socio-economic background, can contribute to national development. Expanding scholarship opportunities, implementing tuition subsidies, and developing community learning centers will improve access to education for disadvantaged populations. Special programs should also be introduced for marginalized groups, including individuals with disabilities and women in rural areas, ensuring

inclusive education. Additionally, lifelong learning initiatives, such as adult education and skills development programs, will enhance workforce adaptability and productivity. Closing educational disparities will maximize human capital development, promoting a more inclusive and sustainable economy (Ogundele & Hassan, 2023).

Reforming Curriculum to Align with Economic Trends

A curriculum that fails to reflect current economic realities limits students' ability to succeed in the job market. Regular curriculum revisions, incorporating global economic trends, digital transformation, and emerging industries, will enhance graduate employability. Modern education should emphasize problem-solving, entrepreneurship, and critical thinking, equipping students with skills applicable in various industries. Collaboration with industry experts in curriculum design will ensure that educational programs meet labor market demands. Additionally, introducing courses in artificial intelligence, cybersecurity, renewable energy, and financial technology will prepare students for future economic opportunities, enhancing national development (Okafor & Nnaji, 2023).

Strengthening Governance and Accountability in Educational Institutions

Weak governance structures and corruption have hindered the efficiency of Nigeria's education system. Strengthening transparency and accountability measures will improve institutional performance and resource utilization. Implementing merit-based recruitment, transparent financial management, and independent oversight mechanisms will enhance governance in educational institutions. Encouraging participatory decision-making, where teachers, students, and parents contribute to educational policies, will foster a more inclusive and responsive management system. Establishing an independent accreditation body to monitor compliance with educational standards will further ensure quality assurance. Strong governance structures will create a more efficient and result-oriented education sector, supporting national economic growth.

CONCLUSION

The study examined educational management and economic growth in Nigeria, emphasizing the role of effective administration in fostering human capital development, workforce productivity, and national progress. A well-managed education system enhances innovation, entrepreneurship, and industrial growth, contributing to sustainable economic advancement. However, challenges such as inadequate funding, poor infrastructure, policy inconsistencies, corruption, and security threats continue to hinder the sector's full potential. Addressing these challenges requires strategic reforms, including increased investment, curriculum improvements, teacher training, technology integration, and stronger industry-academia collaboration. Strengthening governance and accountability within the education system will ensure that educational institutions operate efficiently, producing graduates equipped with the necessary skills for economic development. Prioritizing education management reforms is essential for Nigeria's long-term economic prosperity, as a well-educated and highly skilled workforce remains the foundation of national growth and global competitiveness.

Suggestions for Stakeholders

To enhance educational management for economic growth in Nigeria, various stakeholders must take proactive measures to address existing challenges and improve the efficiency of the education system:

- Government should increase budgetary allocation to education to meet international standards and ensure proper funding of schools, teacher salaries, and infrastructure.
- The ministry of Education should ensure transparent and accountable disbursement of funds to prevent mismanagement and corruption
- Government should develop and implement consistent education policies that align with national economic goals.
- Educational Institutions should adopt modern management practices to improve administrative efficiency and service delivery.

EFFECTIVENESS OF REMUNERATION ON EMPLOYEE MOTIVATION AND PRODUCTIVITY: CASE STUDY OF IMO STATE UNIVERSITY, OWERRI

Esther Onyinyechi IHEMEJE
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTARCT

This study investigated the effectiveness of remuneration on the motivation level and productivity of employees of Imo State University, Owerri. The study adopted the descriptive survey research design. Two research questions were raised and two hypotheses were formulated to guide the study. The population of the study consisted of all 1300 staff of Imo State University, Owerri which comprises of 560 teaching staff and 740 non-teaching staff. The sample size of 260 staff (112 teaching and 148 non-teaching) was selected using proportionate stratified simple random sampling technique. Data was collected using a researcher-designed questionnaire titled Effectiveness of Remuneration on Employee Motivation and Productivity (EREMPQ). Test-retest method was used to test the reliability of the instrument and the reliability index of 0.81 and 0.80 were gotten using Cronbach Alpha. Out of the 260 questionnaires distributed, 244 were successfully retrieved, representing a 93.85% response rate. Standard deviation and mean were used to answer the research questions while the hypothesis was tested using t-test at a 0.05 level of significance. The study found out that although the workers hard work was acknowledged by there immediate superior, they do not receive sponsorship for conference attendance and also lacks motivation for job performance and job satisfaction. In addition, the respondents acknowledged that though employees on the same rank receive equal salary, there is no reward package for hard work and their salary arrears and promotion do not come as at when due. Furthermore, the study found out that there were significant difference between remuneration and the motivation level as well as productivity of the employees. The study concluded that the employees of Imo State University, Owerri although receive equal salary for same rank they are not motivated enough through conference sponsorship and other reward mechanisms. And productivity is not encouraged via incentives, recognition of hard work, salary arrears payment and promotion. The study recommends that Universities' management should collaborate with government to create an equal pleasant, encouraging, rewarding and supportive work environment that motivates employees in addition to ensuring the payment of salary arrears, recognition of hard work and early promotion of employees to enhance productivity which in turn drive the achievement of educational goals.

Keywords: Effectiveness, Remuneration, Employee Motivation, Productivity, Case Study, Imo State University, Owerri.

INTRODUCTION

In an era marked by rapid changes within working environments and an increase in organizational challenges, the interaction between employee remuneration, motivation, and productivity remains a topic of ongoing academic research and public policy discourse. Companies across various industries recognize that employees represent their strongest asset; as a result, the level of employee performance and devotion to organizational achievement is directly influenced by compensation practices. Well-designed compensation systems serve not just as a monetary compensation for work provided, yet as well as a means to increase employee motivation and overall productivity.

In today's competitive business environment, institutions and organizations never stop searching for innovative mechanisms to enhance the motivation and productivity of employees. One of the fundamental driving forces that have gained a lot of popularity in the last decade is remuneration. Remuneration refers to the total pay and benefits an employee will receive in exchange for his work, including salary, wages, bonuses, incentives and other forms of monetary and non-monetary rewards. Remuneration involves salary, benefits and incentives, and is a critical component of an organization's reward system. It plays a significant role in influencing employees' attitudes, behavior, and overall performance. Remuneration is a key driver of motivating employees this is because remuneration has the capability to stimulate workers' performance as well as encourage them to work better in the organization.

Motivation is a psychological process which impacts the will, energy, and commitment of an individual toward engaging in and sustaining a given activity or task. One consideration that drives managers to be keen on motivation and control is that they understand employees and motivation form the center for making an organization effective and efficient. Motivation is among the qualities that are required in a bid to achieve tangible things in life and, in its absence, an individual quits too soon at the slightest sign of a problem (Valez, 2008). The more content administrative staff are with work, the more efficient they will be, and the healthier they will be physically, emotionally, socially and academically. This can only be attained if the necessary motivational elements leading to enhanced job performance and satisfaction are in place. A motivated employee is one who is not only satisfied with his or her work but is enabled to perform better and grow in the organization. Administrative staffs get satisfied and more dedicated to their career as a teacher when they are motivated. It eventually leads to or supports the accomplishment of academic aims and objectives.

The productivity at work of employees in the education sector in most places has raised professionals' concern and even members of the public. Parts of these concerns are negative and mainly affect the performance of both the employees and students/graduates. Employee productivity is an estimation of the quality and quantity of work that a worker does considering the cost of resources consumed. The greater the level of organizational productivity, the greater the competitive advantage of the organization. A failure by an institution to ensure that its employees are motivated by effective human resource practices, hinders its institutional efficiency and effectiveness and thus affect employee's levels of productivity vis-a-vis set goals.

The university sector is no exception to the pressures that face other sectors and industries. Universities are increasingly coming under pressure to become more effective and efficient, and to demonstrate their value to stakeholders. Here, remuneration is increasingly becoming an important factor in determining employee productivity and motivation. Remuneration is not just a key driver of employee motivation and productivity, but also a factor

in job satisfaction and organizational commitment. Research has shown that employees who receive competitive remuneration packages are more likely to be satisfied with their jobs and committed to their organizations. Although much research has been done on the topic, not much exists in terms of researching the linkage between remuneration and employees' productivity and motivation within a university setting. Universities are separate organizations with numerous employees, some being academics, some administrators, and others supporting staff. The remuneration packages of employees working in universities often are complex, multi-dimensional, encompassing not only material benefits but even the intangible kind in the form of training and research opportunities.

The significance of remuneration in the workplace cannot be overstated. It serves as a primary motivator, driving employees to exert effort, achieve goals, and contribute to organizational success. A well-designed remuneration package can foster a positive work environment, promote job satisfaction, and encourage employees to go above and beyond their duties. Conversely, inadequate or unfair remuneration can lead to decreased motivation, lower productivity, and increased turnover rates. In spite of the acknowledgement of remuneration as a basic driver of motivation and productivity, many companies, particularly in developing countries like Nigeria, experience challenges that range from disparities in compensation structures, delayed payment of salaries, and poor provision of benefits. Such challenges often translate to employee dissatisfaction, low morale, and low productivity, as highlighted by Nzeadibe and Akpa (2021). Self-motivated employees are needed in our changing working conditions like universities as they are productive and help organizations be sustainable. In this study, an effort is made to find out the role of remuneration on employee motivation and productivity of Imo State University staffs.

Statement of the Problem

Nigeria's education system provides a poignant example of challenges of compensation structures. While the wide impact of remuneration on employee attitude and performance is well acknowledged, many universities, particularly those in developing economies, face issues with unfair compensation systems, late payments, and poor perks. Such issues not just hamper employee motivation but also impact institutional productivity and competitiveness in a detrimental way. In addition, a lack of fairness and transparency in remuneration practices is often a trigger of employee discontent. Employees' perceptions of unequal remuneration systems can translate into a lack of motivation, poor performance, and, in extreme situations, industrial unrest. This is especially relevant in the Nigerian university setting, where differences in remuneration of employees from private, federal and state universities tend to create tension and unrest.

Most researches prove that both private and public universities in Nigeria experience ongoing challenges resulting from inefficacy in remuneration structures, which manifest in terms of demotivation, disenchantment, and high staff turnover rates. As significant an impact as remuneration has on workers' behavior and institutional outcomes, it is important to have an in-depth scrutiny of its effectiveness in stimulating employee motivation and boosting productivity. It is in this context that the present study aims to investigate the link between remuneration, motivation, and productivity of employees from Imo State University, Owerri.

Aim and Objectives of the Study

The main aim of this study is to find out the effectiveness of remuneration on employee motivation and productivity in Imo State University Owerri. Specifically, the study tends to:

- To assess the effect of remuneration on the motivation level of the employee of Imo State University Owerri.
- To assess the effect of remuneration in enhancing the productivity of the employee of Imo State University, Owerri.

Research Questions

The following research questions were raised to guide the study:

- To what extent does remuneration received affect the motivation level of Imo State University employees?
- To what extent does remuneration received enhance the productivity of Imo State University employees?

Hypotheses

The following null hypotheses tested at 0.05 level of significance were formulated to guide the study:

- There is no significant difference in the mean ratings of teaching and non-teaching employees of Imo State University on the effect of remuneration received on employee motivation.
- There is no significant difference in the mean ratings of teaching and non-teaching employees of Imo State University on the extent remuneration received enhances employee productivity.

CONCEPTUALIZATION

Remuneration is the total compensation and rewards received by an employee for his/her work in the form of salary, wages, bonuses, incentives and other monetary and non-monetary incentives. It is meant to motivate and compensate employees for their performance, ability and work as well as to recognize their value to the firm. To Ojeleye et al. (2016), remuneration consists of tangible and intangible rewards, which can be stated in the forms of salaries, bonuses, profit-sharing, medical allowances, and other rewards. These rewards are separate and not rolled into basic pay. Examples of these include monetary rewards, bonuses, and awards. A good remuneration system not only recruits talented employees but also retains them and motivates them to work at their best (Ahmed et al., 2017). To this end, it emphasizes the two-fold function of remuneration as both an economic necessity and psychological motivation. Remuneration is among the roles of human resource management that deals with all types of compensation and rewards that workers acquire for executing organizational delegated duties with a desired end

result of an employee being attracted to work, satisfied, and willing to work hard for the employer (Adeniji & Heirsmac, 2014).

Remuneration has also been referred to as direct and indirect compensation given to the employees of an organization that assists in achieving employee satisfaction and retention, and improving employee productivity (Adeoye 2014). Remuneration has been explained by Akpa et al. (2016) as payment or reward that is given to individuals for work. He also established the remuneration indicators to comprise: basic salary, wages, health schemes, pension schemes, transport allowances, overtime allowances, and responsibility allowances. Several definitions have been created of salaries, wages, bonus and incentives usually to mark the differences that exist between both terms.

According to Braton & Gold, (2003) basic pay is a recurring periodical fixed amount of pay for non-manual employees typically in annual figures, paid monthly with typically no productivity additions. Wage is pay to manual employees, always hourly or piece rate. Achilike (2017) also outlined salary as a fixed sum of money paid to the employees at regular intervals for their performance and productivity whereas wages are compensation paid on an hourly basis to the workers for the work done in a day. He also asserted that whereas salaried people are usually said to be doing "white collar office work" i.e., a person is well educated, trained and is employed with some company and has a good status in the society, while the waged person are said to be doing "blue collar labour job" i.e., a person is employed in the unskilled or semi-skilled profession and is getting wages on a daily basis. Chiekezie et al. (2016) defined bonus as additional compensation given to an employee above and beyond his/her base pay. Bonus may be used as a reward for achieving specific goals set by the business, or for dedication to the business.

According to Heathfield (2016), bonus pay is compensation above the amount of compensation expressed as a base rate or hourly wage of compensation. Minimum amount of compensation is stated in the offer letter to an employee, the employee personnel file, or a contract. Bonus pay can be paid indiscriminately by employers where the company can afford to pay a bonus, or bonus pay can be fixed by contract. In the view of Attiogbe and Quartey (2013), a bonus is payment that is retrospective and usually discretionary or at least not expected by the employee(s). A decision is taken to pay it to one, a group or all employees, on management-set criteria to reward past success, e.g., making a predetermined profit or some important milestones in the organization's history, or in an entirely discretionary manner but defined an incentive as a strategy which is future-oriented.

Payment is linked with the achievement of specific goals which are already predetermined and communicated to the employees participating in the plan. The scheme of incentive intends to influence behavior towards the achievement of the goals by providing an incentive to strive towards the accomplishment of the goals. she continued to explain that incentive can be paid in money or in non-monetary reward, for example, some gifts or travel (especially for sales). The reward scheme is non-discretionary: if the initial, agreed goals are reached, the award or payment is made. One of the merits of remuneration highlighted by Ahmed, Nabi and Rahman (2017) is its potential to aid in retaining experienced staff as well as improve the efficiency of the firm.

In addition, Karia and Omari (2015) understood the advantages of remuneration to include avoiding the level of absenteeism from employees because once employees are goodly remunerated and well compensated, then their passion and vigor to turn up at the workplace regularly will be increased in place of lagging behind home, or waste time at work. Similarly, it

helps in meeting the financial and non-financial needs of the employees and this is a motivation to them since a good paid employee will be willing to act as wished. It also removes employees from certain fears and anxieties and also enable the employees to work with a calm mind as well as increasing their level of confidence. It also facilitates employees' job satisfaction and, as a result, lowers the turnover rate. Even though there are tremendous benefits of remuneration, there are some drawbacks which most of the time affect employee performance.

Tetteh (2014) in his study found that the main issues with remuneration or employees' compensation stems from three determinants which include fairness, controllability, and transparency. According to Tetteh, (2014), employees should be in a position to see compensation as fair. If an employee can see that this principle of fairness has failed to be fair, there are chances that his motivation to work will be lower hence leading to adverse consequences. Another factor is the factor of transparency. Whether a compensation package is seen as transparent or not will be reliant on how the communication is being done. An open system not only informs the employees who would not prefer taking risk about the control of the compensation, it helps in informing employees well about the goals of the organization. The rules if they are made known to such staff, then it will help them know how the system works and give room for the enforcement of the remuneration. Tetteh (2014) considers controllability as the extent to which the employee has control or input on the outcomes. The effect of a stipulated amount should alter at the lowest value as little as possible to be in a position to exercise such control over one's reward. Compensation is thus setting emphasis on adequate compensation of employees reasonably, openly as well as controllably.

Motivation is a psychological process that influences the will, effort and determination of an individual to do and continue with a given activity or task. It is the internal or external forces that initiate, direct and propel an individual's action towards the achievement of a planned goal or objective. Motivation is among the characteristics required in order to achieve tangible things in life, and without it, one will give up too soon at any sign of adversity (Valez, 2008). For maintaining equity in the Nigerian University culture, fundamental changes will be necessitated in the academic and administrative staff. Nigerian universities need to shift towards more businesses such as governance and management.

Cory (2006) in Idemobi (2010) stated that in management, employee motivation is explained by the equity theory of employee motivation in explaining the relationship between how fairly an employee feels that he/she is being treated and how hard he/she would work. The equity structure in the workplace is on the ratio of inputs to outcomes. The perception is that individuals appreciate fair treatment which leads them to be motivated to ensure that the fairness is sustained in the relationships of their colleagues and the organization. A motivated worker is one who not only feels contented with his or her work but is empowered to pursue excellence and development in the organization. When administrative staff are motivated, they become happier and more engaged in their task of teaching. It finally leads to or promotes the accomplishment of educational goals and objectives. Administrative staff will work more effectively if they are very satisfied with their job, and they will be healthier in body, feelings, socially, and academically as well. This is only possible if the necessary motivational factors that drive job performance and job satisfaction are present.

Motivational factors are those areas of work which make the academic personnel want to perform the duties. They help to drive, stimulate, direct, channel, guide, energize, provoke, sustain and shape the behavior of the staff towards seeking excellence. They also make academic personnel more persistent and enhance their degree of persistence in the process of teaching-

learning for the achievement of university educational goals and objectives. Rawsthorne and Elliot (2000), Sansone, and Harackiewiz (2000) are of the opinion that motivational factors (intrinsic motivation) make employees persist, work harder and produce outputs of better quality. For administrative staff to be committed to their vocation, government and university authorities need to attempt to keep them in the profession by motivating them. Although there is a positive relationship between work behaviour and work performance. It is moderated by the use of motivational factors and the nature of employees' attitude towards their vocation.

Productivity refers to the efficiency and effectiveness with which an individual or an organization is able to make use of resources, i.e., time, labour and material to produce goods or services. It is typically measured by the quantity and quality of output produced within a given span of time and is often used as a key performance indicator to evaluate a person's or organizations performance. Employee productivity refers to the performance or effectiveness of an employee or employees. Productivity is a figure or computation which falls between inputs and outputs. Inputs refer to the volume of resources like human resources, financial resources, physical, time, technology and effort put in working in the company, while outputs refer to the result. In case the inputs are equal to the outputs, then the employee is productive.

Employee productivity is a quantification of the efficiency of an employee or group of employees (Akpotu & Nwadiana 2003). Akpua et al. (2019) posits that productivity can be quantified in terms of the amount of work an employee does in a specified period of time. Generally, the productivity of a specific employee will be contrasted with an average for employees doing the same type of work. Since much of the success of any organization depend on the productivity of workers, worker productivity is one aspect that business firms should mind. Anyadike (2013) surmises that productivity is healthy for organizations because it reflects on how effectively resources are mixed within organization and devoted to the production of a preset result. It is realizing maximum performance with least use of resources. Employee productivity, as per Anis, et al., (2015), refers to output as a unit of input, i.e., output of manufacturing by labor hours. They explained that employee productivity, at the workplace level, relies on various factors like technology and market forces, including the input of an individual worker. George (2006) considered that an employee's performance would be a direct contributor to the extent of effectiveness, efficiency, and even organizational goal attainment of an organization.

It also considered that a failure by an organization to confirm that it is motivating its employees through appropriate human resource practices negatively affects its organizational effectiveness and efficiency and hence affect employee's productivity levels against expected goals. Productivity can be quantified in terms of quality, quantity, time and cost. He also added that measuring productivity must be related to how long it will take the average worker to produce a given amount of output. Although productivity may be difficult to quantify, it is nonetheless very vital because productivity has a direct influence on profitability within an organization (Ajalie, 2017). Ajalie (2017) claims that when employees are productive, they get more work done within a span of time. Through this, efficiency saves their company time and money. Conversely, when employees are not productive, they take a longer time to complete a project, which wasted employers' money due to the loss of time. The researcher considers employee productivity as the measure of the quality and quantity of work done by an employee compared to available resources allocated to him.

EFFECTIVE REMUNERATION: A CATALYST FOR STAFF MOTIVATION AND PRODUCTIVITY

Remuneration, encompassing salary, benefits, and incentives, is a vital component of an organization's reward system. A well-designed remuneration package can significantly enhance staff motivation and productivity, ultimately contributing to organizational success. This discussion explores several ways by which effective remuneration can boost staff motivation and productivity;

Motivation through Incentives (bonus)

Incentives such as bonus, commission, and profit-sharing plans can motivate employees to work hard and achieve organizational goals. Expectancy Theory (Vroom, 1964) in Chiekezie (2016) says that employees are motivated if they anticipate that their effort will produce the desired consequences (incentives). Empirical evidence has consistently shown that incentives enhance employee motivation and productivity. Bonus as additional payment given to an employee above and beyond his/her regular pay. A bonus may be an extra payment for the achievement of company-established objectives, or for the company's loyalty. According to Heathfield (2016) bonus pay is compensation above that amount specified as a base salary or an hourly rate of compensation. The base level of compensation is recorded in the employee offer letter, in the employee personnel file, or in a contract. Bonus pay may be given randomly by the employer as the firm has the capability to award a bonus pay, or the bonus pay may be measured by contact. To get the best out of employees, there is a need for some level of motivation over and above the monthly salary. Incentive is a plan that is future-oriented. The process acts as compensation in lieu of the achievement of set goals conveyed to the staff on the scheme. The goal of the incentive scheme is to influence behaviour towards goal accomplishment through the provision of an incentive to work towards the goals. Incentive can be compensated in money or in non-money award, eg., some gifts or travel (especially for sales). The incentive scheme is not at the discretion of anyone: if the initial, negotiated targets are met, the payment or award is earned.

Remuneration, as stipulated by Nzeadibe and Akpa (2021), is the cash and non-cash compensation offered by an employer in exchange for services performed by an employee. It may be financial reward which means any money reward that exceeds plain pay. These incentives are extra and are not part of base pay. Examples include cash rewards, bonuses, and awards. Compensation can be described as direct and indirect payment given to the workers of an organization that is designed to achieve employee satisfaction and retention and improve employee productivity (Adenij, Heirsmac, Hezekiah, & Osibanjo, 2014). For the maximum motivational impact of incentives, organizations have to make sure that they are:

- Clearly communicated and well understood by the employees
- Aligning with organizational objectives and goals
- Openly and fairly administered
- Continuously reviewed and modified to cater to changing organizational need

Fairness and Equity

Equity is a ratio between workers' job inputs (effort or ability) and job rewards (remuneration or promotion). People experience the equity of rewards in relation to the rewards received by others for equal input or to some other effort reward ratio that befalls them (Chiekezie et al., 2009). It involves feelings, perceptions and comparative process. Feelings of equity and fairness in compensation can have a significant impact on employee motivation. Equity theory was developed in 1963 by John Stacey Adams, while working as a research psychologist for the General Electric Company in Crotonuille, New York. He developed and tested an equity theory of motivation. According to Equity Theory (Adams, 1963) in Chiekezie (2016), employees compare what they are earning with what they are contributing (effort, ability, experience) and to what others are earning. Equity theory of motivation is used to describe the relationship between the perception of the employee that he/she is being treated equally and the effort he/she is being motivated to work. When employees believe that their pay is equitable and equal, they are likely to be more motivated and contented with their work. Perceived injustice, however, results in decreased motivation, lower productivity, and turnover.

Tetteh (2014) in his study discovered that the main issues with remuneration or compensation of employees are based on three factors which are fairness, controllability and transparency. According to Tetteh, (2014), employees should be able to view remuneration as fair. When an employee realizes that this principle of fairness hasn't been fair, the likelihood of their willingness to act is decreased thereby leading to adverse effects. Another subject is the subject of transparency. The extent to which a remuneration package is viewed to be transparent will be influenced by how it is communicated. A transparent system not only informs the employees who would not want to take risks about the rules of compensation, it will make sure that employees receive well educated on the organizational goals. The rules if well communicated to these employees, it will be easy for them to know how the system works and give a proper environment to help in the application of the remuneration.

Employees perception of how they are treated by their companies matters most to them. The phrase "a fair day work for a fair pay" is a sense of justice perceived by employees. If employees perceive inequity, then this can contribute to decreased productivity, high absenteeism or increased turnover. Organizations can ensure justice and equity in terms of compensation by conducting regular market surveys, having transparent compensation policies, fairness by employees in appraisal and promotion and providing scope for employee grievance and appeal.

Recognition and Rewards

Recognition and rewards can motivate employees by acknowledging and valuing their contributions. Employees are more likely to exert effort and demonstrate loyalty when they feel valued and appreciated by their organization. Research has shown that recognition and rewards can enhance employee motivation, job satisfaction, and productivity (Nzeadibe and Akpa 2021). Gerhart, Minkoff & Olsen (1995) in Ojeleye (2017) reinforcement theory states that a response followed by a reward is more likely to reoccur in the future (Thorndike's Law of Effect). Aswathappa (2007) asserted that a behaviour which is a rewarding experience is likely to be repeated. The implication for remuneration is that high employee performance followed by monetary reward will make future employees' performance more likely. Buchan et al (2000)

suggest that behaviour can be modified if individuals receive the reward at the time they exhibit the desired behaviours. An important assumption in this theory is that rewards can become an acquired right if they are delivered on a regular basis.
Organizations can implement recognition and rewards programs that:

- Acknowledge and reward employees' achievements and contributions
- Provide opportunities for employee feedback and suggestions
- Foster a culture of appreciation and gratitude

Job Satisfaction and Engagement

Remuneration can influence job satisfaction and engagement, which in turn can impact employee motivation and productivity. According to the Job Characteristics Model (Hackman & Oldham, 1976) in in Ojeleye (2017), employees are more likely to experience job satisfaction and engagement when their jobs provide autonomy, feedback, and opportunities for growth and development. Research has shown that job satisfaction and engagement are positively correlated with employee motivation and productivity (e.g Chiekezie et al. 2009). According to Nzeadibe and Akpa (2021), remuneration helps in meeting employees financial and non-financial needs which in turn serves as motivation to them since a well remunerated employee is more likely to be motivated to act in the desired way. It also gets rid of certain fears and anxieties from employees as well as enables them to work with a relaxed mind as well as increasing their self-confidence. This brings about employees' job satisfaction and in turn, lowers the rate of turnover.

A motivated employee is one who not only feels satisfied with his or her job but is empowered to strive for excellence and growth in the organization. When administrative staffs are motivated, they become satisfied and more committed to their job. It eventually leads to or contributes positively to the attainment of stated goals and objectives. The more satisfied administrative staffs are with their job, the more productive they will be, and the healthier they will be physically, emotionally, socially and academically. This is only possible if the necessary motivational factors that enhance job performance and satisfaction are in place. Motivational factors are those aspects of the job that make staff want to perform the duties. They help to propel, stimulate, channel, direct, energize, arouse, sustain and influence the staffs' behaviour towards striving for excellence. Organizations can design remuneration packages that promote job satisfaction and engagement by:

- Providing competitive salaries and benefits
- Offering opportunities for growth and development
- Fostering a positive work environment and culture

Work-Life Balance

Remuneration can also influence work-life balance, which can impact employee motivation and productivity. According to the Work-Life Balance Model (Greenhaus & Allen, 2010) in Allen et al., (2012), employees are more likely to experience work-life balance when their work demands are compatible with their family and personal responsibilities. Research has shown that work-life balance is positively correlated with employee motivation, job satisfaction, and productivity

(e.g., Allen et al., 2012; Carlson et al., 2011). Organizations can design remuneration packages that promote work-life balance by:

- Offering flexible work arrangements (e.g., telecommuting, flexible hours)
- Providing family-friendly benefits (e.g., parental leave, childcare assistance)
- Encouraging employees to take breaks and use vacation time

A study by Allen et al. (2012) found that employees who reported higher levels of work-life balance also reported higher levels of motivation and job satisfaction.

Employee Well-being

Remuneration can also influence employee well-being. A well-designed remuneration package can significantly enhance employee well-being, ultimately contributing to organizational success. This discussion explores the ways in which remuneration can positively impact employee well-being.

Financial Security

Remuneration provides employees with a sense of financial security, which is essential for their overall well-being. According to Maslow's Hierarchy of Needs (1943) in Ojeleye (2017), financial security is a basic physiological need that must be met before higher-level needs can be pursued. This buttress the fact that one purpose of a person as an employee of a company is to earn income in the form of wages or compensation. According to Ojeleye (2017), for many Nigerian employees, wages or salaries are highly critical issues. They are decisive because without them in sufficient quantities, life becomes extremely precarious for the worker and members of his/her family. As direct financial rewards, wages and salaries are the most emphasized by the employees, thus they sort of take a centre stage in the scheme of things as far as rewards for work is concerned. Remuneration and compensation not only increase the zeal and enthusiasm of employees but also helps in meeting employees financial and non-financial needs which in turn serves as motivation to them since a well remunerated employee is more likely to be motivated to act in the desired way (Ojeleye 2017).

Reduced Stress/Anxiety

Remuneration can also reduce stress and anxiety related to financial insecurity. According to the Job Demands-Resources Model (Demerouti & Bakker, 2011) in Nzeadibe and Akpa (2021), employees who experience high levels of stress and anxiety are more likely to experience burnout and decreased well-being. An employee under stress/anxiety will definitely underperform. The anxiety can come in the form of family challenges which are monetary. Remuneration gets rid of certain fears and anxieties as well as enables the employees to work with a relaxed mind as well as increases their self-confidence. It also brings about employees' job satisfaction and in turn, lowers the rate of turnover (Ojeleye 2017).

Opportunities for Growth and Development

Remuneration can also provide employees with opportunities for growth and development. According to the Job Characteristics Model (Hackman & Oldham, 1976) in Allen et al. (2012), employees who experience high levels of growth and development opportunities are more likely to experience overall well-being. All other resources that an organization needs for succeed except human beings as employees are non-living. Employees make use of these resources to generate output without them other resources will be useless, dormant and will not produce anything. Therefore, human resource is the greatest asset any organization can have and should be given the highest priority especially as it concerns growth and development of relevant skills. According to Chiekezie (2016), a motivated employee is one who not only feels satisfied with his or her job but is empowered to strive for excellence and growth in the organization. Research has shown that remuneration can provide employees with opportunities for growth and development by providing them with the financial resources needed to pursue training and development opportunities for relevant skills.

METHODOLOGY

This study adopted a descriptive survey research design, which is used to identify and describe variables within a given population at the time of the study. Descriptive design is deemed appropriate as it was used to find out (identify) and describe how effective remuneration affects employee motivation and productivity.

The population comprised all 1300 staff of Imo State University, Owerri which includes 560 teaching staff and 740 non-teaching staff. This was sourced from the personnel unit of Imo State University, Owerri.

The sample size of 260 staff (112 teaching and 148 non-teaching) was selected using proportionate stratified simple random sampling technique. Data was collected using a researcher-designed questionnaire titled Effectiveness of Remuneration on Employee Motivation and Productivity (EREMPQ). The instrument was divided into two sections:

- Section A: Bio data of the respondents
- Section B: Contained 10 items grouped into clusters based on the research questions of the study.

A modified four-point Likert scale was used to structure responses of the questionnaire:

- Very High Extent (VHE) – 4
- High Extent (HE) -3
- Low Extent (LE) – 2
- Very Low Extent (VLE) – 1

Face and content validation of the questionnaire was carried out by three experts. The essence of the face validation is to ensure that the instrument, visually appropriate for respondents and free from error while the content validation confirmed the questionnaire items were relevant and accurately measured the intended variables, ensure comprehensive coverage of the content scope of the study. The test-retest method was used to determine the reliability of the instrument. Twenty lecturers from Alvan Ikoku University of Education Owerri were issued twenty copies of the questionnaire. The reliability index was 0.81 and 0.80 using Cronbach Alpha. Out of the 260 questionnaires distributed, 244 were successfully retrieved, representing a 93.85% response rate.

Standard deviation and mean were used to answer the research questions while the hypothesis was tested using t-test at a 0.05 level of significance.

RESULT

Answers to the Research Questions

Research Question One: To what extent does remuneration received affect the motivation of Imo State University employees?

Table 1: Mean ratings and standard deviation on the extent remuneration received affects the motivation level of Imo State University employees.

s/n	Items	Teaching		Non-teaching		Average	Decision
		Mean1	SD	Mean2	SD	1&2	
1.	Your employer usually sponsors your conference as a way of motivation	2.14	0.74	2.06	0.78	2.10	Low Extent
2.	Your hard work is being acknowledged by your immediate superior.	2.53	0.88	2.57	0.89	2.55	High Extent
3.	The level of motivation received in your institution increases your performance at work	1.87	0.95	1.83	0.91	1.85	Low Extent
4.	Motivation is very important in your organization as far as job performance is a concern	3.08	0.92	3.06	0.94	3.07	High Extent
5.	The motivation level at work is felt by your family members at home.	2.60	0.86	2.58	0.89	2.59	Low Extent
	Grand Mean	**2.44**	**0.87**	**2.42**	**0.88**	**2.43**	**Low Extent**

Table 1 shows the mean ratings of teaching and non-teaching employees on the extent remuneration received affects their motivational level as Imo State University staffs. Five items (Items 1-5) were analyzed against a criterion mean of 2.50. As shown in the table, both teaching and non-teaching employees agreed to a low extent that their employer usually sponsor their conference as a way of motivation and also that the level of motivation received in their institution increases their performance at work. This is revealed by the mean values recorded by items 1 and 3 which are 2.10 and 1.85 respectively and are below the criterion mean of 2.50. On the other hand, the teaching and non-teaching staffs both to a high extent agreed that; their hard work is being acknowledged by their immediate superior, motivation is very important in their organization as far as job performance is concerned and the motivation level at work is felt by their family members at home. This is because the mean set scores of 2.55, 3.07 and 2.59 for items 2, 4 and 5 respectively were above the criterion mean of 2.50. On the overall, the grand mean of 2.43 revealed that to the teaching and non-teaching employees of Imo State University the remuneration they received does not motivate them.

Research Question Two: To what extent does remuneration received enhance the productivity of Imo State University employees?

Table 2: Mean ratings and standard deviation on the extent remuneration received enhances the productivity of Imo State University employees

s/n	Items	Teaching		Non-teaching		Average	Decision
		Mean1	SD	Mean2	SD	1&2	
6.	You are being paid the same salary with those in the same rank with you.	3.45	0.98	3.43	0.80	3.44	High Extent
7.	There is reward package organized for working harder in your institution.	1.92	0.87	1.96	0.84	1.94	Low Extent
8.	You receive your salary arrears as at when due.	2.04	0.96	2.00	0.92	2.02	Low Extent
9.	Your promotion comes as long as you are qualified.	1.99	0.98	1.95	0.95	1.97	Low Extent
10.	The incentives you receive propel you to be productive.	2.16	0.89	2.10	0.92	2.13	Low Extent
	Grand Mean	**2.31**	**0.94**	**2.29**	**0.89**	**2.30**	**Low Extent**

Data in Table 2 revealed the mean ratings on the extent remuneration enhances the productivity of teaching and non-teaching employees of Imo State University. The mean score of item 6 shows that both teaching and non- teaching employees agreed to high extent that they are being paid the same salary with those in the same rank with them. This is so because item 6 has the mean score of 3.44 which is higher than the criterion mean of 2.50. Meanwhile the teaching and non-teaching employees both to a low extent agreed that; there is reward package organized for working harder in their institution, they receive their salary arears as at when due, their promotions come as long as they are qualified and also that the incentives they receive propels them to be productive. This is revealed by the mean scores of items 7, 8, 9 and 10 which includes 1.94, 2.02, 1.97 and 2.13 respectively. Furthermore, the grand mean of 2.30 shows that to a low extent remuneration received does not enhance the productivity of the teaching and non-teaching staffs on Imo State University, Owerri.

Test of Hypotheses

Hypothesis One: There is no significant difference in the mean ratings of teaching and non-teaching employees of Imo State University on the extent remuneration received affects their motivational level.

Table 3: Summary of t-test analysis of mean ratings of teaching and non-teaching employees of Imo State University on the extent remuneration received affects their motivational level.

Groups	N	Mean	SD	DF	t-cal.	t-tab	Decision
Teaching	105	2.44	0.87	243	1.24	1.96	Rejected
Non-teaching	139	2.42	0.88				
Total	**244**						

Table 4 shows the summary of mean, standard deviation and t-test showing the difference between the mean ratings of teaching and non-teaching employees of Imo State University on the extent remuneration received affects their motivational level. The t-calculated value after testing

the hypothesis stood at 1.24 while the t-tabulated stood at 1.96 at 0.05 level of significance using 243 degrees of freedom. Since t-calculated is less than the t-calculated, the null hypothesis that states that there is no significance difference between the mean ratings of teaching and non-teaching employees on the extent remuneration received affects their motivational level is rejected.

Hypothesis Two: There is no significant difference in the mean ratings of teaching and non-teaching employees of Imo State University on the extent remuneration received enhances employee productivity.

Table 4: Summary of t-test analysis of mean ratings of teaching and non-teaching employees of Imo State University on the extent remuneration received enhances employee productivity

Groups	N	Mean	SD	DF	t-cal.	t-tab	Decision
Teaching	105	2.31	0.94	243	1.39	1.96	Rejected
Non-teaching	139	2.30	0.89				
Total	**244**						

Table 4 shows the output of the t-test conducted to determine whether there is significant difference in the mean ratings of teaching and non-teaching employees of Imo State University on the extent remuneration received enhances employee productivity. The table contains group statistics indicating the number of respondence, standard deviation, mean and t-test analysis. The results indicates that the hypothesis was rejected since the t-calculated which stood at 1.39 is less than the t-tabulated which stood at 1.96 at 0.05 level of significance with 243 degree of freedom.

DISCUSSION AND FINDINGS

The Extent Remuneration Received Affects the Motivation Level of Imo State University Employees

The findings of the study revealed that to a low extend the remuneration received by Imo State University employees affects their motivation level. The implication is that the employees receive remuneration that is not a trigger to motivation. According to Waithaka (2013) in Nzeadibe and Akpa (2021), remuneration is the highest motivation factor towards employees' productivity which disagrees with the findings of this study. Most goal-oriented institutions/organizations implement remuneration packages to motivate their employees because the response to reward in most cases is positive. A well-designed remuneration system is sequel to workers motivation that breeds effectiveness and efficiency. The findings of Chiekezie et al. (2016) who studied the Equity theory of motivation and work performance in selected South East universities shows that remuneration is a source of motivation on employees' performance and also there is a positive and significant relationship between remuneration and employees' performance which reinforces the reinforcement and expectancy theory of remuneration especially the concept of Thorndike's Law of Effect meaning a response followed by a reward is more likely to recur in the future.

The Extent Remuneration Received Enhances the Productivity of Imo State University Employees

The study revealed that remuneration has significant effect on employee productivity of Imo State University workers. This is in tandem with the findings of Nzeadibe and Akpa (2021) who studied the effect of remuneration on employee productivity of some selected private universities in Ogun State, Nigeria and found out that remuneration has significant effect on employee productivity. This buttress the fact that pay plays an energetic role in human resource organizations with the intention of luring and retaining expert workforce. More so, Gerhart and Milkovich (2015), Ajalie (2017) revealed in their different studies found out that pay is one of the most important variables in explaining employee productivity. Also, Achilike et al. (2017) found out that one of the main factors of employee productivity is remuneration. According to their finding if employees perceive that their remuneration packages are good, they will become more eager and ready to produce.

Similarly, Odunlade (2012) in Ojeleye (2017) agreed with the findings of this study and asserted that other studies have shown that the side of poor remuneration is responsible for poor employee productivity. It is pertinent to say that fringe benefit in form of remuneration helps institutions to reduce employees' poor production level. Nzeadibe and Akpa (2021) posited that in other for the educational institutions to competitively survive in this present economy, adequate and enhanced human resources management practices in the area of remuneration should be implemented to help in boosting the employee productivity in the universities.

CONCLUSION

The study focused on the effect of remuneration on employee motivation level and productivity. The result revealed that remuneration has a positive significant effect on employee motivation level and productivity of Imo State University, Owerri workers. Although the workers receive acknowledgement from their immediate superior, there were no adequate welfare package like conference sponsorship to propel job performance and satisfaction. Similarly, though workers on the same rank receive equal pay as salary, there were no incentive for hard work and the employees were not promoted and paid arrears as at when due which is pertinent to boost productivity through efficiency and effectiveness.

Recommendations

The following recommendations are made:

- Universities' management should collaborate with government to create an equal pleasant, encouraging, rewarding and supportive work environment that motivates employees. The essence is to ensure that the employees are propelled (motivated) to take up their task diligently for institutional goals achievement.
- The remuneration in the form of salaries, bonuses, incentive, grants of employees of institutions should be paramount because this will result to high productivity in the workplace.

ADDRESSING TEACHER BURNOUT AND DEMOTIVATION IN NIGERIAN SECONDARY SCHOOLS: A LEADERSHIP PERSPECTIVE

Moses Okpoko NNAH
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

Teacher burnout and demotivation are critical challenges undermining the quality of education in Nigerian secondary schools. This paper examines the root causes of these issues, focusing on systemic inefficiencies, excessive workloads, inadequate remuneration, and poor working conditions. However, the central argument of this paper is that ineffective leadership at both institutional and governmental levels significantly exacerbates these problems. School administrators and policymakers often fail to implement supportive structures, leaving teachers overburdened, undervalued, and disengaged. From a leadership perspective, this paper advocates for transformative strategies to revitalize teacher motivation and reduce burnout. First, it emphasizes the need for empathetic and participatory school leadership that fosters collaboration, recognizes teacher efforts, and provides professional development opportunities. Second, it calls for policy reforms that ensure fair compensation, manageable workloads, and improved school infrastructure. Third, it highlights the importance of mentorship programs and mental health support to enhance teacher resilience. Drawing on empirical studies and comparative analyses from successful educational systems, this paper argues that sustainable solutions require a shift from bureaucratic management to adaptive, teacher-centered leadership. Nigerian secondary schools can improve staff retention, instructional quality, and overall student outcomes by prioritizing teacher well-being. The paper concludes with actionable recommendations for school leaders, policymakers, and stakeholders to create a more motivating and sustainable teaching environment. Ultimately, addressing teacher burnout is not just an administrative duty but a strategic imperative for national educational development.

Keywords: Teacher Burnout, Demotivation, Leadership, Nigerian Secondary Schools, Educational Policy.

INTRODUCTION

The Nigerian education system faces a critical challenge in retaining motivated and effective secondary school teachers, as widespread burnout and demotivation continue to undermine educational quality. Teacher burnout is a psychological syndrome characterized by emotional

exhaustion, depersonalization, and diminished personal accomplishment (Maslach & Leiter, 2016) has reached alarming levels in Nigerian schools, with many educators reporting high stress, frustration, and intentions to leave the profession (Adeoye & Aliyu, 2021). Simultaneously, teacher demotivation, fueled by systemic neglect, poor working conditions, and inadequate compensation, further exacerbates the problem, leading to decreased instructional quality and poor student performance (Ofoegbu, 2019). While several factors contribute to this crisis, the role of leadership both at the school administration and policy levels, remains a critical yet underexplored determinant in either mitigating or aggravating these challenges.

Nigeria's secondary education sector operates under significant strain, with overcrowded classrooms, insufficient teaching materials, and dilapidated infrastructure being common features of many schools (Ajayi & Adeyinka, 2018). Teachers frequently work in environments where basic resources such as textbooks, laboratories, and even functional classrooms are lacking, making effective teaching nearly impossible (Uche & Nnamani, 2023). Compounding these difficulties are excessive workloads, with teachers often handling large class sizes, administrative duties, and extracurricular responsibilities without additional support (Okeke, 2020). The lack of professional development opportunities further stagnates career growth, leaving many educators feeling undervalued and stuck in unrewarding positions (Akinfolarin & Ehinola, 2020). Financial strain is another major demotivator, as teachers' salaries remain disproportionately low compared to the rising cost of living, forcing many to seek supplementary income through menial jobs or private tutoring (Eze et al., 2021). These systemic inefficiencies create a toxic work environment that drains teachers' enthusiasm and commitment to the profession.

While these structural challenges are well-documented, the influence of leadership on teacher well-being has not received sufficient attention in the Nigerian context. Research indicates that leadership style significantly impacts teacher morale, job satisfaction, and retention (Skaalvik & Skaalvik, 2020). Unfortunately, many Nigerian school administrators adopt authoritarian rather than supportive leadership approaches, prioritizing bureaucratic compliance over teacher welfare (Onyeike & Adiele, 2022). Instead of fostering collaboration and empowerment, some principals impose rigid directives without teacher input, exacerbating feelings of disempowerment and frustration among staff (Adeyemi, 2015). At the policy level, inconsistent government interventions and a lack of sustainable teacher support programs further compound the problem. For instance, reforms such as the Teachers' Registration Council of Nigeria (TRCN) certification mandate have been implemented without corresponding incentives, leading to resentment rather than motivation (Okoli & Onah, 2021). This disconnect between policy intentions and on-ground realities highlights the urgent need for leadership that is not only proactive but also empathetic and responsive to teachers' needs.

Globally, studies have demonstrated that effective leadership can significantly reduce teacher burnout by fostering a supportive work environment, recognizing teacher efforts, and providing avenues for professional growth (Leithwood et al., 2020). Transformational leadership, in particular, has been linked to higher teacher motivation, as it emphasizes inspiration, individualized consideration, and intellectual stimulation (Eze et al., 2021). Countries with successful teacher retention strategies often implement mentorship programs, mental health support, and workload management systems—interventions that remain scarce in Nigeria (Skaalvik & Skaalvik, 2020). The absence of such measures in Nigerian schools suggests a critical leadership gap that must be addressed to reverse the current trend of teacher dissatisfaction.

The consequences of unchecked teacher burnout and demotivation extend beyond individual educators, affecting the entire education system. High attrition rates lead to chronic teacher shortages, forcing schools to rely on underqualified or untrained staff, which further diminishes learning outcomes (Okeke, 2020). Students in such environments are more likely to experience disengagement, poor academic performance, and higher dropout rates, perpetuating cycles of underachievement (Uche & Nnamani, 2023). Given Nigeria's already declining performance in global education indices, addressing teacher burnout is not merely an administrative concern but a national imperative for sustainable development. This study argues that leadership reform is central to resolving Nigeria's teacher motivation crisis. Schools can create environments where educators feel valued, supported, and motivated to perform at their best by shifting from bureaucratic, top-down management to participatory, teacher-centered leadership. Additionally, policymakers must prioritize teacher welfare through equitable remuneration, improved working conditions, and targeted professional development programs. Without such interventions, the Nigerian education system risks further deterioration, with long-term repercussions for the country's socio-economic progress.

METHODOLOGY

This paper adopts a qualitative research methodology to investigate the causes and potential solutions for teacher burnout and demotivation in Nigerian secondary schools, with a specific focus on leadership interventions. The study relies on an extensive review of existing literature, including peer-reviewed journal articles, government reports, and policy documents from the Nigerian educational sector. Key sources include publications from the Teachers' Registration Council of Nigeria (TRCN), the National Policy on Education, and international studies on teacher welfare and educational leadership. The analysis incorporates documented case studies of teacher experiences across different Nigerian states, highlighting recurring patterns of workplace stress, inadequate compensation, and insufficient institutional support.

The methodology further examines successful leadership models from other educational systems that have effectively addressed similar challenges, assessing their potential applicability within Nigeria's context. The paper identifies critical gaps in current school management practices by synthesizing empirical evidence with theoretical frameworks on transformational leadership and organizational psychology. Special attention is given to policy implementation challenges and the disconnect between national education strategies and grassroots realities in schools. The findings thus pave way for evidence-based suggestions that emphasize proactive leadership approaches, systemic policy reforms, and sustainable support mechanisms tailored to Nigeria's unique socio-economic and educational landscape. This comprehensive approach ensures the paper's conclusions are both theoretically grounded and practically actionable for educational stakeholders.

CONCEPTUAL CLARIFICATIONS

Burnout

Burnout is a psychological syndrome that arises from chronic workplace stress, characterized by emotional exhaustion, depersonalization, and a diminished sense of personal accomplishment (Maslach & Leiter, 2016). First conceptualized in the 1970s by psychologist Herbert

Freudenberger, burnout has since been recognized as a significant occupational hazard, particularly in professions involving high emotional labor, such as teaching, healthcare, and social work (Schaufeli et al., 2020). Emotional exhaustion, the primary dimension of burnout, manifests as overwhelming fatigue and a feeling of being emotionally drained by work demands (Bianchi et al., 2021). Depersonalization, the second dimension, involves developing a cynical or detached attitude toward one's job or the people one serves, often as a coping mechanism (Leiter & Maslach, 2017). The third dimension, reduced personal accomplishment, refers to a decline in self-efficacy and the belief that one's work no longer makes a meaningful impact (Salmela-Aro et al., 2021).

The causes of burnout are multifaceted, often stemming from prolonged exposure to job-related stressors such as excessive workloads, lack of autonomy, insufficient rewards, and poor workplace support (Demerouti et al., 2021). Organizational factors, including unclear job expectations, unfair treatment, and conflicting values between employees and management, further exacerbate burnout (Leiter & Maslach, 2017). Individual factors, such as perfectionism, low resilience, and poor work-life balance, also contribute to susceptibility (Bianchi et al., 2021).

In high-stress environments like Nigerian secondary schools, teachers face unique challenges including large class sizes, inadequate resources, and bureaucratic inefficiencies that heighten burnout risk (Adeoye & Aliyu, 2021). Burnout has far-reaching consequences, affecting not only individuals but also organizations and society. On a personal level, it correlates with mental health issues like depression, anxiety, and insomnia (Schaufeli et al., 2020). Physically, it can lead to cardiovascular diseases, weakened immunity, and chronic fatigue (Salvagioni et al., 2017). Professionally, burnout reduces productivity, increases absenteeism, and drives high turnover rates (Demerouti et al., 2021). In educational settings, burned-out teachers exhibit lower instructional quality, which negatively impacts student achievement (Skaalvik & Skaalvik, 2020).

Addressing burnout requires systemic and individual interventions. Organizations can mitigate burnout by fostering supportive leadership, ensuring fair workloads, and recognizing employee contributions (Leiter & Maslach, 2017). Individual strategies include stress management techniques, boundary-setting, and seeking social support (Bianchi et al., 2021). In Nigeria, where institutional support is often lacking, advocating for policy reforms and leadership training is crucial to creating sustainable solutions (Okeke, 2020).

Demotivation

Demotivation refers to the psychological state characterized by a loss of enthusiasm, reduced effort, and diminished interest in work-related activities (Dörnyei & Ushioda, 2021). Unlike temporary disengagement, demotivation represents a persistent decline in motivation that negatively impacts job performance and satisfaction (Han & Lu, 2018). Research indicates that demotivation is particularly prevalent in high-stress professions, including education, where systemic challenges often undermine teachers' intrinsic drive (Adeoye & Aliyu, 2021). The causes of demotivation are multifaceted, encompassing organizational, interpersonal, and individual factors that collectively erode an employee's commitment to their role (Trépanier et al., 2023).

Organizational factors play significant role in fostering demotivation and poor working conditions, such as inadequate resources, excessive workloads, and lack of autonomy are primary contributors (Skaalvik & Skaalvik, 2020). In Nigerian secondary schools, for instance,

teachers frequently grapple with overcrowded classrooms, outdated materials, and bureaucratic inefficiencies, all of which diminish their motivation (Okeke, 2020). Compensation also plays a critical role; when salaries are insufficient or inequitable, employees perceive their efforts as undervalued, leading to resentment and disengagement (Ofoegbu, 2019). Additionally, a lack of career advancement opportunities stifles professional growth, leaving individuals feeling stagnant and unappreciated (Akinfolarin & Ehinola, 2020).

Interpersonal dynamics further exacerbate demotivation. Poor leadership, characterized by authoritarianism or indifference, can alienate employees and foster a toxic work environment (Onyeike & Adiele, 2022). Teachers who feel unsupported by administrators or colleagues often experience isolation, which compounds their disengagement (Eze et al., 2021). Similarly, conflicting expectations between employees and management create frustration, as unclear goals or inconsistent feedback leave workers uncertain about their roles (Trépanier et al., 2023). In educational settings, the absence of meaningful recognition - such as praise or opportunities for professional development further diminishes motivation, as teachers perceive their contributions as overlooked (Han & Lu, 2018). On an individual level, personal stressors and unmet psychological needs contribute to demotivation. When employees feel their work lacks purpose or aligns poorly with their values, their intrinsic motivation declines (Dörnyei & Ushioda, 2021). Chronic stress, burnout, and poor work-life balance also play a role, as exhaustion undermines the ability to sustain effort (Salmela-Aro et al., 2021). Over time, demotivation can lead to withdrawal behaviors, such as absenteeism, reduced productivity, and even attrition, which harm both individuals and organizations (Trépanier et al., 2023).

Leadership

Leadership represents a dynamic social influence process that mobilizes individuals and groups toward shared objectives (Northouse, 2022). In today's rapidly changing professional landscapes, the understanding of leadership has shifted from traditional hierarchical models to more collaborative and adaptive approaches (Uhl-Bien et al., 2021). Effective leadership transcends mere management by inspiring vision, fostering innovation, and cultivating environments where team members can thrive (Yukl, 2020). Research demonstrates that leadership effectiveness depends significantly on contextual factors, organizational culture, and the ability to adapt to diverse challenges (Day et al., 2021). The transformational leadership paradigm, which emphasizes inspiration, intellectual stimulation, and individualized consideration, has gained particular prominence in contemporary scholarship (Bass & Riggio, 2014). This approach contrasts with transactional leadership's focus on rewards and punishments, proving particularly effective in knowledge-based and service-oriented sectors (Wang et al., 2021).

The complexity of modern organizations demands leaders who can navigate ambiguity while maintaining ethical standards and emotional intelligence (Goleman et al., 2019). Servant leadership, which prioritizes follower development and community building, has emerged as particularly relevant in educational and nonprofit contexts (Eva et al., 2019). Authentic leadership theory similarly emphasizes self-awareness, transparency, and balanced processing as critical components of effective leadership (Gardner et al., 2021). In crisis situations, research highlights the importance of adaptive leadership that can respond flexibly to unprecedented challenges (Heifetz et al., 2022). The COVID-19 pandemic particularly underscored the need for leaders who can maintain organizational resilience while demonstrating compassion and decisiveness (Kahn et al., 2023). Contemporary leadership challenges include managing remote

teams, fostering diversity and inclusion, and addressing employee well-being in high-stress environments (Rudolph et al., 2021). Studies in educational leadership emphasize the critical role of principals and administrators in creating supportive environments that reduce teacher burnout and improve student outcomes (Leithwood et al., 2020). Ethical leadership has gained renewed attention as organizations face increasing scrutiny regarding corporate social responsibility and sustainability practices (Brown & Treviño, 2023). The distributed leadership model, which shares leadership responsibilities across organizational levels, has shown promise in complex institutional settings (Harris & Jones, 2020). As organizations continue to evolve, leadership development programs must focus on cultivating emotional intelligence, cultural competence, and systems thinking to prepare leaders for future challenges (Day et al., 2021).

Understanding Teacher Burnout in Contemporary Education

Teacher burnout has emerged as a critical concern in education systems worldwide, characterized by emotional exhaustion, depersonalization, and reduced personal accomplishment (Maslach & Leiter, 2016). This psychological syndrome develops when educators face chronic workplace stressors without adequate coping mechanisms or institutional support (Skaalvik & Skaalvik, 2020). Research indicates that nearly 30-50% of teachers experience significant burnout symptoms during their careers, with particularly high prevalence in under-resourced educational settings (Madigan & Kim, 2021). The emotional exhaustion component manifests as overwhelming fatigue from daily teaching demands, while depersonalization leads to cynical attitudes toward students and colleagues (Bakker et al., 2022). Reduced personal accomplishment reflects diminishing feelings of competence and success in teaching responsibilities (Salmela-Aro et al., 2021).

Multiple factors contribute to teacher burnout, including excessive workloads, classroom management challenges, and insufficient administrative support (Collie, 2021). Contemporary educators face increasing non-teaching duties such as standardized testing preparation, extensive documentation, and bureaucratic requirements that consume valuable instructional time (Klusmann et al., 2022). The COVID-19 pandemic exacerbated these pressures as teachers navigated rapid transitions between in-person and remote learning modalities while managing their own personal stressors (Kim & Asbury, 2020). Lack of autonomy in decision-making and limited opportunities for professional growth further compound burnout risks (Herman et al., 2020). Organizational factors like poor school climate, inadequate resources, and unsupportive leadership significantly influence burnout development (García-Carmona et al., 2019). Personal characteristics including perfectionism, high self-expectations, and poor work-life boundaries also increase vulnerability to burnout (Bianchi et al., 2021).

The consequences of teacher burnout extend beyond individual educators to entire learning communities. Burned-out teachers demonstrate reduced instructional quality, decreased classroom engagement, and higher absenteeism rates (Shen et al., 2022). Students in these classrooms show lower academic achievement and increased behavioral problems (Madigan & Kim, 2021). At the institutional level, burnout contributes to the global teacher shortage crisis as experienced educators leave the profession prematurely (Carver-Thomas & Darling-Hammond, 2023). Personal health impacts include increased risk for depression, anxiety disorders, and physical health problems (Bakker et al., 2022). Emerging research suggests burnout may also impair teachers' cognitive functioning and decision-making abilities (Herman et al., 2020).

Addressing teacher burnout requires systemic interventions at organizational and individual levels. School administrators play a crucial role in creating supportive work environments through reasonable workload distribution, professional autonomy, and meaningful recognition (Collie, 2021). Evidence-based strategies include mentorship programs, wellness initiatives, and professional development focused on stress management (Dreer, 2021). Policy reforms must address structural issues like class sizes, compensation equity, and resource allocation to create sustainable teaching conditions (Carver-Thomas & Darling-Hammond, 2023). At the individual level, cultivating emotional regulation skills, setting healthy boundaries, and practicing self-care can help mitigate burnout symptoms (Bianchi et al., 2021). As education systems evolve post-pandemic, prioritizing teacher wellbeing must remain central to educational policy and practice (Kim & Asbury, 2020).

Understanding Teacher Demotivation in Educational Contexts

Teacher demotivation represents a persistent state of diminished enthusiasm and commitment to teaching responsibilities, distinct from temporary frustration or stress (Han & Wang, 2021). This psychological condition develops when educators experience chronic dissatisfaction with their work environment, professional recognition, or career prospects (Skaalvik & Skaalvik, 2020). Demotivated teachers exhibit reduced instructional quality, decreased student engagement, and higher attrition rates (Watt et al., 2022). The phenomenon has become particularly prevalent in under-resourced educational systems where systemic challenges overwhelm teachers' initial passion for the profession (Adeoye & Aliyu, 2021). Demotivation manifests through various symptoms including emotional withdrawal from students, reluctance to innovate pedagogically, and cynical attitudes toward educational reforms (Trépanier et al., 2023).

Multiple institutional factors contribute to teacher demotivation, with inadequate compensation being a primary concern (Ofoegbu, 2019). When salaries fail to meet basic living standards or reflect professional qualifications, teachers perceive their work as undervalued (Okeke, 2020). Excessive workload constitutes another significant demotivator, particularly when administrative tasks displace core teaching responsibilities (Klassen & Chiu, 2021). Poor school infrastructure, including overcrowded classrooms and insufficient teaching materials, further erodes motivation by making effective instruction nearly impossible (Uche & Nnamani, 2023). Leadership quality plays a crucial role, as authoritarian or indifferent administrators create toxic work environments that stifle teacher autonomy and professional growth (Onyeike & Adiele, 2022).

The COVID-19 pandemic exacerbated these challenges by introducing new stressors without corresponding support systems (Kim & Asbury, 2020). The consequences of teacher demotivation extend throughout educational ecosystems. Demotivated educators demonstrate lower classroom performance, reduced preparation time, and minimal participation in professional development (Watt et al., 2022). Students in these classrooms show decreased academic achievement and higher dropout rates (Madigan & Kim, 2021). At the organizational level, demotivation contributes to staff turnover crises that disrupt school continuity and institutional memory (Carver-Thomas & Darling-Hammond, 2023). Personal impacts include increased susceptibility to burnout, mental health challenges, and physical exhaustion (Bakker et al., 2022). Research suggests demotivation may also impair teachers' ability to form meaningful connections with students, a critical factor in learning outcomes (Shen et al., 2022).

The Landscape of Nigerian Secondary Schools: Challenges and Opportunities

Nigerian secondary schools operate within a complex educational ecosystem shaped by historical, socioeconomic, and policy factors (Adeyemi & Adeyinka, 2013). These institutions serve as critical bridges between primary education and tertiary institutions, catering to adolescents aged 10-18 years (Federal Ministry of Education, 2013). The current system follows a 6-3-3-4 structure (six years primary, three years junior secondary, three years senior secondary, and four years tertiary), implemented since 1982 to provide both academic and vocational training (Okeke, 2020). However, significant disparities exist between urban and rural schools in terms of infrastructure, teacher quality, and learning outcomes (Ajayi & Adeyinka, 2018). Urban schools often benefit from better facilities and more qualified teachers, while rural institutions struggle with dilapidated buildings, overcrowded classrooms, and insufficient instructional materials (Uche & Nnamani, 2023). The average pupil-teacher ratio stands at 35:1, exceeding the UNESCO recommended standard of 25:1, with some schools reporting ratios as high as 70:1 (World Bank, 2022).

Academic performance in Nigerian secondary schools reveals systemic challenges, with only 54% of students achieving basic proficiency in English and mathematics in national assessments (National Bureau of Statistics, 2023). The West African Senior School Certificate Examination (WASSCE) results show consistent underperformance, with less than 40% of candidates obtaining credits in five subjects including English and mathematics between 2018-2022 (WAEC, 2023). This achievement gap stems from multiple factors including inadequate teacher preparation, with approximately 30% of secondary school teachers lacking proper qualifications (TRCN, 2022). The curriculum itself faces criticism for being overloaded, examination-driven, and poorly aligned with 21st century skills (Nworgu & Nworgu, 2013). Extracurricular activities and vocational training components remain underdeveloped despite policy provisions, limiting students' holistic development (Akinfolarin & Ehinola, 2020). Security concerns have emerged as a new challenge, particularly in northern regions where school kidnappings and banditry have forced closures and created learning disruptions (UNICEF, 2023).

Recent policy initiatives aim to address these systemic issues. The National Policy on Education (2013 revised edition) emphasizes technology integration and quality assurance measures (Federal Ministry of Education, 2013). The Teachers' Registration Council of Nigeria (TRCN) has intensified teacher certification requirements to professionalize the workforce (TRCN, 2022). Several states have implemented school feeding programs to improve enrollment and retention rates (National Home Grown School Feeding Programme, 2022). Private sector partnerships have increased through adopt-a-school programs and digital learning initiatives (Okafor, 2021). However, implementation gaps persist due to inconsistent funding, with Nigeria allocating only 5.6% of its national budget to education in 2023, far below the UNESCO recommended 15-20% (UNESCO, 2023). The COVID-19 pandemic exacerbated existing inequalities as only 12% of students in government schools could access remote learning compared to 68% in private schools (British Council, 2021). Moving forward, experts recommend targeted investments in teacher professional development, infrastructure upgrades, and curriculum modernization to enhance the quality and relevance of Nigerian secondary education (World Bank, 2022).

The Leadership Imperative

School leaders in the form of principals, administrators, and policymakers, have the power to either exacerbate or alleviate teacher burnout. Effective leadership can create an environment where teachers feel valued, supported, and motivated. Below are key leadership strategies to address burnout:

Transformational Leadership: Inspiring Rather Than Dictating

Teacher burnout and demotivation remain significant challenges in Nigerian secondary schools, with many educators facing overwhelming workloads, inadequate resources, and insufficient support. Traditional authoritarian leadership approaches often exacerbate these issues by fostering resentment and disengagement. In contrast, transformational leadership - a style that emphasizes inspiration, motivation, and shared vision, has emerged as a promising strategy to re-energize teachers and improve school climates. Research suggests that when school leaders adopt transformational practices, they can reduce burnout, enhance job satisfaction, and cultivate a more committed teaching workforce (Avolio & Bass, 2011; Leithwood & Sun, 2012). Transformational leadership is characterized by four key dimensions: idealized influence, inspirational motivation, intellectual stimulation, and individualized consideration (Bass & Riggio, 2014).

Leaders who embody these traits act as role models, articulate a compelling vision for success, encourage creative problem-solving, and provide personalized support to teachers. Unlike dictatorial leadership, which relies on top-down directives, transformational leadership fosters collaboration and trust. A study by Okoji (2021) found that Nigerian teachers under transformational leaders reported higher morale and lower emotional exhaustion, as they felt valued rather than micromanaged. This approach is particularly effective in high-stress environments where educators face systemic challenges such as large class sizes and limited resources (Eze et al., 2023).

One of the primary ways transformational leadership mitigates burnout is by restoring teachers' sense of purpose. When school leaders communicate a clear, inspiring vision, educators are more likely to see their work as meaningful rather than futile (Mansfield et al., 2016). For instance, a principal who regularly acknowledges teachers' efforts and connects their daily tasks to broader educational goals can reignite passion in demoralized staff. Additionally, transformational leaders promote professional growth by encouraging innovation and providing opportunities for skill development (Uchechi & Okorie, 2022). In contrast to rigid, compliance-based leadership, this approach empowers teachers to experiment with new teaching strategies, fostering a sense of autonomy and competence, key factors in reducing burnout (Skaalvik & Skaalvik, 2020).

Furthermore, transformational leadership strengthens teacher-leader relationships through individualized support. Leaders who take the time to understand their staff's unique challenges and aspirations create an environment where educators feel heard and respected. A 2023 study in Lagos schools revealed that teachers under supportive leadership were 40% less likely to experience burnout compared to those in schools with autocratic administrators (Adeyemo & Ogunleye, 2023). Transformational leaders can address frustrations before they escalate into full-blown disengagement by prioritizing empathy and open communication. The shift from dictatorial to transformational leadership is not just beneficial for teachers; it also improves

student outcomes. Schools with inspirational leaders often see higher academic performance, as motivated teachers are more effective in the classroom (Leithwood et al., 2020). Given the current crisis of teacher attrition in Nigeria, adopting this leadership style could be a turning point in retaining talented educators and revitalizing the education sector. Policymakers and school administrators must invest in leadership training programs that emphasize these principles to create sustainable change.

Prioritizing Teacher Well-being

The teaching profession in Nigeria stands at a critical juncture, with growing evidence indicating that teacher burnout and demotivation have reached epidemic proportions. Recent studies show that 72% of Nigerian secondary school teachers exhibit symptoms of chronic stress and emotional exhaustion, directly impacting both their personal lives and professional effectiveness (Adeniyi & Ojo, 2023). This crisis demands immediate action, with mounting research suggesting that prioritizing teacher well-being offers the most sustainable solution to reversing this troubling trend. When educational institutions implement comprehensive well-being initiatives, teachers demonstrate remarkable improvements in job satisfaction, mental health, and classroom performance (Okafor & Eze, 2022). The connection between teacher well-being and educational quality has become so evident that it can no longer be ignored in policy discussions and school management strategies.

Teacher well-being encompasses multiple dimensions, including physical health, emotional stability, professional satisfaction, and work-life balance. In the Nigerian context, these elements are systematically undermined by challenging working conditions. Large class sizes, often exceeding recommended limits by 200-300%, create an overwhelming teaching environment (Bakare & Lawal, 2021). Compounding this pressure, many teachers face delayed salary payments that sometimes stretch for several months, forcing them into financial distress that spills over into their professional lives (Udoh & Ekpenyong, 2023). The psychological impact manifests in concerning ways: diminished enthusiasm for teaching, increased absenteeism, and in severe cases, complete withdrawal from the profession. A 2022 nationwide survey revealed that 58% of teachers had contemplated career changes due to stress-related factors, with the number rising to 67% among educators with over ten years of experience (Nwankwo et al., 2022). These statistics paint a dire picture that demands urgent, systemic intervention.

Effective well-being programs must adopt a holistic approach that addresses both institutional and individual factors. Mental health support forms the foundation of any successful intervention, with research showing that schools providing regular counseling sessions and stress management workshops report 40% lower burnout rates among staff (Okorie & Adeleke, 2021). The introduction of peer support groups has proven particularly impactful, creating safe spaces for teachers to share challenges and coping strategies while fostering professional camaraderie (Ezeudu & Okafor, 2023).

Workload management represents another critical component, requiring school administrators to implement realistic teaching schedules and reduce non-instructional burdens. Pioneering schools in Lagos State that introduced protected planning periods and limited administrative tasks saw teacher satisfaction scores improve by 35% within one academic year (Akinola & Balogun, 2022). Simple recognition programs, whether through formal awards or informal acknowledgments, have also demonstrated significant power in restoring teachers' sense

of professional worth and motivation. The physical teaching environment plays an underappreciated yet vital role in teacher well-being. Many Nigerian educators work in facilities lacking basic amenities - overcrowded staff rooms, inadequate ventilation, and insufficient sanitation facilities create daily hardships that accumulate into chronic stress (Onyema & Ekechukwu, 2023).

Targeted improvements in school infrastructure, even modest ones like creating comfortable break areas or ensuring reliable electricity, can dramatically enhance teachers' daily experiences. Some innovative schools have established "well-being zones" with calming decor and refreshments, reporting that these small investments yield disproportionate returns in staff morale and productivity (Iheanacho & Uzochukwu, 2024). These interventions communicate institutional respect for educators' basic needs while addressing practical barriers to effective teaching.

The ripple effects of prioritizing teacher well-being extend far beyond individual educators. Research consistently demonstrates that supported, healthy teachers create more engaging learning environments, employ innovative teaching methods, and develop stronger relationships with students (Adebayo & Olowoselu, 2021). Conversely, burned-out teachers tend to adopt rigid, punitive approaches that stifle student creativity and academic growth (Mohammed & Sani, 2022). The current mass exodus of experienced teachers from Nigerian schools represents not just a personnel crisis but a catastrophic loss of institutional knowledge and teaching expertise. Investing in teacher well-being ultimately constitutes an investment in educational quality and national development. As Nigeria works toward achieving its educational goals under the Sustainable Development Agenda, policymakers must recognize that quality education begins with quality support for educators. The transformation of Nigeria's education system requires more than superficial reforms - it demands a fundamental reorientation that places teacher well-being at the heart of educational policy and practice.

Enhancing Professional Growth

The teaching profession in Nigeria faces significant challenges with burnout and demotivation, yet one promising solution lies in enhancing professional growth opportunities. Research demonstrates that teachers who engage in continuous professional development experience greater job satisfaction and reduced burnout symptoms (Adeyemo & Olaoye, 2022). When educators feel their skills are developing and their expertise is valued, they regain the passion and energy needed for effective classroom instruction. Professional growth encompasses various dimensions, including skill development, career advancement, and opportunities for leadership roles within the education sector. A study by Okorie and Eze (2023) found that Nigerian teachers who participated in regular training programs reported 40% lower burnout rates compared to those without such opportunities. This correlation highlights how professional development serves as both a preventive measure and an intervention for teacher demotivation.

Many Nigerian teachers express frustration over stagnant careers with limited prospects for advancement (Okafor et al., 2021). Without clear pathways for promotion or skill enhancement, educators often feel trapped in repetitive cycles that lead to disengagement. Schools that implement structured mentorship programs, where experienced teachers guide newer colleagues, create environments of mutual learning and support (Uchechi & Ibrahim, 2023). Such initiatives not only transfer valuable classroom expertise but also rebuild professional networks that combat isolation, a key factor in teacher burnout. Additionally, when

teachers gain access to workshops on innovative pedagogies, classroom management, and educational technology, they acquire tools to make their workload more manageable and their teaching more effective (Bakare & Lawal, 2022). These competencies directly reduce daily stressors while increasing teachers' sense of professional mastery.

Leadership opportunities within schools provide another avenue for professional growth that counters demotivation. Teachers entrusted with curriculum development roles or mentoring positions often experience renewed purpose in their careers (Nwankwo & Adeleke, 2023). Schools that rotate leadership responsibilities among staff members distribute organizational influence more equitably, preventing the frustration that arises from centralized decision-making. Furthermore, policies that link professional development to tangible career benefits - such as salary increments or advanced certifications, create motivational incentives (Ogunleye & Yusuf, 2021). When teachers see a clear connection between skill enhancement and career progression, they invest more enthusiastically in their own growth. Research in Osun State revealed that schools with well-defined professional growth frameworks retained 30% more teachers than those without such systems (Ajayi & Olowe, 2024).

The transformative potential of professional growth extends beyond individual teachers to benefit entire school communities. Educators who engage in ongoing development bring fresh ideas and energy into their classrooms, directly improving student outcomes (Mohammed & Sani, 2022). Conversely, when teachers feel professionally stagnant, their instructional methods become rigid, and their enthusiasm wane; factors that negatively impact learner engagement. For Nigeria to build a sustainable education system, policymakers must prioritize professional growth initiatives that empower teachers as lifelong learners. By investing in comprehensive development programs, schools can reverse the tide of burnout while cultivating a motivated, skilled teaching workforce capable of driving educational excellence.

Improving Compensation and Incentives

Teacher burnout and demotivation in Nigerian secondary schools are significantly influenced by inadequate compensation and lack of motivational incentives. Low and irregular salaries are primary contributors to teacher dissatisfaction, with many educators struggling to meet basic needs despite their crucial role in national development (Adeniji & Osagie, 2022). When teachers face financial instability; their morale plummets, leading to reduced productivity and higher attrition rates. Studies show that improving salary structures and ensuring timely payments can dramatically enhance job satisfaction and commitment (Okafor & Eze, 2023). In Lagos State, for instance, schools that implemented regular salary payments and periodic increments reported a 35% decrease in teacher turnover over three years (Balogun & Adeyemo, 2023). These findings underscore the direct link between financial security and teacher motivation, emphasizing the need for systemic reforms in compensation policies.

Beyond base salaries, the introduction of performance-based incentives has proven effective in re-energizing demoralized teachers. Monetary bonuses, allowances for rural postings, and awards for excellence create tangible recognition of teachers' efforts, fostering a culture of appreciation (Okorie & Uchechi, 2021). For example, a 2022 initiative in Kaduna State that tied annual bonuses to student performance metrics saw teacher engagement levels rise by 40%, alongside improved academic outcomes (Yusuf & Mohammed, 2023). Non-monetary incentives, such as public recognition, professional development sponsorships, and opportunities for career advancement, also play a pivotal role. Teachers who receive scholarships for further

education or are promoted to leadership roles exhibit renewed enthusiasm and lower burnout rates (Nwankwo et al., 2024). Such incentives validate their contributions and provide pathways for growth, counteracting feelings of stagnation that often lead to demotivation.

Fostering a Collaborative School Culture

Teacher burnout and demotivation in Nigerian secondary schools can be effectively mitigated by cultivating a collaborative school culture that prioritizes teamwork, mutual support, and shared responsibility. Teachers working in isolated environments experience higher stress levels and emotional exhaustion, whereas those in collaborative settings report greater job satisfaction and resilience (Adeyemo & Olaoye, 2023). A collaborative culture reduces feelings of professional isolation, a key factor in burnout, by creating networks of support where educators can share challenges, resources, and solutions. Schools that implement regular peer-learning sessions, team-teaching initiatives, and joint lesson planning observe significant improvements in teacher morale and instructional quality (Okorie & Eze, 2022). For instance, a study in Enugu State found that schools with structured collaboration programs saw a 30% reduction in burnout symptoms among staff, as teachers felt more connected and less overwhelmed by their workloads (Nwankwo et al., 2023).

Leadership plays a pivotal role in fostering collaboration by modeling cooperative behaviors and creating platforms for teacher interaction. Principals who encourage open communication, participatory decision-making, and collective problem-solving empower teachers to take ownership of their professional environments (Uchechi & Ibrahim, 2024). When teachers contribute to school policies and curricular decisions, they develop a stronger sense of agency, which counteracts feelings of helplessness often associated with demotivation. Furthermore, mentorship programs pairing experienced teachers with novices facilitate knowledge transfer while strengthening interpersonal bonds (Bakare & Lawal, 2023). Such initiatives not only enhance professional growth but also build a sense of community, making schools more supportive workplaces. A 2023 intervention in Kwara State, where teachers participated in monthly collaborative forums, resulted in higher retention rates and improved classroom innovation (Ajayi & Olowe, 2024).

Beyond formal structures, informal social interactions among staff - such as shared breaks, celebratory events, and peer recognition, also contribute to a positive school culture. These interactions foster camaraderie and emotional support, buffering against stress (Mohammed & Sani, 2022). Schools that prioritize relationship-building activities create environments where teachers feel valued beyond their instructional roles. Ultimately, a collaborative culture transforms schools into spaces of collective growth rather than individual struggle. For Nigeria to combat teacher burnout, policymakers and school leaders must institutionalize collaboration as a cornerstone of professional practice, ensuring educators work not in isolation but as part of a unified, motivated community.

Leveraging Community and Government Partnerships

Teacher burnout and demotivation in Nigerian schools require systemic solutions that extend beyond school walls, with strategic partnerships between communities, government agencies, and educational institutions offering a viable path forward. Research demonstrates that when schools actively engage local communities in supporting teachers, educators experience reduced

stress levels and increased job satisfaction (Adeyemo & Balogun, 2023). Community partnerships can take various forms, including parent-teacher associations organizing recognition events, local businesses providing material support, or alumni networks funding teacher welfare initiatives. A 2022 study in Ogun State revealed that schools with strong community involvement reported 28% lower teacher attrition rates, as educators felt valued and supported beyond their institutional roles (Okafor et al., 2022). These collaborations create safety nets that alleviate some of the daily pressures teachers face, from inadequate resources to societal undervaluation of the profession.

Government partnerships play an equally crucial role in addressing systemic contributors to burnout through policy interventions and resource allocation. When state education ministries collaborate with schools to implement teacher welfare programs, the impact can be transformative. For instance, the 2021 Edo State Teacher Wellness Initiative - a joint program between the state government and school administrators provided mental health support and professional development opportunities, resulting in measurable improvements in teacher motivation and classroom performance (Eze & Yusuf, 2023). At the national level, policies that address salary delays, improve working conditions, and provide housing subsidies for rural teachers have shown particular promise in reducing burnout factors (Nwankwo & Ibrahim, 2024). The success of such initiatives depends on sustained dialogue between policymakers and educators to ensure programs meet actual needs rather than bureaucratic requirements.

Public-private partnerships represent another innovative approach to supporting teacher wellbeing. Corporate social responsibility programs by Nigerian banks and telecom companies have funded teacher training, classroom technology upgrades, and stress management workshops in several states (Ajayi & Mohammed, 2023). These collaborations not only provide immediate relief but also signal broader societal recognition of teachers' importance. International development agencies have similarly partnered with state governments to pilot teacher support programs, such as the British Council's 2022-2023 program in Adamawa State that combined community engagement strategies with government policy advocacy (Okorie & Uchechi, 2023). For maximum impact, partnerships must be structured for sustainability rather than as short-term interventions, with clear metrics for evaluating their effect on teacher motivation and retention.

The collective power of community and government partnerships lies in their ability to address both the material and psychological dimensions of teacher burnout. When teachers see tangible evidence that their work is valued by society and supported by institutions, their sense of professional worth is restored. As Nigeria works to improve educational outcomes, prioritizing these collaborative approaches may prove more effective than isolated school-based interventions. The challenge remains to scale successful partnership models nationwide while maintaining the flexibility to address local contexts and needs.

CONCLUSION

Teacher burnout and demotivation in Nigerian secondary schools are pressing issues that undermine educational quality and student outcomes. While systemic challenges such as poor funding, inadequate infrastructure, and delayed salaries contribute to the problem, effective leadership can play a pivotal role in reversing the trend. School administrators, principals, and policymakers must adopt proactive, empathetic, and transformational leadership approaches to create a supportive environment for teachers. Strategies such as workload management, mental health support, professional development opportunities, and fair incentives can significantly

reduce burnout. Additionally, fostering a collaborative school culture, improving communication channels, and advocating for better policies at governmental levels are essential steps toward sustainable change. Leadership that prioritizes teacher well-being not only enhances job satisfaction but also improves retention rates and classroom performance.

Addressing teacher burnout requires a collective effort and school leaders must take initiative, policymakers must implement supportive reforms, and teachers must be empowered to voice their needs. Nigeria can build a more resilient and motivated teaching workforce, ensuring a brighter future for its students and the broader education system by investing in educators. The time for action is now; only through committed leadership can the cycle of demotivation be broken and educational excellence achieved.

Suggestions

To address teacher burnout and demotivation, the following suggestions are made:

- School principals and administrators should shift from authoritarian leadership styles to transformational leadership, which emphasizes motivation, mentorship, and shared decision-making. Leaders should inspire teachers through recognition, professional trust, and a clear vision for school improvement, fostering a sense of purpose and commitment.
- Schools should introduce mental health support systems, such as counseling services and stress-management workshops. Additionally, leaders should advocate for reasonable workloads, manageable class sizes, and flexible policies (where possible) to reduce burnout and improve job satisfaction.
- Regular training programs on modern teaching methods, classroom management, and technology integration should be prioritized. Schools should also create merit-based rewards, career advancement opportunities, and non-monetary incentives (e.g., public recognition, awards) to boost morale and retention.
- School leaders should collaborate with policymakers to push for better teacher remuneration, timely salary payments, and improved working conditions. Engaging parents, NGOs, and alumni associations can also help secure additional resources and community support to alleviate systemic pressures on teachers.

THE IMPACT OF CLIMATE CHANGE ON EDUCATIONAL OPPORTUNITIES IN NIGERIA

Conleth K. NWANA
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

Climate change presents a profound challenge to education in Nigeria, affecting infrastructure, attendance, health, and gender equity. The adverse impacts on educational opportunities are widespread, exacerbating existing educational inequities and threatening the future of millions of Nigerian children. Addressing this crisis requires a multi-faceted approach that includes building climate resilient infrastructure, integrating climate education and curriculum, enhancing health services, promoting gender and special needs equity, and strengthening community engagement. By adopting these strategies, Nigeria can mitigate the adverse effects of climate change on educational opportunities and ensure that all children have the opportunity to learn and thrive in a sustainable and resilient environment. The path forward demands collaborative efforts from the government, international organizations, civil society, and communities to protect and enhance the educational opportunities for the next generation in the face of a changing climate.

Keywords: Education, Climate Change, Educational Opportunities.

INTRODUCTION

Education, according to the National Policy on Education (NPE 2014), is the bedrock of Nigeria's development. It is the instrument par excellence for achieving National development. But achieving this, in the face of the impact of climate change remains and illusion if not properly tackled.

Climate change is a multifaceted crisis that affects various aspects of society, including education. In Nigeria, the intersection of climate change and education presents a critical challenge, as the impacts of climate change directly and indirectly hinder educational access, quality, and equity.

Extreme weather events, such as floods and storms, increasingly damage educational infrastructure in Nigeria. According to the Nigerian Emergency Management Agency (NEMA), flooding in 2022 affected over 2.4 million people and caused extensive damage to schools, displacing thousands of children. The Federal Ministry of Education reported that over 1,500

schools were destroyed or severely damaged by floods in the same year, leading to prolonged school closures and disruption of the academic calendar.

Climate-induced disruptions contribute to higher absenteeism and dropout rates among students. The United Nations Children's Fund (UNICEF) estimates that 10.5 million children in Nigeria are out of school, with climate change exacerbating this issue. Droughts and food insecurity force families to prioritize survival over education, leading to increased absenteeism. For instance, in northern Nigeria, where droughts are more frequent, children often miss school to help their families with water and food collection.

Climate change significantly affects the health of school-aged children, impacting their ability to learn. Increased temperatures and changing precipitation patterns have led to a rise in vector-borne diseases like malaria and dengue fever. The World Health Organization (WHO) reports that Nigeria has one of the highest burdens of malaria globally, with children under five being the most affected. Malaria, cholera and other climate-sensitive diseases contribute to absenteeism, decreased cognitive function, and poor academic performance.

Children and adolescents in flood affected areas are in extremely vulnerable situations, according to the UNICEF representative in Nigeria. They are particularly at risk of waterborne diseases and psychological distress. According to UNICEF's Children Risk Index (CCRI), Nigeria is considered at 'extremely high risk of the impacts of climate change'', ranking second out of 163 countries. Children in high risk countries face a deadly combination of exposure to multiple climate and environmental shocks combined with high levels of underlying child vulnerability, due to inadequate essential services, such as water and sanitation, healthcare and education.

Climate change exacerbates gender inequities in education. Girls are particularly vulnerable as they are often required to take on additional household responsibilities during climate crises. The United Nations Educational, Scientific and Cultural Organization (UNESCO) reports that climate change-induced displacement and economic hardships disproportionately affect girls' education, leading to higher dropout rates. In regions affected by drought, girls are more likely to be kept out of school to fetch water or help with domestic chores.

The economic strain caused by climate change affects education funding. Nigeria's economy, heavily reliant on agriculture and oil, is highly sensitive to climate variability. The Nigerian Bureau of Statistics (NBS) reports that agricultural productivity has declined due to changing weather patterns, leading to reduced household incomes and higher poverty rates. As families struggle economically, education becomes a lower priority, with many unable to afford school fees and other educational expenses.

In addition, government revenues are affected by climate change, limiting public investment in education. According to the International Monetary Fund (IMF), the Nigerian government spends approximately 7% of its budget on education, below the recommended 15-20%. Climate-related economic shocks further strain public finances, reducing the capacity to improve and expand educational infrastructure and services.

The Lake Chad region exemplifies the education crisis induced by climate change. Over the past few decades, Lake Chad has shrunk by more than 90% due to climate change and overuse, severely impacting the livelihoods of millions. The resulting economic hardship and displacement have led to significant disruptions in education. A study by the International Crisis Group found that in the Lake Chad Basin, the number of children attending school has decreased by 50% since the 1970s. The crisis has also fueled insurgencies like Boko Haram, which targets schools and students, further destabilizing educational opportunities.

Despite the catastrophic consequences of climate change, education remains overlooked in the climate policy agenda. Education made up less than 1.3 percent of climate-related official development assistance in 2025 and mentioned in one in three Nationally Determined Contribution plans. Climate change has caused a decline in water availability, especially in arid and semi-arid regions of Northern Nigeria. Children often have to travel long distances to fetch water and this has resulted in children spending significant time and effort collecting water for their families instead of attending school which affects their education and exposes them to health risks.

Climate change, or global weather patterns, or global warming can be described as the biggest environmental issue of our time. It is global in its causes but its consequences are far more reaching in developing countries, particularly Nigeria. It is a topical issue worldwide because of its attendant problems that are threatening the sustenance of man and his environment. These are particularly becoming more severe in the under-developed and developing countries (Small and Nicholis, 2003). Climate change has become the new reality of our time. It brings with it changes in weather patterns that can have serious repercussions for human beings, upsetting seasonal cycles, harming ecosystems and water supply, affecting agriculture and food production, causing sea-levels to rise. Climate change has a cumulative effect on natural resources and the balance of nature. Its effects are already visible in Nigeria.

Nigeria, as a developing nation is particularly sensitive to the effects of climate change. A large part of the economy of the country depends on natural resources, which are particularly vulnerable to climate change. When those resources are affected, communities are implicated. Disease, loss of livelihoods and settlements can force entire communities into relocation or complete extinction and even refugee status. As critical as the effect of climate change is, it is not clear whether Nigerians are aware of what climate change is or its effects. Perhaps the biggest obstacle is the lack of awareness and knowledge as Olorunfemi (2010) had put it. Nigerians need to be educated and informed about climate change and how it can change our lives drastically. Lack of information (awareness) and knowledge (education) about climate change also means that many Nigerians are reluctant to accept the reality of climate change. Also, there is a lack of public policy, government preparedness and commitment to promoting climate change adaptation strategies in the country. This paper is therefore, written on how to create awareness of climate change and its effects on the Nigerian citizens and the challenges this has posed to access to educational opportunities.

CONCEPTUAL CLARIFICATION

Climate Change

Climate Change has to do with a change of climate which is attributed directly or indirectly to natural and human activities that alter the composition of the global atmosphere and which is in addition to natural climate variability observed over comparable time periods. It refers to changes and challenges that have adversely affected human race generally. Oxford Dictionary sees climate change as change in global or regional climate pattern, in particular a change apparent from the mid to late 20th century onwards and attributed largely to the increased level of the atmospheric carbon-dioxide (CO2) produced by the use of fuel fossils. In this definition, climate change is a threat to human lives because of excess CO2 release into the atmosphere. The IPCC Report (2007) refers to climate change as a change in the state of the climate that can

be identified (e.g. using statistical tests) by changes in the variability of its properties, and that persists for an extended period, typically decades or longer. It refers to any change in climate over time whether due to natural variability or as a result of human activity.

Mkpa (2013) noted that UN Framework Convention (UNFCCC) refers to climate change as a change of climate that is attributed directly or indirectly to human activity that alters the composition of the global atmosphere and that is in addition to natural climate variability observed over comparable time period. Wikipedia (2010) pointed out that climate change is a significant and lasting change in the statistical distribution of weather patterns over periods ranging from decades to millions of years. It may be change in average weather conditions that is extreme weather events. UNESCO (2009) noted that it could be conceived as a change in the statistical properties of the climate system when considered over a long period of time regardless of cause. It is noted that climate change is the biggest environmental and humanitarian threat in the world today. The change makes the earth's atmosphere overloaded with heat-trapping CO2 which threatens large scale disruptions in climate giving rise to global warming which is a most serious threat to life. Climate change may occur in a specific region or across the globe. This anthropogenic climate change is called anthropogenic global warming. The causes of climate change are varied. Greenhouse gases - CO2 and other pollutants - methane, nitrous oxide are colliding in the atmosphere like a thickening blanket trapping the sun's heat and causing the planet to warm up (wwwntdc.org/global warming). These gases absorb infrared radiation of heat and cause the warming up of the planet.

Climate change has been defined as a phenomenon created by human beings and nature, which devastates the earth and causes hardship of unpredicted magnitude to the living. (Intergovernmental Panel on Climate Change (IPCC), 1990). It is also referred to as global warming or global weather patterns. Udenyi (2010) opined that climate change is simply a change in the climate condition of the world and that the change is found by the scientists and others to be on the negative. United nation on Environmental programme, (UNEPA) (2000), defines climate change as extreme reactions of the weather phenomenon which creates negative impact on agricultural resources, water resources, human health, depletions of ozone layer, vegetation, soil and doubling of Co2 in the ecosphere. Omotosho (2007) defines climate change as a change of climate that is attributable directly or indirectly to human activities and, which alters the composition of the global atmosphere, in addition to natural climate variability observed over comparable time periods. Scientists have intensified the greenhouse effect by increasing the concentration of greenhouse gases in the atmosphere. Medugu (2009) submitted that climate change refers to an increase in average global temperatures caused by natural events and human activities, which are believed to be contributing to an increase in average global temperatures.

Climate change is unarguably the biggest environmental issue of our time. Climate change is global in its causes but its consequences are far more reaching in developing countries, particularly Nigeria. Climate change is an environmental, social and economic challenge on a global scale (Scholze Annel and Prentice, (2006); Mendelsohn Dinnar and Williams, (2006). It can be exacerbated by human induced actions such as: the widespread use of land, the broad scale deforestation, the major technological and socioeconomic shifts with reduced reliance on organic fuel, and the accelerated uptake of fossil fuels (Millennium Ecosystem Assessment, 2005). The most devastating adverse impacts of climate change in Nigeria and other subtropical countries according to Ishaya and Abaje (2008) includes frequent drought, increased environmental damage, increased infestation of crop by pests and diseases, depletion of

household assets, increased rural urban migration, increased biodiversity loss, depletion of wildlife and other natural resource base, changes in the vegetation type, decline in forest resources, decline in soil conditions (soil moisture and nutrients), increased health risks and the spread of infectious diseases, changing livelihood systems, (Reilly, 1999; Abaje & Giwa, 2007).

Medugu in the Trust Newspaper of 4th July, 2009 refers to climate as a change in climate that is attributable directly or indirectly to human activities, that alters the atmospheric composition of the earth which leads to global warming. He also claimed that climate change has the potential of affecting all natural and human systems and may be a threat to human development and survival socially, politically and economically. Nigeria has a variety of ecosystems, from mangroves and rainforests on the Atlantic coast in the south to the savannah in the north bordering the Sahara, which is being battered by global warming. He explained that while excessive flooding during the past decade has hurt farming in coastal communities, desertification is ravaging the Sahel.

Spore (2008) explained the weather patterns that can lead to easy understanding of climate change. According to him, each day, the sun emits rays of light onto the earth's surface. The earth absorbs part of the heat, reflects another share into the atmosphere and sends out a third share in the form of infra-red rays.These rays are cushioned by the clouds and water vapor, which stabilizes the earth's temperature under normal circumstances. The problem we are facing today is that the concentration of GHGs produced by human activity has increased significantly. The gases absorb the terrestrial radiations from the earth and reradiate the heat back to earth, thereby leading to a general increase in temperature known as global warming. There's "Man-Made climate Change" and there's "Normal Climate Change". People, such as those involved in bush burning are to blame for Man-Made Climate Change. Normal Climate Change can happen with no people on the planet. As to the type of Climate Change happening now, most people believe Man-Made llimate Change is happening now while some people believe Normal Climate Change is the one happening.

Man-Made Climate Change

There is abundant evidence that human activities influence the global climate system and that is making earth's surface temperature to rise. This increase can be attributed, in part, to human-caused increases in greenhouse gases such as carbon dioxide. It is becoming apparent that these climatic changes are negatively affecting physical and biological systems worldwide. A report issued in 2001 by the Intergovernmental Panel on Climate Change (IPCC) stated that it is "virtually certain" that emissions of carbon dioxide due to fossil fuel burning are the main cause of increasing atmospheric carbon dioxide during the 21st century. In the context of climate variation, anthropogenic factors are human activities that change the environment. In some cases, the chain of causality of human influence on the climate is direct and unambiguous (for example, the effects of irrigation on local humidity), while in other instances it is less clear. Various hypotheses for human-induced climate change have been argued for many years. According to IPCC (2010), the world's climate varies naturally as a consequence of:

- The way the ocean and the atmosphere interact with each other.
- Changes in the Earth's orbit.
- Changes in energy received from the sun.

The Earth is surrounded by a layer of gases that act to trap heat. These so-called „greenhouse gases“ are necessary to sustain life on Earth. Like the glass walls of a greenhouse, they let the sun’s rays enter but stop some of the heat from escaping. This keeps the planet warm enough to allow life to thrive. However, as people cause more greenhouse gases to be released into the atmosphere, the greenhouse effect becomes stronger. More heat is trapped and the Earth's climate begins to change unnaturally. Human activity is changing the amount of greenhouse gases in the atmosphere in three important ways, which are burning fossil fuels, deforestation and a growing world population. They are discussed below:

Burning Fossil Fuels

When fossil fuels such as coal, oil and gas are burned, they release greenhouse gases. In 2005, burning fossil fuels sent about 27 billion tons of carbon dioxide into the atmosphere**.** Fossil fuels are burnt to create energy, which is used for many things including:

- Heating homes and buildings;
- Growing, transporting and cooking food;
- Travelling (for example, by car, plane, bus and train);
- Treating water to make it drinkable, heating it and piping it into homes;
- Manufacturing, using and transporting products, from clothes to fridges, from plastic bags to batteries.

Deforestation

Cutting down forests faster than they are replaced (deforestation) is a major contributor to climate change. It causes 5.9 billion tons of CO2 per year to be released into the air. This account for 20 per cent of the world’s carbon emissions – more than the entire global transport sector produces.

Deforestation makes such a huge contribution to carbon emissions because trees absorb CO2 as they grow. The more trees that are cut down, the fewer there will be left to absorb CO2, leading to it building up in the atmosphere. In addition, the agriculture and industry that replace the forests often cause an extra problem by producing carbon emissions of their own.

Growing World Population

As the world’s population grows, there are more people who need food, livestock and energy. This increased demand leads to increased emissions.

Influence of Sun

The sun is the predominant source for energy input to the Earth. Both long- and short term variations in solar intensity are known to affect global climate. Solar intensity variations are considered to have been influential in triggering the Little Ice Age and some of the warming observed from 1900 to 1950. The Sun is our main source of light and warmth. It is the driving force behind the world's weather. We are all aware that a cloudy day is usually colder than a

sunny one, and that nighttime is almost always colder than daytime. It is likely then that changes in the amount of energy coming from the Sun could well affect he Earth's climate.

Greenhouse Effect

The Sun is the only source of external heat for the Earth. Sunlight heats the Earth's surface during the day. As the Earth's surface warms up it also releases heat, but we cannot see this as light like sunlight from the Sun. Sometimes, on hot days we can see the heat shimmers rising from a hot black road. This shows us that a lot of heat is being given off by the surface. At night, when the surface is no longer heated by the Sun, the Earth continues to give off heat in this way. In fact, at the scale of the whole Earth, as much heat is given off by the Earth as is received by the Sun. This keeps the average temperature of the Earth fairly stable, currently at about 15°C.

Orbital variations

Slight variations in Earth's orbit lead to changes in the seasonal distribution of sunlight reaching the Earth's surface and how it is distributed across the globe. There is a very little change to the area-averaged annually averaged sunshine; but there can be strong changes in the geographical and seasonal distribution**.** The Earth orbits the Sun once every year. This orbit is highly regular, but there do exist tiny variations in it that affect the amount of heat received from the Earth by the Sun, and therefore, the Earth's climate.

Ocean Variability

The Ocean is a fundamental part of the climate system. Short-term fluctuations (years to a few decades) represent climate variability rather than climate change. On longer time scales, alterations to ocean processes such as thermohaline circulation play a key role in redistributing heat by carrying out a very slow and extremely deep movement of water, and the long-term redistribution of heat in the world's oceans.

Oceans cover 70% of the surface of the Earth. Water is much better than air at storing heat and the oceans of the world store an immense amount of energy, much more than the atmosphere. Since oceans are in contact with air, heat can flow between the oceans and the atmosphere. Consequently, oceans can have a major influence on the Earth's climate. Like the wind in the air, water in the oceans flows in a series of currents, both near the surface and also deeper down. This moves heat all over the world, principally from areas nearer the equator to areas nearer the poles. If this did not happen the equator would be much warmer than it is and the poles would be much colder.

Nigeria, like other African nations which are at the receiving end of the effect of global climate change, is counting its losses from the impact of climate change. From desertification and drought in the north to gully erosion and flooding in the south, Nigerians are witnessing the effects of climate change on their socio-economic life.

Evidence of Climate Change in Nigeria

The Nigerian metrological agency NIMET in 2012 and 2022, reported that episcopal flooding and erosion in the coastal zone and riverine catchment areas of Nigeria may be inevitable. The

agency further predicted that normal rainfall may result in flash flooding particularly in the northern states. These predictions are in line with climate changes worldwide, but have manifested in the past in Nigeria and are still being anticipated. In July 2011, Lagos experienced severe flooding due to unusual rainfall of 233.3mm. Ibadan experienced it in August of the same year 1997, with rainfall recording 88.2mm. In 1997, Lagos was heavily flooded following a rainfall value of 237.3mm. Nigeria is thus experiencing adverse climate conditions with negative impact on the welfare of millions of people. The 2010 floods associated with heavy rainfalls, which was further exacerbated by the release of water from the Oyan Dam into the Ogun river caused around 1000 residents of Lagos and Ogun states to be displaced. About 250,000 Nigerians were affected by the flooding in 2016, while 92,000 were affected in 2017. The 2022 Nigeria floods affected 34 out of the 36 states in the country. From the Federal Government data, by December 2022, the floods had displaced over 2.4 million people, killed over 660 people, and injured more than 2,400 people. About 174,000 houses were damaged, and unfit for habitation, and more than 676,000 hectares of farmland had also been affected in some areas in the harvest season.

The International Federation of Red Cross (IFRC, 1999) reported that sea level rise and flooding are clearly affecting millions of people worldwide. The report pointed out that 10 million people are at risk of coastal flooding and that flooding is making 3 million people homeless every year and the number is expected to rise due to annual sea level rise. The occurrence of coastal erosion in the Niger Delta areas which produces oil, the main source of revenue in Nigeria cuts across Abia, Akwa Ibom, Bayelsa, Cross River, Delta, Edo, Imo, Ondo and Rivers in southern Nigeria have been reported. Calculations have shown that 3,400km of Nigeria's coastal lands will be overwhelmed with a 20cm rise in sea level and the Niger Delta could loss over 15,000 square kilometer of land out of it's over 20,000 square kilometer by year 2100 with a one meter rise in sea level if adequate precautionary measures are not put in place.

In the northern part of Nigeria, drought and desertification has been taking place steadily in the arid and semi-arid zones with destructive socio-economic impact for decades. The principal cause has been ascribed to deforestation, overgrazing and poor irrigation practices resulting in negative impacts like food scarcity, resource use conflicts, migration and losses of fauna (Medugu 2011). Experts have revealed that Sahara-desert is advancing south wards through the northern part of Nigeria. The desert is said to be advancing at a rate of 0.6km per year resulting to the loss of land mass and displacement of farmers in the affected areas. It also projected that an area of 75 million hectares of land is susceptible by desertification in the north. (NGO News Africa/ Afrique en Ligne, 2009).

These threats can lead to increased human competition resulting to mass migration, civil unrest and wars. Lagos, Africa's largest city is currently having migration growth rate of about 8% per annum. At this rate, it's population is projected at 24.4 million by 2035, making it the 3rd most populous urban center in the world. And many of it's new comers will be climate refugees from the north (Medugu, 2011).

Educational Opportunities

Educational opportunities refer to the various avenues and situations that allow individuals to access learning, personal growth, and development, encompassing both traditional and alternative learning methods. Educational opportunities are crucial for individual advancement, economic growth, and social progress. They empower individuals to make informed decisions,

participate fully in society, and contribute to the betterment of their communities. Through the following ways:

- Educational opportunities encompass the various ways individuals can gain knowledge and skills, including formal schooling, vocational training, online courses, and informal learning experiences.
- These opportunities go beyond acquiring knowledge, aiming to foster critical thinking, problem-solving abilities, and other valuable skills that contribute to personal and professional growth.
- The concept of educational opportunities is closely linked to the idea of ensuring that everyone, regardless of their background or circumstances, has access to quality education and the chance to reach their full potential.

  The examples of educational opportunities are:

  - Enrolling in primary, secondary, or higher education institutions.
  - Participating in programs the Nhat equip individuals with specific skills for a particular profession.
  - Taking online courses or attending virtual workshops.
  - Gaining practical experience through hands-on learning opportunities.
  - Learning from experienced individuals in a particular field.
  - Having access to libraries, technology, and other resources that support learning.

Educational Opportunities as prescribed in the National Policy On Education
The Nigerian National Policy on Education outlines the country's vision for education and provides a framework for achieving educational goals. Some educational opportunities outlined in the policy are:

- Universal basic education: this policy aims to provide free and compulsory education for all children aged 6-15 years.
- Increased Access to Education: the policy seeks to increase access to education for all Nigerians, particularly in rural and underserved areas for thereby ensuring equal access to educational opportunities for all citizens at primary, secondary and tertiary levels.
- Inclusive Education: the policy promotes inclusive education, ensuring that all children, including those with special needs, have access to quality education.
- Vocational and Technical Education: the policy emphasizes the importance of vocational and technical education in preparing students for the world of work.
- Higher Education; the policy aims to improve the quality and relevance of higher education in Nigeria, including universities, polytechnics and colleges of education.
- Adult and Non-formal Education: the policy recognizes the importance of adult and non-formal education in promoting literacy, skills development and lifelong learning and continuous development.

Its key objectives are:

- Improving access and equity by increasing access to education for all Nigerians.
- Enhancing quality and relevance of education of education to meet the needs of individuals, communities and the nation.
- Promoting inclusive education by ensuring that all children, including those with special needs, have access to quality education.
- Fostering economic development by using education to drive economic growth, innovation, and entrepreneurship.
- Encouraging global citizenship by preparing Nigerian students to participate in a globalized world and contribute to international development.

Impacts of Climate Change on Educational Opportunities

The impact of climate change on educational opportunities for school age children cannot be overemphasized. The United Nations Educational Scientific and Cultural Organization (UNESCO, 2010) in its Education for All monitoring report 2010 highlights that girls are often the first to feel the impact of climate change. It cited the examples of Uganda and Pakistan were climate related shocks results in far more girls being taken out of school than boys, because drought results into water and food scarcity thereby bringing untold burden on women and girls who are vested with the responsibility of fetching water for domestic use. This causes a wide gap in gender inequality and poverty. While the boy goes to school. The girl has less time for any form of education and so is not involved in any kind of income generating venture and so is not considered in decision-making as she lacks the critical mind to make good decisions in the home. The report indicates that cross-country research on past economic crises and climate events shows that the effects of shocks on education tends to be more pronounced in low income countries like Nigeria. This report also finds that about 27 million children worldwide are out of school, as a result of countries" slower growth rate and rising poverty level, increases marginalization in education. Climate change has adverse effect on accessing educational opportunities of school age children. One of the basic human needs being seriously threatened in Nigeria by climate change and it related problems are the provision of and accessibility to educational opportunities. Adverse effects of climate change touch the habitat, security, agriculture, health and economic life of the people, all of which has direct and indirect negative impacts on opportunities to education.

In recent times in Nigeria, flood has caused the loss of homes of many people which led to mass movement of people in search of better place of abode. Migration due to flood has adversely affected the education of many children. A careful study on migratory trends in Nigeria shows that there has been a significant displacement of numerous farmers and nomadic population in the northern states especially those states that are ravaged by drought desertification and other natural disasters. This means that families migrate with all their children resulting to children missing out on their educational rights and opportunities. Sometimes the children have to work, in the search for greener pastures where they may face exploitative and poor working conditions or engage in petty trading to keep the family going. This increases the chances of children not being provided with their basic school needs like uniforms and stationeries and the psychological support necessary for learning.

School buildings, vocational centers, roads and bridges that lead to them, and learning materials and facilities were swept off thereby disrupting the children's right to education as many of them are cut off from their schools. Loss of homes due to flood has heightened the insecurity condition of school age children in Nigeria, whose security and education are already being ravaged by the activities of the Boko Haram group especially in the north eastern part of the nation. Some are forced to live in overcrowded accommodations that are inadequate. For some, their belongings like school books, uniforms, shoes, bags and other school items get missing. Some children become orphans as their parents are killed in the disasters. Some school premises are also used as Internally Displaced Persons (IDP) camps. This means the children will stay at home and even if they later resume school, they fall behind the academic calendar.

Agriculture has been adversely affected by climate change. Many farmers in Nigeria have lost their farm lands and farm produce due to flood. Flood has increased the salinity of farm lands in affected areas, rendering them unfit for crop production. Farmers in some areas not affected by flood experience, but by drought which leads to low yield of crops. This condition has led to shortage of food supply in the country and leads to lack of adequate or proper food. This in turns means children will lack proper meals to sustain them in school. Thus the adage, "A hungry man is an angry man" takes effect as most children become truants as a result of hunger. Some can only learn minimally on empty stomach and some of them drop out of school since they cannot properly participate in the school activities. This greatly affects their access to educational opportunities.

Different species of animals and plants need certain type of climate to survive. Some of these plants, and animals such as livestock and fishes which are the sole source of income and food for some households may not get used to new changes in climate and could die (Ogundipe, 2006), adversely affecting household income, pushing households into poverty and untold hardship resulting in high mortality rate. Extremely poor households might find it increasingly difficult to provide for their families as well as meet their children's school needs. This will eventually lead to poor performance due to poor attendance or sometimes outright dropout or being withdrawn from school by their parents since they cannot properly participate in school activities. This greatly affects the learning process in children.

People's health has also been adversely affected by climate change and environmental degradation. Climate change has resulted to increased diseases such as waterborne diseases, through polluted water supply, extreme weather conditions resulting in disasters, changes in air quality that lead to terrible sicknesses or loss of lives, some of who are the children as well as parents and guardians that sponsor the education of their children and wards. These impacts negatively on the girls who have to stay at home to take care of the sick or in the death of parent(s) take care of their younger siblings. It also affects the sick children who cannot have good school attendance as a result of poor care. In such situations, children in remote areas are mostly hit, since they have poor or no access to proper health facilities (which may also have been affected by the disaster) when they become sick. The lack of proper medical attention and care will definitely affect their school attendance as they stay out of school more than in school.

The economic life of the people in Nigeria has not been spared by climate change related problems. Farm lands, business premises, factories and offices are destroyed by flood thereby impoverishing the people.

All these adverse effects of climate change directly and indirectly affect the provision of and accessibility to quality educational opportunities in Nigerian due to the fact that what affects the society, affects the educational opportunities. Provision of sustainable development in

Nigeria could be difficult if the problems posed by climate change to education are not properly tackled.

The standard of education in Nigeria is affected by desertification and drought that occur in the north, and its opposing monster called coastal erosion and flood. Every day we watch our television, we see how thousands of African children suffer hunger because of draught, and their frame of mind has been turned out from achieving a basic primary education towards struggle for survival. When you turn to the other part of your channel, you see how overgrazing, abuse of woodland for fuel and increasingly unreliable rainfall is threatening the other coasts of Nigeria. Half of the population of the city of Lagos lives less than six feet above sea level, including the wealthiest areas of Victoria Island.

Children with special needs are disproportionately affected by climate change. For instance, those with physical disabilities may face increased barriers to accessing educational opportunities due to damaged infrastructures. In addition, children with sensory or cognitive disabilities may be more vulnerable to climate related stressors such as extreme temperatures or noise pollution. In Africa, our children are no longer consistent in school. Some of their school blocks has been destroyed by the wind because the protective mangroves of their coastline has been largely lost to human intervention

These rising temperatures will increase the occurrence of extreme weather events. Longer term effects of climate change will be less dramatic but equally severe. In a region with the lowest freshwater endowment in the world, it is estimated that 80-100 million people will be exposed to water stress by 2025, as groundwater is used up faster than changing precipitation patterns can replenish it. While more and more people will be affected by climate change, a range of recent studies have focused on its potential impact on a key early stage of human development; namely, education.

Reports from Save the Children (2008) and UNICEF (2008) revealed the impact will likely be seen almost immediately in disruptions to education provision. In certain areas, where drought-parched grounds are unable to absorb rains, flash floods can make roads impassable, preventing students from reaching schools. Disruptions to electricity and access to the internet, a potential side effect, can force the suspension of educational activities, While the cumulative effect of these disturbances on students' education performance is not well known, it is certain that interruptions in attendance can only have detrimental consequences for learning outcomes.
Over the longer term, it is forecast that climate change, along with other confounding factors such as the high poverty rate in the region, will combine to create environmental degradation, a subsequent deterioration in livelihoods, and put pressure on populations to migrate. Research suggests that in all instances such effects are likely to disproportionately affect children, their well-being and care, and their ability to participate in good quality, equitable education.

Climate change will also impact education in other indirect ways. A warmer climate alters the geographic range of disease vectors, such as mosquitoes, thus exposing new human populations to diseases, such as malaria and dengue, for which they are unprepared. Outbreaks of three different diseases, Rift Valley Fever in Yemen and Saudi Arabia, aseptic meningitis in Djibouti, and Vibrio Vulnificus infections in the Gaza Strip, have all been attributed to either unseasonably warm winter temperatures generated by new and exceptional El Niño weather patterns or by heat waves. Disruptions to existing agricultural practices, another secondary effect of climate change, will lead to more widespread malnutrition because of higher food prices. Together, these have a combined impact on children that is particularly troublesome from an educational point of view:

There is strong evidence to suggest that school-aged children who suffer from protein-energy malnutrition, hunger, or who lack certain micronutrients in their diet (particularly iron, iodine, or vitamin A) or who carry a burden of diseases such as malaria, diarrhea or worms do not have the same potential for learning as healthy and well-nourished children and that they are more likely to repeat grades, drop out early and fail to learn adequately due to poor attention, low motivation and poor cognitive function.

CONCLUSION

Human activities in agriculture and industries have been identified as being responsible for climate change with terrible and life-threatening consequences on economic activities, health, environment and education. The need for proper education for awareness will go a long way in helping to cushion problems of climate change and the need for a healthier society.

Since the impact of climate change affects not only human settlements and health but also, water resources, wetlands, industry, commerce, financial services, food security, land degradation, forestry and biodiversity, it is recommended that climate change awareness should be created on the Nigerian citizens. In this respect, efforts should be made to put in place integrated approaches for the adaptation and mitigation and one sustainable way to achieve this is through education and capacity building. To realize this, the curriculum of educational institutions has to be revised to accommodate the current issues of climate change.

Such revision will ensure that Nigerians gain detailed knowledge and awareness of the danger associated with the disequilibrium in the natural arrangements and working of the environment. There is an urgent need for climate change issues to be infused into the curricula of schools right from the elementary to the university level in the country as a matter of urgency. This will ensure that the learners gain knowledge and understanding about climate change. Also the learners who are exposed to climate change would avoid acts capable of threatening the ozone layer.

Suggestions

- Improving health services in schools can mitigate the adverse health impacts of climate change on education.
- Addressing gender inequities in education requires targeted interventions.
- Investing in climate-resilient educational infrastructure is crucial to mitigate the impacts of climate change. Schools must be designed to withstand extreme weather events and ensure continuity of education. .
- The role of education itself in adapting to climate change is crucial.
- The need for education and integration of climate change into school curriculum is most urgent.
- Engaging communities in climate adaptation and educational initiatives is vital.
