Table 5 presents the Pearson Product Moment Correlation Coefficient (PPMCC) analysis examining the relationship between accreditation compliance and effective instructional delivery in universities in Rivers State. The correlation coefficient (**r**) between accreditation compliance and effective instructional delivery is 0.80, indicating a high positive relationship**.** The p-value (α = 0.05) is compared with the calculated correlation coefficient (r = 0.80**)** and the critical value **(**r = 0.195**).** Since rcal (0.80) is greater than rcrit (0.195)**,** and the calculated t-value (tcal = 23.51**)** is greater than the critical t-value (tcrit = 1.96**),** the result is statistically significant**.** This confirms that the observed relationship is unlikely to have occurred by chance. Given that the p-value is less than 0.05, we reject the null hypothesis (H_{02})**.** This indicates that there is a significant relationship between accreditation compliance and effective instructional delivery in universities in Rivers State.

Hypothesis 3: There is no significant relationship between provision of infrastructure and effective instructional delivery in universities in Rivers Stat**e.**

Table 6: Pearson Correlation Summary Analysis between provision of infrastructure and effective instructional delivery in public universities in Rivers State

Variable	**N**	**∑X ∑Y**	**$\sum X^2\sum Y^2$**	**∑X∑Y**	**df**	**A**	**r_{cal}**	**r_{crit}**	**t_{cal}**	**t_{crit}**	**Rmk**
Infrastructure and Facilities (X)	428	760.11	2618.12	2573.12	426	0.05	0.86	0.195	28.02	1.96	Rejected
Effective Instructional Delivery (Y)	428	1108.04	3228.06								

Table 6 presents the Pearson Product Moment Correlation Coefficient (PPMCC) analysis examining the relationship between the provision of infrastructure and effective instructional delivery in universities in Rivers State. The correlation coefficient (**r**) between infrastructure provision and effective instructional delivery is 0.86, indicating a strong positive relationship**.** The p-value (α = 0.05) is compared with the calculated correlation coefficient **(**r = 0.86**)** and the

critical value (r = 0.195**).** Since rcal (0.86) is greater than rcrit (0.195)**,** and the calculated t-value (tcal = 28.02**)** is greater than the critical t-value (tcrit = 1.96**),** the result is statistically significant**.** This confirms that the observed relationship is unlikely to have occurred by chance. Given that the p-value is less than 0.05, we reject the null hypothesis (H_{03})**.** This indicates that there is a significant relationship between the provision of infrastructure and effective instructional delivery in universities in Rivers State.

DISCUSSION OF FINDINGS

Extent of Relationship Between Curriculum Review and Effective Instructional Delivery in Universities in Rivers State

Findings on Research Question 1, as presented in Table 1, revealed that there is a high positive relationship between curriculum review and effective instructional delivery in universities in Rivers State, with a correlation coefficient (**r**) of 0.83. This indicates that the extent to which universities review their curriculum significantly influences instructional delivery. This finding aligns with Okoro (2021)**,** who stated that continuous curriculum revision ensures that teaching methods and course content remain relevant, engaging, and responsive to changing societal and technological demands, ultimately improving instructional effectiveness.

Furthermore, Hypothesis 1, as shown in Table 4, tested the significance of the relationship. With a t-calculated value of 30.13, which is greater than the t-critical value of 1.96**,** the null hypothesis was rejected**,** confirming that there is a significant relationship between curriculum review and effective instructional delivery. This corroborates the findings of Adegbite (2022)**,** who examined the impact of curriculum modifications on instructional quality in Nigerian universities and found that institutions that frequently revise their curricula experience enhanced student engagement, improved learning outcomes, and increased adaptability to global academic standards.

Extent of Relationship Between Accreditation Compliance and Effective Instructional Delivery in Universities in Rivers State

Findings on Research Question 2, as shown in Table 2, revealed that there is a strong positive relationship between accreditation compliance and effective instructional delivery in universities in Rivers State, with a correlation coefficient (**r**) of 0.80**.** This suggests that adherence to accreditation requirements significantly influences the quality of instruction in higher institutions. This finding is in agreement with Eze (2023)**,** who noted that compliance with accreditation standards ensures that universities maintain quality faculty, modern teaching facilities, and updated instructional materials, all of which contribute to enhanced instructional delivery.

Additionally, Hypothesis 2, as presented in Table 5, examined the statistical significance of this relationship. The t-calculated value of 23.51 was found to be greater than the t-critical value of 1.96**,** leading to the rejection of the null hypothesis**.** This finding aligns with the study by Olawale (2020)**,** who investigated the effect of accreditation compliance on university teaching efficiency in Nigeria and found that institutions that rigorously adhere to accreditation guidelines tend to have better instructional frameworks, improved student performance, and higher institutional rankings.

Extent of Relationship between Provision of Infrastructure and Effective Instructional Delivery in Universities in Rivers State

Findings on Research Question 3, as illustrated in Table 4.3, indicated that there is a strong positive relationship between the provision of infrastructure and effective instructional delivery in universities in Rivers State, with a correlation coefficient (**r**) of 0.86. This suggests that the availability of essential infrastructural facilities, such as classrooms, laboratories, libraries, and ICT resources, greatly enhances teaching and learning outcomes. This finding concurs with Adebayo (2021)**,** who emphasized that adequate infrastructure fosters a conducive learning environment, thereby improving students' comprehension and lecturers' instructional effectiveness.

Furthermore, Hypothesis 3, as analyzed in Table 4.6, tested the significance of the relationship. The t-calculated value of 28.02 was significantly higher than the t-critical value of 1.96**,** leading to the rejection of the null hypothesis. This confirms that there is a significant relationship between the provision of infrastructure and effective instructional delivery. The finding is in consonance with Mba (2022)**,** who studied the impact of infrastructural development on teaching efficiency in Nigerian universities and found that institutions with well-equipped facilities recorded higher student engagement, improved lecturer productivity, and enhanced academic performance.

CONCLUSION

This study examined the relationship between curriculum review, accreditation compliance, provision of infrastructure, and effective instructional delivery in universities in Rivers State. Findings revealed a strong positive relationship between these variables and instructional delivery, indicating that regular curriculum review, adherence to accreditation standards, and adequate infrastructural provisions significantly enhance teaching effectiveness. The hypothesis testing confirmed that these relationships were statistically significant. Therefore, improving these key areas is crucial for fostering quality education in universities.

Recommendations

- Universities should periodically revise their curricula to align with contemporary educational trends, technological advancements, and industry needs.
- Institutions should adhere to accreditation standards by ensuring qualified faculty, up-to-date instructional materials, and effective quality assurance mechanisms.
- Government and university administrators should prioritize investment in educational facilities, including modern classrooms, laboratories, and ICT resources, to create a more conducive learning environment.

ABSTRACT

This study was undertaken to investigate principals' administrative skills and its effectiveness in instructional delivery in public secondary schools in Okpe/Sapele/Uvwie Federal Constituency of Delta State. Two (2) research questions and hypotheses were raised to give the research direction. The research design considered most suitable for this research was the descriptive survey design of the ex-post-facto type. The population for the study consists of 1,218 principals and teachers in the public secondary schools, comprising of 49 secondary school principals and 1,169 secondary school teachers. A multi stage sampling techniques was used to select 5 teachers in each of the schools by means of simple random sampling technique. On whole 245 teachers served as respondents for this study. A purposeful sampling was used to select two (2) vice principal from each of the local government area including the forty-nine school principals. A total of three hundred (300) teachers, vice principals and principals were selected in the secondary schools. The instrument utilized for collection of data was a structured questionnaire titled "Principals' administrative skills on effective instructional delivery (PASEID). Validity of the instrument was established through judgement of experts and test-retest method and Pearson product moment correlation coefficient was used to establish the reliability. The research questions were answered with mean rating and standard Deviation while Pearson moment correlation was utilized to test the null hypotheses at 95% level of significance. Items on the instrument were scored based on the four points scoring scale. Findings show that there is no significant relationship between principals' supervisory skills, while there was significant relationship between principals' organization skills and instructional delivery in Delta State public secondary schools. It concluded that constraints such as funding and availability of facilities influence principal administrative style in Delta States. It was recommended among others in the study that principals should be knowledgeable, professional and administratively competent, as well as resourceful so as to complement the efforts of the government towards achieving the goals of the schools.

INTRODUCTION

Solid foundations for higher education are laid during secondary education and as such, is a very important level of education in Nigeria. According to the Federal Republic of Nigeria (2014), secondary education is the form of education children receive after primary education and before tertiary stage. Specifically, the secondary education should provide an increasing number of primary school pupils with the opportunity for education of a higher quality irrespective of sex, social, religious and ethnic background, respect the views and feelings of others, respect the dignity of labour and appreciate those values specified under our broad national aims, and live as good citizens, foster Nigerian unity with an emphasis on the common ties that unite us in our diversity, inspire its students with a desire for achievement and self-improvement both at school and in later life (FRN, 2013). In fact, the aim of secondary schools like any other educational institutions is to achieve specific goal of preparing individuals as good and responsible citizens.

Secondary schools are headed by principals who work together with teachers on the basis of a hierarchical structure that is based on superordinate – subordinate relationship. Functionally, this hierarchy of relationship is the locus of allocating and integrating tasks in order to achieve the goals of secondary schools. More so, the functions of the principal include leading, controlling, directing and motivating teachers toward accomplishment of secondary school goals. Principals are key administrators in secondary schools through whom their competencies would influence teachers to achieve secondary educational goals (Olajide, 2016). Principals could play their roles effectively towards the attainment of the objectives of secondary schools when they possess the requisite competencies, leadership talents, administrative efficiency, managerial skills, planning skills and the competency to motivate teachers to pursue such effort which could help in the achievement of secondary educational goals.

Every principal as an administrator is expected to provide professional guidance to teachers in order to improve the conditions which affect learning and growth of the students and teachers. Fika, et al. (2015) asserted that, in discharging their administrative roles, principals may help teachers to perform their jobs of preparing lesson plans; good use of instructional aids; keeping and maintaining of school records, provision of required instructional materials to teachers among others. It is expected that principals' administrative roles are meant to influence teachers' instructional delivery. This desired expectation in secondary education could be achieved through effective discharge of administrative roles by principals since it creates the awareness of sound education philosophies in teachers as the responsibility of achieving effective instructional delivery lies with principals' administrative role by employing various strategies to enhance teachers' job performance. A teacher is any person that undertakes the great task of educating the child who looks to him for knowledge, wisdom, manners, morals, inspiration, and enlightenment and so on. It is the work of teachers to make sure that they prepare the students for furthering their education and acquiring these basic skills for a better life.

The role of a principal as an administrator is a very crucial issue because it is anchored on instructional improvement towards effective teaching and learning in secondary schools. The major role of principals is to facilitate the implementation of the various educational programmes at secondary educational with the aim of improving teaching and learning situation. A teacher whether newly employed or experienced, needs support and guidance in the process of implementing the instructional programmes. Principals as school administrators are expected to support and guide teachers by overseeing their activities in the school system. An effective

principal is required to devote him or herself to supervise, monitor and evaluate the teaching-learning processes in his or her school. The principal as an administrator plays the role of overseeing the activities of teachers in the school system to ensure that they conform to the generally accepted principles and practice of secondary school system (Suleiman et al., 2016).

The effective performance of these functions to a large extent is dependent on good administration involving adequate and well qualified teachers, adequate funds for infrastructural facilities, libraries and laboratories (Ikegbusi & Ihennacho, 2016). Giving credence to this, Oboegbulem (2016) maintained that to adequately discharge these functions, there must be massive investment of funds and facilities for secondary school principals to enable them perform their administrative duties affectively. In essence, administrative effectiveness requires that the principal be able to manage resources such as staff, finance, facilities among other things for optimum benefit of the school.

However, different reports have indicated that there are public crises of various dimensions such as poor funding, poor educational infrastructure which include inadequate classroom, shortfall and inadequacies in education funding, manifest in overcrowded classrooms, lack of facilities and equipment, ill-equipped workshops, libraries and laboratories where they exist at all, which combine to frustrate teaching and learning (Ikegbusi & Iheanacho, 2016; Olorunsola & Bello, 2018). This situation may disenchant principal's efforts to effectively administer schools. When this happens, the outcome may be unruly, unsettle students and lower the quality of instructional delivery, which may manifest in poor academic performance. In fact, secondary schools in Delta State are not exonerated from this ugly state of affair. Many have witnessed student violence, frequent outburst of unruly behaviour among students and lack of various amenities. Consequently, the inability of secondary school principals to demonstrate adequate administrative effectiveness could be as a result of some of these challenges.

Federal Republic of Nigeria, (2013) indicated that to ensure quality control in schools, it is necessary to have good teachers and supervisors. The primary responsibility of principals is to ensure that high standards are maintained and that schools are ran in accordance with the laid down policy. Quality education is tough to achieve without teachers playing a significant role. Principals on the other hand, encourage effective instructional delivery among teachers by identifying their needs and help them to meet such needs. This encouragement depends on the various principal's administrative skills. When teachers are satisfied with the administrative skills of their principals, their job performance might improve tremendously, because they tend to be more committed and dedicated to their job. Job performance is important to ensure that quality instruction takes place effectively at school. Factors which may ascertain teachers' job performance are the salary structure, career structure, promotion opportunities, availability of school facilities, school disciplinary policy and principal's administrative behaviour (Thomson, in Oguejiofor, 2020).

Principals' supervisory skill is the ability of the principals to monitor and harmonize activities in the schools to enhance effective instructional delivery. This involves checking records to ensure that things are working according to plan, visiting the classrooms to observe teachers and student, inspecting the school compound to see that things are in order and putting staff and students in the right track among others. In every organization, it is common to see the superior officer monitoring what the subordinate does to ensure that a set standard is obtained. Educational system has a set of goals that should be achieved. Chandrasekar in Oguejiofor (2020) remarked that supervision is a professional relationship that provides support and improves the practice of both teachers and supervisors. Thus, it is a vehicle that facilitates

growth, maintenance of professional standards and quality services. Effective supervision requires well trained managers with knowledge, interpersonal skills and technical skills that are developed to provide the necessary and appropriate guidance and support to the teaching staff. These personal attributes are essential for the principals' supervisory skills to ensure direct assistance to teachers as well as enhancing their job performance. Nakpodia in Oguejiofor (2020) in his study discovered that teachers' performance in secondary schools is significantly dependent on the capacity of the principals to effectively conduct adequate and valuable supervision which validates the importance of discipline, record keeping and teaching aids.

Oleforo, et al. (2017) explained that the character of a school reflects and tells the character of the principal. As such, everything in the school, the plant, the staff, the curriculum, methods and techniques of teaching; co-curricular activities, human relationships, bear the impress of the personality of the principal of the institution. It is rightly said that the schools become great not because of the magnificent buildings but because of "magnificent" principals; since the principal is the major component of school administration on whose ability and skill, personality and professional competence will largely define the tone and efficiency of the school.

Planning, organizing, supervising, staffing, assessing, coordinating, leadership, and acquiring and maintaining instructional materials, equipment, and buildings are among the administrative duties that principals are expected to accomplish. Principals are also responsible for overseeing the school's finances, as well as maintaining staff and student discipline. Instructional leadership strategy looks into whether principals involve their teachers in evaluation of the education process, in selection of materials and textbooks for their subjects, in school curriculum planning, in budget preparation, whether school objectives are clearly communicated among others. The instructional supervision strategy looks into whether teachers' activities are carefully monitored, constant classroom visitation, constructive criticism is used to correct teachers, lesson notes are supervised regularly and different supervisory techniques are employed by the principals among others. Therefore, a situation whereby principals fail to adopt effective administrative strategies in managing the schools, this might affect teacher commitment. Many of the teachers in such situation will not give best performances while executing their primary duties and students who are always at the receiving end suffer the consequences. The study is therefore designed to examine principals' administrative skills and effective instructional delivery in public secondary schools in Okpe/Sapele/Uvwie Federal Constituency of Delta State.

Statement of the Problem

It is the expectation of the government, parents and even students that quality education is received by students in Nigeria secondary schools through the adoption of appropriate administrative skills by the principals. Although principals have been providing leadership in the school system to some extent, but some administrative skills that could lead to the achievement of school objectives are still lacking. In fact, observations and visits to some public secondary schools in Okpe/Sapele/Uvwie Federal Constituency of Delta State have shown lack of effective instructional delivery in secondary schools in the area. This can be seen in the areas of inadequate funding, inadequate facilities, poor instructional supervision, inadequate equipment, laboratory and conflict among teachers, poor principal teacher relationship and poor school-community relations among others. These situations seem to have led to poor academic

achievement among the secondary school students in Okpe/Sapele/Uvwie Federal Constituency of Delta State.

There are many skills that could be employed by principals in order to have a grip of the whole school and consequently move the school forward academically. These ranges from setting a clear vision for the school, monitoring of teachers' and non-teaching staff activities, use of committee system in schools, performance appraisal, participatory decision making, delegation of duties, proper communication and regular staff meeting.

Therefore, the study investigates principals' administrative skills and effective instructional delivery in public secondary schools in Okpe/Sapele/Uvwie Federal Constituency of Delta State**.**

Aim and Objectives of the Study

The main purpose of this study is to find out principals' administrative skills and effective instructional delivery in public secondary schools in Okpe/Sapele/Uvwie Federal Constituency of Delta State. The specific objective of the study is to:

- Examine teacher's perception of principals' supervisory skills on effective instructional delivery in public secondary schools in Okpe/Sapele/Uvwie Federal Constituency of Delta State.
- Investigate teacher's perception of principals' organization skills on effective instructional delivery in public secondary schools in Okpe/Sapele/Uvwie Federal Constituency of Delta State.

Research Questions

The following research questions will guide the proposed study:

- What is the teacher's perception of principals' supervisory skills on effective instructional delivery in public secondary schools in Okpe/Sapele/Uvwie Federal Constituency of Delta State?
- What is the extent of teacher's perception of principals' organization skills on effective instructional delivery in public secondary schools in Okpe/Sapele/Uvwie Federal Constituency of Delta State?

Research Hypotheses

The following hypotheses will be formulated and tested at 0.05 level of significance:

- There is no significant difference of teacher's perception on principals' supervisory skills on effective instructional delivery in public secondary schools in Okpe/Sapele/Uvwie Federal Constituency of Delta State based on gender.
- There is no significant difference of teacher's perception on principals' organization skills on effective instructional delivery in public secondary schools in Okpe/Sapele/Uvwie Federal Constituency of Delta State based on gender.

METHODS

Research Design

The research design considered most suitable for this research was the descriptive survey design of the ex-post-facto type. This was because the researcher solicited for already existing information in the subject. This meant that there will be no treatment and hence the researcher only tested the knowledge of respondents that had already existed.

Area of the Study

The study covers Okpe/Sapele/Uvwie Federal Constituency of Delta State in the South-South geo-political zone of Nigeria. Considering the 2006 National Census figures, the population are 176,000, 174,273 and 188,728 for Okpe, Sapele and Uvwie respectively, total of 539,001. By projection, using a 20% increase, the Federal Constituency's population is about 650,000. Orerokpe, Sapele and Effurun are the headquarters of the three Local Government Areas that constitute the constituency and they share borders with Ethiope, Udu, Itsekiri and Ughelli. The notable landmarks in the area include the Federal University of Petroleum Resources and the Petroleum Training Institute at Effurun, Warri Refinery and Petrochemical Company and many other oil companies. The local government areas have infrastructural facilities like electricity, good roads and good communication network. Many of the residents have private bore holes that serve as their major source of water supply. The people in the federal constituency are mainly traders, business owners, civil servants and farmers. It has a number of rivers and stream flowing within its territories. The federal constituency was chosen for this study because of their love and interest in the education of their people.

Population of the Study

The study population consisted of all teachers and principals in the forty-nine (49) public secondary schools in Okpe/Sapele/Uvwie Federal Constituency of Delta State. Teacher's population in constituency is 1,169 teachers and 49 principals at the 2022/2023 school year (Ministry of Basic and Secondary Education, Delta State).

Sample and Sampling Techniques

A multi stage sampling techniques was used to select the sample of the study. In the first stage the forty-nine secondary schools were sampled in the federal constituency. In each of the schools, 5 teachers were selected by means of simple random sampling technique. On whole 245 teachers served as respondents for this study. The second stage, a purposeful sampling was used to select two (2) vice principal from each of the local government area including the forty-nine school principals. A total of three hundred (300) teachers, vice principals and principals were selected from Okpe/Sapele/Uvwie Federal constituency.

Instrument for Data Collection

The research instrument used for data collection was a self-structured questionnaire by the researcher titled "Principals' administrative skills and effective instructional delivery". The

construction of the questionnaire was guided by opinion and findings in the reviewed related literature. The instrument has two (2) sections, A and B. Section A consists of elicit personal information used to collect the demographic data of the respondents. Section B contains a total of 20 items. The questionnaire items were arranged in six clusters (Principal Supervisory Skill, and Principal organization Skill) to elicit information regarding the administrative leadership skills needed by principals. The study adopted a four-point Likert scale of Strongly Agree (SA), Agree (A), Disagree (D) and Strongly Disagree (SD).

Validity of the Instrument

The validity of the instrument used for the study was done through the content validity method. The instrument (questionnaire) was submitted to the supervisor for reading, scrutinizing and modification. The validation of the instrument was done by my supervisor and Dr. G. O. Okurumeh, a lecturer who specialises in curriculum studies and computer appreciation. After proper checking, and analysis of the various items in it, necessary modification and corrections were made and the instrument was thereafter approved for use by the project supervisor.

Reliability of the Instrument

The reliability of the instrument was established using test-retest method and correlated using Pearson product moment correlation coefficient from the correlation a coefficient of the instrument was established.

Administration of the Instrument

The structured and validated instrument was personally administered by the researcher and three (3) trained research assistants in their respective sample areas. The copies of questionnaire were given during school hours and retrieved immediately after they have been duly responded to. This was done to avoid loss.

Method of Data Analysis

The data obtained from the study were analyzed using descriptive statistics and inferential statistics. Statistical weighted mean was used to answer research questions while Pearson correlation was used in testing the hypotheses at 0.05 significant levels. The cut off points of research questions one is 2.50, therefore means responses of 2.50 and above were given positive interpretation (agreement) while those below 2.50 were interpreted negatively (disagreement). If the calculated t-value is greater than the critical t-value at alpha level of 0.05, the null hypotheses were rejected and vice versa.

RESULTS

Presentation of Data

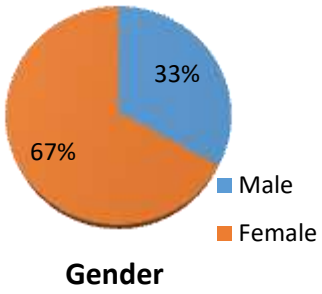

Figure 1: Showing the distribution of teachers in the study area

Figure 1 show the distribution of teachers in the study area. It shows that female was 201 (67%) and male were 99 (33%).

Research Question One

What are the principals' supervisory skills on effective instructional delivery in public secondary schools in Okpe/Sapele/Uvwie Federal Constituency of Delta State?

Table 1: Descriptive Statistics Showing the Principals' Supervisory Skills on Effective Instructional Delivery

S/N	Item	Mean	SD	Decision
1.	Principal easily identify lapses in teachers through regular supervision.	3.60	0.58	Agree
2.	Principal regularly visits teachers in classrooms to observe their teaching methods.	3.45	0.50	Agree
3.	Principal is very skilful in assigning teachers classes based on their areas of specializations.	3.30	0.46	Agree
4.	Principal suggest ways of improvement in the areas of their weak points.	3.25	0.43	Agree
5.	Teachers learn new teaching skills at the end of supervision.	3.35	0.48	Agree
6.	Principal guides teachers towards effective teaching through supervision.	3.35	0.57	Agree
7.	Politeness and coaching role of principal during supervision would boost teachers' morale and enhance their effectiveness in instructional delivery.	3.30	0.56	Agree
8.	Effectiveness in teaching depends on effective discharge of principal's administrative skill.	3.10	0.70	Agree
9.	Class lesson attendance register is effectively used by principal to identify teachers who skip their lessons.	3.10	0.54	Agree
10.	Principal constantly going through teachers' lesson note enhances instructional delivery	3.05	0.74	Agree

Aggregate mean 3.29

Table 1 presents the mean scores of teachers on their opinion concerning the principals' supervisory skills on effective instructional delivery which shows that item 1 on the table with a mean of 3.60 indicates that principal easily identify lapses in teachers through regular supervision. While item 2 which states that principal regularly visits teachers in classrooms to observe their teaching methods got a mean score of 3.45. This shows that in the study area, principals often visit teachers while they are teaching in class.

Item 3 with a mean of 3.30 indicates that principal is very skilful in assigning teachers classes based on their areas of specializations in the study area. Item 4 which were on principal suggesting ways of improvement in the areas of their weak points had a mean value of 3.25, meaning it was accepted by the teachers to be the case. Item 5 with a mean value of 3.35 accepted the statement that teachers learn new teaching skills at the end of supervision. Item 6 in the table above on principal guides teachers towards effective instructional delivery through supervision had a mean score of 3.35 from the respondents, this indicate that the statement is true in the study area.

Item 7 with a mean value of 3.30 showed that politeness and coaching role of principal during supervision would boost teachers' morale and enhance their effectiveness in instructional delivery. Item 8 with a mean score of 3.10 affirm the statement that effectiveness in teaching depends on effective discharge of principal's administrative skill. Item 9 had a mean value of 3.10 which agrees to the statement that class lesson attendance register is effectively used by principal to identify teachers who skip their lessons.

Also, item 10 with a mean score of 3.05 showed that principal constantly go through teachers lesson note enhance instructional delivery. With the overall mean value of 3.29, the respondents agree that principals' supervisory skills has a positive effect on instructional delivery in public secondary schools in Okpe/Sapele/Uvwie Federal Constituency of Delta State.

Research Question Two

To what extent do principals' organization skills affect effective instructional delivery in public secondary schools in Okpe/Sapele/Uvwie Federal Constituency of Delta State

Table 2: Descriptive Statistics Showing the Extent of Principals' Organization Skills on Effective Instructional Delivery

S/N	Items	Mean	SD	Decision
1.	Instructions on instructional delivery are timely and correctly given to teachers by principal.	3.05	0.74	Agree
2.	Upward communication is discouraged by principal and this reduces teachers' morale towards instructional delivery.	2.25	0.89	Agree
3.	Principal lack the basic communication skills that are necessary to enhance teachers' instructional delivery ability.	1.85	1.06	Agree
4.	Teachers' jobs are well-scheduled based on timetable to enhance efficient instructional delivery.	3.05	0.67	Agree
5.	Teachers prepare adequately for their jobs as the responsibilities are always given to them in advance by the principal.	3.10	0.70	Agree
6.	Principal always expect feedback from teachers on every instruction given to them.	3.10	0.54	Agree
7.	Principal encourages self-expression, creativity and interaction among staff in the school.	3.20	0.40	Agree
8.	Principal communicates openly to staff about the school activities.	3.15	0.79	Agree

9.	Principal uses appropriate communication channels to pass information to all staff.	3.30	0.64	Agree

Aggregate mean 2.89

Table 2 presents the mean value of the extent to which principals' organization skills affect effective instructional delivery in public secondary schools in Okpe/Sapele/Uvwie Federal Constituency of Delta State. Item 1 on the table with a mean of 3.05 indicates that instructions on instructional delivery are timely and correctly given to teachers by principal.

Item 2 with a mean of 2.25 indicate that the statement that upward communication is discouraged by principal and this reduces teachers' morale towards instructional delivery was rejected. Item 3 with a mean of 1.85 shows that principal lack the basic communication skills that are necessary to enhance teachers' instructional delivery ability. Item 4 with a mean value of 3.05 shows that the statement that teacher' jobs are well-scheduled based on timetable to enhance efficient instructional delivery was accepted.

Item 5 with a mean score of 3.10 indicates that teachers prepare adequately for their jobs as the responsibilities are always given to them in advance by the principal. Item 6 with a mean value of 3.10 indicates that principal always expect feedback from teachers on every instruction given to them. Item 7 showed that principal encourages self-expression, creativity and interaction among staff in the school with a mean of 3.20. Item 8 with a mean value of 3.15 indicates that principal communicates openly to staff about the school activities.

Item 9 with a mean of 3.30 shows that principal uses appropriate communication channels to pass information to all staff. The overall mean of 2.89 shows that principal' organization skills affect effective instructional delivery in public secondary schools in Okpe/Sapele/Uvwie Federal Constituency of Delta State.

Hypothesis 1: There is no significant difference of teacher's perception on principals' supervisory skills on effective instructional delivery in public secondary schools in Okpe/Sapele/Uvwie Federal Constituency of Delta State based on gender.

Table 3: Pearson (r) Analysis on Principals' Supervisory Skills and Instructional Delivery

		Principals' supervisory skills	Instructional delivery
Principals' supervisory skills	Pearson Correlation	1	.058
	Sig (2-tailed)		.317
	N	300	300
Instructional delivery	Pearson Correlation	.058	1
	Sig (2-tailed)	.317	
	N	300	300

*. Correlation is significant at the 0.05 level (2-tailed)

Table 3 above shows the relationship between principals' supervisory skills and effective instructional delivery with r value of .058 and significance p = .317. Therefore, the null hypothesis which states that there is no significant relationship between principals' supervisory skills and effective instructional delivery in Okpe/Sapele/Uvwie Federal Constituency of Delta State public secondary schools was accepted. Thus, there is no significant relationship between principals' supervisory skills and instructional delivery in Delta State public secondary schools.

Hypothesis 2: There is no significant difference on principals' organization skills on effective instructional delivery in public secondary schools in Okpe/Sapele/Uvwie Federal Constituency of Delta State

Table 4: Pearson (r) Analysis on Principals' Organization Skills and Instructional Delivery

		Principals' organization skills	Instructional delivery
Principals' organization skills	Pearson Correlation	1	.491*
	Sig (2-tailed)		.000
	N	300	300
Instructional delivery	Pearson Correlation	.491*	1
	Sig (2-tailed)	.000	
	N	300	300

*. Correlation is significant at the 0.05 level (2-tailed)

Table 4 above shows the relationship between principals' organization skills and effective instructional delivery with r value of .491 and significance P = .000. Therefore, the null hypothesis which states that there is no significant relationship between principals' organization skills and effective instructional delivery in Okpe/Sapele/Uvwie Federal Constituency of Delta State public secondary schools was rejected. Thus, there is a significant relationship between principals' organization skills and instructional delivery in Delta State public secondary schools.

DISCUSSION OF RESULTS

According to the findings in Okpe/Sapele/Uvwie Federal Constituency of Delta State public secondary schools, there is no relationship between principals' supervisory skills on effective instructional delivery. Although, supervision enables principal to easily identify lapses in teachers through regular inspection and through regularly visits to teachers in classrooms, they observe their teaching methods. Supervision plays an important role in the effective administration of the schools. Effective and adequate supervision is required by the principals, perhaps as a result of the fact that some teachers are lazy and may not want to do their jobs as expected. It is therefore germane for the principal to get them supervised from time to time in order to ensure that they do their jobs as required. There is no gain saying the fact where teachers are not properly supervised, it will have adverse effect on the administrative effectiveness and excellence of the school principals.

No wonder Manafa (2020), posited that of the major functions of the school principals' no one is greater than their functions as supervisors, instruction and curriculum planners. The principals are therefore the overall supervisors of the school programmes. The supervising skills of the principals will help in rating teachers, help the teachers to use various measures of self-evaluation and to a large extent make the principal provide suitable enabling environment for teaching-learning activities. Manafa (2020) also opined that supervision brings about excellence and quality and it helps to give concrete and constructive advice and encourage teachers in order to improve teaching and learning. The respondents in this study agreed that in using instructional supervision in secondary schools' principals supervise teachers' activities to avoid deviation, engage in routine classroom visitation to improve on teachers' delivery of instruction, check teachers lesson notes to make sure they are up to date and take regular attendance of teacher's activities in the classroom to ensure teacher commitment (Agu & Okoli, 2021).

Mobegi et al. cited in Agu and Okoli (2021) further noted that principals should take up their roles as quality assurance officers in their schools and ensure that there is adequate departmental supervision. As instructional leaders, principal's administrative tasks may include supervision, monitoring, assessment, evaluation and dissemination of current information on management and academic techniques to teachers leading to effective instructional delivery. The principals may also be described as an executive head of the school (Achimugu in Agu and Okoli (2021) because of the way he makes decisions and implement its policies and programmes. It was evident across the schools sampled that there was inconsistent instructional supervision and monitoring of students' learning through consistent and more practical assessment procedures which could have contributed to poor student performance. It was also evident that monitoring of curriculum instruction by principals was erratic in most schools to ensure schools meet their targets. However, this study differs from that of Oleforo et al. (2017) in their study on the relationship between principals' supervisory skill and proper conduct of examination among secondary school students, which revealed that there is a significant relationship between principals' supervisory skill and proper conduct of examination among secondary school students. They attributed their result to the prominent role which supervision has in an organization.

Thus, to achieve acceptable standards and results, principals must supervise the staff and students regularly to ensure the achievement of the goals and objectives of education at that level and invariably control the incidence of examination misconduct in schools and their finding is in line with the view of Oleforo (2014), who opined that principals' supervisory skill is significantly related to teachers job performance; and hence if teachers deliver their duties effectively, students on their part will be committed and this will lead to reduction if not complete eradication of the incidence of examination misconduct in schools. The findings of the study, however, disagreed with Oguejiofor (2020) who submitted that there was no significant influence of principals' supervisory role on teachers' job performance in Catholic secondary schools in Nasarawa State. The role of a principal as a supervisor is to improve, encourage, coordinate and direct teachers towards personal and institutional goal attainment. Supervision of teachers by principals is a prerequisite to promote professional standards in the teaching profession. As such, it is the responsibility of principals to assist teachers through supervision to identify and provide the way forward to challenges that hinder teachers' effective job performance.

Based on the findings, it was discovered that there is a significant relationship between principal's organization skill and effective instructional delivery in public secondary schools in Okpe/Sapele/Uvwie Federal Constituency of Delta State. This means that good organization skill enables the principals to put the right person in the right place to do the right thing at the right time, by implication, it is evident that internal organization and control of the schools depend largely and solemnly on the principals. The principals thus make use of the organization skill to ensure good organization structure in the school for administrative effectiveness and for effective accomplishment of the specific goals and objectives of the schools. The above finding correlates with the opinion of Manafa (2020), who submitted that for principals to be effective administratively, he must be able to organize human material resources in the school to bring about effective learning and attainment of goals.

CONCLUSION

Effective instructional delivery In Okpe/Sapele/Uvwie Federal Constituency of Delta State public secondary schools are determined by administrative efficiencies, such as the principal's effective administrative skills. It implies that schools where principals display high administrative skills particularly supervision and organization of staffs and non-staffs, students and instructional facilities, teachers would aspire to be in school daily and impart knowledge to the students. In turn, these students would achieve greater height academically, thereby achieving the schools' goals and objectives. As a result, it is suggested that Delta State secondary school principals should consider their administrative skills as a source of teacher productivity and students' excellence. Secondary school principals in Delta State should be knowledgeable, professional and be administratively competent, as well as resourceful so as to complement the efforts of the government towards achieving the goals of the schools.

Implication on the Study

While previous researchers have focused on or may have focused on different principals' administrative skill on effective teaching and learning, this researcher focused on principals' supervisory skills and principals' organization skills on instructional delivery in public secondary schools and the results showed that when principals exhibit high level of these skills, it positively affects instructional delivery.

Recommendations

Based on the findings of the study, it was recommended that:

- The modern-day school principals should be knowledgeable, professionally and administratively competent, as well as resourceful so as to complement the efforts of the government towards achieving the goals of the schools.
- Teachers and students should be supervised regularly by the principals. The teachers should be made to do their work effectively; their lesson notes/work plan should be checked to ensure adequate lesson preparation, ensuring their come to school on time and attain to their lessons appropriately. Students, on their own part, should be encouraged to take their studies seriously.
- Government should make provision for sponsoring principals and organising conferences for them to serve as a means for professional growth as well as incentives to the principals. Government should refrain from frequent changes in educational policies as policies which are ambiguous with marked difference from the existing ones may leave school principals confused.
- Principals must define objectives with teachers as teachers would be committed in their job to ensure that the objectives are achieved as they participated in deciding the objectives.

THE ADMINISTRATOR'S ROLE IN CURBING INDISCIPLINE AND TEACHER TURNOVER IN SECONDARY SCHOOLS IN NIGERIA

Florence Akanimo INWANG
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

Indiscipline among students and high teacher turnover are significant challenges facing secondary schools in Nigeria, undermining educational quality and institutional stability. This paper examines the critical role of school administrators in addressing these issues, focusing on strategies to foster discipline and retain qualified teachers. Through a qualitative review of literature, the study identifies poor leadership, inadequate motivation, weak disciplinary policies, and unfavorable working conditions as key contributors to these problems. It noted among others that effective administrators play a pivotal role in curbing indiscipline by implementing clear, consistent disciplinary measures, promoting student engagement, and fostering a positive school culture. Additionally, proactive leadership in teacher retention involves improving welfare packages, providing professional development opportunities, and enhancing workplace conditions. The paper highlighted the importance of collaborative governance, where administrators work with teachers, parents, and policymakers to create a supportive and disciplined learning environment. Suggestions include strengthening administrative training programs, adopting participatory management approaches, and advocating for better teacher remuneration and incentives. The paper concludes that competent and proactive school leadership is essential in reducing indiscipline and minimizing teacher turnover, thereby improving overall educational outcomes in Nigerian secondary schools.

Keywords: School Administration, Indiscipline, Teacher Turnover, Secondary Schools, Nigeria, Leadership Strategies.

INTRODUCTION

The Nigerian secondary education system faces a dual crisis of escalating student indiscipline and alarming teacher turnover rates, both of which undermine the quality of education and the stability of schools. Student indiscipline manifests in various forms, including truancy, classroom disruptions, bullying, substance abuse, and even physical violence against teachers and peers (Adegboyega, 2021). At the same time, teacher turnover has reached critical levels, with many educators leaving the profession due to poor working conditions, lack of support, and the stress

of managing unruly classrooms (Uchechi, 2022). These interconnected issues create a vicious cycle: as student behavior worsens, teachers become demoralized and exit the profession, leading to staffing shortages that further destabilize school environments and exacerbate disciplinary problems (Nwogu & Eke, 2021). Amid this crisis, school administrators; principals, vice-principals, and other leadership figures play a pivotal yet often underutilized role in addressing these challenges. Their leadership style, policies, and daily decisions significantly influence both student behavior and teacher job satisfaction, making them central to any sustainable solution (Adeyemi & Adeyinka, 2018).

Administrators are uniquely positioned to curb indiscipline by fostering a school culture that prioritizes respect, accountability, and positive behavior. Schools with strong, visible leadership report lower rates of student misconduct and higher levels of teacher retention (Gregory et al., 2020). Effective administrators implement clear, consistent disciplinary policies that are fairly enforced, ensuring that students understand the consequences of their actions while also providing support systems such as counseling and mentorship programs (Okeke & Nzewi, 2020). For instance, restorative justice approaches, which focus on repairing harm and rebuilding relationships rather than punitive measures, have proven successful in reducing recidivism and improving school climates (Ajayi & Ekundayo, 2020). However, many Nigerian schools lack such structured interventions, often due to administrative negligence or a lack of training in modern disciplinary strategies (Olatunji & Folorunsho, 2019). When administrators fail to address indiscipline decisively, teachers are left to manage chaotic classrooms alone, leading to frustration and burnout - a key driver of turnover (Adegboyega, 2021).

Beyond discipline, administrators directly impact teacher retention through their management practices. Teachers are more likely to remain in schools where they feel supported, valued, and professionally fulfilled (Adeyemi & Adeyinka, 2018). Unfortunately, many Nigerian secondary school teachers report feeling abandoned by their administrators, who fail to provide adequate resources, professional development opportunities, or even basic protections against student violence (Uchechi, 2022). For example, female teachers facing sexual harassment from male students often find their complaints ignored or mishandled by school leaders, further eroding trust in the administration (Nwogu & Eke, 2021). Conversely, administrators who actively advocate for their staff; whether by ensuring timely salary payments, reducing bureaucratic burdens, or creating opportunities for career advancement can significantly enhance job satisfaction and reduce attrition rates (Okafor & Onyishi, 2021). The absence of such support is particularly damaging in under-resourced schools, where teachers already grapple with overcrowded classrooms, inadequate materials, and minimal infrastructure (Okeke & Nzewi, 2020).

The administrator's role extends to bridging the gap between schools and communities, which is critical for addressing the root causes of indiscipline and teacher dissatisfaction. In many cases, student misbehavior reflects broader societal issues, such as poverty, family instability, or the erosion of traditional values (Olatunji & Folorunsho, 2019). Administrators who engage parents, local leaders, and community organizations in school governance can foster a shared sense of responsibility for student conduct and teacher welfare (Gregory et al., 2020). For instance, parent-teacher associations (PTAs) and community policing initiatives have been effective in some regions for monitoring student behavior outside school hours and providing a support network for educators (Ajayi & Ekundayo, 2020). However, such collaborations require proactive leadership, which is often lacking in schools where administrators are overwhelmed by

bureaucratic demands or lack the skills to mobilize community stakeholders (Adeyemi & Adeyinka, 2018).

In a concluding note, the crisis of indiscipline and teacher turnover in Nigerian secondary schools cannot be resolved without recognizing and strengthening the administrator's role. Effective school leadership is not merely about enforcing rules or managing staff; it involves creating a vision for a positive school culture, advocating for necessary resources, and building systems that support both students and teachers (Adegboyega, 2021). This requires targeted investments in leadership training programs, better oversight mechanisms to hold administrators accountable, and policies that empower school leaders to make decisions tailored to their unique contexts (Uchechi, 2022). Without such measures, the cycle of dysfunction will persist, leaving teachers overburdened, students underserved, and Nigeria's education system in perpetual decline.

CONCEPTUAL CLARIFICATIONS

School Administration

School administration is a critical component of the educational system, encompassing the processes, policies, and leadership strategies necessary to ensure the effective operation of schools. It involves the coordination of human, financial, and material resources to create an environment conducive to teaching and learning. School administrators, including principals, vice-principals, and other leadership personnel, play a pivotal role in shaping school culture, implementing curricula, managing staff, and fostering community relationships (Hallinger, 2018).

Effective school administration is characterized by strong leadership, clear communication, and a commitment to continuous improvement. One of the primary functions of school administration is instructional leadership, which focuses on improving teaching quality and student achievement. Instructional leaders work closely with teachers to develop curricula, monitor classroom practices, and provide professional development opportunities (Robinson et al., 2011). Schools with strong instructional leadership tend to have higher student performance, as administrators prioritize data-driven decision-making and evidence-based teaching strategies (Leithwood et al., 2020). Administrators must ensure that schools comply with local, state, and national education policies, which often requires balancing regulatory demands with the unique needs of their school communities (Fullan, 2014).

Another key aspect of school administration is organizational management, which includes budgeting, staffing, and facility maintenance. Efficient resource allocation is essential for sustaining educational programs and maintaining a safe learning environment (Hoy & Miskel, 2013). Administrators must also address challenges such as teacher retention, student discipline, and parental engagement, all of which influence school effectiveness. A study by Darling-Hammond (2017) highlighted the importance of supportive leadership in reducing teacher turnover, as educators are more likely to remain in schools where they feel valued and professionally empowered. Furthermore, school administration plays a crucial role in fostering inclusive and equitable learning environments. Administrators must address disparities in educational access by implementing policies that support marginalized students, including those from low-income backgrounds, students with disabilities, and English language learners (Khalifa et al., 2016). Culturally responsive leadership, which emphasizes understanding and addressing

the diverse needs of students, has been shown to improve academic outcomes and school climate (Gay, 2018).

In recent years, the role of school administrators has expanded to include crisis management, particularly in response to events such as the COVID-19 pandemic. Administrators were tasked with transitioning to remote learning, ensuring student and staff safety, and addressing the socio-emotional impacts of the crisis (Harris & Jones, 2020). This experience underscored the need for adaptive leadership skills in navigating unforeseen challenges. School administration is a multifaceted field that requires a combination of leadership, management, and interpersonal skills. Effective administrators must balance instructional oversight, organizational efficiency, and equity-focused initiatives to create thriving educational environments. As schools continue to evolve in response to societal changes, the role of administrators will remain central to shaping the future of education.

Indiscipline

Indiscipline refers to the failure to adhere to established rules, norms, or codes of conduct, often leading to disruptive behavior in educational, social, or professional settings. In schools, indiscipline manifests as student misconduct, including tardiness, absenteeism, aggression, defiance, and classroom disruptions, which hinder the learning process (Maphosa & Mammen, 2011). The causes of indiscipline are multifaceted, stemming from individual, familial, societal, and institutional factors. Poor parental supervision, peer influence, lack of motivation, and ineffective school policies contribute significantly to unruly behavior among students (Osher et al., 2016). Additionally, socio-economic challenges, such as poverty and exposure to violence, exacerbate disciplinary problems, particularly in underprivileged communities (Gudyanga et al., 2019).

Teachers and school administrators play a crucial role in managing indiscipline, yet many struggle with implementing effective corrective measures. Traditional punitive approaches, such as suspensions and expulsions, often fail to address the root causes of misconduct and may even reinforce negative behavior (Skiba et al., 2014). Restorative practices, positive behavioral interventions, and socio-emotional learning programs are more effective in fostering self-discipline and conflict resolution skills among students (Gregory et al., 2020). Schools that emphasize a supportive and inclusive climate, where students feel valued and understood, tend to experience fewer disciplinary issues (Bear et al., 2017).

Beyond the classroom, indiscipline in broader society - such as workplace misconduct, civil unrest, and criminal behavior reflects deeper systemic failures. Weak governance, corruption, and inadequate enforcement of laws contribute to a culture of impunity (Transparency International, 2022). Addressing indiscipline requires a holistic approach, combining strict but fair consequences with preventive strategies that promote ethical behavior and accountability. In conclusion, indiscipline is a complex issue influenced by various personal and environmental factors. Effective solutions must go beyond punishment and instead focus on mentorship, positive reinforcement, and systemic reforms that encourage discipline at individual and institutional levels.

Teacher Turnover

Teacher turnover refers to the rate at which educators leave their teaching positions, either to transfer to other schools or exit the profession entirely. High teacher turnover poses significant challenges to educational systems, disrupting student learning, increasing recruitment costs, and undermining school stability (Sutcher et al., 2016). Teacher attrition is highest among early-career educators, with nearly 10% leaving the profession after their first year and up to 30% departing within five years (Ingersoll et al., 2021). The causes of teacher turnover are complex, encompassing low salaries, poor working conditions, lack of administrative support, and high-stress environments (García & Weiss, 2019).

Schools in high-poverty areas experience even greater turnover rates, exacerbating educational inequities (Simon & Johnson, 2015). One of the primary drivers of teacher turnover is job dissatisfaction, often linked to inadequate compensation and excessive workloads. Teachers frequently report feeling overburdened by administrative tasks, standardized testing pressures, and large class sizes, leaving little time for meaningful instruction (Skaalvik & Skaalvik, 2020). Insufficient professional development and limited career advancement opportunities contribute to frustration and attrition (Ronfeldt et al., 2013). The emotional demands of teaching, including: managing student behavior and addressing socio-emotional needs, further strain educators, leading to burnout (Madigan & Kim, 2021).

The consequences of high teacher turnover are far-reaching. Frequent staff changes disrupt instructional continuity, negatively impacting student achievement, particularly in disadvantaged schools (Carver-Thomas & Darling-Hammond, 2017). Furthermore, constant hiring and training of new teachers drain school budgets and reduce overall morale among remaining staff (Podolsky et al., 2019). Retaining experienced educators is crucial for maintaining institutional knowledge and fostering a positive school culture. Efforts to reduce teacher turnover must focus on improving working conditions, offering competitive salaries, and providing mentorship programs for novice teachers. Schools with strong leadership, collaborative environments, and opportunities for professional growth report higher retention rates (Kraft et al., 2016). Policymakers must also address systemic issues such as equitable funding and teacher autonomy to create sustainable career pathways in education.

Secondary Schools in Nigeria

Secondary education in Nigeria serves as a critical bridge between primary schooling and tertiary education, typically covering six years divided into junior and senior secondary levels. Despite its importance, the sector faces numerous challenges that hinder its effectiveness. The Nigerian secondary education system is governed by national policies, including the National Policy on Education, which mandates a 6-3-3-4 structure (six years of primary, three years of junior secondary, three years of senior secondary, and four years of tertiary education) (Federal Ministry of Education, 2013). However, implementation gaps persist due to inadequate funding, poor infrastructure, and teacher shortages (Adeyemi & Adeyinka, 2018). Many schools lack basic facilities such as laboratories, libraries, and functional classrooms, particularly in rural areas, which disproportionately affect learning outcomes (Okeke & Nzewi, 2020). Teacher quality and availability remain significant concerns.

A substantial proportion of secondary school teachers are unqualified or underqualified, particularly in core subjects like mathematics and sciences (Adedeji & Olaniyan, 2011). This

contributes to poor student performance in national examinations such as the West African Senior School Certificate Examination (WASSCE), where pass rates in key subjects often fall below 50% (Nwogu & Eke, 2021). Additionally, frequent strikes by teachers' unions over unpaid salaries and poor working conditions further disrupt academic activities (Ajayi & Ekundayo, 2019). The student-teacher ratio is also high, averaging 40:1 in many public schools, which limits individualized attention and effective learning (Uchechi, 2022).

Socio-economic factors further exacerbate disparities in secondary education. Many families struggle to afford school fees, uniforms, and textbooks, leading to high dropout rates, particularly among girls (Onyejiaku & Obioma, 2020). Security challenges, such as insurgency in northern Nigeria, have also forced many schools to close, leaving thousands of adolescents without access to education (Onyeaju, 2021). Despite these challenges, some interventions, such as the Universal Basic Education (UBE) program and private sector partnerships, have improved access and quality in certain regions (Adeniran & Yusuf, 2022). Reforming Nigeria's secondary education system requires increased government funding, teacher training programs, and infrastructure development. Addressing socio-economic barriers through scholarships and community engagement is also crucial. Without systemic improvements, the potential of Nigerian youth remains untapped, perpetuating cycles of poverty and underdevelopment.

Leadership Strategies

Effective leadership strategies are essential for organizational success, influencing productivity, employee engagement, and long-term growth. Leadership strategies encompass the approaches and techniques leaders employ to guide teams, make decisions, and achieve organizational objectives (Northouse, 2022). Contemporary leadership theories emphasize adaptive strategies that respond to dynamic workplace environments, including transformational, servant, and distributed leadership models (Avolio & Yammarino, 2013). Transformational leadership, which focuses on inspiring and motivating employees through vision and shared goals, has been shown to enhance performance and innovation (Bass & Riggio, 2014).

Similarly, servant leadership prioritizes employee development and ethical decision-making, fostering trust and collaboration within teams (Greenleaf, 2016). A critical aspect of leadership strategy is emotional intelligence, which enables leaders to manage interpersonal relationships effectively. Leaders with high emotional intelligence demonstrate empathy, self-awareness, and conflict-resolution skills, contributing to positive organizational climates (Goleman, 2015). Emotionally intelligent leaders are better equipped to navigate workplace challenges and maintain employee morale (Mayer et al., 2016). Additionally, inclusive leadership strategies, which promote diversity and equity, have gained prominence in addressing systemic biases and fostering inclusive cultures (Hollander, 2018). Inclusive leaders actively seek diverse perspectives, ensuring all team members feel valued and heard (Chin, 2021).

The digital age has necessitated adaptive leadership strategies to manage remote and hybrid work environments. Leaders must leverage technology to maintain communication, collaboration, and engagement across dispersed teams (Kane et al., 2021). Agile leadership, characterized by flexibility and iterative decision-making, has emerged as a vital strategy for navigating uncertainty and rapid change (Dweck, 2017). Also, ethical leadership strategies, which emphasize transparency and accountability, are crucial for building stakeholder trust and sustaining organizational integrity (Brown & Treviño, 2019). Leadership strategies must also address generational differences in the workforce. Millennials and Generation Z employees often

value purpose-driven leadership, seeking alignment between organizational goals and personal values (Twenge, 2020). Leaders who adopt coaching and mentorship strategies can bridge generational gaps, fostering knowledge transfer and professional growth (Clutterbuck, 2020).

CAUSES OF INDISCIPLINE IN SECONDARY SCHOOLS

Indiscipline among students manifests in various forms, including truancy, examination malpractice, bullying, and disrespect for authority. Key contributing factors include:

Poor Parenting and Societal Influence

Indiscipline among secondary school students in Nigeria has become a growing concern, with increasing instances of truancy, bullying, examination malpractice, and disrespect for authority. Two significant factors contributing to this problem are poor parenting practices and negative societal influences. The family, as the primary socializing agent, plays a crucial role in shaping children's behavior, yet many Nigerian parents fail to instill discipline due to various socio-economic pressures (Adegboyega, 2021). Absentee parenting, where parents are physically or emotionally unavailable due to work demands or other commitments, leaves children without proper guidance and moral direction (Ojo & Adebayo, 2020). Permissive parenting styles, characterized by excessive leniency and lack of boundaries, further exacerbate indiscipline as children grow up without understanding the consequences of their actions (Olatunji & Folorunsho, 2019). Conversely, authoritarian parenting, which relies on harsh punishments rather than constructive discipline, can breed resentment and rebellious behavior in adolescents (Eze & Onyishi, 2021).

Societal influences also play a detrimental role in fostering indiscipline among students. The glorification of wealth and material success in Nigerian society, often without emphasis on hard work and integrity, creates unrealistic aspirations among youths (Akinfolarin & Ehinola, 2022). Many students engage in examination malpractice and other forms of misconduct, believing that the end justifies the means (Ajayi & Ekundayo, 2020). The media, particularly social media and entertainment industries, frequently portray negative role models who celebrate violence, fraud, and disrespect for authority, further influencing vulnerable adolescents (Onyejiaku, 2021). Peer pressure compounds these issues, as students often emulate the delinquent behaviors of their friends to gain acceptance or avoid bullying (Uchechi, 2022). Additionally, the erosion of traditional values and communal child-rearing practices has weakened the moral fabric that once reinforced discipline in younger generations (Nwogu & Eke, 2021).

The Nigerian education system itself sometimes inadvertently contributes to indiscipline through inadequate counseling services, overcrowded classrooms, and poorly trained teachers who lack effective classroom management skills (Okeke & Nzewi, 2020). While schools struggle to enforce discipline, the broader societal tolerance for corruption and rule-breaking undermines their efforts (Adeyemi & Adeyinka, 2018). Addressing this challenge requires a multi-faceted approach involving parents, educators, and policymakers. Parenting education programs could help caregivers develop more effective discipline strategies, while community initiatives should promote positive role models and values (Onyeaju, 2021). Schools must strengthen their guidance and counseling departments while fostering partnerships with parents to reinforce consistent behavioral expectations. Without concerted efforts to improve parenting practices and

curb negative societal influences, the cycle of indiscipline in Nigerian secondary schools will persist, with long-term consequences for the nation's development.

Ineffective School Policies

The rising incidence of indiscipline in Nigerian secondary schools is significantly exacerbated by ineffective school policies that fail to address contemporary behavioral challenges. Many school policies remain outdated, rigid, and poorly implemented, creating an environment where misconduct thrives (Adeyemi & Adeyinka, 2018). One major issue is the reliance on punitive measures rather than preventive strategies. Schools often emphasize corporal punishment and suspension without addressing the root causes of indiscipline, such as poor teacher-student relationships or inadequate counseling services (Okeke & Nzewi, 2020). Zero-tolerance policies, which automatically punish infractions without considering context, often worsen student behavior by fostering resentment rather than reform (Skiba et al., 2014).

Another critical failure is the lack of clear, consistent enforcement of school rules. Many institutions have well-drafted codes of conduct, but implementation is weak due to administrative negligence, teacher apathy, or corruption (Ajayi & Ekundayo, 2020). For instance, some school officials overlook offenses like examination malpractice or bullying due to pressure from parents or fear of reputational damage (Nwogu & Eke, 2021). This selective enforcement erodes respect for authority and emboldens students to flout rules. Additionally, overcrowded classrooms and understaffed administrative units make it difficult to monitor and manage student behavior effectively (Uchechi, 2022).

Likewise, school policies often neglect the role of student engagement in promoting discipline. Many Nigerian secondary schools operate under authoritarian systems where students have no voice in rule-making or school governance (Olatunji & Folorunsho, 2019). Studies indicate that involving students in creating and reviewing school policies increases their commitment to compliance (Gregory et al., 2020). However, such participatory approaches are rare, leaving students feeling marginalized and more likely to rebel against imposed rules. The absence of professional development for teachers on classroom management and conflict resolution further undermines discipline. Many teachers lack training in modern disciplinary techniques, relying instead on outdated, coercive methods that escalate conflicts (Adegboyega, 2021). Without proper support, even well-intentioned policies fail in practice.

Teacher Incompetence and Unfair Treatment

The persistent problem of indiscipline in Nigerian secondary schools is significantly compounded by teacher incompetence and unfair treatment of students. Many teachers lack the necessary pedagogical skills and subject-matter expertise to effectively manage classrooms and deliver quality instruction (Adegboyega, 2021). This professional deficiency often manifests in poor teaching methods, inability to maintain student engagement, and failure to implement appropriate disciplinary measures, all of which contribute to disruptive behavior (Olatunji & Folorunsho, 2019). Studies reveal that teachers who struggle with classroom management frequently resort to authoritarian tactics, such as public humiliation or excessive punishment, which exacerbate student resentment and rebellion (Eze & Onyishi, 2021). The prevalence of unqualified teachers, particularly in rural schools, further worsens this situation, as many

educators lack formal training in child psychology or modern disciplinary approaches (Adedeji & Olaniyan, 2011).

Unfair treatment of students by teachers and school administrators is another critical factor driving indiscipline. Favoritism, bias in punishment, and the unequal application of school rules create a sense of injustice among students, leading to defiance and misconduct (Nwogu & Eke, 2021). For instance, students from wealthier families or those with connections to school staff often receive leniency for infractions, while others face harsh penalties for similar offenses (Ajayi & Ekundayo, 2020). This double standard erodes trust in school authority and encourages disrespect among students who perceive the system as corrupt (Uchechi, 2022). Additionally, some teachers engage in verbal abuse, discrimination, or even sexual harassment, which not only violates students' rights but also fosters a hostile learning environment (Okeke & Nzewi, 2020). Such unethical behavior undermines the moral authority of educators and justifies student resistance in the eyes of their peers.

The combination of teacher incompetence and unfair treatment creates a cycle of indiscipline that is difficult to break. Students who feel marginalized or unfairly targeted are more likely to disengage from academic activities, disrupt classes, or drop out altogether (Onyejiaku & Obioma, 2020). To address these issues, the Nigerian education system must prioritize teacher training, professional development, and strict accountability measures to ensure educators are both competent and equitable in their treatment of students (Adeyemi & Adeyinka, 2018). Without these reforms, teacher-related factors will continue to fuel indiscipline in secondary schools, hindering academic achievement and overall school effectiveness.

Overcrowded Classrooms

Overcrowded classrooms in Nigerian secondary schools have become a significant contributor to student indiscipline, creating an environment where effective teaching and learning are severely compromised. With student-teacher ratios often exceeding 50:1 in many public schools (Uchechi, 2022), teachers struggle to maintain order, monitor behavior, and provide individualized attention. This congested learning space naturally leads to increased noise levels, physical discomfort, and frequent distractions that make classroom management exceptionally challenging (Okeke & Nzewi, 2020). Overcrowding directly correlates with higher incidents of disruptive behaviors such as talking out of turn, physical altercations, and general classroom unrest (Adeyemi & Adeyinka, 2018). The physical constraints of overcrowded classrooms also limit teachers' ability to implement interactive teaching methods or move freely to supervise students, inadvertently creating opportunities for misconduct (Nwogu & Eke, 2021).

The psychological impact of overcrowding further exacerbates disciplinary problems. Students in congested classrooms often experience heightened stress levels, frustration, and decreased motivation, which manifest in aggressive or attention-seeking behaviors (Olatunji & Folorunsho, 2019). Teachers in these environments frequently resort to authoritarian control methods or neglect minor infractions due to sheer exhaustion, both of which reinforce patterns of indiscipline (Ajayi & Ekundayo, 2020). Additionally, overcrowding makes it difficult to implement modern disciplinary approaches like restorative justice or peer mediation that require space and time for proper facilitation (Gregory et al., 2020). The situation is particularly acute in urban schools where population pressures combine with inadequate infrastructure to create persistently overcrowded conditions (Adegboyega, 2021). Without urgent measures to reduce class sizes through infrastructure development and increased teacher recruitment, overcrowded

classrooms will continue to undermine discipline and learning outcomes in Nigerian secondary schools.

CAUSES OF TEACHER TURNOVER IN SECONDARY SCHOOLS

High teacher attrition negatively impacts educational quality. Major reasons for teacher turnover include:

Poor Working Conditions

Teacher turnover in Nigerian secondary schools has reached alarming levels, with poor working conditions emerging as a primary driver of this trend. Many teachers face inadequate infrastructure, including dilapidated classrooms, insufficient teaching materials, and lack of basic facilities like staff rooms and libraries (Adegboyega, 2021). These substandard working environments not only hinder effective teaching but also demoralize educators, pushing them to seek better opportunities elsewhere (Olatunji & Folorunsho, 2019). Additionally, overcrowded classrooms with student-teacher ratios exceeding 50:1 make classroom management exhausting, further contributing to job dissatisfaction (Uchechi, 2022).

Another critical factor is the irregular payment of salaries and allowances, which remains a persistent issue in many states (Ajayi & Ekundayo, 2020). Teachers often endure months of unpaid wages, forcing them to take on additional jobs or leave the profession entirely to meet basic financial needs (Nwogu & Eke, 2021). The lack of professional development opportunities exacerbates the problem, as teachers feel stagnant in their careers without access to training, promotions, or career advancement programs (Okeke & Nzewi, 2020). Poor working conditions also extend to safety concerns, with many schools lacking security measures, making teachers vulnerable to harassment, violence, or even kidnappings in high-risk areas (Adeyemi & Adeyinka, 2018).

The cumulative effect of these challenges leads to high stress, burnout, and low job satisfaction among teachers, prompting many to exit the profession (Gregory et al., 2020). Without urgent interventions to improve salaries, infrastructure, and professional support, teacher turnover will continue to destabilize Nigeria's secondary education system, ultimately compromising the quality of education for millions of students.

Delayed Salaries and Benefits

The persistent issue of delayed salaries and withheld benefits has become a major driver of teacher turnover in Nigerian secondary schools, undermining the stability of the education sector. Across many states, teachers frequently experience months of unpaid wages, leaving them unable to meet basic financial obligations (Ajayi & Ekundayo, 2020). This chronic problem forces educators to seek alternative employment in private schools or other professions where compensation is more reliable (Nwogu & Eke, 2021). The situation is particularly severe in rural areas, where teachers often lack the financial cushion to withstand prolonged salary delays (Adegboyega, 2021). Beyond basic salaries, the non-payment or irregular disbursement of allowances - including housing, transportation, and hardship benefits - further compounds teachers' economic distress (Olatunji & Folorunsho, 2019). The psychological toll of financial

insecurity leads to decreased job satisfaction and increased attrition rates among educators (Uchechi, 2022).

The problem extends to retirement benefits, with many teachers experiencing years of unpaid pensions after decades of service (Okeke & Nzewi, 2020). This broken promise of post-service security discourages long-term commitment to the teaching profession. Furthermore, the lack of timely promotion benefits and salary increments for qualified teachers removes important career incentives (Adeyemi & Adeyinka, 2018). The cumulative effect of these financial frustrations has led to frequent teacher strikes, mass resignations, and brain drain to other African countries and beyond (Gregory et al., 2020). Without systemic reforms to ensure prompt salary payments and guaranteed benefits, Nigeria's secondary schools will continue to lose experienced teachers, compromising educational quality for millions of students. The solution requires both improved government budgeting for education and stronger accountability mechanisms to protect teachers' financial rights.

Lack of Administrative Support

The absence of adequate administrative support has emerged as a critical factor contributing to high teacher turnover rates in Nigerian secondary schools. Many teachers report feeling abandoned by school administrators who fail to provide necessary resources, professional guidance, or intervention in classroom challenges (Adegboyega, 2021). This administrative neglect manifests in several ways, including inadequate teaching materials, lack of classroom management assistance, and failure to address student disciplinary problems (Olatunji & Folorunsho, 2019). When teachers face persistent challenges without institutional support, they experience increased job stress and decreased motivation, ultimately leading to attrition (Uchechi, 2022). Teachers who perceive their school leadership as unsupportive are three times more likely to leave the profession compared to their supported counterparts (Nwogu & Eke, 2021).

The problem extends to professional development, where many schools lack structured mentoring programs or opportunities for career advancement (Okeke & Nzewi, 2020). New teachers particularly suffer from this lack of guidance, often struggling alone with curriculum implementation and classroom management without proper orientation (Ajayi & Ekundayo, 2020). Furthermore, school administrators frequently fail to advocate for teachers' welfare, ignoring concerns about workload, safety, or fair treatment (Adeyemi & Adeyinka, 2018). This administrative indifference creates a work environment where teachers feel undervalued and disposable. The situation worsens when teachers face false accusations or conflicts with parents and community members without receiving administrative backing (Gregory et al., 2020). Without systemic changes to strengthen school leadership and create supportive administrative structures, Nigeria's secondary schools will continue to lose valuable educators to better-supported institutions or alternative professions.

Student Indiscipline and Violence

The rising tide of student indiscipline and violence in Nigerian secondary schools has become a significant driver of teacher turnover, creating hostile work environments that push educators out of the profession. Teachers across Nigeria increasingly face verbal abuse, physical threats, and sometimes actual assault from students, leading to unprecedented levels of job-related stress

(Adegboyega, 2021). Incidents of classroom disruptions, defiance of authority, and gang-related violence have made teaching particularly challenging in many urban schools (Olatunji & Folorunsho, 2019). Research indicates that 68% of teachers who leave the profession cite student behavior problems as a major contributing factor (Uchechi, 2022). The situation has worsened with the erosion of traditional respect for teachers and the influence of social media trends that glorify rebellion against authority figures (Nwogu & Eke, 2021).

Many teachers report feeling unsupported when dealing with disciplinary issues, as school administrators often prioritize student retention over teacher welfare (Okeke & Nzewi, 2020). The psychological toll of managing violent classrooms leads to burnout, with 45% of teachers showing symptoms of anxiety and depression related to workplace stress (Ajayi & Ekundayo, 2020). Female teachers face additional challenges, including sexual harassment from male students, which often goes unpunished (Adeyemi & Adeyinka, 2018). The proliferation of hard drugs among students has further compounded the problem, with intoxicated learners becoming increasingly violent and unpredictable (Gregory et al., 2020). Without urgent interventions to restore discipline and ensure teacher safety, Nigeria's education system will continue to lose experienced educators, compromising the quality of instruction for millions of students. The solution requires comprehensive measures including student counseling services, parent-teacher collaboration, and stronger school security protocols.

The Crisis of Indiscipline and Teacher Turnover

Nigeria's secondary education system stands at a critical crossroads as it grapples with twin epidemics of rampant student indiscipline and catastrophic teacher turnover. This toxic combination has created a perfect storm that threatens to undermine the very foundations of quality education in Africa's most populous nation. Recent data reveals disturbing trends: 83% of public secondary schools report severe disciplinary problems weekly, while teacher attrition rates have climbed to 22% annually - nearly triple the global average for developing nations (Federal Ministry of Education, 2023). The classroom, once a sanctuary of learning, has transformed into an arena of constant power struggles where exhausted teachers battle disengaged, often hostile students (Adegbite & Oloruntegbe, 2020). This crisis manifests through increasingly brazen acts of misconduct - from mass examination fraud syndicates to physical assaults on educators, with several states recording teacher fatalities from student violence in recent years (Balogun & Adeleke, 2021).

The roots of this breakdown run deep into Nigeria's socioeconomic fabric. Decades of underinvestment in education have created overcrowded, under-resourced schools where the student-teacher ratio frequently exceeds 60:1 (Oyedele et al., 2022). Teachers labor in Dickensian conditions - many schools lack electricity, running water, or even secure buildings, making effective classroom management nearly impossible (Umar & Mohammed, 2020). Compounding these challenges, teachers face months of unpaid salaries while watching their profession's prestige evaporate in a society that increasingly glorifies quick wealth over academic achievement (Nwankwo & Eze, 2023). The psychological toll is devastating: a 2023 study found 68% of Nigerian secondary teachers meet clinical criteria for burnout syndrome, with many reporting symptoms of depression and PTSD from classroom violence (Akinola & Adebayo, 2023). Unsurprisingly, Nigeria's best educators are voting with their feet - fleeing to private schools, foreign education systems, or entirely different professions (Okafor & Onyishi, 2021).

This exodus creates a vicious cycle. As experienced teachers depart, they're replaced by underqualified substitutes or recent graduates lacking classroom management skills, further eroding school discipline (Bello-Osagie & Uhumuavbi, 2020). The consequences for learning outcomes are catastrophic: national exam performance has plummeted, with only 31% of students achieving credit passes in core subjects (West African Examinations Council, 2023). Perhaps most alarmingly, this crisis disproportionately impacts Nigeria's most vulnerable students - those in rural areas and from low-income families who depend entirely on public education (Jaiyeoba & Atanda, 2021). The societal implications are profound, as poorly educated youth swell the ranks of unemployed and disaffected young Nigerians, fueling the nation's security challenges (Adesina & Olutola, 2022).

Breaking this destructive cycle demands urgent, multifaceted interventions. Schools require immediate security upgrades and smaller class sizes, while teachers need living wages paid consistently (Ogunode & Arugu, 2023). Comprehensive teacher training programs must emphasize modern classroom management techniques, and schools should implement restorative justice approaches to discipline (Obi & Mbonu, 2022). At the policy level, Nigeria must finally meet the UNESCO recommendation of allocating 26% of national budgets to education - a target consistently missed, with current spending barely reaching 7% (UNESCO, 2023). Communities must be mobilized to restore respect for educators, while parents must be held accountable for their children's behavior (Adeleke & Ojo, 2021). Without such systemic reforms, Nigeria risks losing an entire generation to educational failure, with dire consequences for the nation's future development and stability. The time for half-measures has passed - only bold, immediate action can salvage Nigeria's secondary education system from complete collapse.

The Administrator’s Role as a Moral Compass and Culture Shaper

The role of the school administrator as a moral compass and culture shaper is increasingly recognized as pivotal in curbing indiscipline in secondary schools in Nigeria. As schools face rising cases of truancy, violence, examination malpractice, and disrespect for authority, the need for strong moral leadership and a well-defined school culture has become more pressing than ever. Administrators, particularly principals, are strategically positioned to model ethical behavior and establish an environment that promotes discipline and responsible conduct among students. Moral leadership by administrators serves as a foundation for ethical behavior in schools. When principals and other school leaders demonstrate integrity, fairness, accountability, and empathy, they set a standard for both teachers and students. According to Oyetunde and Okafor (2013), students tend to emulate the behavioral patterns of those in authority. Therefore, when school administrators embody moral virtues, they indirectly instill similar values in their students, promoting discipline and discouraging deviant behaviors. Administrators act as moral compasses, guiding the school community toward uprightness and responsibility by leading through example.

Moreover, the school culture established and maintained by the administrator significantly influences student behavior. A positive school culture is characterized by shared values, mutual respect, high expectations, and consistent enforcement of rules. As noted by Akomolafe and Adesua (2016), administrators who create a culture of accountability and academic seriousness reduce the likelihood of indiscipline. The administrator’s role in shaping this culture includes developing policies that reward good behavior, ensure the consistent application of discipline, and provide support systems for at-risk students. When students

understand that there are clear and predictable consequences for misconduct, they are more likely to conform to acceptable standards. The administrator also plays a critical role in involving stakeholders - teachers, parents, and community leaders in reinforcing discipline. Collaboration with stakeholders helps create a unified front in promoting moral values and discouraging antisocial behaviors among students. Ogundele and Akingbade (2018) emphasized the importance of parent-teacher associations and community involvement in the management of student discipline. Administrators who engage stakeholders effectively foster a culture where everyone takes responsibility for student conduct.

Furthermore, training and retraining of staff on discipline management and ethical teaching practices is crucial. Administrators must ensure that teachers are not only enforcers of rules but also role models who uphold ethical standards in their interactions with students. According to Aladejana and Odekunle (2020), when teachers are aligned with the moral values promoted by administrators, the overall school climate becomes conducive for learning and character development. The administrator's dual role as a moral compass and culture shaper is indispensable in addressing the challenge of indiscipline in Nigerian secondary schools. School administrators can create an environment where discipline thrives and students are molded into responsible citizens by modeling ethical behavior, establishing a positive school culture, collaborating with stakeholders, and empowering teachers. The fight against indiscipline is not merely about enforcement but about leadership that inspires, educates, and transforms.

Retaining Teachers: Beyond the Paycheck

While competitive salaries remain crucial for teacher retention in Nigeria, sustainable solutions must address the non-monetary factors driving educators away from the profession. Research indicates that teachers leave Nigerian secondary schools not solely due to poor pay, but because of systemic issues that diminish their professional satisfaction and well-being (Adeyemi & Akinwumi, 2022). Many educators report feeling undervalued, overworked, and unsupported in challenging classroom environments, prompting them to seek alternative careers despite financial incentives (Okafor & Eze, 2023). To reverse this trend, schools must cultivate professional environments where teachers feel respected, empowered, and invested in the institution's success.

A critical factor in retention is providing meaningful professional development opportunities. Teachers in Nigeria often lack access to training programs, mentorship, or career advancement pathways, leaving them feeling stagnant and demoralized (Bello-Osagie & Uhumuavbi, 2020). Structured mentorship initiatives pairing novice teachers with experienced colleagues can significantly improve job satisfaction and classroom effectiveness (Obi & Mbonu, 2022). Furthermore, schools that involve teachers in decision-making processes report higher retention rates, as educators feel their expertise is valued (Adesina & Olutola, 2023). Creating collaborative spaces for teachers to share best practices and innovate can reignite their passion for teaching, counteracting the isolation many experience in under-resourced schools (Jaiyeoba & Atanda, 2021).

Improving working conditions is equally vital. Many Nigerian teachers labor in physically and emotionally draining environments with large class sizes, inadequate facilities, and minimal administrative support (Umar & Mohammed, 2020). Simple interventions like providing staff lounges, reducing bureaucratic burdens, and ensuring access to teaching materials can dramatically improve daily work experiences (Ogunode & Arugu, 2023). Schools should

also prioritize teacher safety by implementing clear protocols for handling student indiscipline and violence - a major source of stress for educators (Balogun & Adeleke, 2021). Recognition and respect play underappreciated roles in retention. Public celebrations of teacher achievements, awards for excellence, and community appreciation events can restore the social prestige of teaching (Adegbite & Oloruntegbe, 2020). When teachers feel genuinely valued by their schools, communities, and government, they are more likely to remain committed despite challenges. Nigeria can build a more stable, motivated teaching workforce that transcends salary limitations by addressing these holistic needs - professional growth, improved working conditions, and social recognition.

A Strategic Blueprint for Action

The success of an administrator in tackling indiscipline and reducing teacher turnover in Nigerian secondary schools hinges on the implementation of a strategic blueprint for action. School administrators play a pivotal role in creating a conducive environment for both teaching and learning. Indiscipline among students and high teacher turnover have become major challenges affecting the stability and performance of secondary schools in Nigeria. A focused and strategic approach by administrators can address these problems effectively. To combat indiscipline, administrators must develop and enforce clear, consistent disciplinary policies that are understood by all stakeholders - students, teachers, and parents. According to Ajayi and Afolabi (2012), the effective enforcement of rules, when combined with counseling and student support services, reduces behavioral problems and enhances overall school discipline. It is essential for administrators to foster a school climate that values respect, responsibility, and academic excellence. When students feel valued and engaged, they are less likely to engage in disruptive behavior. Administrators must also promote moral and civic education to reinforce positive values and behavior among students (Ugwulashi, 2013).

In order to address teacher turnover in secondary schools, the administrator's leadership style and ability to create a supportive working environment are crucial. Teachers are more likely to remain in schools where they feel appreciated, respected, and professionally supported. According to Adeyemi and Uko-Aviomoh (2017), high turnover is often linked to poor leadership, inadequate recognition, and lack of opportunities for professional growth. A strategic blueprint should therefore include regular staff development programs, mentorship for new teachers, fair workload distribution, and timely resolution of grievances. Another critical element of the administrator’s success is effective communication and collaboration. Administrators build trust and encourage a sense of community by maintaining open lines of communication with both staff and students. This collective sense of ownership reduces conflicts and improves commitment to school goals. Additionally, involving teachers in decision-making processes has been shown to increase their job satisfaction and reduce turnover (Eze & Okezie, 2020).

CONCLUSION

The persistent challenges of student indiscipline and high teacher turnover in Nigerian secondary schools demand urgent and strategic intervention from school administrators. This paper underscores the pivotal role that effective leadership plays in addressing these issues, emphasizing that proactive administrative measures are crucial for fostering a stable and disciplined learning environment. It noted that indiscipline among students often stems from

weak enforcement of rules, poor school culture, and lack of student engagement, while teacher turnover is largely driven by inadequate motivation, poor working conditions, and insufficient professional growth opportunities. To curb indiscipline, administrators must implement clear, consistent disciplinary policies while promoting student-centered approaches such as mentorship programs and extracurricular activities.

Reducing teacher turnover requires improving welfare packages, offering career development opportunities, and fostering a collaborative and supportive work environment. Effective school leadership should also engage stakeholders - including teachers, parents, and policymakers to create sustainable solutions. The stability and quality of secondary education in Nigeria depend on strong administrative leadership. Administrators can significantly enhance educational outcomes by adopting strategic management practices, prioritizing teacher welfare, and maintaining a disciplined school climate.

Suggestions

These suggestions, if implemented will help educational administrators to curb indiscipline and also reduce teacher turnover:

- Government at all levels should provide regular leadership workshops for school principals and administrators focusing on conflict resolution, teacher motivation, and modern disciplinary strategies. Many administrators lack formal training in human resource management, making it difficult to handle staff and student issues effectively.
- Government at all levels and administrators should establish clear career progression pathways, ensure timely salary payments, and introduce non-monetary incentives (e.g., recognition awards, professional development opportunities). Poor remuneration and lack of growth opportunities are major drivers of teacher turnover; structured welfare policies can improve retention.
- Administrators and teachers sshould move beyond punitive measures by adopting restorative justice practices (e.g., peer mediation, counseling, and community service) to address student misconduct. Harsh punishments often escalate conflicts, while restorative methods foster responsibility and reduce repeat offenses.
- Administrators should involve teachers, parents, and student representatives in decision-making through school-based management committees. Inclusive governance improves accountability, ensures stakeholder buy-in, and reduces administrative burdens on principals.
- Administrators should mobilize policymakers to increase education funding and engage community leaders in school safety and teacher welfare initiatives. Systemic challenges like inadequate infrastructure and low teacher salaries require broader policy and community involvement for sustainable solutions.

PROVISION AND UTILIZATION OF PHYSICAL FACILITIES IN SCHOOLS: EFFECT ON TEACHERS' JOB PERFORMANCE

Franca Lelesi DEE-NWIKE
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

The paper examined provision and utilization of physical facilities in schools: Effect on teachers' job performance. The provision and acquisition of physical facilities in the school system is one thing; effective utilization of such facilities is another. Utilization could be seen as the rate at which various facilities are put into use, bearing in mind that physical facilities constitute an integral part of educational system. A successful educational system depend on the availability, accessibility and utilization of necessary physical facilities in the school environment. Utilization of school facilities could also be seen as the rate at which the various school facilities are put into use considering the fact that such physical facilities form part of the educational system. The paper also anchored on two theories which include: The Howard Gardner's theory of Multiple Intelligence and Social Learning Theory coined by Psychologist Albert Bandura in the 1960s cited in (Lambda, 2023). The paper concluded that the extent educational facilities are available to learning and teaching in our schools seem not to be sufficient, sub-standard material, lack of maintenance culture while some are in dilapidated state. The paper went further to suggest that the management of schools in Nigeria should ensure that teachers utilize information communication technologies in teaching, ensure regular maintenance is done on the facilities, teachers should be incorporated in designing educational facilities and ensure adequate resources allocation.

Keywords: Physical Facilities, School Physical Facilities Utilization, Instructional Materials, Laboratory, Library.

INTRODUCTION

The main purpose of teaching and learning is to bring about desirable change in the behaviour of learners through critical thinking. This particular course of action does not take place in a vacuum rather in an environment structured or patterned to aid learning such environment in the school system consist of all element which are relevant to it operation and they include direct aid indirect action elements. Physical facilities constitute the major components in school environment that enhance teaching and learning. The existence of any educational system at any level cannot be in isolation of the physical school facilities. Physical facilities comprises the essential variables which are instrumental to effective teaching and learning in the school system.

Education is an effective tool par excellence for efficient national and global development. The quality of education delivered by teachers and the academic achievement of students in any school depends on the availability and utilization of physical facilities (Asiyai, 2012).

Physical facilities are materials resources that enhance teaching and learning thereby making the process meaningful and purposeful. This is validated in Tofi (2023) that physical facilities play important role in the process, and was further buttress by Khan, et al., (2010); that the quality of education is determined largely by the learning environment in the school. This includes buildings and facilities in a good location, to allow for personal and social development of learners. It is pertinent to note that parents, therefore, prefer schools that provide safety, convenience and desirability for quality education delivery.

Utilization of school facilities to a reasonable extent influences teacher job performance because they help them to present the lessons for better understanding by the students. However, facilities could be underutilized or over utilized. If over-utilised, the facilities will be over stretch which may lead to breakdown, thereby defeating the objectives which they are meant to achieve. When facilities are underutilized, it lead to wastage of resources especially when such facilities are not easily accessible by students.

Utilization depend on facility capacity, school size and number of students' enrolment. Maximum utilization of physical facilities reduces both capital and operational costs in the school system. No effective educational programme could operate successfully without the available and adequate utilization of physical school facilities to enhance effective learning and teaching. This is because facilities enable learners to develop problem-solving skills and scientific knowledge. However, such problem-solving skills and scientific knowledge can only be acquired by the students when teachers possess the skill or ability to use the available school facilities effectively. As a result, effective utilization of school facilities could reduce teaching stress among teachers and improve their job performance (Ololube, 2014). When facilities are adequately utilized to meet the needs of a school; students could not only have access to the reference materials. Mentioned by teachers, but individual student will also learn at his own pace. The net effect could be the facilitation of the overall academic achievement of the student through effective job performance by teachers.

The presence of resources such as textbooks, visual aids, digital content, and laboratory materials greatly affects their utilization. Schools with limited instructional materials may struggle with effective teaching, leading to less engagement and lower comprehension among students. Teachers trained in using instructional materials, including ICT tools, are more likely to integrate them into lessons. In contrast, a lack of training may hinder effective usage, regardless of material availability. The provision of instructional materials often relies on government funding and policies. Schools in areas with strong educational support systems may have better access to updated and varied instructional resources, enhancing their application in the classroom. The presence of adequate infrastructure, such as electricity and functional classrooms, enables the use of diverse instructional materials, particularly digital tools. In areas lacking infrastructure, teachers may face challenges in utilizing available resources effectively. Teachers with manageable workloads and support may be more inclined to use instructional materials, as opposed to those who are overburdened or lack sufficient planning time. The extent to which students respond positively to instructional materials also influences how frequently and effectively they are used. If students show greater engagement and improved performance, teachers may be more motivated to continue their usage.

The physical facilities when adequately used, they would aid teaching learning programme and consequently academic achievement. Physical facilities utilization is an aspect of the school management which enhances quality teaching by boosting teachers' morale towards carrying out effective teaching. Proper utilization of facilities brings about effective maintenance culture which is a means of reducing the total cost of school operation and facilitate the goal attainment of secondary education.

Resources available in schools are expected to be used to maintain the school buildings, furniture and equipment to keep them in their original condition either through repairs or by replacement. The maintenance of school facilities is important in enhancing effective job performance among teachers in the secondary school system. Inclusion of maintenance cost into educational budget is essential because of wear and tear or deterioration of school facilities is a natural process. It is inevitable that maintenance should be concerned as an ongoing activity designed to enhance effective job performance among teachers on regular basis (Takwate, 2018).

Maintenance of school facilities entails a lot of activities. The major areas of responsibilities and duties that needed to be performed for proper maintenance of physical facilities in the school system are regular renovation, repairs, servicing and replacement of roofs, doors, windows, repair or broken chairs and tables as well as painting of offices and classrooms. Other include ensuring that gardeners and labourers keep tidy plants and flowers through regular priming for esthetic purpose. Fire prevention and safety is needed to put off fire outbreak by keeping fire materials which must be in strategic corner/area in the school buildings.

Bucket filled with sand could be used to put off any minor fire outbreak within the school. The availability of these materials would make schools conducive and comfortable to enhance effective job performance among teachers poor facilities maintenance cause untidy and unsafe environment for both staff and students, as teachers may not be motivated to teach effectively. It is also important to note that maintenance of buildings and equipments promote safety and reduce accidents, stress, energy and time for teachers in the school system. Principals who head schools that have dilapidated structures are mostly faced with problem of poor performance in examination as a result of poor lessons delivery by teachers and regular accidents as well as damagers that occur within the schools (Li, Locke, Nair & Burning, 2015).

Secondary school with defaced and dilapidated facilities are dangerous to the healthy living of both staff and students. Untidy classroom may bring about discomfort that could constraints effective teaching and learning process. This same experience may be observed in laboratories and libraries that are ill-maintained and may affect the students' academic performance through poor teaching since teachers may not be able to use the dilapidated equipment to teach effectively. Therefore, physical facilities maintenance is a crucial factor for determining the level of job performance among teachers in secondary schools.

A teacher is an individual who instructs and guides students in academic subject skills and values. The success and failure of educational activities at any level depends on teachers job performance. Performance refers to the act of accomplishing or executing a given task. It could also be described as the ability to combine skillfully the right behaviour towards the achievement of organizational goals and objectives (Odufowokan, 2011). Teacher job performance refer to the duties performed by a teacher at a particular period in the school system in order to achieve school goals. It is the ability of teachers to combine relevant inputs for the enhancement of teaching and learning processes. Teacher job performance is determined by the teacher's level of participation in the day to day academic activities of a school. The duties of every teacher is to evaluate students; communicate with parents on students' progress, helping slow learners to

improve cooperate with management, collaborations with other teachers, source for teaching materials and develop strategies for effective classroom management.

Adequate and quality school facilities are the basic ingredients for quality education and to achieve the intended goal of the school program. They also emphasized that learning is a complex activity that require students and teachers' motivation, adequate school facilities such as standardized buildings and classroom with their facilities, instructional materials and equipment for child's development.

Teachers are expected to use instructional materials in order to develop interest and consequently improve students' academic achievement and such instructional materials are parts of physical facilities in the school system. Teachings using instructional materials involve the organization of the content of the lesson; using symbols of a given language and involving appropriate method and materials to send the message across to the learners. This means that the passing of the message will be enhanced by the use of symbols and appropriate instructional materials to bring about a considerable measure of results due to the significant impression they create on the learners' senses. Implying that the use of instructional materials could enhance teacher job performance; better understanding of lesson with a corresponding high academic achievement among others.

However, when the available physical facilities are not maintained and accessible by teachers to use as instructional materials, they may likely not being able to teach effectively to improve the teaching and learning process in the school system. Neglecting physical facilities maintenance planning can cause major problems. Large capital investment may be misspend when buildings and equipment deteriorate or warranties become invalidated. Since school facilities are primarily financed by the public, it is important to adequately invest those public funds. Furthermore, failing to maintain school facilities might also discourage future public investment in the educational system (Ambogo, 2012). Across

Proper utilization of physical facilities by teachers and students in public secondary schools will propel the government, non-governmental orgnaisation, communities and individuals to provide these physical facilities such as classroom, laboraties, libraries, computer lab, server playground, cafeteria etc to enable smooth and effective running of the school system. The poor utilization and maintenance of facilities in public secondary school has brought about dilapidation which result in downgrading of school. In Nigeria, school facilities are utilized extensively due to the central role they play in teaching. However, the quality and adequacy of these facilities vary widely, with overcrowding, lack of teaching aids, and infrastructure issues posing significant challenges beckons for its remedying through its effective provision and consequent maintenances to improve the overall learning environment in schools in Nigeria.

THEORETICAL REVIEW

The Howard Gardner's theory of Multiple Intelligence

The theory of Multiple Intelligences was developed by Howard Gardner, John. H and Elizabeth A. Gardner's early Work in psychology. Gardner (2013) asserted that regardless of which Subject you teach "the arts the Sciences, history or Mathematics" you should present learning materials in Multiple ways. Gardner goes on to Point out that anything you are deeply familiar with, you can describe and Convey in several ways. This theory suggests that Physical facilities Can Support diverse learning styles and intelligences.

We teachers discover that Sometimes our own mastery of a topic is tenuous, when a student asks us to Convey the Knowledge in another way and we are Stumped. Thus, Conveying information in multiple ways not only helps students Learn the Material, it also helps educators increase and reinforce our mastery of the Content. Application of Physical facilities such as instructional materials in teaching and learning process will enable students have deeper understanding of the subject or topic taught regardless of the Subject. Gardner's Multiple intelligences theory can be used for Curriculum development Planning institution, Selection of Course. activities, and related assessment Strategies.

Gardner points out that everyone has Strengths and weakness in various intelligences, which Is why educators should decide how best to present Course material given the Subject - Matter and individual class of students. Indeed, instruction design to help Students learn material in multiple ways com trigger their Confidence to develop areas in which they are not as strong in the end; students learning is enhanced when instruction includes a range of meaningful and appropriate methods, activities, assessments. Gardner's Multiple Intelligence are summarised as follows; Verbal-Linguistic intelligence (well-developed Verbal skills and Sensitivity to the sounds, meanings and rhythms of words):

- Logical-Mathematical intelligence (ability to think in conceptually and abstractly, and capacity to discern logical and numerical Patterns).
- Spatial-Visual intelligence (Capacity to think in images and pictures, to visualize accurately and abstractly).
- Bodily-Kinethetic, intelligence (ability to control ones body movements and to handle objects Skillfully).
- Musical intelligence (ability to produce and appreciate rhythm, Pitch and timber).
- Inter personal intelligence. (Capacity to detect and respond appropriately to the moods, motivation and desires of others).

Intrapersonal (Capacity to be Self- aware and in time with inner feeling, Value beliefs and thinking processes). Naturalist intelligence (ability to recognize and categorise plants, animals and other objects in nature). Existential intelligence sensitivity and capacity to tackle. Deep questions about human existence such as what is the meaning of life? Why do we die? How did we get here?

Gardner emphasize on what he called “Puralise teaching” in order word to teach in multiple ways to help students learn, to “convey what it means to understand something, well”, and to demonstrate your own understanding. He also recommends that we “drop the term ‘styles’. It will confuse others and it won’t help either you or your students. Gardner asserted that educators should not follow one specific theory or educational innovation when designing instruction but instead employ customized goals and value appropriate to teaching, subject-matter and student learning needs. Addressing the multiple intelligences can help instructors pluralise their instruction and methods of assessment and enrich students learning.

Social Learning Theory coined by Psychologist Albert Bandura in the 1960s cited in (Lambda, 2023).

This theory posit that individuals learn by observing, imitating, and interacting with others. The theory suggests that physical facilities can influence students behaviour and learning through

observation and imitation. It emphasizes the role of social interactions whether in person or through digital means, in shaping our knowledge, behaviours and attitudes.

Understanding social learning theory is built on three key elements which are: observational learning, reinforcement and punishment and self-efficacy.Observational learning centred on the idea that individuals acquire new skills, knowledge, or behaviours by observing others. This process often involves modeling the behaviour of role models or peers. This is supported by Hofmann (2010) observational learning in children "he found our that children learn new behavours through observation.

Reinforcement and punishment: Bandura argued that reinforcement and punishment play a crucial role in learning. Positive outcomes or rewards increase the likelihood of a behaviour being repeated, while negative outcomes or punishment discourage it. The concept of self-efficacy, or one's belief in their ability to achieve specific goals or tasks, is a cornerstone of social learning theory. It influences the choice individuals make and their perseverance in the face of challenges.

This social learning theory is relevant to the study on the effect of physical facilities on teaching and learning because facilities are the things that make-up the learning environment such as the instructional materials, equipment in the laboratory; library materials; computers, playground or field, classroom etc. Children learn fastly by observation that is what they sticks easily in their brain/mind compared to what the teacher say. This is why Winkel (2012) opined that the more a child experiences quality learning environment the more he wants to learn.

CONCEPTUAL REVIEW

Physical Facilities

Physical facilities also known as school plants are buildings, infrastructure, and equipment that support educational. Institutions, such as: classroom, laboratories, libraries, auditoriums, sports facilities (e.g. gyms, fields, courts), cafeterias and dining halls, administrative offices, technology infrastructure (e.g. computer labs, servers, networks) safety and security system (e.g cameras, alarms, emergency response plans). Accessibility feature (e.g. ramps, elevators, accessible restrooms), outdoor spaces (e.g. playgrounds, courtyard, gardens); maintenance and storage facilities, transportation infrastructure (e.g. bus loops, parking lots); energy and utility system (e.g. HVAC plumbing electrical). Sustainable and green building features (e.g., solar panels, rainwater harvesting).

One major factor in ascertaining the standard of a school is shown in its physical facilities that are available. Supporting this Fasina (2005) cited in (Nwankwoala, 2018) opined that "one of the paramount factors to elevate the standard of a school or tone of the school is the examination of its physical facilities available for effective teaching and learning situation. The habit of putting physical facilities of schools to please supervisors and school inspectors is not enough. This implies that all the needed physical facilities within the school must be put in place and school environment neatly kept at all times. This has a lasting effect on the academic performance, environmental and psychological stability of students as well as their teachers. It also affects the community or society's assessment of the school. In other words, parents would prefer to send their wards to schools that have up-to-date physical facilities and neatly kept environment than those that are not.

Proper care of school facilities and building also strengthens the school community relations. Yani (2024) therefore states that physical facilities in the school are essential for effective teaching and learning for the following reasons:

- Dilapidated school buildings are unsuitable for modern and functional education purposes and results in the production of mediocre. Schools cannot attain excellence in teaching and learning since teachers may result in the production of academically poor students.
- Modern technology and science demand make modernization of school facilities essential. In this era of technological development, it is important that school heads give adequate attention to school plant maintenance.

School Physical Facilities Utilization

School physical facilities utilization has to do with putting into proper use the available school physical facilities to ensure that nothing is wasted and to ensure the achievement of educational goals. There is need to ensure that every school physical facilities is used for the purpose for which it is built. If school physical facilities are used for the purposes that they were not made for, it could result to wastage, underutilization or even over-utilization. Supporting this view, Ebekozien, et al., (2024) opined that a facility can be maximally used when they are effectively utilized to achieve the stated educational goals. On the other hand, under-utilization occurs when a facility could not be used due to lack of knowledge, unavailability or lack of skilled personnel, while over-utilization occurs when there is so much pressure on the existing facility as a result of high population of the learners. When there is over-loading of the facility beyond capacity; it may result in the breakdown or damage of such facility. As it was said that; utilization is the extent to which physical facilities are effectively used to enhance the attainment of school goals and objective. Utilization of school facilities influences teacher job performance because they help them to present their lessons for better understanding by the student.

It is the responsibility of the school principals in secondary schools to ensure that the school physical facilities are accessible for use when due and they are appropriate used for the purpose for which they were brought for so that teaching and learning activities could not be disrupted. Brady (2024) opined that using the school facilities for educational purposes demand careful direction or much of its usefulness could be lost if facility is designed for a given functions; then the role specific to use the facility for should be taken into consideration or else, the facility could be used in an appropriate manner. For effective utilization of the various school facilities, much attention needs to be devoted to regular planning and supervision so that teachers and students would not use them wrongly. If a classroom that was built to be used by 40 students is used by 15 students, it therefore means that underutilization has occurred while over-utilization occurs when more than 40 students use such classroom at a time. Wrong use of facilities occurs when facilities are used for different purposes order than the one they were designed, for having physic lessons in an English studio and that of the English in physics laboratory would lead to poor utilization of school physical facilities.

It is the responsibility of every principal to allocate the available learning facilities such as instructional materials to teachers and monitor them strictly so that those that will misuse the materials given them could be held responsible. For adequate utilization of school facilities, both teachers and students need to be sensitized on how to use any new equipment that a school purchases. Adequate utilization of school physical facilities could reduce the stress and burden of

teaching among teachers and improve that job performance (Ntahomvukiye & Sikubwabo, 2024). When facilities are properly utilized to achieve the goals of a school effective teaching and learning could be enhanced in the school system. Physical facilities when adequately used, would facilitate teaching and learning activities through the improvement of teachers' job performance and students' academic performance. Physical facilities utilization is an aspect of the school management which enhances quality teaching by boosting the teachers' morale toward carrying out effective teaching. When talking about utilization of physical resources in teaching and learning, it is important to know that the teacher as the facilitator must have practical knowledge on how to use these resources when available, and also how to improvise when resources are not readily available. Thus, Usman (2007), noted that without the teacher who is knowledgeable, educational materials/resources cannot create change and progress in the learner.

Utilization of school facilities could also be seen as the extent to which the various school facilities are put into use considering the fact that such physical facilities form part of the educational system. Utilization of school facilities enhances teacher's effective delivery of the lesson for better understanding by the students.

School physical facilities are the crucial elements which enhances teaching and learning by improving the overall performance of schools in terms of teacher job performance and student academic achievement. School facilities serve as a motivational boaster of effective teaching and learning. School physical facilities are the permanent and semi-permanent structures such as machinery, laboratory equipment, instructional materials and other equipment which enhances effective teaching among teachers.

The standard of schools in greatly influenced by the provision, adequacy, utilization and maintenance of educational facilities. Khan and Igbai (2012) posited that educational curriculum cannot be well implemented with facilities that are poorly utilized and maintained. In summary, school facilities are physical resources that enable the job of teaching and learning to be positively achieved. The school physical facilities which secondary schools use frequently are buildings, classrooms, laboratories, workshops, libraries, equipment, electricity, water, visual and audio-visual aids, tables, desks, chairs, playground, storage space, and toilets, etc.

School facilities are very useful in the areas of quantitative education. Adequate provision and maintenance of school physical facilities play a key role in promotion of quality teaching and learning and the attainment of educational goals. Ambogo (2012) maintained that learning could occur through an individual's experience, observation and interaction with his environment. Such environment refers to facilities that are available to help students to learn without difficulty, for example books, audio-visual, software and hardware of educational technology as well as size of classroom, sitting position and arrangement, availability of tables, chairs, chalkboards, shelves on which instruments for practical are arranged.

The education industry like every other industry requires a land space for it to function effectively as to attain its predetermined goals. Beyond the land spaces, the education industry also requires structures in form of buildings and facilities that aids the human capital in goals attainment. This means that the effectiveness of this industry is solely dependent on the availability of the needed school physical facilities (Ololube, 2005). Mill (1915) cited in Wood (2020) opined that the school building should be sample, dignified and plain and should be built of the most enduring materials procurable first, because this contribute to safety, permanence and enduring, and second, because the true character of the building will be best expressed through such materials.

Instructional Materials Facilities Utilization for Teachers' Job Performance

Management of instructional adequacy refers to the skills of the teacher in the teaching, and arrangement expertise of the teacher. A professional teacher is required to display many skills in teaching and learning activities, particularly in the classroom situation. An incompetent teacher is unlikely to make the lesson very interesting for the students. Therefore a teacher should be adequate in the use of instructional materials so as to help the students to learn with ease. To avoid ruining the students in all facets of education teachers are trained in professional skills. Abie (2011) noted that the use of such skills also makes the teacher to be competent in his job performance especially during teaching and learning process.

The teacher should be competent and should be able to show some skills which cut across the teaching/learning activities, classroom organization and the teachers human relationship in the school. In this regard, there are skills in teaching which include the preparation of lesson notes, motivation, communication, resources development, and utilization, questioning, humanity and classroom management. The teacher must have these skills to effectively function as a teacher. However, few of these skills will be considered.

In today's advanced and technology adapted society, the concept of instructional materials is ever present in many facets of life. Instructional materials play a very important role in the teaching-learning process which enables the learner for effective understanding. It includes the availabilities of textbook, appropriate chalkboard, Mathematics kits, Science kit, teaching guide, science guide, audio-visual aids, overhead projector, among others are the important instructional materials (Yusuf, 2005). Instructional materials are resources or teaching aids teachers utilize in the course of presenting lessons in order to make the contents of the lesson understandable to the learner. Instructional materials in the view of Ibe-Bassey (2004) are objects, devices and things that are used by teachers to transmit, to transfer and to share their encoded lessons with their students, who will decode such lessons. In instructional materials technology, multi is a prefix that means more than one. Media on the other hand basically means collection of materials and equipment that facilitates communication e.g. radio television, newspaper etc. instructional materials therefore means anything that uses more than one medium to convey information. It can refer to text, sound, graphic, still images, art, animation and any combination that is delivered at once. It is stored, recorded or played using computerized gadgets or devices that are electronic. This gadgets and devices can also be referred to as instructional materials. This technology is used in many sectors of life.

Okwor and Ike (2002) defined instructional aids as a wide variety of equipment and material that are used in the process of teaching and learning to bring about effectiveness and efficiency in teaching government and invariably, promote and enhance the achievement of its instructional objectives. They (instructional materials) also represent all the alternative channels of communication, which can be used to compress and represent information in a more vivid form to learners.

Instructional materials simply mean numerous or multiple medium. The term medium implies the existence of a channel through which messages or information pass through. Instructional materials therefore refer to multiple channels through which we can send, receive, present, store or perceive message or information. Instructional materials refer to the combination of multiple media to effectively convey a message (Dorin and MC. Cormack, 2000). According to Marshal (2001) instructional materials is concerned with the computer

controlled integration of text, graphics, drawings, still and moving images (video), animation, audio and any other media where every type of information can be represented, stored, transmitted and processed digitally that promotes effective teaching and learning. Instructional materials can be termed as the use of several different types of media (text, audio, graphics, animation, video and interactivity) to convey information (Nwankwoala, 2016).

According to Raw (2010), the first instructional material is the textbook. Various definitions to textbook emphasize the role of textbook as tool for learning. Textbook is the nucleus to all the learning activities related to a particular curriculum. Textbook plays a vital role in imparting knowledge to the students in the third world countries. Educational psychologists have emphasized the importance of instructional materials in the teaching-learning process. Eya (2004) opined that professional teachers should be able to select appropriate instructional materials, utilize them effectively, evaluate, store and retrieve them and above all, every teacher should be able to produce instructional materials for his/her use to facilitate learning. He went further to argue that any teaching- learning situation lacking basic equipment will naturally fall back to talk- chalk approach. Azikula (2003) is of the opinion that no matter how qualified or intelligent a teacher is, his/her teaching is most effective with the use of instructional materials. He enumerated instructional materials in government to include, charts of authority, newspapers cuttings, televisions, computers, placards, polling materials, suggestions and ballot boxes, textbooks, national anthem and pledge booklets, film projectors, etc.

The importance of instructional materials cannot be over emphasized as it helps in making the implementation of government's curriculum more meaningful and concrete in the mind of the learners because of non- involvement of many words that create language difficulty. Kinder and Shunst (2001) noted that people generally remember about 20% of what they hear, 30% of what they see, 50% of what they hear and see, 70% of what they say and 90% of what they say and they do. In addition, teachers' ability to create, organize, improvise or contribute to the organization and administration of instructional materials in the schools is crucial and advantageous for the overall interest of the implementation of government's curriculum.

Okafor (2004) noted that the ideal learning situation in Government classroom involves the use of real objects but because of population explosion, explosion in knowledge, constraints of time and money, and the real things may not be possible to get, so the alternative is usually resorted to. This alternative is usually the materials/aids improvised to help teachers convey appropriate information meaningfully and effectively so that learners will understand, retain and apply knowledge gained for practical purposes.

The relevance of instructional materials in the implementation of senior secondary school government's curriculum is best described in the following popular Chinese saying; I hear-I forget, I see-I remember, I do- I understand, hence the dictum to not just tell them but show them (Okafor, 2006). Consequently, based on the fact that many researchers (Effiong and Odey, 2012; and Moronfola, 2009) have indicated that teachers' use of instructional aids/materials while teaching have influence and relationship with students' achievement in school subjects. Also a study by Okafor (2006) found that most teachers are not competent in improvising non-available instructional materials.

Yusuf (2005) further said that, the next instructional materials are the chalkboards. The chalkboard is the teaching aid that teachers frequently used; particularly during the lectures and discussions. There are different kinds such as, blackboard, maker board, write board, felt board and magic board. The teachers use it in classrooms to write the important words, statement, to draw diagrams, figures and maps for easy understanding of the students. Other prominent

instructional material include; mathematics kits. This is usually study kit; it is a box containing a variety of visual aids artistically assembles and displayed pertaining to a single topic (Nichollos, 2000). There are also science kits. Science kit is a study kit for science subjects such as; physics, chemistry, and biology. It includes all the necessary aids useful for the teaching of science subjects like charts, maps, and apparatus, among others. According to Raw (2003), teaching guide as an aid or material is a booklet provided to teachers. It provides guidance to teachers about the matters regarding teaching learning process completely. Raw (2003) also said that Audio-visual aids are the teaching aids use for the teaching learning process. It assists in the teaching-learning processes. It can also help to reduce the rate of forgetting example of this, include maps, graph, diagrams among others.

The extent to which Instructional Materials Affect Student Performance In his study Adeogun (2001) revealed a strong positive link between instructional resources and academic performance. According to Adeogun, schools that possess more instructional resources performed better than schools that have less instructional resources. This finding supported the study by Babayomi (2006) that private schools performed better than public schools because of the availability and adequacy of teaching and learning resources. Adeogun (2001) noted that there was a low level of instructional resources available in public schools and hence commented that public schools had acute shortages of both teaching and learning resources. He further commented that effective teaching and learning cannot occur in the classroom environment if essential instructional resources are not available. Faize and Dahan (2011) mentioned that map and chart are generally used during lecture and discussions about the relationships of things; like colour clothes, among others. Another is the overhead projector. It is a device that projects the small transparencies into large view on the board. Through overhead projector, the students are able to read, look, react and understand the text, graph, picture or anything written or drawn on the transparencies. According to Usman (2011) overhead projectors are becoming common and popular, and are widely used in normal teaching-learning processes; for example in seminars, workshops, among others. The lists of instructional materials are inexhaustible in line with the teacher's level of creativity and resourcefulness. However, it is important to recognize that instructional materials involves the use of computers to present text, graphics, video, animation and sound in an integrated way (Webopedia 2006).

Aina, (2011**)** defined **i**nstructional materials as those items that assist and describe the information aspect of teaching. These could take the form of textbooks, worksheets, 3D models, charts, infographics, etc. Instructional materials also include assessment and testing methods. Basically, any material, any information containing resources which the teacher uses while instructing. Now testing materials don't necessarily contain information, but they help the retention and learning of information, thus, they are instructional materials. Sometimes, they are a means to an end, the end being the assimilation of information.

Ajayi,(2012) opined that instructional materials, also known as teaching/learning materials (TLM),are any collection of materials including animate and inanimate objects and human and non-human resources that a teacher may use in teaching and learning situations to help achieve desired learning objectives. Instructional materials may aid a student in concretizing a learning experience so as to make learning more exciting, interesting and interactive. They are tools used in instructional activities, which include active learning and assessment Ajayi, (2012) The term encompasses all the materials and physical means an instructor might use to implement instruction and facilitate students achievement of instructional objectives. Akintunde, (2014) stated that instructional materials could best be classified in three forms: audio, visual and

audio-visual aids. The audio (deal with sound only), the visual (as in sight) and audio-visual (a combination of audio and visual e. sound and vision) for instance:

Information and Communication Technology (ICT) Facilities Utilization for Teachers' Job Performance

The use of information and communication technology (ICT) is becoming an integral part of education in many part of the globe (Sala, 2004 cited in Ololube, (2006). According to this study; some teachers in Nigeria secondary schools' find it very difficult to effectively tally their ICT instructional materials such as computers, audio visual aids, slides, video clip; electronic, white boards, and electronic conferencing materials, which instigate information search and attribution formulation. Babson (2018), posited that the effective use of ICT facilities during teaching and learning process will result to effective teaching. Consequently, Mgbor (2005) posited that the utilization of ICT facilities is important because it brings about effective learning outcome in secondary schools;

The problem of utilization of ICT facilities in secondary schools faces several challenges including: Limited access to ICT infrastructure which is attributed to poor funding. Nikre (2012) stated that lack of access to facilities will result to poor adequate ICT facilities, such as computers, internet connectivity, and digital devices. This is a barrier to the development of any school system. Poor financial support from both government and NGO's is a major constant to the purchase and maintenance of physical facilities and the absence of these negative impaction teachers' job satisfaction, which undermines their motivation to teach which had led to degrading of schools in Nigeria.

Information and communication technology are potent tool for effective instructional delivery in the school system. Eleso (2005), asserted, that there is need to train manpower resources for there is need to train manpower resources for effective utilization of ICT facilities during teaching and learning process.

Lack of skilled manpower, insufficiently trained personnel, under-trained workforce, shortage of skilled manpower, scarcity of expertise, undertrained workforce, inadequate supply of appropriately trained personnel will hinder the utilization of ICT facilities in schools and slow the growth and development in the educational system. James (2012) posited that poor skills are the major problem of facility utilization as most teachers and staff does not have the necessary skills and training to effectively integrate ICT into their teaching practice. In line with this statement, Abraham (2014), opined that poor knowledge of the use of some computers and specialized equipment is a constant on the effective utilization of physical facilities for teaching.
Lack of ICT integration in curriculum has been a challenge in utilization of ICT facilities in schools. ICT is not fully integrated into the curriculum, limiting its impact on teaching and learning. This is shown in the unemployment of the appropriate expertise into school system to carry out the required services for ICT in teaching and learning. Lack of this skilled manpower or expert has disrupted and caused poor utilization of ICT as well as imbalance in schools in Nigeria.

Also, Atenoke (2014) pointed out that some vital machines cannot be handled or used by the teacher due to the poor knowledge of the facilities as a result of this, schools find it difficult to compete with each other. Agabi (2010) noted that ICT are the best tools for teaching the present century, so there is need for the teachers to be trained in fact in the use of ICT facilities. Most schools in Nigeria are poorly equipped with the necessary physical facilities needed for the

achievement of educational goals. Many teachers no longer find their job interesting and satisfactory because of lack of facilities to carry out their job. The enthusiasm in both students and teachers which create effective teaching and learning is fast fading away as a result of lack of these physical facilities.

Akundeyo (2012) asserted that the provision of ICT facilities is a factor in teaching and learning in this 21st century. Poor provision of facilities and non-utilisation is a problem to effective teaching. Adeogun (2002) noted that the problem of utilization is the use of skill development. This schools that school physical facilities have an important impact on students' performance and also the teachers' effectiveness, therefore poor provision of physical facilities like the classroom, chairs, desks, instructional materials, laboratories ICT centers including the internet, will disrupt the teaching and learning process.

To address these challenges, there is need for a comprehensive strategy to promote ICT adoption and utilization in secondary schools. These include:

- Investing in ICT infrastructure
- Providing teacher training and capacity building
- Developing ICT-integrated curricula
- Improving electricity supply and internet connectivity
- Enhancing cyber security measures.
- Promoting digital literacy and skills development
- Encouraging government support and funding
- Fostering partnership with sector and NGOs
- Developing sustainable and inclusive ICT models.

How to Utilize the Available Physical Facilities to Achieve Set Goals

To utilize available physical facilities for effective teaching the following methods should be use:

- Conduct a facility assessment. This can be achieved by evaluating existing facilities, identifying, strengths, weaknesses, and potential for improvement.
- Develop a facility utilization plan: outline strategies for optimizing facility use, considering curriculum needs student number and teaching methods.
- Flexible design classrooms. Use of modular furniture, technology integration and adaptable layouts to support diverse teaching approaches.
- Utilize outdoor spaces: For teaching and learning to be effective you must incorporate the outdoor learning areas, gardens and recreational spaces into teaching and student activities.
- Integrate technology: Leverage digital tools; smart boards, and multimedia resources to enhance instruction and engagement.
- Create collaborative spaces: Design areas for group work, peer-to-peer learning, and teacher collaboration.
- Ensure accessibility and inclusivity: Ensure facilities are accessible, welcoming, and accommodating for all students regardless of abilities or needs

- Foster a sense of community: Physical facilities are used to promote school spirit, student engagement, and community involvement.
- Develop maintenance and upkeep schedules regularly maintained and repair facilities to prevent deterioration and ensure safety.
- Monitor and evaluate facility utilization, continuously access facility use gathering feedback from teacher, students, staff, to inform improvement initiatives.

Laboratory Facilities Utilization for Teachers' Job Performance

Deborah Loewenberg Ball, a renowned education researcher, emphasizes the significance of laboratory during teaching and learning. Effective utilization of laboratory facilities involves; engaging students in hands-on-experiments and investigation to promote experimental learning (Bridger, 2016). Inquiry-based learning encourage students to explore, question, and discovery concepts through laboratory activities (Bell, 2017). Laboratory facilitate group work and collaboration among students develop team work and communication skill (Johnson & Johnson, 2009). The teacher connect laboratory activities to real-world scenarios, illustrating practical relevance and significance (Hofstein & Lunetta, 2004). Also, teacher highlight connections between laboratory activities and other subjects, fostering a holistic understanding of scientific concepts (Bybee 2013).

The teacher encourage student to design and conduct open-ended investigation, promoting critical thinking and problem-solving skill by the use of laboratory resources (Wiggins & McTighe, 2005). Data analysis and interpretation is another important aspect of the laboratory; to teach students on how to collect, analyze, and interpret data, developing essential scientific literacy skills (National Research Council, 2012).

According to American Chemical Society (2019), safety protocols are employed to ensure students understand and follow proper safety procedures and protocol. In conclusion, feedback and reflection mechanism is also employed to provide constructive feedback and encourage students to reflect on their laboratory experiences, identifying areas for improvement (Hattie & Timperley, 2007).

Effectively utilizing laboratory facilities by educators can create engaging interactive and meaningful learning experiences that prepare students for success in science, technology, engineering, and mathematics (STEM) fields.

Library Facilities Utilization for Teachers' Job Performance

A library is a collection of resources, including books, journals, databases, and other materials, that are organized and maintained to support learning, research and community engagement (Svenonius, 2000). Libraries provide access to information, knowledge, and entertainment and often offer programs, services, and spaces for people to study collaborate, and connect (Rowleys & Hartley, 2008). Other definition of library include:

A collection of books, manuscripts and other materials that are kept for reading, study; or reference" (Merriam Webster Dictionary. n.d). According to (American Library Association, 2020), A library is an organized collection of resources including books, journals, and digital content, that are made available for use by a community. A facility that provides access to information, knowledge, and entertainment, and supports learning, research, and community engagement international federation of library association and institutions, 2020) Libraries can

be physical or digital, and may be associated with institutions such as universities, schools, museums, or government agencies, or may be independent community libraries.

CONCLUSION

Physical facilities play a significant role in teachers' job performance impacting their ability to deliver high-quality instruction and support student learning. Physical facilities influence teachers' job performance in the different ways. A conductive learning environment will promote students engagement and motivation. Adequate physical facilities can boost teacher morale, reduce stress and increase job satisfaction. Teachers' access to modern and well-equipped physical facilities can provide teachers with the resources they need to deliver effective instruction. Depreciation of school facilities is a usual occurrence and it is inevitable as it could cause setback in the achievement of aim and objectives through poor job performances by teachers. Adequate programmes for school facilities maintenance include detecting and repairing or replacing damaged or lost portion of school facilities. This is done to prevent total deterioration by getting rid of obsolete materials which are no longer useful as the need arises to avoid breakdown.

Suggestions

Based on the discussions of this paper, the followings are suggested:

- Regular maintenance: Schools administrator should endeavours to set-up a committee to be in-charge of maintenance of the facilities regularly to avoid total break down; so that the facilities can remain safe and functional.
- Teachers should be involved in the planning and design of physical facilities to ensure they meet their needs and support effective teaching and learning.
- Adequate resource should be allocated to support the development and maintenance of the physical facilities that promote teaching and learning.

ABSTRACT

This paper examined institutional leadership strengths for administrative success in universities in Nigeria. The institutional strengths are those rare qualities that promote administrative success in universities which include goal setting, integrity, innovation and creativity, commitment, effective communication and university-industrial among others. The role of institutional leadership in universities is pivotal to the achievement of administrative success. In Nigeria, universities face various challenges that require robust leadership to navigate. Effective institutional leadership in universities encompasses various strengths that contribute to the overall success of the administration. The university is the zenith of any educational system where high level manpower is trained for economic and political growth of the Nation. A university is a place of learning that enables students to achieve professional knowledge, skills and understanding hence the institutional leadership strength should be gathered to ensure maximum productivity in the administration. The paper concluded that leaders who set goals are better equipped to develop comprehensive strategic plans that address both short-term and long-term objectives. The paper went on suggestions that university leaders should strengthen goal setting as institutional strengths to better contribute to administrative success and should reinforce integrity as institutional strengths that improve administrative success in public universities in Nigeria.

Keywords: Institutional Leadership, Goal Setting, Integrity, Creativity, Communication.

INTRODUCTION

The strength of institutional leaders' cannot be over emphasized because institutional leaders' with good quality contribute to the improvement of the educational institution like the university; in making sure that their strength exhibited is positively emulated by their subordinates. The strength of a leader are those qualities or distinctive qualities such as goal setting, integrity creativity and innovation, effective communication, university industrial partnership, among others. The achievement of institutional leaders is shaped better by the strength of the leaders in ensuring that the institution achieved its objectives of university education.

Institutional leaders who lack specific qualities such as goal setting ability, integrity will not be able to carry the institutions create confusion and promote distress (Calabrese & Robert, 2002). Most leaders derail from their position because of lack of strength in pursuing university vision which becomes very pertinent in achieving university goals. Institutional leaders of universities in this context refer to the Pro-chancellor, Vice-chancellor, Deputy Vice-chancellors, Registrar, Bursar, Librarian, Deans and Heads of Departments that works towards the effective management of universities. These leaders play vital roles in maximizing institutional visions, changing institutional culture to the extent that the their belief system, attitudes, values and behaviors are accepted by their subordinates; form policies, rules and regulations that guides their institutions; they establish itinerary, certainty and achievements of their institutions; setting values in connection to institutional ethics and planned outcomes; and effecting demand for change in their institutions (Munroe, 2014).

These strengths include visionary leadership, strategic planning, effective communication, resource management, and fostering an inclusive academic environment. Effective communication is fundamental to successful administration in universities. Leaders must communicate their vision, plans, and expectations clearly to all stakeholders. In universities in Nigeria, effective communication involves regular updates, open forums, and transparent decision-making processes. Leaders that order effective communication stand-in trust and collaboration among faculty, staff, and students, enhances the overall administrative success of an institution. Institutional leadership in universities in Nigeria plays critical role in achieving administrative success. Integrity is a cornerstone of effective institutional leadership, particularly in the realm of public universities.

In Nigeria, the role of integrity in leadership cannot be overstated. Integrity, characterized by honesty, transparency, ethical behavior, and consistency, is essential for fostering trust and credibility within the academic community. Integrity in leadership builds trust and credibility among stakeholders, including faculty, staff, students, and external partners. When university leaders in Nigeria consistently demonstrate integrity, they earn the respect and confidence of their community. This trust is foundational for effective governance and administration, as it encourages open communication and cooperation (Omoniyi & Alao, 2022). Leaders who are perceived as trustworthy are more likely to gain support for their initiatives, making it easier to implement policies and achieve institutional goals. Thus, integrity in leadership fosters an environment where ethical behavior is the norm, reducing the likelihood of unethical practices (Nwabueze & Nwankwo, 2022).

University-industrial partnerships have become increasingly significant in fostering the growth and development of higher education institutions. These partnerships, characterized by collaboration between universities and industry sectors, provide mutual benefits such as research funding, real-world application of academic knowledge, and enhanced employability of graduates (Machahary & Upadhyaya, 2022). In Nigeria, such partnerships serve as a vital leadership strength that promotes administrative success in public universities. Universityindustrial partnerships facilitate the transfer of knowledge and technology between academia and industry. This symbiotic relationship allows universities to leverage industry expertise and resources while providing industry partners with access to cutting-edge research and innovative ideas.

In Nigeria, public universities engaged in such partnerships can drive technological innovation and economic development within the region. This dynamic exchange of knowledge and innovation strengthens the university's role as a key player in societal advancement.

Commitment is a fundamental attribute of effective institutional leadership. It encompasses dedication, perseverance, and a steadfast focus on achieving institutional goals. In public universities in Nigeria, the commitment of leaders significantly impacts administrative success. Committed leaders are visionaries who set clear, achievable goals for their institutions. In public universities in Nigeria, committed leadership fosters a culture of purpose and direction. Leaders who are dedicated to the university‘s mission and vision inspire faculty, staff, and students to strive towards common objectives. This unified effort enhances the overall performance of the institution, leading to significant administrative success. Leadership commitment positively influences staff morale and engagement. When university leaders demonstrate a high level of commitment to their roles and responsibilities, it sets a standard for the entire institution.

In Nigeria, public university leaders who are committed to their duties motivate faculty and staff to perform at their best. This leads to increased job satisfaction, reduced turnover rates, and a more engaged workforce, all of which are crucial for administrative efficiency and success. Commitment as an institutional leadership strength plays a pivotal role in promoting administrative success in public universities in Nigeria. By building a visionary and goal-oriented culture, enhancing staff morale and engagement, promoting accountability and responsibility, driving continuous improvement and innovation, strengthening external relationships and partnerships, ensuring effective resource management, and fostering a supportive and inclusive environment, committed leaders lay a strong foundation for their institutions' success. As public universities in Nigeria continue to pilot the challenges of the educational landscape, the unwavering commitment of their leaders will be instrumental in achieving sustained administrative success. Committed leaders are always looking for ways to improve and innovate (Godday & Uwomano, 2023). They are not content with maintaining the status quo but are driven by a desire to achieve excellence. In public universities in Nigeria, such leaders encourage continuous improvement in academic programs, research initiatives, and administrative processes. This commitment to innovation ensures that the universities remain competitive and can adapt to changing educational landscapes, thereby contributing to long-term administrative success. Goal setting is a critical component of effective institutional leadership. It provides a clear direction and a roadmap for achieving organizational objectives.

In public universities in Nigeria, goal setting plays a vital role in promoting administrative success. Goal setting involves defining clear, measurable objectives that guide the activities of the university. In public universities in Nigeria, effective leaders use goal setting to articulate a vision for the institution and establish a strategic plan to achieve it. Clear goals provide direction and focus, ensuring that all efforts are aligned with the university's mission and vision. This alignment is crucial for administrative success as it helps to prioritize initiatives and allocate resources effectively. Goal setting is integral to the strategic planning and decision-making processes in universities. In public universities in Nigeria, strategic planning guided by well-defined goals ensures that decision making is data-driven and aligned with the institution's priorities. This strategic approach enhances administrative success by enabling the university to adapt to changing circumstances and seize opportunities.

Institutional leaders of the universities manage the difficult task of effecting transformation; setting standards in connection to institutional ethics and the intended results that is in line with the ethics; they are to shun corruption and compromise (Ololube et al., 2018) and to hold unto equity and justice. The strength of institutional leaders in Nigeria universities are perhaps the slightest measures used in assessing students’ academic achievement. More so, strength of institutional leaders can support the academic achievement of students’ in

universities, it will also be of benefit to the faculty members, professionals and non- teaching staff.

The institutional leaders' strength will either make or destroy the institution. It will motivate or de-motivate the subordinates to achieve educational goals of the institution. Thus, strength of institutional leaders will to a great extent influence the subordinates ethical positively or negatively. Soludo in Ololube (2017) pointed out that institutional leadership is a key to human and institutional improvement, growth and transformation. Reports of corruption in Nigerian universities are in the increase. Corrupt practices such as misappropriation of funds, favouritism, injustice, Godfatherism, embezzlement of funds meant for the development of the institution, graft, lawlessness to mention but a few are on the increase in Nigerian universities. Theses corrupt are the limiting factor to the strength of institutional leadership which delays administrative success in universities in Rivers State. Some of these corrupt practices have been found wanting in character in some institutional leaders (Chiemeka-Unogu, 2018). Institutional leaders with viable strength will birth academically inclined students through viable leadership. Hence, this study will focus on institutional leadership strengths for administrative success in public universities in Nigeria

Theoretical Framework

The theoretical framework of this study will be based on Transformational Leadership Theory as cited in Oluoke (2015). Transformational leadership theory was developed since the late 1970's by scholars such as (Bush & Bell, 2005). From their views; a leader is a person who not only adapts his behavior to the situation but will as well transforms it.

Transformational leadership theory has been chosen as one of the theoretical framework for this research. The leadership approach exercised by any leader determines the growth of the organization. The difference between leaders are in their leadership styles, it determines the success of the organization, the quality of its products, level of staff efficiency and welfare of the people in the organization. In schools, leadership determines the level of performance of teachers and the quality of students. Most leadership models address transactional leadership, but transformational leadership transcends beyond transactional leadership which focuses on leaders guiding or motivating their followers in the direction of established goals, by clarifying roles and tasks requirement; and charismatic leadership which focuses on the leader with compelling vision or sense of purpose and the ability to communicate the vision for followers to understand through his behavior such as; focus on his pursuit, consistency, integrity, honesty, assertiveness and self-confidence, followers go the extra miles and are able to achieve goals that are perceived difficult or unpopular as a result.

This means that transformational leaders are charismatic, they want followers to not only adapt the charismatic world view but to go beyond that by attempting to instill in them the ability to question established views and eventually those established by the leader. Leadership development today places authority not only in the hands of one person, but is all about a collaborative process whereby, authority and power is shared by a group with shared interest (Branson, 2014). Transformational leaders being charismatic give some overlaps between transformational leaders and charismatic traits. Transformational leaders in their charismatic approach are proactive about the organizational vision and mission, shaping staff beliefs, values and attitudes and raising options for the future.

Transformational leaders guide, motivate and inspire others in the direction of established goals by clarifying roles and tasks requirement, the leader inspires followers to transcend their own self-interest for the benefit of the organization. Kalabgor (2017) noted that in as much as leaders use their positions (authority) to influence the behavior of followers, for them to be able to change followers' attitude, increase their commitment through interactive process with followers, is viewed as transformative leadership. The transformational approach sees school leadership as motivating teachers and subordinates to go to a very high level much more than expected of them. The source of motivation of staff is fostered through the reputable character of the leader. This leadership style facilitates significant changes in followers' personal life and social system. By the force of the personality of the leader, he reshapes behavior of followers to suit his vision or goals. Transformational leaders are capable of having a profound and extraordinary effect on his followers. They give attention to the concerns and development needs of staff (Robbins & Coulter, 1998). They help the staff to look at old problems in new ways by changing the staff awareness of issues. They are able to elicit excitement, arouse and inspire staff to willingly put in their best in order to achieve group goals.

That is why Burns in Armstrong (2012) called it transforming leadership. he stated that it incorporate motivating individuals to aspire for higher goals. To him, good leadership has a moral responsibility to respond to the values and needs of people in such a manner that is favorable to the highest form of human relationship. The highest task of moral leadership is the ability to surpass the huddles of the various challenges of everyday needs, wants and expectations.

Transformational leaders develop followers into leaders. They adopt different methods such as, connecting the staff sense of identity to the mission and group identity. Bernard Bass in 1985 developed more on Burns study by delving into the psychological mechanisms that make up transforming leadership by pointing out that the extent leaders can be classified as transformational is determined by their influence on their followers in relation to the level they feel trust, admiration, loyalty and respect for the leader and are desirous of working harder than initially expected.

The relevance of this theory to the study institutional leaders are to play key roles as transformational leaders to bring about changes in learning, teaching and curriculum, transform different contextual constraints and create opportunities that will bring about innovation in the institution. When a leader is capable of inspiring the mission, vision and giving followers an identity by transforming and motivating followers, such leaders are then seen as transformational leaders. Institutional leaders as transformational leaders shape the organizational culture of the institution.

METHODOLOGY

This position paper adopts a qualitative research approach rooted in a review of existing literature, expert opinions, and policy documents. The methodology is guided by the aim to critically analyze how institutional leadership strengths contribute to administrative success in Nigerian universities. The paper utilizes a descriptive and exploratory design. This approach is suitable for identifying, describing, and interpreting the core leadership strengths that influence effective administration within universities. The design supports a position-based argument that is informed by data, observations, and documented experiences within higher education institutions. Data for this position paper were obtained through peer-reviewed journal articles,

books, government policy reports, and university strategic documents published between 2010 and 2024 were systematically reviewed; reports from organizations such as the National Universities Commission (NUC), UNESCO, and World Bank regarding university leadership and governance in Nigeria were also analyzed; relevant case studies from Nigerian universities, including documented best practices and leadership models, were incorporated to support the arguments presented. Sources were selected based on relevance to leadership and university administration in the Nigerian context. Inclusion of conceptual works discussing institutional leadership traits such as integrity, creativity innovation, among others. As a position paper based solely on secondary data, there were no direct ethical risks involved. However, all sources were appropriately cited to maintain academic integrity and give credit to original authors.

CONCEPTUAL CLARIFICATION

Leadership

The term 'leader 'or 'leadership 'is often misunderstood or misused. It has been defined by different scholars from different perspectives. For instance, in a workplace, a leader often times is referred to the Chief Executive Officer (CEO), Manager or Board members or anyone who occupies a position of authority in the workplace; in the rural community, the term leader is referred to anyone who is wealthy and recognized in the family. Some see it as someone who has certain skills and knowledge. Others view leaders as a sequence of detailed traits or uniqueness. Leadership is the process of guiding and directing the actions of a certain group of people towards the attainment of set goals (Koko & Nwiyi, 2006). It is an act of influencing people to work towards the achievement of set objectives.

Nnabuo et al. (2005) posited leadership as the ability to convince others to seek defined objectives willingly and the leader is the human factor, which joins a group together and motivates it towards goals. Sorenson and Epps (1996) in Kolzow (2014) defined leadership as a forceful and dynamic personality who really leads from the front; an architect and implementer of strategy; a mediator in conflict situations; an integrator who assures the climate of the organization; a person able to motivate subordinates and who, by persuasion, compulsion or example to others; succeeds in getting others to follow the leader's wishes. Leadership is inspiring others to follow your vision within the bound you set, to the extent that it becomes a shared effort, a shared vision and a shared success (Zeitchik, 2012).

Leadership is a type of responsibility which is geared towards achieving particular ends by applying the available resources (human and capital) and guarantee a cohesive and coherent organization in process (Ololube, 2013). Hence, leadership is leading people in the right direction to achieve a goal. The following are different perspectives as to what leadership is.

Many scholars have defined leadership as influencing others to achieve a set goal. Northhouse (2013) defined leadership as a process whereby an individual influences a group of individuals to achieve a common goal. Kraus (2005) as cited in Manilla (2006) posits that leadership is a process whereby a person influences another to accomplish a mission, an objective or a task. Leadership is the process of providing a suitable environment and influencing people to strive willingly and enthusiastically towards the achievement or attainment of group or organizational goals (Amah, 2006).

Agi and Adiele (2015) posited that leadership is a process by which a person influences others through motivation and direction thereby achieving a group goal and also aiding them to

face future challenges that may be encountered in the organization. Blanchard (2010) defined leadership as the capacity to influence others by unleashing their power and potential to impact the greater good. Hence, leadership is a process whereby a person influences, encourages and motivates others to work for better tomorrow. A leader can only influence others when his/her subordinates feel some sense of participation as leaders at some level.

Components of Good Leadership

Good leaders are those who knows where they intend going and what they intend to achieve. They have the capability to take charge, communicate their vision to their followers, get their followers into action and ensure that they achieve their set goals (Armstrong, 2009). Good leaders are dependable; they know their strength and weaknesses and have the skill to understand the needs, approach and viewpoint of their followers. Adair (2005) listed the following qualities that good leaders should possess:

- Enthusiasm: getting things done which can be communicated to others;
- Confidence believing in oneself, which again people can sense (but this must not be overconfidence, which leads to arrogance);
- Toughness: resilient, tenacious and demanding high standards, seeking respect but not necessarily popularity;
- Integrity: being true to oneself, personal wholeness, soundness and honesty, which inspires trust;
- Warmth in personal relationship, caring for people and being considerate;
- Humility: willingness to listen and take the blame, not being arrogant and over bearing.

A good leader consults and involves people in decision making. A good leader can change freely from one leadership style to another as situation demands. A leader is regard as good leader only when his followers are good. This statement is in agreement with Adair (2013) who posits that any good leader has a good product that is to say a high performance team. This can be seen by the level of trust and commitment that one‘s followers have towards their leader.

Institutional Leadership in University

The university is the apex of an educational system. It is a place where high level of manpower is prepared for economic and political development of any nation (Ogbu, 2019). The university is a place of higher learning after secondary education. Institutional leadership in the university comprises of few people that have the economic right, power, ethical responsibility and high motivation to manage the institution. They consist of the visitor (the president for federal university and the governor for state university), the chancellor, the pro-chancellor, the vicechancellor, the deputy vice-chancellor, registrar, librarian, bursar, professors, deans, directors and heads of departments.

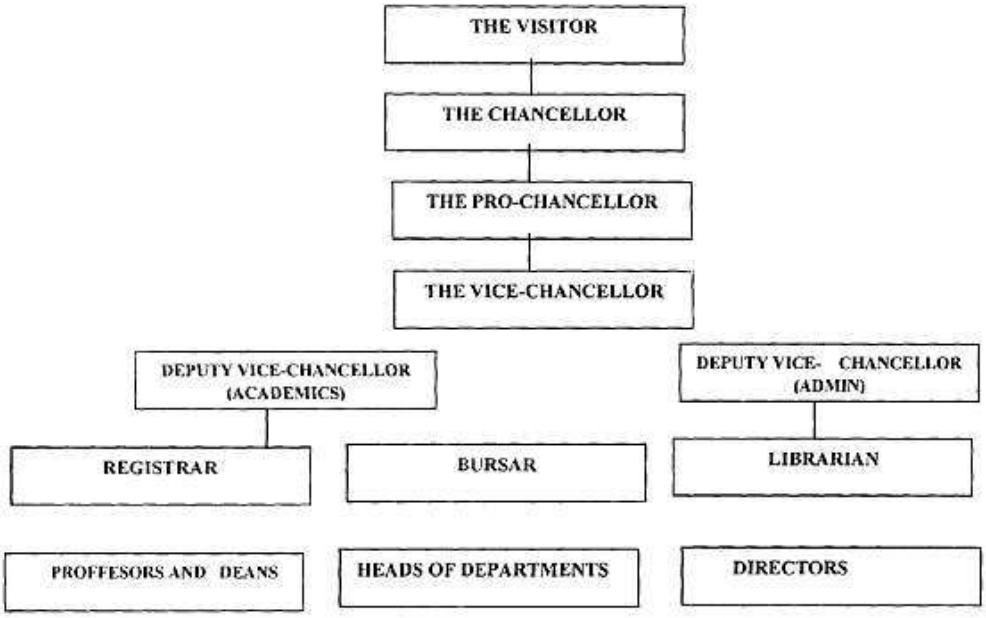

Figure 1: Organogram chart of Institutional Leadership in the Universities.

The visitor: In Nigerian university system, the visitor is the president or governor for any federal or state university respectively. The visitor appoints the chancellor, pro-chancellor, vice- chancellor.

The chancellor: He/she is the supposed head or father figure of the university. He/she is appointed by the government and is a person of reputable standard in the society, who can command the respect of both the university and the government.

The pro-vice chancellor: He/she presides over all members of the university, except the chancellor and vice chancellor especially during convocation if he/she happens to be the chairman.

The vice-chancellor: He/she is the chief executive and head officer of academics in the university, the chief accounting officer, chairman of senate and head of the university community. He/she takes superiority over the university except the chancellor and proI chancellor. he/she directs the affairs of the university towards actualization of its vision, mission and objectives.

Deputy vice-chancellor: He/she acts in the absence of the vice-chancellor.

The Registrar: He/she is the chief Administrative officer of the university and works with the vice-chancellor for the effective management of the university. He/she is the secretary to the university, council, senate, congregation and convocation. He is the custodian of institutional records.

The Bursar: He/she is the chief financial officer of the university, gives advice on finance and account matters.

The Librarian: He/she is directs the affairs of the library and information retrieval in the university.

The Professors, Deans of Faculties: They are called the academic leaders. The dean is in-charge of the various faculties in the universities.

The Head of Departments, Directors: they direct the affairs of the departments and reports directly to the dean.

Goal Setting as Institutional Leadership Strengths for Administrative Success in Universities

Goal setting is a fundamental component of effective institutional leadership in universities. It serves as a strategic tool that drives administrative success by providing clear direction, fostering motivation, and enhancing accountability. This article explores how goal setting functions as a leadership strength and its impact on administrative success in universities, supported by recent academic research from 2019 onward. Goal setting provides a clear roadmap for universities, ensuring all efforts align with common objectives. This alignment streamlines processes and enhances institutional efficiency (Brown & Green, 2019). It helps leaders prioritize tasks and allocate resources effectively, thereby improving overall operational performance.

Well-defined goals serve as a source of motivation for faculty, staff, and students. They foster a sense of purpose and engagement, driving individuals to work towards achieving the institution's vision (Wilson & Smith, 2021). Motivated employees are more likely to put in extra effort, leading to higher productivity and job satisfaction.

Specific goals allow for the measurement of progress and performance. This facilitates accountability and continuous improvement, which are essential for maintaining high standards in educational institutions (Nguyen & McCartney, 2020). Regular performance reviews based on these goals can identify areas for improvement and reinforce successful strategies. Clear goals help prioritize the allocation of resources, ensuring critical areas receive necessary support. This optimizes the use of financial, human, and technological resources (Martin & Scott, 2021).

Effective resource management ensures that the institution can meet its goals without wastage or shortfalls. Effective goal setting is integral to the strategic planning process. It enables universities to navigate challenges, leverage opportunities, and adapt to the changing educational landscape (Smith & Johnson, 2020). Strategic planning with clear goals helps institutions stay ahead of trends and maintain a competitive edge. Goals focused on academic excellence drive improvements in teaching, research, and student outcomes. Universities that set high academic standards and monitor progress tend to achieve better educational outcomes (Locke & Latham, 2019). These institutions can attract top talent and secure funding based on their reputation for excellence. Clear goals streamline administrative processes, reducing redundancy and enhancing efficiency. This leads to better utilization of resources and improved service delivery to students and staff (Parker & Taylor, 2020).

Efficient operations can reduce costs and increase satisfaction among stakeholders. Setting and achieving ambitious goals enhances the university's reputation. This attracts top-tier faculty, students, and funding opportunities, further bolstering the institution's standing (Thomas

& Jones, 2021). A strong reputation can lead to increased enrollment and partnerships with other prestigious institutions. Goals that address the needs and expectations of stakeholders, including students, parents, faculty, and the community, lead to higher satisfaction levels. Engaged and satisfied stakeholders contribute positively to the university's environment and success (Lee & Kim, 2019). Positive stakeholder relationships can enhance support for the institution's initiatives and programs.

Long-term goals focused on sustainability and growth ensure that universities adapt to changing educational landscapes while maintaining core values and standards (Carter & Williams, 2019). Sustainable growth strategies can help institutions remain resilient in the face of economic and social changes. Ensure goals are Specific, Measurable, Achievable, Relevant, and Time-bound. This framework enhances clarity and focus, making it easier to track progress and achieve objectives (Locke & Latham, 2019). SMART goals provide a structured approach to goal setting that can be easily communicated and monitored. Engage a broad range of stakeholders in the goal-setting process. This fosters a sense of ownership and ensures goals reflect diverse perspectives and needs (Lee & Kim, 2019).

Integrity as Institutional Leadership Strengths for Administrative Success in Universities

The word integrity is derived from the Latin word ‗Integritas', which means wholeness, coherence, rightness or purity (Sarros et al., 2006). The word integrity lacks clarity regarding the meaning. To some scholars, integrity is wholeness or truthful while to some others, it is doing things right. To another group, integrity means consistency while some others see it as moral or ethical behavior. Integrity therefore is defined as being truthful, whole and having strong moral principles. Integrity can also mean doing things right at the right time.

Carter (1996) in Pillay (2014) posited that integrity is like the weather, everyone talks about it but no one knows what to do about it. Integrity is an ever-present ideal in leadership; citizens clamor for it from politicians, employees desire it from their managers, religious faithful expect it from the clergy, and stakeholders demand it from corporations. Every leader is expected to have integrity to enable his/hers subordinate to do same. Integrity is being true to oneself in order to achieve outstanding results. Integrity means doing the right thing because it is the right thing to do. Leaders with integrity are not afraid to face the truth. Integrity means telling the truth even if the truth is ugly. It is better for a leader to have integrity than to mislead others because you are probably misleading yourself too. Leaders with integrity are incorruptible and incapable of breaking the trust of those who have confided in them. Every human is born with a conscience therefore has the ability to determine what is right or wrong.

The hallmark of integrity is choosing the right irrespective of the consequences. Integrity is those characteristics of an individual that are always considerate, empathetic, transparent, honest and ethical (Duggar, n.d). Leaders with integrity are those who can do consistently what is ―right‖ and they are trustworthy, certain in dealing with others and with matters, they are defenders of what is fair, just and acceptable (Ogbu, 2019). Leadership and academic integrity, faculty integrity in Nigerian university system are judged by students' academic achievement (Ololube et al., 2018). Integrity is how well people match their adopted values to their actual values. Integrity is the highest professional conduct and standard that a leader should have.

Honesty is one of the fundamental properties of a leader with good character. Honesty means telling the truth or being true. Without honesty, a leader can't lead with integrity. Honesty serves as the gateway for trust and inspiration. Honesty is absolutely essential to leadership. A

dishonest leader has no chance of succeeding because as soon as such a leader loses trust, the leader is as well as a ghost to the institution. A leader‘s capacity for honesty can help his subordinates work positively on solving problems. Subordinates are truly hungry for some good old-fashioned honest leaders. They would rather work with leader‘s who they trust can be honest with them about the reality of their situation (Sarros et al., 2006).

Integrity and honesty are key attributes of the character of a good leader. The important nature of integrity and honesty cannot be ignored. Integrity and honesty is the keystone of good citizenship, social responsibility and psychological healthy institution and society. Personal integrity and honesty supplies the inner strength of character that enables a leader to make difficult decisions and add to the general good in a timeless manner. As a leader, you need to know yourself and values. Find an institution that aligns with your values and then model your values and that of the institution together. Make a personal decision to be honest with yourself and your team at all times. Be transparent. Cultivate integrity and honesty in your faculty members and students‘. If you make mistake, admit it, take responsibility for your mistake, resolve it and learn from it.

Innovation and Creativity as Institutional Leadership Strengths for Administrative Success in Universities

University leaders who prioritize these elements are better equipped to navigate challenges, enhance academic quality, and maintain competitive advantages. This article explores how innovation and creativity serve as key leadership strengths and their impact on administrative success in universities, supported by recent academic research from 2019 onward. Innovative leadership drives the development of cutting-edge academic programs that meet the evolving needs of students and industry. Universities that embrace innovative curricula and teaching methods attract top talent and improve educational outcomes (Bessant, 2019). Innovation in research practices and funding strategies enables universities to stay at the forefront of scientific discovery and technological advancement. Creative approaches to securing grants and partnerships amplify the institution's research capabilities (Clark & Lattimer, 2020).

Innovative administrative practices streamline operations, reduce costs, and improve service delivery. Automation and data-driven decision-making are examples of how innovation can enhance administrative efficiency (Davies & Hamilton, 2021). Institutional leaders who prioritize innovation create a culture of continuous improvement. This culture encourages faculty and staff to seek new solutions to existing problems and adopt best practices (Elliott & Reeves, 2020). Innovation in technology adoption, such as implementing advanced learning management systems and virtual classrooms, ensures universities remain relevant in the digital age. This adaptability is essential for maintaining a competitive edge (Fischer & Kim, 2019). Creative leadership fosters interdisciplinary collaboration, leading to the generation of novel ideas and solutions. Such collaboration enhances research outputs and educational programs (Garcia & Moreno, 2021).

Creative approaches to teaching and student engagement, such as experiential learning and gamification, improve the learning experience and student satisfaction (Huang & Lin, 2020). Engaged students are more likely to achieve academic success and contribute positively to the university community. Creative leaders leverage community engagement to build partnerships and support. These initiatives can enhance the university's reputation and provide additional resources and opportunities for students and faculty (Jackson & Porter, 2020).

Creativity in professional development programs ensures faculty members are equipped with the latest pedagogical skills and knowledge. This support helps faculty innovate in their teaching and research (Kelly & Silver, 2019). Creative leadership in diversity and inclusion initiatives fosters an inclusive campus environment. Diverse perspectives contribute to a richer academic experience and innovative problem-solving (Lopez & Mitchell, 2021). Universities that prioritize innovation and creativity build strong academic reputations. These institutions attract high-caliber students, faculty, and research funding, bolstering their standing in the academic community (Miller & Johnson, 2020).

Innovative and creative strategies in student recruitment and retention improve enrollment numbers and reduce dropout rates. Engaging marketing campaigns and personalized support services are examples of such strategies (Nash & Robertson, 2021). Innovation and creativity support sustainable growth by ensuring universities adapt to changing educational landscapes. This adaptability allows institutions to thrive despite economic or social challenges (O'Connor & Sanders, 2020). Creative approaches to financial management, including diversified revenue streams and strategic investments, enhance the university's financial stability and capacity for growth (Phillips & Turner, 2019).

Innovation and creativity in stakeholder engagement build stronger relationships with alumni, donors, and the community. These relationships provide vital support and resources for university initiatives (Quinn & Morgan, 2021). Institutional leaders should create an environment that encourages calculated risk-taking. This approach can lead to breakthrough innovations and creative solutions (Smith & Walker, 2019). Allocating resources for innovation and creativity initiatives, such as seed funding for research and development projects, is essential. Support systems, including mentorship programs, also foster these efforts (Taylor & Adams, 2020). Adopting and integrating the latest technologies can drive innovation and creativity. Universities should invest in technological infrastructure and training to maximize these benefits (Upton & Shaw, 2021). Creating opportunities for collaboration across departments and with external partners fosters a culture of innovation and creativity.

Collaborative projects can lead to significant advancements and new discoveries (Vaughn & Hart, 2020). An inclusive environment that values diverse perspectives enhances creativity. Policies and practices that support diversity and inclusion are crucial for fostering a creative campus culture (Wright & Daniels, 2021).

Innovation and creativity are vital leadership strengths that significantly contribute to administrative success in universities. By enhancing academic programs, promoting research excellence, improving operational efficiency, and fostering a culture of continuous improvement, these elements enable universities to achieve their strategic objectives and remain competitive. Adopting best practices that encourage risk-taking, provide resources, leverage technology, facilitate collaboration, and promote inclusivity ensures that universities harness the full potential of innovation and creativity, leading to sustained growth and excellence in higher education.

Effective Communication as Institutional Leadership Strengths for Administrative Success in Universities

The importance of right communication skills cannot be over emphasized. A lot of emphasis was on communication skills (verbal and non-verbal) that leaders have made. In recent times we have noticed superior communication skills in political leaders, business leaders and modern day management leaders. There are also numerous leaders who have suffered with their position

because of their less communication skills. For instance, in the school environment where local languages, behaviors and expectations are different, it takes a leader with good communication skill to succeed. A leader is appointed to manage the staff and is based on a particular office location. It becomes very important for the leader to communicate well and give clear directions to his subordinates so that they remain motivated and achieve the desired results. A typical example is Ignatius Ajuru University of Education with three different campuses at different location; being managed by the Vice Chancellor.

Effective communication is paramount to the success of any organization, especially within the complex environment of universities. Strong communication from institutional leaders is crucial for administrative success, impacting various aspects of university operations. Effective communication involves the clear, timely, and efficient exchange of information among all stakeholders within the university. This includes faculty, students, administrative staff, and external partners. Strong communication fosters transparency, builds trust, and ensures everyone is aligned with the university's goals and objectives. Transparency in communication helps build trust among stakeholders. When leaders communicate openly about institutional goals, policies, and challenges, it fosters a sense of trust and inclusiveness. According to Alase (2019), transparent communication from university leaders helps in mitigating uncertainties and rumors, thereby enhancing institutional stability.

Effective communication plays a significant role in shaping and reinforcing organizational culture. Consistent and clear messaging from leadership helps instill a shared vision and values among university members. This is crucial for creating a cohesive and supportive academic environment (Yıldırım, 2019). Universities often undergo significant changes, such as curriculum updates, policy revisions, and infrastructure developments. Effective communication is essential in managing these changes smoothly. As noted by Kotter and Cohen (2019), clear and consistent communication from leaders is critical in guiding stakeholders through transitions, reducing resistance, and ensuring successful implementation. Effective communication enhances decision-making processes by ensuring that relevant information is disseminated accurately and timely. This allows for informed decisions that reflect the collective input of stakeholders. Ahmed (2020) highlighted that universities with strong communication channels are better equipped to make strategic decisions that drive institutional success.

Universities are integral parts of their broader communities. Effective communication between university leaders and external stakeholders, including local businesses, government agencies, and alumni, strengthens these relationships. This engagement is crucial for securing support and resources, as well as fostering a positive public image (Morrison, 2019). In a university setting, collaboration among departments and teams is essential for achieving academic and administrative goals. Effective communication from leaders encourages teamwork and collaboration, leading to enhanced productivity and innovation. As per Jackson and Parry (2020), leaders who communicate effectively can break down silos and promote a collaborative culture. In times of crisis, such as natural disasters or public health emergencies, effective communication from university leaders is vital. Clear, accurate, and timely communication helps manage the crisis effectively, ensuring the safety and well-being of all stakeholders. Smith and Riley (2020) emphasize that universities with robust communication strategies are better prepared to handle crises and recover more swiftly.

University-Industrial Partnership as Institutional Leadership Strengths for Administrative Success in Universities

University-industrial partnerships have become increasingly crucial in the modern educational landscape. These collaborations bridge the gap between academia and industry, fostering innovation, enhancing research capabilities, and providing students with real-world experience. One of the most significant benefits of university-industrial partnerships is the enhancement of research and development (R&D) capabilities. Collaborations with industry provide universities with access to additional funding, advanced technologies, and practical insights that can drive innovative research. According to Järvensivu and Möller (2019), such partnerships lead to groundbreaking discoveries and technological advancements, thereby elevating the university's research profile and reputation.

University-industrial partnerships ensure that academic programs remain relevant to current industry needs. By collaborating with industry partners, universities can tailor their curricula to include the latest technological advancements and industry practices. This alignment between academic offerings and industry demands enhances the employability of graduates, as highlighted by Edwards et al. (2020). Effective university-industrial partnerships facilitate the transfer of knowledge and expertise between academia and industry. This exchange benefits both parties: universities gain practical insights and industry applications for their research, while companies benefit from academic expertise and innovative solutions. As noted by Perkmann et al. (2019), knowledge transfer activities contribute to the overall success and competitiveness of both universities and industries.

Collaborations with industry often lead to increased funding and resources for universities. These partnerships can provide access to grants, scholarships, and investments that support academic and infrastructural development. According to Bradley and Taylor (2020), such financial support is crucial for universities to sustain and expand their operations, especially in times of limited public funding. University-industrial partnerships create valuable opportunities for students, including internships, co-op programs, and collaborative projects. These experiences provide students with practical skills and industry exposure, enhancing their career prospects. As reported by Widding et al. (2020), students involved in industry partnerships are better prepared for the job market and have higher employability rates.

Successful partnerships with reputable industry players enhance the institutional reputation of universities. These collaborations signal to prospective students, faculty, and partners that the university is committed to innovation, practical application, and industry engagement. According to Laursen and Salter (2020), a strong reputation attracts high-quality students and faculty, further contributing to the university's success.

University-industrial partnerships foster a culture of innovation and entrepreneurship within academic institutions. By working closely with industry partners, universities can create incubators, accelerators, and startup ecosystems that encourage entrepreneurial activities among students and faculty. As highlighted by Siegel and Wright (2020), these initiatives lead to the commercialization of research and the creation of new businesses, driving economic growth and societal impact. Collaborations with industry also strengthen the university's engagement with the local community. Universities can leverage their partnerships to address regional challenges, contribute to economic development, and support community initiatives. According to Mansfield (2019), such community engagement activities enhance the university's social responsibility and public image.

Universities with strong industrial partnerships are better positioned to influence policy decisions at local, national, and international levels. By demonstrating the practical impact of their research and collaborations, these universities can advocate for policies that support academic and industrial innovation. As noted by Bruneel et al. (2019), policy influence is an important aspect of administrative success, enabling universities to shape the broader environment in which they operate. Sustainability is a critical consideration for modern universities. University-industrial partnerships contribute to sustainability by promoting environmentally friendly practices, supporting green technologies, and fostering sustainable development initiatives.

According to Lozano et al. (2020), such partnerships are essential for universities to achieve their sustainability goals and demonstrate their commitment to environmental stewardship. In conclusion, university-industrial partnerships play a pivotal role in the administrative success of universities. These collaborations enhance research and development, improve curriculum relevance, facilitate knowledge transfer, boost funding and resources, enhance student opportunities, strengthen institutional reputation, promote innovation and entrepreneurship, enhance community engagement, facilitate policy influence, and ensure sustainability. As universities continue to navigate an increasingly competitive and dynamic landscape, leveraging industrial partnerships because leadership strength will be crucial for their long-term success and impact.

CONCLUSION

Institutional leadership plays a critical role in shaping the administrative success of public universities, especially in Nigeria. This study highlighted the significant connection between effective leadership practices and the attainment of organizational goals in higher education. Strong leadership fosters an environment of goal-setting, collaboration, innovation, effective communication and accountability, ensuring that academic and administrative functions align seamlessly with the institution‘s mission.

The strengths of institutional leadership in public universities in Nigeria include strategic vision, transparent decision-making, effective communication, and the ability to inspire staff and students alike. Leaders who exhibit these qualities not only enhance institutional efficiency but also contribute to the holistic development of the university community. Furthermore, leadership that prioritizes staff development and stakeholder engagement ensures that administrative processes are inclusive and adaptive to changing educational demands.

The success of public universities in Nigeria hinges on the leadership's ability to harness their institutional strengths to drive administrative excellence, and cultivating leadership that is visionary, inclusive, and results-oriented, universities will be able to achieve sustainable growth and maintain their relevance in a competitive academic landscape. Future research should explore strategies for enhancing leadership capacity and addressing contextual challenges to further elevate the administrative success of public universities.

Suggestions

From the discussions of this paper the following are suggested to improve university leadership:

- University leaders should strengthen goal setting as institutional strengths to better contribute to administrative success in public universities in Nigeria.
- University leaders should reinforce integrity as institutional strengths that improve administrative success in public universities in Nigeria.
- University leaders should support innovation and creativity as institutional strengths to enhance administrative success in public universities in Nigeria.
- University leaders should make stronger commitment as institutional strengths to boosts administrative success in public universities in Nigeria.
- University leaders should encourage effective communication as institutional strengths to increase administrative success in public universities in Nigeria.
- University leaders should strengthen university-industrial partnership as institutional strengths to contribute to administrative success in public universities in Nigeria.

ADMINISTRATIVE LEADERSHIP STYLES AND RESOURCE ALLOCATION EFFICIENCY IN SECONDARY SCHOOLS

Grace ANINGENIME
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria
aningenimegrace@gmail.com

ABSTRACT

This paper examines the relationship between administrative leadership styles and resource allocation efficiency in public secondary schools, with a specific focus on the Nigerian educational context. The paper posits that the efficiency of resource distribution and utilization in these schools is largely influenced by the nature of leadership exercised by school administrators. Leadership in educational settings not only defines the direction and vision of an institution but also determines how human, financial, material, and infrastructural resources are prioritized, allocated, and monitored for effectiveness. Given the recurring issues of mismanagement, underutilization, and inequitable distribution of resources in Nigerian public secondary schools, this paper asserts that a shift toward more transformative, participative, and capacity-driven leadership styles is critical. The paper is grounded in theoretical perspectives that explain how leadership influences systemic efficiency and offers practical policy recommendations to strengthen leadership capacity, institutional accountability, and strategic planning. It concludes that enhancing leadership competence is not merely an administrative requirement but a strategic pathway to improving educational outcomes and institutional performance in public secondary schools.

Keywords: Administrative Leadership, Leadership Styles, Resource Allocation Efficiency, Public Secondary Schools, Educational Management, Nigeria.

INTRODUCTION

The dynamics of educational administration in the 21st century have increasingly brought to the forefront the indispensable role of administrative leadership in shaping the functionality, development, and output of public secondary schools, especially in developing contexts such as Nigeria, where educational institutions face significant infrastructural and managerial challenges. Leadership within the administrative context of public secondary schools is not merely a positional or ceremonial responsibility but a fundamental determinant of institutional culture, planning, and effectiveness in resource allocation and utilization. As noted by Uka (2021), administrative leadership functions as a framework through which educational goals are

operationalized, staff motivation is harmonized, and resources both human and non-human are strategically deployed to yield desirable academic and institutional outcomes. In the face of limited financial subventions, uneven resource distribution, and bureaucratic encumbrances, the manner in which school administrators navigate the task of allocating resources effectively determines not only the quality of teaching and learning but also the sustainability of school operations and stakeholder satisfaction.

Public secondary schools across various Nigerian states continue to battle with systemic inefficiencies that arise from poor planning, weak monitoring frameworks, and leadership incapacity to effectively deploy available resources to meet educational targets. These inefficiencies often manifest in form of overcrowded classrooms, mismanaged staff distribution, insufficient instructional materials, dilapidated infrastructures, and an overall lack of fiscal transparency in resource application. As highlighted by Odigwe and Inko-Tariah (2023), administrators in several public junior secondary schools in Rivers State have been unable to translate national education policies into effective school-level implementation due to leadership gaps, lack of strategic planning skills, and absence of performance-based accountability systems. Furthermore, Obah and Asiyai (2022) assert that many school leaders lack the essential administrative and managerial skills required to assess resource needs, prioritize competing demands, and implement cost-effective strategies for equitable and efficient allocation of both tangible and intangible resources. The cumulative effect of these gaps is the stagnation in educational outcomes and the perpetuation of systemic inequities across public school systems.

In light of the prevailing conditions and administrative realities facing public secondary education in Nigeria, it becomes critically imperative to interrogate the correlation between the leadership styles adopted by school administrators and the efficiency with which resources are allocated to meet the academic and developmental needs of the school community. Leadership styles such as transformational, democratic, transactional, authoritative, and laissez-faire are not merely conceptual variations but operational models that fundamentally influence decision-making patterns, staff coordination, policy implementation, and the prioritization of resource needs in schools. Ekundayo and Alonge (2020) emphasized that school principals who adopt transformational and participatory leadership styles are more likely to engage stakeholders in budgetary planning, promote transparency in school resource utilization, and initiate innovations that optimize learning conditions and teacher productivity. In contrast, rigid or passive leadership models often stifle innovation, discourage collaboration, and result in poor resource planning and inefficient allocation practices that undermine institutional growth and equity.

The purpose of this position paper is to critically examine the relationship between administrative leadership styles and resource allocation efficiency in public secondary schools, with a specific focus on how leadership behaviors, planning competencies, and interpersonal communication mechanisms influence the strategic deployment of available resources in resource-constrained school environments. It aims to evaluate existing leadership practices, highlight best-fit models for public secondary education, and recommend transformative strategies for enhancing leadership capacity toward efficient resource management. This examination will be grounded in educational leadership theories such as Transformational Leadership Theory and Path-Goal Theory, which offer explanatory frameworks for understanding how leadership behaviors shape organizational efficiency and staff motivation. The review will also draw empirical insights from Nigerian and African contexts to validate the propositions and strengthen the contextual applicability of the recommendations.

This discourse holds profound significance for Nigeria's public secondary education system, as it provides evidence-based perspectives that can inform policymaking, improve administrative practices, and foster a culture of accountability and efficiency among school leaders. By examining the interplay between leadership and resource management, this paper offers practical recommendations for institutional capacity building, leadership training, and structural reforms needed to reposition public secondary schools as effective delivery agents of educational equity, inclusion, and quality. Ultimately, this paper asserts that administrative leadership styles are not peripheral considerations in school governance but central levers through which public secondary school administrators can enhance resource allocation efficiency, elevate staff and student performance, and build resilient institutional systems that are responsive to the dynamic challenges of modern education.

THEORETICAL FRAMEWORK

Two prominent theoretical frameworks that help understand administrative leadership and resource allocation efficiency in public secondary schools are Transformational Leadership Theory and Path-Goal Theory. These theories offer insightful perspectives on how leadership can shape organizational practices, including resource distribution and management, to enhance educational outcomes.

Transformational Leadership Theory

Transformational Leadership Theory, introduced by James Burns (1978) and later expanded by Bernard Bass in 1985 as cited in Northouse (2018), is a leadership model that centers on the ability of leaders to inspire and motivate their followers to achieve exceptional results by transcending their individual self-interests and fostering innovative thinking. The core tenet of transformational leadership lies in its focus on developing the intrinsic motivation and morale of followers, thus encouraging them to pursue the collective goals of the organization. In educational contexts, this leadership style is particularly effective due to its emphasis on vision, inspiration, and intellectual stimulation—qualities that are essential for motivating both school staff and students toward academic excellence. According to Bass (1985), transformational leaders in public secondary schools are viewed as role models who lead by example and inspire change by communicating a compelling vision that aligns the efforts of the entire school community toward achieving shared educational objectives.

In terms of resource allocation, transformational leadership significantly impacts school management by ensuring that resources—whether financial, human, or infrastructural—are distributed efficiently and effectively. Transformational leaders foster an inclusive decision-making environment, actively involving staff in the allocation process. This inclusive approach ensures that resources are distributed in alignment with the educational vision of the school. Moreover, transformational leaders encourage creativity and resourcefulness among teachers and staff in utilizing available resources. Northouse (2018) added that empowering school staff, these leaders foster an environment where resources are maximized, not merely allocated. This approach ensures that resource allocation is integrated into the broader educational mission, contributing not only to efficiency but also to academic success.

The effectiveness of transformational leadership in resource allocation lies in its ability to cultivate a strong organizational culture based on trust, collaboration, and shared responsibility.

Transformational leaders promote an environment that encourages transparency and accountability, which ensures that all stakeholders understand the rationale behind resource distribution. This leads to improved coordination in managing school resources, as staff members are motivated to work collectively toward optimizing resource use. In schools where resources are often limited, such as in public secondary schools, transformational leadership helps ensure that available resources are distributed innovatively and efficiently, ultimately leading to improved student outcomes and greater overall school performance.

Path-Goal Theory

Path-Goal Theory, developed by Robert House (1971) as cited in Yukl (2010), posits that a leader's primary role is to provide clear guidance and support to followers, enabling them to achieve their goals. The theory emphasizes that effective leaders adapt their leadership style to the specific needs of their followers and the challenges of the tasks at hand. Path-Goal Theory identifies four leadership styles: directive, supportive, participative, and achievement-oriented. The selection of leadership style depends on the situation and the specific needs of the followers. In public secondary schools, this theory emphasizes the need for school leaders to be flexible, adjusting their leadership approach to address challenges related to resource allocation and the unique needs of staff and students.

When applied to resource allocation, Path-Goal Theory provides a framework for school leaders to adapt their leadership style to optimize resource use. For example, in situations where resources are limited, a directive leadership style may be more appropriate, with the leader providing clear instructions on how resources should be allocated. Conversely, when resources are more plentiful, a participative leadership style may be more effective, involving teachers and staff in decision-making processes and allowing for input on how resources should be used (Yukl, 2010). This adaptability in leadership style ensures that resources are allocated effectively, based on the specific circumstances of the school. By adjusting their leadership style, school leaders can ensure that resources are allocated efficiently, with the goal of maximizing their impact on educational objectives.

The supportive leadership style within Path-Goal Theory also plays a vital role in enhancing resource utilization. When school leaders demonstrate care and concern for the welfare of their teachers, they foster trust and morale, which are essential for effective resource use. In cases where staff may feel overwhelmed by resource constraints, supportive leadership can alleviate stress and promote collaboration, enabling teachers to make the most of the available resources. Similarly, an achievement-oriented leadership style, where leaders set high standards and encourage excellence, can drive the efficient use of resources by motivating staff to work toward high performance and maximizing the impact of available materials and infrastructure (Robinson & Timperley, 2007). This dynamic approach ensures that school leaders can create an environment where resources are effectively managed to achieve the best possible educational outcomes.

Comparison and Justification

Both Transformational Leadership Theory and Path-Goal Theory offer valuable insights into the relationship between leadership and resource allocation efficiency in public secondary schools, although they approach the issue from different perspectives. Transformational leadership

focuses on inspiring and motivating staff to work collaboratively toward shared goals, thereby creating a culture of innovation and resource efficiency. According to Bass (1985), this leadership style fosters an environment where resources are utilized creatively and effectively. In contrast, Path-Goal Theory, as articulated by House (1971), emphasizes the adaptability of leaders, suggesting that effective leaders adjust their styles based on the specific needs of their staff and the resources available. This flexibility ensures that leaders can implement the most appropriate strategies for resource allocation, depending on the circumstances.

The combination of both theories provides a comprehensive framework for understanding how leadership can influence resource allocation in public secondary schools. While transformational leadership fosters a culture of collaboration and innovation, Path-Goal Theory offers a practical approach to resource management by emphasizing adaptability and responsiveness to contextual challenges. Together, these theories offer school leaders a robust toolkit for optimizing resource allocation. By applying both approaches, school leaders can create an environment where resources are not only allocated efficiently but also maximized in their impact on student achievement and overall school performance (Northouse, 2018; Robinson & Timperley, 2007). Therefore, school leaders can develop strategies that ensure optimal resource utilization, ultimately improving educational outcomes for students in public secondary schools.

CONCEPTUAL CLARIFICATIONS

In educational administration, Administrative Leadership refers to the role of school leaders, particularly principals, in guiding and managing the school's operations, shaping its vision, and ensuring alignment of resources with educational goals. Leadership Styles describe the approaches school leaders use to manage their staff and students, such as transformational leadership, which focuses on inspiring and engaging teams, or transactional leadership, which emphasizes structure, compliance, and rewards. Resource Allocation involves distributing resources financial, human, material, and infrastructural in a way that supports educational objectives. Resource Allocation Efficiency refers to the effective use of these resources to maximize educational outcomes while minimizing waste. The administrative structure in public secondary schools in Nigeria typically includes a principal at the top, followed by vice-principals, department heads, and teachers. The principal manages resource allocation, ensures policy implementation, and leads the school towards achieving its educational goals. Understanding these concepts is essential for assessing the impact of leadership on resource efficiency and overall school performance.

Understanding Administrative Leadership in Education

Administrative leadership in education is a multifaceted concept that extends beyond traditional management to encompass the strategic direction, cultural development, and operational efficiency of educational institutions. In the context of Nigerian public secondary schools, particularly in Delta State, the role of school administrators is pivotal in navigating the complexities of educational delivery amidst socio-economic and infrastructural challenges. According to Okorodudu (2018), effective school leadership in Nigeria requires administrators to possess a blend of managerial acumen and visionary insight to foster environments conducive to learning and development. The structural hierarchy within Nigerian public secondary schools

places principals at the apex of administrative leadership, supported by vice principals, heads of departments, and other key staff members. This hierarchical framework delineates clear lines of authority and responsibility, facilitating coordinated efforts towards achieving educational objectives. Akinyemi and Siyanbola (2020) highlight that principals are tasked with overseeing curriculum implementation, staff development, financial management, and the maintenance of discipline, all while aligning school activities with national educational policies and standards.

Expectations of school administrators in Nigeria are multifaceted and often conflicting, requiring a delicate balance between academic excellence and socio-emotional support for students. Ajayi and Olatunji (2018) argue that principals must adeptly manage limited resources, address the diverse needs of students, and maintain a positive school culture. This necessitates the development of leadership competencies that encompass emotional intelligence, conflict resolution, and community engagement, enabling administrators to navigate the intricate dynamics of school management effectively. External factors such as government policies, community expectations, and societal norms further influence the administrative leadership landscape.

Nwagwu and Igwe (2018) asserted that principals are often positioned as mediators between the educational system and the community, tasked with interpreting and implementing policies while addressing local concerns. This role underscores the importance of contextual awareness and adaptability in leadership practices, ensuring that administrative decisions resonate with the community's values and expectations. Therefore, administrative leadership in Nigerian public secondary schools is characterized by a complex interplay of internal responsibilities and external influences. The effectiveness of school administrators hinges on their ability to integrate strategic planning, resource management, and community relations into a cohesive leadership approach. As Uzoigwe (2016) notes, the evolving educational landscape demands that principals continuously refine their leadership skills to meet the dynamic challenges of school administration, thereby ensuring the realization of educational goals and the holistic development of students.

Leadership Styles in Educational Administration

Leadership styles in educational administration significantly impact the operational efficiency and resource management within schools. The application of various leadership styles—authoritative, democratic, transformational, transactional, and laissez-faire—can influence the effectiveness of school management, particularly in resource-constrained settings like Nigerian public secondary schools. Understanding these styles and their implications is crucial for administrators aiming to optimize school performance and teacher engagement. The authoritative leadership style is characterized by centralized decision-making, where leaders exercise significant control over school operations. While this approach can lead to swift decision-making and clear direction, it may also stifle creativity and reduce staff morale if overused. In the context of Nigerian public secondary schools, this style may be employed in situations requiring immediate action or in environments where strict adherence to policies is necessary.

However, as Bush (2016) cautions, over-reliance on authoritative leadership can hinder collaborative efforts and innovation. Conversely, the democratic leadership style emphasizes participatory decision-making, where input from staff members is actively sought and valued. This inclusive approach can enhance teacher motivation and commitment, as it fosters a sense of ownership and accountability. Northouse (2018) notes that democratic leadership can lead to

more effective resource utilization, as staff members are more likely to contribute ideas and solutions. In Nigerian schools, particularly in regions like Delta State, where community involvement is integral, democratic leadership can strengthen school-community relationships and improve educational outcomes. Transformational leadership focuses on inspiring and motivating staff to achieve shared goals and exceed expectations. Bass (1985) highlights that transformational leaders foster a positive school culture by setting high standards and encouraging innovation.

In resource-constrained environments, such as many Nigerian public schools, transformational leadership can drive teachers to utilize available resources creatively, leading to improved student outcomes. However, this style requires a high level of emotional intelligence and communication skills to effectively inspire and engage staff. Transactional leadership is based on a system of rewards and punishments, where compliance with established rules and performance targets is emphasized. Northouse (2018) suggested that while transactional leadership can ensure order and discipline, it may not encourage the creativity or initiative needed for effective resource management. In Nigerian public secondary schools, transactional leadership may be effective in maintaining discipline and ensuring that teachers adhere to prescribed procedures, but it may not foster the innovative thinking required to address resource limitations. The laissez-faire leadership style is characterized by minimal intervention, allowing staff members to make decisions independently. While this approach can promote autonomy and innovation, it may lead to a lack of direction and accountability if not carefully managed.

In Nigerian public secondary schools, where resources are often limited, laissez-faire leadership can result in inefficient use of resources due to a lack of coordination and oversight. As Bush (2016) notes, this style may be more effective in environments where staff members are highly experienced and self-motivated. In Nigeria secondary schools, each of these leadership style offers distinct advantages and challenges in the context of Nigerian public secondary schools. The effectiveness of a particular style depends on various factors, including the school's specific challenges, the experience and motivation of staff, and the broader educational context. As Northouse (2018) suggests, a balanced approach that integrates elements from multiple leadership styles may be most effective in addressing the diverse needs of schools and maximizing resource utilization. School administrators must be adept at assessing their school's unique context and adapting their leadership approach accordingly to enhance administrative effectiveness and educational outcomes.

Resource Allocation in Public Secondary Schools

Resource allocation in public secondary schools is a critical component of effective educational management and a key factor influencing the overall performance of schools. In Nigerian public secondary schools, resource allocation has become particularly challenging due to budget constraints, inadequate infrastructure, and socio-economic pressures. Effective resource allocation ensures that schools operate efficiently, meeting both educational and administrative objectives. The process encompasses the distribution of various resources, including human, financial, material, and infrastructural, all of which contribute to the achievement of educational goals:

Human Resources

Human resource allocation in public secondary schools primarily involves the distribution of teaching and non-teaching staff across various departments, subjects, and administrative roles. The effective management of teachers is fundamental to improving educational outcomes, as teachers are the primary agents of instruction. The Nigerian education system faces significant challenges in this area, such as teacher shortages, high student-teacher ratios, and insufficient professional development opportunities (Adebayo & Olatunde, 2019). Additionally, the allocation of teaching staff is often influenced by factors such as seniority, political affiliations, and geographical location, rather than merit or need. This inequitable distribution can result in some schools being under-staffed, while others have an oversupply of teachers, leading to inefficiencies in resource utilization (Okorodudu, 2020). The human resource allocation process is often governed by both state and federal policies, which are supposed to ensure that schools are staffed appropriately to meet curricular requirements and student needs. However, these policies are not always effectively implemented, and principals often face difficulties in making optimal staffing decisions. As such, principals must balance teacher workloads, address the demands of large class sizes, and manage teacher performance, all while navigating the political and social challenges of their specific educational context (Ajayi & Olatunji, 2018).

Financial Resources

Financial resources are essential to the operational success of any educational institution. Public secondary schools in Nigeria face severe financial constraints due to limited funding from both state and federal governments (Akinyemi & Siyanbola, 2020). The allocation of financial resources in these schools typically focuses on salaries, infrastructure development, and the procurement of educational materials. However, the allocation process is often opaque, with schools receiving insufficient funds to cover their operational needs. This leads to significant challenges in managing budgets, meeting the demand for textbooks, and providing students with adequate learning materials (Uzoigwe, 2016). In Nigeria, financial resources are often distributed unevenly, with urban schools receiving more funding compared to their rural counterparts. This disparity exacerbates the already significant challenges faced by schools in rural areas, where the lack of proper facilities, insufficient staffing, and limited educational resources hinder the quality of education provided. The allocation of financial resources is also impacted by mismanagement and corruption within the educational sector, further limiting the effectiveness of resource distribution.

Material Resources

Material resources in public secondary schools include textbooks, teaching aids, laboratory equipment, and technological tools used in the delivery of education. These resources are essential for facilitating effective teaching and learning, yet many Nigerian public secondary schools face a shortage of adequate learning materials. The allocation of material resources is often uneven, with wealthier schools having access to modern teaching tools, while schools in economically disadvantaged regions struggle to provide basic educational materials (Ogunyemi, 2019). The distribution of material resources is typically managed at the local or state level, with education ministries overseeing procurement and allocation. However, issues such as lack of

proper inventory management, insufficient procurement processes, and delayed distribution of materials often lead to inefficiencies in resource allocation. In many cases, Nwagwu and Igwe (2018) principals are forced to find alternative means of acquiring teaching materials, such as relying on donations from parents or non-governmental organizations (NGOs).

Infrastructural Resources

Infrastructural resources encompass physical facilities such as classrooms, administrative offices, toilets, libraries, and sports facilities. The state of infrastructure in Nigerian public secondary schools is generally poor, with many schools operating in dilapidated buildings with insufficient classrooms and overcrowded facilities. The allocation of infrastructural resources is often determined by the level of government, with the federal government typically funding large-scale infrastructural projects, while state governments are responsible for maintaining existing facilities (Akinyemi & Siyanbola, 2020). The challenges in allocating infrastructural resources include budget constraints, inadequate maintenance, and the slow pace of infrastructure development. In many cases, schools are left to manage crumbling facilities with minimal government support, resulting in overcrowded classrooms, poor sanitation, and inadequate learning environments. Uzoigwe (2016) posits that allocation process of resources in Nigeria secondary schools is often plagued by inefficiencies, as resources are not always distributed based on the actual needs of schools, but rather on political considerations.

Resource allocation in Nigerian public secondary schools is a complex and multifaceted process that requires careful planning, transparent distribution, and effective management. Given the constraints imposed by limited financial resources, inadequate infrastructure, and an uneven distribution of teaching staff, it is crucial for school administrators to adopt strategies that maximize the use of available resources. In many cases, this involves innovative solutions, such as fostering partnerships with NGOs, seeking alternative funding sources, and implementing more effective resource management practices.

Indicators of Resource Allocation Efficiency in Public Secondary Schools

Efficient resource allocation is a key determinant of the academic success and long-term sustainability of public secondary schools, particularly in Nigeria. This efficiency can be assessed through various indicators that measure how effectively inputs such as financial resources, infrastructure, and human capital are transformed into desired educational outcomes. An input-output analysis framework is often used to evaluate these efficiency indicators, which ultimately informs decision-makers on how to optimize resource utilization for improved educational results (Akinsolu, 2012). By analyzing these indicators, educational administrators can identify areas where resources are underutilized or misallocated, providing a basis for corrective actions aimed at enhancing resource efficiency and, consequently, educational effectiveness.

Input–Output Ratio (Efficiency Score)

One of the fundamental indicators of resource allocation efficiency is the **input-output ratio**, which essentially measures how efficiently resources (inputs) are transformed into outputs such as student performance, graduation rates, and other educational outcomes. The input-output ratio

is a direct reflection of the capacity of a school to use its resources effectively in achieving its educational goals. Akinsolu (2012) highlighted that schools in Nigeria, particularly in the South-South region, often face challenges in maintaining a balanced input-output ratio due to systemic inefficiencies such as insufficient teacher training, inadequate infrastructure, and poor allocation of resources. However, when managed well, a high input-output ratio indicates that schools are able to leverage limited resources to achieve optimal academic results. According to Obadara and Alaka (2010), schools that demonstrate an effective input-output ratio often show improved student outcomes despite facing resource constraints. This demonstrates the importance of strategic planning in ensuring that resources are used efficiently to maximize educational achievement.

Input–Output Ratio Efficiency Score Table

School	Total Resources (₦)	Student Performance (Scores)	Input-Output Ratio
School A	10,000,000	85	0.12
School B	7,500,000	75	0.10
School C	12,000,000	90	0.15
School D	9,000,000	80	0.11

This chart illustrates the efficiency score of resource allocation across selected public secondary schools using an input–output analysis framework. Inputs such as teacher workforce, classroom facilities, and instructional materials are compared against outputs like student academic performance and graduation rates. Schools scoring above 1.0 are deemed efficient, indicating optimal resource utilization, while those below 1.0 reflect inefficiencies that necessitate managerial review and intervention. The visual underscores disparities in resource-use efficiency, serving as a guide for equitable reallocation and administrative planning.

Resource Allocation Balance

Another significant indicator of resource allocation efficiency is the **resource allocation balance**, which evaluates how resources are distributed across various sectors and schools. In many Nigerian public secondary schools, resource allocation is often skewed, with some schools receiving disproportionately higher resources compared to others, leading to significant inefficiencies (Famade, 2010). The imbalance in resource distribution can create disparities in educational outcomes, particularly in underfunded schools, which are forced to operate with fewer resources and lower teaching quality. Famade (2010) further pointed out that resource allocation balance is critical for ensuring equity in education, as schools that receive an adequate share of resources are better equipped to offer quality education to all students, irrespective of their socio-economic background. Therefore, ensuring that resources are evenly distributed is essential for promoting fairness and efficiency in the educational sector, particularly in public schools located in disadvantaged areas.

Capacity Utilization Rate

The capacity utilization rate measures how effectively a school uses its existing resources such as classrooms, staff, and instructional materials. This indicator is crucial for understanding whether

schools are using their available resources to their maximum potential. Akinsolu (2012) noted that many schools in Nigeria experience challenges related to underutilization of available resources, such as poorly maintained classrooms or under-enrolled programs that lead to resource wastage. High capacity utilization rates, on the other hand, indicate that schools are using their resources efficiently to cater to the needs of a large student population. Effective capacity utilization allows schools to deliver quality education while minimizing unnecessary expenditures. For example, schools that optimize their classroom space, utilize technology effectively, and deploy their teaching staff efficiently often achieve better educational outcomes (Obadara & Alaka, 2010). As such, monitoring and improving capacity utilization should be a priority for educational administrators aiming to enhance resource efficiency in public schools.

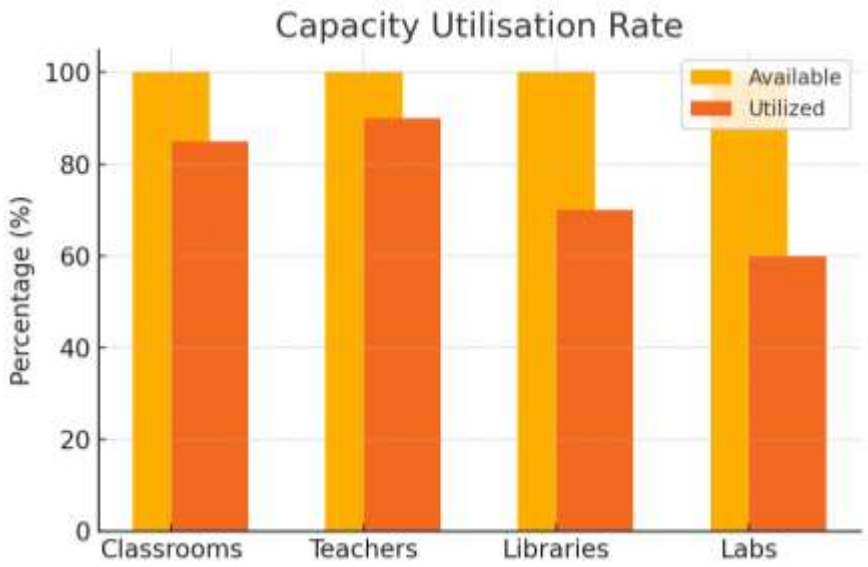

Figure 1: Capacity Utilization Rate Model Chart.

The model presented in this diagram depicts the relationship between available educational infrastructure and its actual use within public secondary schools. It emphasizes the proportion of utilized classrooms, laboratories, and teaching hours against their total capacity. A high utilization rate signals efficiency and proper resource engagement, while underutilization reveals wastage and poor scheduling. This model is instrumental for school administrators and policymakers to align infrastructural investments with enrollment trends and teaching demands for improved school performance.

Cost-Effectiveness Analysis

Cost-effectiveness analysis is a key financial indicator used to evaluate the efficiency of resource allocation in relation to the outcomes achieved. This indicator compares the financial investment made by a school with the educational results obtained, providing a clear picture of whether resources are being spent wisely. According to Famade (2010), schools that conduct cost-effectiveness analyses are better positioned to identify areas of financial waste and reallocate resources to high-impact areas that will yield better results for students. For instance, schools that invest heavily in infrastructure but fail to invest in teacher development may see poor

educational outcomes, even with high financial input. Conversely, schools that effectively allocate funds toward staff training, curriculum development, and student support services often achieve higher academic performance relative to their financial expenditure (Obadara & Alaka, 2010). Thus, cost-effectiveness analysis is critical for ensuring that schools are spending their resources in ways that maximize student learning and achievement.

Performance Indicators

Performance indicators such as student retention rates, graduation rates, and standardized test scores are essential metrics for evaluating the efficiency of resource allocation in secondary schools. These indicators directly reflect the outcomes achieved through the resources invested in the school system. Akinsolu (2012) emphasized that performance indicators serve as a comprehensive measure of educational effectiveness, as they provide data that can be used to assess whether resource allocation aligns with academic success. Furthermore, performance indicators allow administrators to track the impact of specific interventions, such as additional funding for teacher professional development or improvements in infrastructure, on student achievement. According to Obadara and Alaka (2010), schools with high performance indicators typically benefit from well-managed resources, which are distributed efficiently to areas that directly influence student success. Monitoring performance indicators regularly enables school leaders to make data-driven decisions that foster continuous improvement in resource allocation and overall school performance.

In Nigerian public secondary schools, the efficiency of resource allocation is often measured by examining the relationship between available resources and student performance. For example, schools with higher funding and better infrastructure may be expected to produce better academic results compared to schools with limited resources. However, research has shown that the mere availability of resources does not always guarantee improved outcomes. Factors such as effective leadership, teacher quality, and the efficient management of resources also play significant roles in determining the efficiency of resource allocation (Nwagwu & Igwe, 2018).

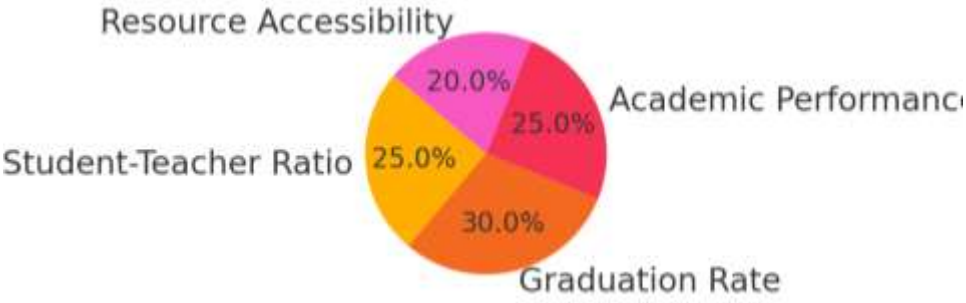

Figure 2: Performance Indicators Chart.

This chart outlines core performance indicators used to evaluate the effectiveness of resource allocation within secondary schools. Indicators include student-teacher ratios, average test scores, infrastructure adequacy index, and school completion rates. Through mapping these indicators against national benchmarks, the chart provides a diagnostic view of institutional productivity. It aids in identifying performance gaps, supporting data-driven decisions for leadership improvement, capacity development, and strategic resource deployment.

Strategic Evaluation of Resource Efficiency

Several strategies are employed to evaluate the efficiency of resource allocation in public secondary schools. One common approach is performance-based evaluation, which involves assessing student performance relative to the resources allocated to schools. For example, schools that consistently produce high academic outcomes despite limited resources are considered more efficient than schools that receive higher funding but perform poorly (Okorodudu, 2018). This type of evaluation highlights the importance of resource management practices, as it emphasizes the role of leadership and strategic decision-making in maximizing the impact of available resources.

Another strategy for evaluating efficiency is benchmarking, which involves comparing the performance of schools with similar resources. By examining the best practices of high-performing schools, administrators can identify strategies and approaches that may be adopted to improve resource allocation efficiency in other schools (Ogunyemi, 2019). Benchmarking is particularly useful in identifying areas where resources may be underutilized or where improvements can be made in resource management.

Challenges in Measuring Resource Efficiency

Measuring the efficiency of resource allocation in Nigerian public secondary schools is fraught with challenges. One of the main difficulties is the lack of reliable data on resource allocation and student performance. In many cases, data on resource distribution is not readily available, and where it is, it is often incomplete or outdated (Ajayi & Olatunji, 2018). This lack of accurate data makes it difficult to conduct meaningful output/input analyses and to assess the true efficiency of resource allocation.

Additionally, the quality of data on student performance may be inconsistent, as different schools may use varying assessment methods and standards. The absence of standardized performance metrics further complicates the evaluation of resource efficiency (Bass, 2015). Furthermore, external factors such as socio-economic conditions, government policies, and the political landscape can influence the effectiveness of resource allocation, making it challenging to isolate the impact of resource management practices on educational outcomes.

The efficiency of resource allocation in public secondary schools is a critical factor in determining the success of educational systems. By utilizing output/input analysis and implementing strategies such as performance-based evaluations and benchmarking, administrators can better understand the effectiveness of their resource management practices. However, challenges such as inadequate data and external influences complicate the measurement of resource efficiency in Nigerian schools. Addressing these challenges will require a concerted effort to improve data collection, standardize performance metrics, and strengthen the management of resources at all levels of the educational system.

The Interplay between Leadership and Resource Allocation

Leadership within Nigerian public secondary schools plays an essential role in shaping how resources are allocated and utilized, which significantly affects the quality of education provided. Leadership decisions regarding the allocation of human, financial, material, and infrastructural

resources are pivotal in determining a school's operational effectiveness. The strategic direction provided by school leaders primarily the principals determines the efficacy of resource distribution and the degree to which these resources align with educational objectives. Several leadership styles, including autocratic, democratic, transformational, and transactional, play key roles in shaping resource allocation processes in these schools.

Autocratic leadership in schools typically involves centralized decision-making, where school principals make the majority of decisions without consulting teachers or other staff members. This leadership approach often results in resource mismanagement because the perspectives of those directly involved in the educational process are not adequately considered. Akinyemi and Siyanbola (2020) observed that autocratic leadership often leads to resource allocation practices that do not reflect the actual needs of students or educators. In contrast, democratic leadership fosters a more inclusive decision-making process, where the principal works closely with teachers and staff to make decisions that reflect the collective needs of the school. This collaborative style is often more effective in ensuring that resources are allocated in a way that aligns with the real-time demands and goals of the school community (Nwagwu & Igwe, 2018).

Transformational leadership is particularly impactful in resource allocation, as it emphasizes long-term vision and the empowerment of teachers. Leaders who embrace transformational styles encourage innovation, collaboration, and professional development, which in turn enhances the strategic utilization of resources. Principals adopting transformational leadership tend to prioritize human capital development, aiming to improve both the skills of the staff and the school's resource management practices. Adebayo and Olatunde (2019) noted that transformational leaders focus on creating an atmosphere of collaboration and transparency, which ensures resources are used sustainably and effectively, with a focus on educational improvement.

In schools led by transformational leaders, decision-making is often transparent, which significantly influences resource allocation. Ajayi and Olatunji (2018) highlighted that transparent leadership fosters trust and accountability, as resource allocation decisions are visible to all stakeholders. This approach allows for a more equitable distribution of resources, ensuring that all areas of the school's operations receive adequate support. A lack of transparency, on the other hand, breeds suspicion and inefficiency, often leading to resources being misallocated or used ineffectively. Therefore, leaders who prioritize transparency and accountability in resource allocation contribute to a culture of trust and mutual respect, ultimately leading to more efficient use of available resources.

Leadership style plays a pivotal role in the allocation and use of resources in Nigerian public secondary schools. A collaborative, transparent, and transformational approach to leadership enhances the alignment of resources with educational goals and ensures that those resources are utilized in the most effective and efficient manner possible. The implementation of strong leadership practices, including accountability mechanisms, will likely improve resource allocation outcomes, contributing to enhanced educational performance.

Challenges in Resource Allocation in Public Secondary Schools

The challenges in resource allocation within Nigerian public secondary schools are deeply rooted in systemic issues. These include policy bottlenecks, poor planning, corruption, and infrastructural deficits. Despite the importance of leadership in guiding resource allocation,

several challenges continue to hinder the effective use of resources in Nigerian public secondary schools. These challenges stem from a range of systemic issues, including policy bottlenecks, poor planning, corruption, administrative inefficiencies, and infrastructural deficits. These barriers complicate the efficient distribution and utilization of available resources, which negatively impacts the quality of education. The distribution of resources is often inconsistent across schools, resulting in some schools receiving inadequate support, while others experience inefficiencies due to mismanagement.

Policy bottlenecks represent a significant challenge to effective resource allocation in Nigerian schools. The decentralization of the education system, with involvement from federal, state, and local governments, often leads to coordination problems. Akinyemi and Siyanbola (2020) explained that delays in the release of funds and resources from different levels of government contribute to the inefficient implementation of educational programs. Bureaucratic delays, coupled with inconsistent policies on resource distribution, exacerbate existing deficiencies and prevent timely responses to immediate resource needs. As a result, schools are often unable to address their needs in a timely manner, which affects overall educational performance.

In addition to policy delays, poor planning remains a major obstacle to resource allocation. Many schools lack comprehensive strategic plans for resource management, resulting in reactive decision-making. For instance, schools may prioritize immediate, visible needs such as repairing damaged classrooms or purchasing new textbooks, while neglecting other critical areas such as teacher development or long-term infrastructure projects. Okorodudu (2020) noted that this reactive approach leads to inefficient resource utilization, as resources are allocated without consideration for sustainable educational outcomes. Schools that fail to conduct thorough needs assessments and lack clear long-term goals often waste valuable resources, failing to address core issues in the educational system.

Administrative inefficiencies and corruption further exacerbate the challenges of resource allocation. The mismanagement of funds and resources is a well-documented issue in many public schools. Adebayo and Olatunde (2019) highlighted how corruption among school administrators and government officials leads to the diversion of resources away from their intended educational purposes. This misallocation results in significant disparities between schools, where some institutions struggle with resource shortages, while others experience wasteful spending due to lack of oversight. Furthermore, a lack of accountability and transparency in resource management perpetuates these inefficiencies, as there are few mechanisms in place to monitor and rectify the misuse of funds (Ogunyemi, 2019).

Infrastructural challenges also play a central role in resource allocation difficulties. Many Nigerian public secondary schools are housed in aging, dilapidated buildings that require substantial investment in repairs and maintenance. Akinyemi and Siyanbola (2020) noted that despite the availability of funds, many schools continue to operate in inadequate facilities due to poor prioritization of infrastructural needs. Overcrowded classrooms, lack of adequate sanitation facilities, and insufficient learning materials exacerbate the resource allocation challenges. Schools that fail to invest in improving their physical infrastructure often struggle to create conducive learning environments, which further hampers the quality of education offered. Overcoming these challenges requires comprehensive reforms aimed at improving policy coordination, enhancing accountability, and investing in school infrastructure. Only through addressing these persistent barriers can Nigeria's public secondary schools effectively allocate

resources to improve educational outcomes and create an equitable learning environment for all students.

The Role of School Leaders in Promoting Equity and Efficiency

The role of school leaders in promoting equity and efficiency within public secondary schools is crucial, particularly when considering the challenges associated with resource allocation in Nigerian educational settings. School leadership is fundamental to ensuring that all students, regardless of their background, have access to quality education and the resources required for effective learning. In a Nigerian context, where there is often a disparity between well-resourced and underfunded schools, leaders must be proactive in ensuring that resources are not only allocated effectively but also distributed equitably.

Research by Adebayo and Olatunde (2019) has shown that school leaders who adopt inclusive policies can create a more balanced and fair educational environment. Inclusive leadership involves prioritizing fairness in the distribution of resources, ensuring that marginalized and disadvantaged students are not left behind. This is particularly important in Nigeria, where there are significant regional disparities in resource availability, especially between urban and rural areas, and in schools located in economically disadvantaged zones. Inclusive policies, therefore, become critical as they guide the distribution of resources in such a way that every student has the opportunity to succeed. For example, principals who implement resource-sharing policies among schools, or those who encourage partnerships with local communities to enhance school resources, promote both equity and efficiency (Nwagwu & Igwe, 2018).

Strategic planning plays an essential role in promoting both equity and efficiency. Principals who engage in comprehensive planning are better positioned to allocate resources in a way that meets the needs of all students. Effective strategic planning ensures that resources are distributed based on priority needs, rather than simply being allocated according to available funding or political influence. In Nigerian public secondary schools, strategic planning often involves assessing the educational needs of students, evaluating existing resources, and aligning them with national education policies and goals. This approach facilitates the creation of tailored resource distribution models that can respond to the diverse needs of schools within different contexts (Ajayi & Olatunji, 2018). Moreover, school leaders who adopt a long-term perspective are better able to create sustainable strategies that can ensure equitable resource distribution even in times of financial constraint or administrative challenges.

Furthermore, school leaders must foster an organizational culture that emphasizes accountability, transparency, and the active participation of all stakeholders in decision-making processes. When leaders promote transparency, it builds trust among teachers, students, and parents, which in turn enhances the efficiency of resource use. A transparent resource allocation model ensures that all parties are aware of the criteria used in distributing resources and can hold the leadership accountable for any discrepancies or mismanagement. Studies have shown that when Nigerian school leaders embrace transparency in their decision-making processes, it leads to more efficient use of resources and greater stakeholder satisfaction (Akinyemi & Siyanbola, 2020). In sum, the role of school leaders in promoting equity and efficiency in resource management is multifaceted, requiring inclusive policies, strategic planning, and the fostering of a transparent, accountable culture.

Gender and Leadership Influence on Resource Management

Gender plays a significant role in shaping leadership styles and has notable implications for resource management and allocation efficiency in secondary school administration. In many African countries, including Nigeria, there is still a traditional view that leadership positions in schools should be occupied by men, but this perception is gradually changing as more women assume leadership roles. However, gender continues to influence how leaders approach resource management, and it is important to explore how female and male school leaders approach resource allocation differently.

Research by Adebayo and Olatunde (2019) has suggested that female leaders tend to adopt more collaborative and participatory leadership styles compared to their male counterparts, who may lean more towards authoritative or top-down leadership approaches. This difference in leadership styles has significant implications for resource management. For example, women in leadership positions are more likely to prioritize inclusivity and collaborative decision-making when allocating resources. This inclusivity allows for more equitable distribution of resources and promotes greater efficiency in their use. Studies from Nigerian schools have found that female school leaders tend to engage more with teachers, students, and parents in decision-making processes, which results in a better alignment of resources with the actual needs of the school community (Ogunyemi, 2019). In contrast, male leaders may focus more on administrative control, which could lead to a more centralized and less inclusive approach to resource allocation.

Moreover, gender influences the way resources are distributed in Nigerian schools. Female school leaders have been found to allocate resources with a focus on promoting gender equality, ensuring that both male and female students have access to similar opportunities and resources. In schools with male leaders, resource allocation may sometimes inadvertently reflect gender biases, as there may be a lack of awareness or consideration of the needs of female students. This can manifest in the unequal distribution of educational materials, sports equipment, and even opportunities for leadership roles within the school (Nwagwu & Igwe, 2018). Consequently, the gender of school leaders can have a profound impact on the extent to which resources are allocated equitably, which, in turn, influences the overall effectiveness of resource management in schools.

In light of these dynamics, it is crucial to provide mentorship and leadership development programs that specifically address gender issues and their impact on leadership styles. Providing training for both male and female leaders on gender-sensitive leadership and resource management practices can help mitigate gender biases and improve the overall efficiency of resource allocation in Nigerian public schools. As highlighted by Akinyemi & Siyanbola (2020) fostering a more gender-inclusive leadership environment, schools can ensure that both male and female leaders are equipped to manage resources in ways that promote equity and efficiency.

Integrating Leadership Capacity Building with Resource Efficiency

Leadership capacity building is essential in improving the efficiency of resource management in schools. School leadership training, mentorship programs, and capacity development initiatives are critical components that contribute to more effective resource use in Nigerian public secondary schools. The development of leadership capacity among school leaders is directly linked to their ability to manage resources efficiently and align them with the educational goals

of the school. Equipping school leaders with the tools, knowledge, and support they need, schools can ensure that resources are managed efficiently and that the needs of all students are met.

Research by Adebayo and Olatunde (2019) has shown that school leaders who engage in continuous professional development are better equipped to manage school resources efficiently. Leadership training provides school heads with the necessary skills and knowledge to make informed decisions about resource allocation, planning, and utilization. Programs focused on leadership capacity building can help school leaders understand the complexities of resource management and the importance of data-driven decision-making. In Nigerian public secondary schools, leaders who undergo capacity-building training tend to be more proactive in identifying resource gaps and finding innovative solutions to address them (Nwagwu & Igwe, 2018).

Mentorship programs also play a key role in enhancing leadership capacity. Mentorship involves experienced leaders guiding and supporting less experienced ones, offering advice and sharing best practices in resource management. By learning from experienced mentors, new school leaders are better prepared to navigate the challenges of managing resources and can adopt more efficient strategies for resource allocation (Akinyemi & Siyanbola, 2020). Mentors can also assist in developing leadership qualities that emphasize collaboration, transparency, and accountability essential components of efficient resource management.

Additionally, capacity-building initiatives that focus on fostering leadership skills in areas such as strategic planning, financial management, and data analysis contribute to better resource management in schools. Effective resource management requires a thorough understanding of financial principles, the ability to assess the needs of the school, and the capacity to align resources with educational goals. Through targeted capacity-building programs, school leaders can learn how to better allocate financial and human resources, thereby maximizing the use of available resources (Ajayi & Olatunji, 2018). The integration of leadership capacity building with resource efficiency in Nigerian public secondary schools is a vital step toward improving educational outcomes. Leadership training, mentorship programs, and capacity development initiatives are key strategies that can enhance the resource management capabilities of school leaders and contribute to the overall success of the educational system.

CONCLUSION

This paper has critically explored the indispensable role of school leadership in promoting equity and efficiency in Nigeria's public secondary schools, with focused attention on Rivers and Delta States. It reaffirmed that sound administrative leadership is foundational to strategic planning, equitable resource distribution, and inclusive educational practices that foster improved learning environments. The discussion also highlighted the nuanced influence of gender on leadership styles, where both male and female school leaders contribute distinctively to the dynamics of resource management. Furthermore, the integration of leadership capacity development through structured training, mentorship, and continuous professional development was emphasized as a catalyst for improved efficiency in resource use. In sum, strengthening administrative leadership through inclusive strategies and capacity-building interventions remains central to enhancing governance structures and driving sustainable educational outcomes across public secondary schools.

Suggestions

The following suggestions were proposed to offer practical strategies aimed at strengthening administrative leadership and improving resource efficiency in Nigeria's public secondary schools:

- The Federal Ministry of Education should implement comprehensive leadership development programs that focus on strategic planning, financial management, and inclusive practices to enhance the capacity of school administrators.
- The State Schools Board should establish mentorship schemes that pair experienced school leaders with emerging administrators to facilitate knowledge transfer and succession planning.
- The Local Government Education Authorities should develop and enforce transparent resource allocation frameworks that prioritize equity and efficiency in the distribution of educational resources.
- The Secondary School Governing Councils should encourage active stakeholder engagement by involving teachers, parents, and community members in decision-making processes related to resource management.
- Educational policymakers should regularly review and update policies to reflect the evolving needs of schools, ensuring that leadership practices align with contemporary educational challenges and resource demands.

THE ROLE OF SHARED GOVERNANCE IN ENHANCING ACADEMIC EXCELLENCE IN HIGHER EDUCATION

Aniekan Johnny AKPAN
Department of Educational management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria
evangelistanie@gmail.com

ABSTRACT

Shared governance has become an essential principle in the administration of higher education institutions, especially as universities face increasing complexity in academic, financial, and technological domains. This article explores the role of shared governance in enhancing academic excellence by examining how inclusive decision-making among faculty, administrators, and other stakeholders contributes to institutional quality. Drawing on theoretical perspectives from participative decision-making and organizational behavior, the article analyzes governance models across diverse higher education systems, including both developed and developing contexts. A qualitative case-article approach is employed, focusing on selected institutions that have successfully implemented shared governance mechanisms. Findings suggest that when faculty, staff, and administrators collaborate effectively, there is a significant improvement in academic planning, research innovation, and institutional morale. However, the implementation of shared governance is not without challenges; tensions between traditional hierarchies and collaborative ideals, resistance to change, and resource constraints often undermine its potential. The article concludes by offering a framework for embedding shared governance in university structures, with recommendations for institutional leaders, policymakers, and accreditation bodies seeking to align governance practices with academic goals. Ultimately, the article underscores that shared governance, when genuinely practiced, can be a driving force for excellence, resilience, and innovation in higher education.

Keywords: Role, Shared Governance, Academic Excellence, Higher Education.

INTRODUCTION

The 21st-century university operates in a context marked by rapid change, complex stakeholder expectations, and intensifying demands for academic accountability. As institutions of higher learning navigate issues such as globalization, digital transformation, financial austerity, and equity mandates, the question of how they are governed has gained renewed importance. In this evolving landscape, shared governance has emerged as a vital mechanism for balancing

administrative authority with academic freedom, fostering collaboration, and enhancing institutional effectiveness.

Shared governance refers to the organizational principle that empowers various stakeholders most notably faculty members, administrators, and, in some contexts, students to participate meaningfully in institutional decision-making. Traditionally rooted in the collegial model of university governance, shared governance upholds the notion that those closest to the core academic mission teaching, research, and service should have a voice in shaping the policies and priorities that govern academic life. This principle contrasts with purely top-down managerial models, which may prioritize administrative efficiency but often do so at the expense of transparency, morale, and academic integrity.

Despite its normative appeal, shared governance remains a contested and unevenly practiced ideal. In many institutions, particularly in developing economies, governance structures are either overly bureaucratic or highly centralized, marginalizing faculty input and limiting responsiveness to academic needs. Furthermore, as universities face mounting financial pressures, there is a growing tendency to adopt corporate-style governance models that prioritize market competitiveness over participative engagement. These shifts raise critical questions:

- Does shared governance genuinely contribute to academic excellence?
- If so, how can it be effectively operationalized across diverse institutional contexts?

This article aims to address these questions by exploring the conceptual foundations, practical applications, and measurable outcomes of shared governance in higher education. Drawing on both literature and case studies, it examines how inclusive governance structures influence academic quality, faculty morale, research productivity, and institutional innovation. It also critically analyzes the challenges institutions face in implementing shared governance and proposes strategic recommendations for embedding this principle in a manner that aligns with the goals of academic excellence.

By situating shared governance within the broader discourse on educational leadership and policy reform, this article contributes to an urgent conversation on how universities can remain mission-driven, stakeholder-responsive, and academically robust in an era of unprecedented change.

Statement of the Problem

The traditional top-down governance approach of governance often leads to disengagement, lack of transparency, and resistance to change, ultimately undermining academic performance and innovation. Shared governance a model that promotes collaborative decision-making among faculty, administrators, and sometimes students and staff is widely recognized as a means of fostering institutional effectiveness and academic excellence.

Despite the increasing complexity of higher education systems and the growing demand for accountability, many institutions continue to operate under centralized administrative structures that limit the participation of faculty and other stakeholders in decision-making processes. However, in practice, its implementation remains inconsistent and poorly defined across institutions, especially in developing countries. There is a lack of empirical evidence linking shared governance practices to measurable improvements in teaching quality, research productivity, and student learning outcomes. This gap raises important questions about the actual

impact of shared governance on academic excellence and the conditions under which it can be effectively implemented in diverse higher education contexts.

In Nigeria, the higher education system is facing increasing challenges related to declining academic standards, inadequate funding, brain drain, and institutional instability. A significant contributing factor to these problems is the limited involvement of key academic stakeholders particularly faculty members in institutional decision-making processes. Many Nigerian universities operate under highly centralized and hierarchical administrative systems that marginalize academic staff from governance structures, leading to dissatisfaction, low morale, industrial disputes, and reduced commitment to institutional goals. While the principle of shared governance where administrators, faculty, and sometimes students collaboratively shape academic policies and strategic decisions has been widely promoted as a means to enhance academic excellence, its application in Nigerian universities remains weak and fragmented. There is little empirical research examining how shared governance, when effectively practiced, can improve teaching quality, research productivity, and student outcomes in the Nigerian context. Without clear evidence and strategic models tailored to the unique challenges of Nigerian higher education, the potential of shared governance to foster academic excellence remains largely untapped.

Definition of Terms

Shared governance is Inclusive decision-making: Shared governance involves involving multiple stakeholders, such as faculty, staff, students, and alumni, in decision-making processes. This can lead to more informed and equitable decisions and show of commitment by all the stakeholders since they were part of the deed.

Due to the increasing pressure to efficiently administer higher education institutions, the practice of shared governance is receiving more attention than ever. Some political leaders and boards of trustees argue that sharing authority abolishes their right to make big decisions, as someone who knows what's best for the institutions.

On the other hand, institutions and labor unions like the American Federation of Teachers tout that all college and university employees should have a voice in institutional decisions. These include top-tenured and junior faculty, classified and support staff, and even professional staff with or without faculty rank.

The complexity of tasks in higher education creates an inevitable interdependence among the governing boards, administration, and faculty. This calls for joint effort and the opportunity to collaborate, making shared governance necessary.

While it values the perspectives of faculty and staff, shared governance is not always well-understood by key participants. Explore below how shared governance can help higher education institutions in attaining their missions and goals.

Shared Governance in Higher Education

Shared governance in higher education is a collaborative decision-making process that involves sharing authority, responsibility, and accountability among various stakeholders. This approach recognizes the unique knowledge, expertise, and perspectives of faculty, staff, administrators, and students, and aims to ensure that all stakeholders have a voice in decision-making processes.

To formalize shared governance, institutions establish governance structures such as committees, councils, and task forces etc. These structures are responsible for developing policies and making decisions that affect the academic and administrative aspects of the institution. The goal of shared governance is to foster a culture of collaboration and shared responsibility that supports the institution's mission and values.

LITERATURE REVIEW

Conceptualizing Shared Governance in Higher Education

In higher education Shared governance is a decision-making framework that emphasizes collaborative leadership and participatory structures involving faculty, administrators, staff, and sometimes students. According to Kezar and Eckel (2004), shared governance promotes inclusivity, transparency, and accountability in institutional decisions, particularly concerning academic programs, budgeting, and strategic planning. The American Association of University Professors (AAUP) defines shared governance as a system where academic staff and administration work together to achieve institutional goals while respecting each other's areas of authority.

Theoretical Foundations of Shared Governance

The concept of shared governance in higher institution is grounded in democratic and organizational theories that advocate for decentralization and stakeholder engagement. Participative decision-making theory suggests that individuals involved in decision-making processes tend to show greater commitment to organizational goals (Likert, 1967). Systems theory also supports the idea that universities function best when all subunits operate interdependently and contribute to the institution's overall effectiveness.

Shared Governance and Academic Excellence

Numerous studies have linked shared governance to improved academic outcomes. Birnbaum (1988) argues that shared governance enhances institutional adaptability and innovation, especially in curriculum development and quality assurance. When academic staff are involved in governance, they are more likely to uphold academic standards, ensure relevance in curriculum content, and engage more fully in research and mentorship. Moreover, collaborative governance is positively associated with job satisfaction and reduced faculty turnover (Minor, 2003).

Challenges in the Implementation of Shared Governance

Despite its theoretical application, shared governance faces several practical challenges. These include power struggles between faculty and administrators, lack of clarity in governance structures, and time constraints that hinder faculty participation. O'Meara (2005) notes that institutional culture and leadership style greatly affect the implementation of shared governance. In environments where authoritarian leadership dominates, such as many universities in developing nations, shared governance is often symbolic rather than functional.

Shared Governance in the Nigerian Higher Education Context

The practice of shared governance remains largely underdeveloped in Nigeria. Many public and private universities operate within bureaucratic frameworks heavily influenced by federal or state government policies. Academic unions, such as the Academic Staff Union of Universities (ASUU), have consistently criticized university management for sidelining faculty in strategic decision-making. Studies by Ajayi & Ekundayo (2008) and Babalola (2014) point to an urgent need for governance reforms that promote collaboration, transparency, and academic autonomy. However, there is limited empirical research examining how shared governance models could be adapted to the socio-political realities of Nigerian universities to foster academic excellence.

Emerging Trends and Future Directions

Globally, there is a shift toward more inclusive and adaptive governance models that integrate shared leadership, digital communication, and performance-based accountability. Nigerian universities must learn from international best practices while customizing governance structures to local needs. The integration of faculty voices in academic decision-making could lead to more relevant research, improved student learning outcomes, and greater institutional resilience.

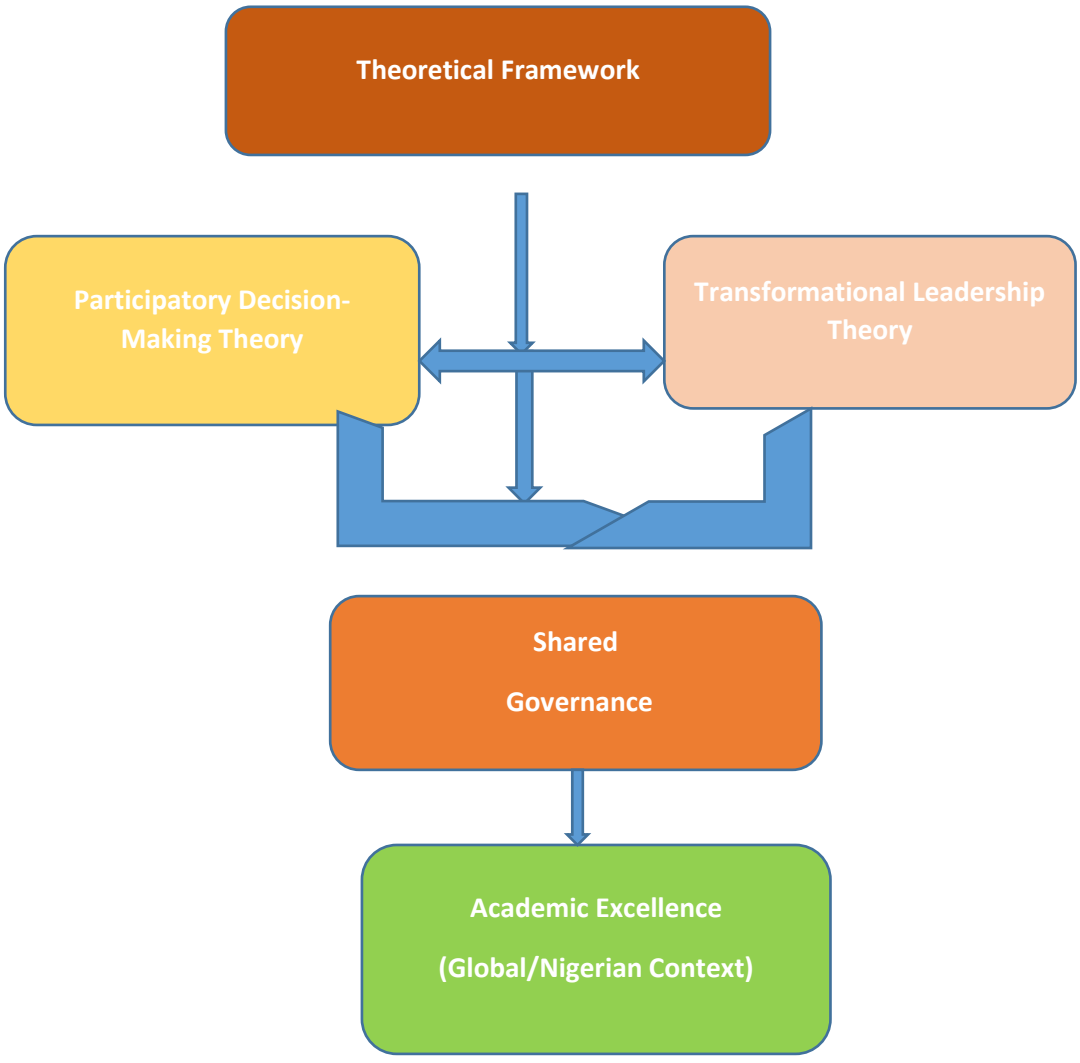
THEORETICAL FRAMEWORK

Participative Decision-Making Theory

Participative Decision-Making Theory (PDM), rooted in organizational behavior literature, posits that individuals who are involved in the decision-making processes of an institution are more likely to be committed to its goals, show higher levels of motivation, and contribute positively to organizational outcomes (Likert, 1967). In the context of higher education, this theory supports the view that when faculty, staff, and other stakeholders are included in governance, it leads to improved policy outcomes, better alignment between academic programs and institutional goals, and enhanced accountability.

In Nigerian universities, where hierarchical administrative systems often dominate, this theory highlights the need to move towards more inclusive and decentralized governance structures. Applying PDM could increase faculty engagement, reduce internal conflicts, and ultimately improve student learning and research productivity.

Transformational Leadership Theory



Transformational Leadership Theory, developed by Burns (1978) and later expanded by Bass (1985), emphasizes leadership that inspires, motivates, and fosters a shared vision among organizational members. Transformational leaders empower others, encourage intellectual stimulation, and consider the individual needs of team members. In the higher education context, this theory aligns closely with the principles of shared governance by advocating leadership that promotes collaboration, trust, and mutual respect.

In Nigerian universities, transformational leadership can play a vital role in cultivating a culture of shared governance. University leaders who embrace this model are more likely to support

inclusive policy-making, mentor faculty, and champion academic freedom—all of which contribute to academic excellence.

Synthesis of Theories

The integration of Participative Decision-Making Theory and Transformational Leadership Theory provides a comprehensive framework for examining the role of shared governance. While PDM explains the structural and procedural aspects of inclusive governance, Transformational Leadership highlights the human and motivational elements necessary to sustain it. Together, they offer a robust lens through which to assess how shared governance can enhance academic standards, improve institutional performance, and foster a culture of excellence in Nigerian higher education.

FINDINGS

Structural Inclusion and Decision-Making Power

In all institutions, the presence of formal governance bodies such as academic senates, curriculum committees, and faculty councils demonstrated the institutional commitment to shared governance. However, the degree of actual influence these bodies wielded varied significantly.

The faculty participation was embedded in the institutional DNA. Faculty senates had statutory authority over curricular matters, research priorities, and faculty hiring. Interviewees described a culture in which consultation was not only procedural but meaningful. One faculty member stated, *"The administration knows better than to bypass the senate; it would lead to real consequences."*

Equally, at the public university in the developing country, while governance structures formally existed, they were often ceremonial**.** Key decisions, especially around budgeting and resource allocation, were made by senior administrators or influenced by external political actors. A faculty member lamented, *"We attend meetings, but decisions are already made before we get there."* This disconnect between structure and substance limited the potential of shared governance to impact institutional performance.

The private university represented a hybrid model. Faculty members were deeply involved in academic matters but excluded from strategic financial decisions. This partial model still contributed to strong academic ownership but limited broader institutional impact.

The above findings support organizational theory in higher education, which suggests that the collegial model yields better academic outcomes when faculty have actual—not just symbolic—power. The data also confirm that decision-making authority must be distributed meaningfully for shared governance to move beyond rhetoric.

Impact on Academic Quality and Innovation

The research revealed a strong correlation between effective shared governance and **enhanced** academic quality and innovation. At the developed research university, shared governance facilitated a continuous process of curriculum review, faculty-led research agendas, and cross-departmental collaboration. Faculty described how the governance process encouraged academic experimentation: *"Because we have control over our programs, we can take pedagogical risks that improve learning outcomes."*

At the private university, faculty involvement in curriculum design led to programs that were both locally relevant and internationally competitive. Faculty members reported feeling a sense of ownership that translated into higher teaching quality and sustained research engagement.

However, at the public university, the centralization of decisions limited innovation. Curricula were often outdated, and faculty initiatives required prolonged approval processes that discouraged experimentation. Students expressed dissatisfaction with the relevance of their academic programs, pointing to a lack of responsiveness from institutional leadership.

This aligns with participative decision-making theory, which emphasizes that involvement enhances commitment and creativity. Institutions with strong shared governance

structures were more responsive to academic needs and better positioned to pursue innovation. The data suggest that shared governance can serve as a platform for **academic agility**, especially in rapidly changing global and technological landscapes.

Faculty Morale and Institutional Commitment

A consistent theme across all cases was the link between shared governance and faculty morale. Faculty at institutions with effective governance structures described high levels of institutional loyalty, lower turnover, and a strong sense of community. As one professor noted, *"When your voice matters, your commitment deepens."*

Conversely, at the public university where governance was largely top-down, faculty morale was low. Many spoke of feeling disengaged and undervalued, with some actively seeking employment elsewhere. This environment bred cynicism and undermined academic performance, with ripple effects on student learning.

This finding underscores the affective dimension of shared governance. Beyond its structural and functional aspects, shared governance fosters a sense of belonging and professional respect. These affective factors are crucial for maintaining high faculty performance and for building a cohesive academic culture that supports excellence.

Barriers to Effective Shared Governance

Despite its benefits, shared governance faces significant barriers, particularly in resource-constrained or politically volatile contexts:

- Bureaucratic Resistance: In the public university, entrenched hierarchies and rigid administrative protocols impeded participatory reforms. Efforts to strengthen governance often stalled due to lack of political will or administrative buy-in.
- Role Ambiguity: At the private university, blurred lines between faculty and administrative responsibilities occasionally led to conflict and inefficiency. Some faculty felt overburdened by governance responsibilities without corresponding institutional support.
- Power Dynamics: Even in the developed research university, tensions occasionally emerged between faculty autonomy and managerial efficiency. For example, efforts to streamline operations were sometimes perceived as attempts to bypass the governance process.

These challenges reflect insights from political models of governance, which acknowledge that universities are contested spaces where interests must be negotiated. Successful shared governance requires clear role definitions, capacity-building, and a culture of mutual respect. It also demands institutional autonomy particularly from external political pressures to flourish.

SYNTHESIS OF FINDINGS

In sum, the article finds that shared governance enhances academic excellence when it is substantive, not merely symbolic. Institutions that embedded shared governance in both structure and culture reported better academic outcomes, more innovative programs, and stronger faculty

engagement. However, the benefits were contingent upon institutional will, clarity of roles, and the capacity to navigate power dynamics constructively.

Challenges and Critiques of Shared Governance

While shared governance is widely endorsed as a foundational principle for effective university administration, its implementation is often fraught with complexities. This section critically examines the practical, structural, and ideological challenges associated with shared governance, drawing on empirical findings and broader theoretical insights.

Bureaucratization of Governance Structures

One of the most frequently cited challenges is the bureaucratization of shared governance. In many institutions, governance structures become overly procedural, slow, and resistant to timely decision-making. Faculty senates and academic councils, though inclusive, can become entangled in layers of deliberation, leading to decision fatigue and administrative paralysis.

In the public university case, for example, the curriculum review process required approvals from multiple committees and ultimately the vice-chancellor's office, often resulting in year-long delays. A faculty member observed: *"By the time we finish reviewing a course, the industry it was meant to address has already moved on."*

This tendency toward procedural excess challenges the assumption that participation necessarily leads to efficiency or quality. It reveals a tension between democratic inclusivity and administrative agility, especially in fast-changing academic environments. Without appropriate mechanisms for streamlining and delegating authority, shared governance can inadvertently stifle the very excellence it seeks to promote.

Unequal Participation and Representation

Despite its egalitarian ethos, shared governance often suffers from uneven participation. In many institutions, governance roles are dominated by senior faculty or specific departments, leaving early-career academics, adjuncts, or marginalized disciplines underrepresented.

At the private university, for example, junior faculty reported feeling excluded from major decisions, despite formal access to governance committees. Similarly, non-teaching staff and students—though stakeholders in academic outcomes—were often tokenized or ignored in the process.

This challenge exposes a democratic deficit in shared governance practices. The ideal of participatory decision-making is undermined when only a subset of the academic community wields actual influence. To be effective and equitable, shared governance must include diverse voices and proactively address power asymmetries within the academic system.

Managerialism and Corporate Pressures

Another major challenge is the rise of managerialism the importation of corporate management practices into the governance of universities. This trend prioritizes efficiency, performance metrics, and market responsiveness, often at odds with the deliberative nature of shared governance.

In the developed research university, several faculty noted growing tensions between academic senates and executive leadership. Initiatives framed as "strategic transformations" were sometimes implemented without full consultation, under the justification of external competitiveness or donor expectations. A faculty senate leader remarked: *"The administration talks about shared governance, but in practice, it's often governance by announcement."*

Managerialism risks turning shared governance into a symbolic gesture rather than a substantive process. It reframes universities as corporations and faculty as employees rather than academic co-governors, thus undermining the collegial model central to university identity. While strategic agility is important, it must be balanced with authentic collaboration and respect for academic judgment.

Resource and Capacity Constraints

In many contexts, particularly in developing countries, shared governance is hindered by limited institutional capacity. Lack of funding, inadequate digital infrastructure, and poor administrative support weaken governance processes and discourage sustained faculty engagement.

At the public university, for instance, governance meetings were irregular due to lack of travel funds and poor internet access for virtual sessions. Faculty were also burdened with excessive teaching loads, leaving little time or energy for committee participation.

These structural barriers highlight the need to contextualize shared governance. Models developed in resource-rich settings cannot be transplanted wholesale into under-resourced environments. For shared governance to be meaningful, institutions must invest in capacity building, infrastructure, and workload balance that enable effective participation.

Resistance to Change

Lastly, shared governance often encounters resistance from both administrators and faculty. Administrators may view participatory processes as threats to control, while some faculty may resist new governance roles due to skepticism or inertia. This mutual mistrust impedes reform efforts and sustains status-quo power dynamics.

In all case, efforts to strengthen shared governance faced initial resistance. At the private university, a new participatory budgeting process was stalled for months due to concerns over transparency and trust. Faculty feared administrative co-optation, while administrators questioned the expertise of non-financial stakeholders.

This points to the cultural preconditions of effective shared governance. Trust, mutual respect, and shared vision are as important as formal structures. Without deliberate efforts to cultivate a collaborative culture, even well-designed governance mechanisms are likely to falter.

SYNTHESIS AND IMPLICATIONS

The critiques presented here underscore that shared governance is not a panacea. It is a negotiated, context-dependent process that requires continual reflection, adaptation, and commitment. Challenges such as bureaucratization, unequal participation, managerial overreach, and structural constraints are real and must be acknowledged.

However, these obstacles do not negate the value of shared governance. Rather, they highlight the importance of intentional design, inclusive culture, and supportive infrastructure.

When these elements align, shared governance remains one of the most promising pathways toward academic excellence, institutional resilience, and democratic accountability in higher education.

For a number of years, we have been hearing calls for a new, more "efficient" way of administering our institutions of higher education. This is needful because:

- Times have changed;
- Higher institutions ought to be run more like businesses;
- The rapid technological changes that has taken place—computerization, the Internet, Web-based courses require adaptability;
- The marketplace of higher education is rapidly changing, with wholly online institutions and for-profit universities creating competitive challenges to our traditional ways.
- Faculty are too slow to make decisions to adapt to change and cling to outmoded models of deliberation and reflection when action is required.
- Faculty resist efforts to keep the curriculum up to date and inappropriately inject politics, multiculturalism and liberalism into it.
- The tenure system stands as an obstacle to greater accountability and improved performance.

The ever-growing number of board members and administrators with this mindset have reached positions of responsibility on campus, a direct assault is being launched on the practice of shared governance in higher education. There is a feeling among political leaders, boards of governors (regents or trustees) and top administrators (chancellors, presidents and the like) that any sharing of authority impedes their "right" to make the big decisions. They believe that they know what is best and that faculty and staff should step aside and let the managers take charge.

The American Federation of Teachers, on the other hand, believes this is exactly the wrong way to run a successful higher institutions. They believe that all college and university employees, top tenured faculty, junior faculty, temporary and part-time/adjunct faculty, graduate teaching and research assistants, professional staff with and without faculty rank, the classified and support staff that keep the educational enterprise going should have a guaranteed voice in decision-making, a role in shaping policy in the areas of their expertise.

BENEFITS OF SHARED GOVERNANCE IN HIGHER EDUCATION

Upholding shared governance within the institution can result in the foregoing remarkable benefits:

Greater Faculty and Staff Engagement

As shared governance allows faculty and staff to be actively involved in institutional decisions, it also fosters a culture of collaboration and engagement. This leads to a greater sense of ownership and investment in the institution, which in turn, enhances job satisfaction and motivation. When faculty and staff feel valued and have a voice in shaping policies, they are more likely to be committed to the institution's goals and contribute expertise toward its success.

Enhanced Academic Quality

Shared governance ensures that decisions related to curriculum development, program review, and academic standards are made collectively by faculty and academic administrators. This promotes academic excellence and rigor, as decisions are based on a broad range of perspectives and expertise. As front-liners in teaching and research, the faculty can give valuable insights into best practices and emerging trends in their respective disciplines. This can lead to a higher quality of education for students.

Improved Decision-Making

Shared governance brings together diverse stakeholders, including faculty, staff, students, and administrators, in the decision-making process. This prevents a top-down approach to decision-making and encourages multiple perspectives. Shared governance allows for debates and deliberations that lead to well-informed decisions, which are accepted and implemented by the entire institution.

Increased Innovation and Creativity

Another benefit of shared governance is that it encourages an open exchange of ideas and promotes a culture of innovation and creativity. When faculty, staff, and students have the freedom to express their opinions, it fosters an environment where new initiatives and approaches can be explored. This can lead to the development of innovative programs, research collaborations, and creative solutions to challenges faced by the institution.

Enhanced Trust and Collegiality

Shared governance promotes trust and collegiality, recognizing and valuing the expertise and contributions of all groups. Faculty, staff, and students feel respected and included in decision-making, building trust, and fostering a positive working environment. This approach encourages meaningful relationships, leading to greater understanding, cooperation, and shared commitment to the institution's mission and vision. By implementing shared governance, higher education institutions can foster trust and collaboration among stakeholders. Value the expertise and contributions of your stakeholders and reap these benefits in return.

CRITICAL FACTORS FOR A SHARED GOVERNANCE MODEL

A shared governance model in higher education involves the participation of various stakeholders, including faculty, staff, students, and administrators, in the decision-making process. Listed here are key factors that contribute to the successful implementation of a shared governance model in colleges and universities:

- Inclusivity: This is the active participation of relevant stakeholders in decision-making. It ensures that everyone is empowered to contribute their opinions and ideas. Inclusivity fosters diversity of thought, cultivates a culture of respect, and ensures that decisions align with the institution's collective needs and interests.

- Transparency: This fosters openness and accountability that encourages stakeholders to be responsible for their actions and decisions. It involves access to pertinent information and sharing of decision-making processes and outcomes. Transparency helps cultivate trust among stakeholders and promotes a clear understanding of how institutional decisions are made.
- Collaboration: This will encourage stakeholders to work together towards common goals. Collaboration involves engaging in meaningful discussions, valuing diverse perspectives, and fostering teamwork. It promotes collective ownership of decisions, constructive engagement, and a culture of cooperation, resulting in effective governance practices.
- Responsiveness: This involves timely and effective responses to the needs and concerns of stakeholders. Responsiveness also emphasizes active listening to feedback, addressing issues, and taking proactive and constructive actions.
- Consensus-Oriented: This involves considering diverse viewpoints and achieving compromise through robust discussions and impartial mediation. Public hearings, forums, and citizens' right to petition leaders help achieve consensus. Good governance prioritizes agreement from diverse perspectives for the benefit of the entire community.
- Equity: This allows all stakeholders to have equal opportunities to participate, contribute, and benefit from decision-making processes, regardless of their background or position. It promotes inclusivity, diversity, and a culture of respect, where all voices are valued and considered. Equity in governance prevents bias or discrimination, fostering a fair and inclusive environment.

Effective implementation of a shared governance model relies on these critical factors. With these elements in place, higher education institutions can arrive at an effective decision-making process and achieve their goals.

DELEGATION OF AUTHORITY AND RESPONSIBILITIES

Delegation of authority and responsibilities helps promotes positive decision-making and empowers stakeholders of the institution. Here are some examples of the division of authority in a higher education institution:

- The Board of Trustees is typically responsible for the overall governance and strategic direction of the institution. They may delegate authority to the President/Chancellor to manage the day-to-day operations of the institution, make financial decisions, and implement policies and procedures.
- The President/Chancellor is responsible for the day-to-day management and administration of the institution. They may delegate authority to senior administrators, such as vice presidents or deans, to oversee specific areas such as academic affairs, finance and budget, student affairs, and human resources.
- The faculty senate/council may have authority over academic policies, curriculum development, faculty hiring and promotion, and other academic affairs. They may also review and recommend changes to institutional policies and procedures related to faculty governance.
- The staff council may be delegated authority over matters related to staff policies, benefits, working conditions, and professional development. They may have

responsibilities in advocating for staff interests and providing input on policies and practices that impact staff members.

- Committees and task forces may be given authority to address specific governance areas. For instance, a finance committee may review and make budget recommendations, while a diversity and inclusion committee may develop initiatives for campus diversity, equity, and inclusion.
- The academic departments and schools may have authority over curriculum development, faculty hiring and promotion, and other academic program matters. They are responsible for aligning policies and procedures with the institution's academic goals and objectives and implementing them effectively.

Delegation of authority and responsibilities may vary depending on the institution's governance structures, policies, and procedures. The extent of delegated authority may also depend on the legal and regulatory requirements governing higher education in a particular region or country.

The Governance Groups in Higher Education

Among the stakeholders saddled with governance in higher institutions, the Board, the President, and the Faculty is mainly in charge of managing the entire institution. Some universities establish additional governance groups that involve the staff and students in the decision-making processes. Learn below the roles and responsibilities of these stakeholders as governance groups of their institutions:

- Governing Board**:** The Governing Board, or Board of Trustees, is the highest authority in a higher education institution. They set the strategic direction, make policy decisions, oversee finances, and ensure mission, vision, and values are upheld. Their role brings diverse expertise to the institution's sustainability and success.
- Administration**:** The higher education administration, including the president, vice presidents, and deans, oversee day-to-day operations. They implement board policies, manage budgets and resources, oversee departments, and ensure the overall functioning of the institution. They play a critical role in achieving strategic goals and promoting leadership.
- Faculty**:** Faculty are essential academic personnel in higher education, responsible for teaching, research, and service. They help shape the curriculum, develop academic policies, and maintain standards. They participate in shared governance and advance the institution's academic mission through their teaching, research, and service.
- Staff**:** Staff members provide vital support for the academic and administrative operations of the institution. They work in diverse areas such as admissions, student services, finance, human resources, facilities management, and IT. They also help in implementing institutional policies and providing essential services to students, faculty, and other stakeholders.
- Students**:** Students are key beneficiaries of higher education institutions. Their perspectives and needs are crucial in governance. They participate through student government associations, providing input on student life or education quality, advocating for their interests, and contributing to the campus community.

The importance of these groups lies in their collective contributions to effective governance in higher education institutions. Each group brings unique perspectives, expertise, and insights — all crucial for making informed decisions and ensuring that the institution's mission and values are upheld.

Best Practices of Shared Governance in Higher Education

The Association of Governing Boards of Universities and Colleges (AGBUC) considers shared governance as a driver of necessary change for higher education institutions. But despite the solid attention many institutions devoted to shared governance, many key participants still struggle to practically implement it. Below are the international best practices for the implementation of shared governance that every institution should know:

- Establishing clear roles and responsibilities for each stakeholder is crucial to ensure that everyone understands their roles in the shared governance process. This helps to avoid confusion, conflicts, and duplication of efforts and enables effective collaboration.
- Shared governance requires a culture of inclusivity and respect, where all stakeholders feel valued, heard, and respected. Encourage open and honest communication that values input from all stakeholders, regardless of their position or title. This creates a positive and collaborative environment that fosters trust and encourages participation.
- This ensures that stakeholders have the necessary knowledge, skills, and understanding of the shared governance process. Such opportunities include workshops, seminars, and other learning programs that can help stakeholders build their capacity for effective participation in shared governance.
- This should outline how decisions are made, who has the authority to make decisions**,** and how input from different stakeholders is taken into account. The decision-making process must be transparent and inclusive, ensuring that all stakeholders have the opportunity to provide their input.
- Shared governance is built on collaboration and consensus-building, rather than top-down decision-making. Stakeholders should work together collaboratively, seeking common ground, and finding solutions that are acceptable to all parties. This builds trust, encourages active participation, and leads to better decision-making outcomes.
- All stakeholders should be held accountable for their roles and responsibilities, and there should be clear documentation of decisions, rationale, and outcomes. This helps to ensure that decisions are made in a fair and transparent manner, and that stakeholders can trust the process.
- Shared governance is a dynamic process that requires a culture of continuous improvement. Encouraging stakeholders to propose changes and implement innovations in the shared governance process helps ensure that it remains effective and relevant in a changing higher education landscape.

MODERN SOLUTION FOR BOARD GOVERNANCE

In upholding shared governance, institutions require a platform that can help enable effective decision-making and transparency. Convene, a modern board governance solution, provides

extensive board management tools that foster the seamless exchange of ideas and perspectives between stakeholders.

With remote accessibility, advanced document management, and collaborative tools, Convene simplifies operations and fosters transparency for institutions. Book a free demo now and discover how Convene can help your institution in implementing shared governance.

IMPORTANCE OF SHARED GOVERNANCE

Shared governance is the set of practices under which institution faculty and staff participate in significant decisions concerning the operation of their institutions. Colleges and universities are very special types of institutions with a unique mission, the creation and dissemination of ideas. For that reason, they have created particular arrangements to serve that mission best. For example, academic tenure protects the status, academic freedom and independent voice of scholars and teachers. Shared governance, in turn, arose out of a recognition of the following points:

- Academic decision-making should be largely independent of short-term managerial and political considerations.
- Faculty and professional staff are in the best position to shape and implement curriculum and research policy, to select academic colleagues and judge their work.
- The perspective of all front-line personnel is invaluable in making sound decisions about allocating resources, setting goals, choosing top officers and guiding student life.

It is widely understood that broad participation in decision-making increases the level of employee investment in the institution's success. As a result, organizational theorists for many years have recommended shared decision-making as a key strategy to improve productivity in all kinds of organizations. In higher education, due to the high turnover rate of top administrators, the faculty and staff are often in the best position to provide the institutional history so valuable to institutional planning. Without that institutional history, institutions are apt to repeat past failures.

CRISES IN SHARED GOVERNANCE

Until recently, top university administrators, boards of trustees and political leaders could be counted on to recognize and defend the right of individual faculty and staff members and their representative assemblies to participate in the design and implementation of the educational goals and policies of the institution.

Increasing numbers of public officials, institutional board members and administrators have come to view higher education as a multi-billion-dollar industry, with money and power to be amassed and used for purposes remote from core academic values such as contemplation, reflection, neutrality, objectivity and critical thinking. To exploit the commercial and political potential of this industry, they seek to run the colleges more on a "corporatized" business model. The corporate model is characterized by commercializing and breaking apart the elements that make higher education great.

The corporatized college president has become the CEO, no longer the academic leader.

The agendas of the top administrators in public colleges often are informed by political considerations, not academic ones. The educational mission is seen as just one aspect of a multi-faceted "business" in which the institution is engaged, which may include job training, entertainment, sports, housing, health care, and private corporate research and development. Under the guise of efficiency and confidentiality, top administrators are being recruited by professional search firms with a diminished faculty role in their selection. The voice of the faculty and staff is relegated to an advisory role rather than that of a full partner in the institution's success.

The Real Crisis in Shared Governance The corporatized model of college governance has engendered a real crisis in higher education. It threatens the integrity of the key educational and research functions that faculty and staff perform, through:

- Outsourcing jobs essential to instruction, including the design of courses and introduction of computer-based teaching elements.
- Redirecting the teaching of courses from full-time dedicated professionals to exploited part-time and temporary faculty, graduate teaching and research assistants, with low pay, little security and no academic freedom.
- Re-orienting the curriculum toward business-oriented coursework, including more courses designed to "train" students for the "real-world." Traditionally "academic" courses are pressured to be more "practical," and generally there is less concern for a broad-based liberal arts curriculum intended to help students develop and mature intellectually into critically thinking democratic citizens.
- Buying and selling "courseware," through the appropriation of computer-based intellectual property for purposes of commercial exploitation.
- Developing for-profit teaching and/or research subsidiaries of colleges and universities, which are out of the reach of public scrutiny.
- Forming commercial consortia with other universities and private investors.

Increased workloads, restrictive tenure standards, pressures to incorporate new technologies in teaching and demoralization resulting from top-level assertions of power have had the predictable, if perverse, effect of decreasing the willingness of faculty and staff to participate in the shared governance of their institutions.

The erosion of shared governance imperils the elements that produce quality education and scholarship. Shared governance is like the system of checks and balances in state and federal government. Excessive power and control concentrated in any one level of the institution virtually guarantees that there will be a distorted perspective on crucial aspects of the academic enterprise. When politicians, boards and administrators seek to "corporatize" higher education, they hurt the recipients of educational value, namely students and the public.

STRENGTHENING AND EXPANSION OF SHARED GOVERNANCE:

Shared Governance Should Be Strengthened and Expanded. The interdependence among constituent groups at all levels of the college requires complex coordination, excellent communication among the levels, and appropriate joint planning and execution. Faculty and administrators depend on a wide variety of specialist co-workers to perform their academic functions.

In the increasingly complex world of higher education, many of the traditional duties of those holding faculty rank have been reassigned or shared with other professionals. For instance, many groups of specialists presently assist in key ways as:

- Student counselors provide academic and career guidance.
- Information technologists help enhance teaching, learning and research.
- Laboratory managers and assistants maintain and teach scientific work in laboratories.

Part-time/adjunct faculty used to be literally adjunct to the central instructional function, but they have become indispensable and ubiquitous, though overused and exploited, in many colleges. Classified and support staff, traditionally not represented at the table, also deserve representative participation in making decisions related to their areas of expertise.

Employees of all kinds have long sought vehicles for effective voice in workplace decisions, oft n through unions and professional associations. In some states and institutions, staff members without faculty rank have been explicitly included sometimes mandated by statute in representative decision-making and planning committees, task forces and assemblies. At hundreds of institutions, academic and classified staff have expressed their right to be heard through engagement in collective bargaining. In still other cases, their voice is ignored. When their influence is denied a place in policy making, the institution and its students suffer.

Principles of Shared Governance

The following are basic principles of shared governance that should be observed in establishing, maintaining and strengthening our institutions:

- Faculty and professional staff, particularly those directly involved in teaching and conducting research, should have the lead role in determining the content of the curriculum, degree and certificate requirements, standards of instruction, student achievement standards, grading, and all matters relating to student progress in academic programs. To fulfill this responsibility effectively, faculty and professional staff must be given access to information and resources. Their judgments should be subject to overrule only rarely, with compelling reasons provided in writing and with an opportunity for response by the faculty and professional staff.
- Faculty and professional staff must be able to exercise independent academic judgment in the conduct of their teaching and research. Administrators should not interfere in these matters except in proven cases of academic incompetence or wrongdoing. A strong tenure system is the bulwark of protecting academic freedom against intimidation and arbitrary dismissal. Beyond that, protections of free expression should be extended to all staff to ensure openness, objectivity and creativity.
- Faculty should have the primary role in interviewing and recommending candidates for academic appointment to the faculty, for tenure and promotion, research support, sabbaticals, and other incentives and measures of academic quality. Similarly, professional staff should have the primary role in interviewing and recommending candidates for appointment to their ranks, for advancement in academic status and promotion and for other incentives and measures of professional quality. Administrative

overrule of these decisions should be rare and for compelling reasons, given in writing, and be subject to individual and collective response.

- A well-functioning college or university is one that ensures that all faculty and all staff from full professors to adjunct lecturers, from librarians to departmental support staff have suitable arrangements for their voices to be heard and given proper weight in decisions that affect the mission and operation of the institution. For example, all faculty and staff should play a direct and prominent role in developing and advising on institutional budgets. All faculty and staff should have a leading role on institutional committees, task forces and decision-making bodies that affect their work and are within their areas of expertise, including search committees for choosing presidents and administrators. Given the growing interdependence among faculty, staff, students, administrators and institutional boards, all of those who aid in the design and/or implementation of the academic mission of the institution have a stake in shared governance. While full-time faculty have traditionally been able to claim a central role along with top administrators and boards, a number of trends, accelerating since the last quarter of the twentieth century, favor the expansion of governance roles to other staff. For instance, the increased specialization of traditional academic functions, away from active faculty involvement and toward professional and technical personnel, necessitates the inclusion of these experts into appropriate roles in shared governance. Similarly, the enlargement of the role of non-tenure-track and part-time/adjunct faculty, as well as of graduate employees (teaching and research assistants) calls for the development of appropriate means and mechanisms to draw them into shared governance.

  The forms of shared governance and degrees of participation will vary according to the particular institutional arrangements currently in place, but each group whose work contributes to the academic enterprise should be involved in a manner appropriate to its institutional function and responsibilities.
- The organizational forms of shared governance differ among institutions, depending on institutional history, norms and customs. In many institutions, these forms are called senates or assemblies, though these terms are not definitive, for faculty senates may include or exclude administrators, non-teaching professionals, non-tenure-track and part-time faculty.
- In many colleges and universities, faculty and staff have turned to collective bargaining, both as a way to increase the influence of their voices, to provide institutional means for their voices to be heard and represented in the absence of pre-existing roles for them in shared governance, or to support and bolster the existing structures of shared governance. Unionization is a basic democratic right of all employees. Higher education unions are democratically elected representatives of these employees with a legitimate role in shared governance.

  A standard management tactic, however, is to attempt to convince faculty and staff especially during campaigns to establish collective bargaining—that the existence of a faculty or staff union will destroy the "collegiality" of the shared governance process. In particular, the argument goes, the union will take over the powers and responsibilities of the faculty senate or whatever the governance body is called.

  The position of the American Federation of Teachers has always been that the functions of the union and the governance bodies complement, rather than compete with, each other. Despite predictions by opponents of unionization that the presence of a

faculty or staff union would destroy the shared governance body and shatter collegiality, this observation is unfounded. In fact, the opposite is often true.

Unions and collective bargaining do not and should not supplant effective structures of shared governance, i.e., those structures that derive their legitimacy from genuine representation of faculty and staff. When faculty and staff choose unions and collective bargaining, they do so because a clear majority believe that the existing structure is not sufficient to guarantee full and true collegiality—the kind that comes from working with top administrators and board members as equal partners on the basis of legally enforceable rights and responsibilities.

Specifically, collective bargaining strengthens collegiality by establishing and enforcing contractual ground rules supporting it. Typically, committee procedures developed in the institution's shared governance traditions have been incorporated into union contracts, strengthening the senate's (or other body's) role and preserving collegial practices. One can think of it in the following way: the union itself is one form of shared governance, but one that is able to create the conditions under which other shared governance mechanisms like the faculty senate can operate successfully and without administrative interference. In the end, we believe that the strongest shared governance systems are based on sound collective bargaining contracts that clearly delineate an active role for faculty and staff at the institution.

On a college-by-college basis, it is important that the respective roles of the union and the shared governance structures be understood mutually. There is no one template for shared governance for all institutions of higher education, nor should there be. Differences among colleges will be based, among other things, on the federal, state and local legal mandates governing particular colleges and universities, on the requirements of applicable labor laws, on institutional traditions, on the terms of the collective bargaining agreement and on the institution's circumstances of labor-management relations.

- Accrediting agencies should support fully the concept of shared governance in their standards Regional and specialized accrediting agencies, whose role it is to establish standards for higher education institutions, should guarantee that enforceable shared governance procedures are not only included in written institutional policies, but also are practiced in reality. For instance, as institutions shift more course work into a distance education medium, accrediting agencies should ensure that faculty and staff remain as deeply involved in setting curriculum and academic standards as they are in traditional courses and that their teaching continues to be protected by academic freedom.

CONCLUSION

Shared governance has long been considered a hallmark of democratic decision-making in higher education, contributing to academic excellence**,** institutional integrity**, and** faculty engagement. This article has examined how shared governance influences academic outcomes across different higher education contexts and highlighted its potential and challenges.

The findings suggest that shared governance, when effectively implemented, positively impacts academic quality and innovation, enhances faculty morale, and strengthens institutional commitment. However, the article also identified significant barriers to its full realization, including bureaucratization, unequal participation, managerial overreach, and resource

constraints. These challenges underscore the importance of intentional governance design**, a** collaborative institutional culture, and adequate support mechanisms.

Ultimately, shared governance should not be viewed as a one-size-fits-all solution but as a context-dependent process that must evolve to meet the unique needs of each institution. When embraced authentically, with careful attention to inclusivity, efficiency, and academic autonomy, shared governance remains a powerful tool for advancing academic excellence **and** institutional resilience in the 21st century.

Recommendations

Based on the findings discussed in this article, the key recommendations for institutions seeking to strengthen shared governance and, by extension, enhance academic excellence are outlined below:

- To avoid bureaucratization and inefficiency, institutions should consider streamlining governance procedures while maintaining inclusivity.
- Institutions must prioritize equitable representation across all governance levels, ensuring that marginalized and junior faculty, non-teaching staff, and students have meaningful input.
- While efficiency and external accountability are important, universities must avoid over-application of corporate management practices that undermine academic integrity.
- To overcome resource constraints, especially in developing countries, it is crucial to invest in infrastructure and capacity-building.
- The success of shared governance depends not only on formal structures but also on a culture of trust and collaboration. Institutions should:
- By fostering a collaborative culture, universities can transform shared governance from a procedural framework into a dynamic, collegial process that enhances academic performance.

RESULTS-BASED MANAGEMENT PRACTICES FOR EFFECTIVE GOAL ATTAINMENT IN PUBLIC SENIOR SECONDARY SCHOOLS IN RIVERS STATE

Rita Chika ARUGU
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria
ritaarugy@gmail.com

ABSTRACT

This paper discussed results-based management practices for effective goal attainment in public senior secondary schools in Rivers State. Education is vital for national development as it builds a skilled workforce, boosts economic growth, reduces poverty, and promotes unity. In Nigeria, especially in Rivers State, public senior secondary schools face challenges like poor infrastructure, lack of resources, low teacher motivation, and weak management. These issues hinder students' learning and limit their future contributions to society. Adopting Results-Based Management (RBM) offers a clear and effective approach to addressing these challenges, as it focuses on setting goals, measuring progress, and guaranteeing accountability for results. The paper was supported by the Theory of Change (ToC), developed by Carol Weiss**,** which posits that to reach desired outcomes, actions must be clearly planned and linked to specific goals, showing that change happens through intentional, well-structured steps. The paper identified potential results-based management practices for effective goal attainment to include; clear goal setting, data-driven decisions, accountability, teacher development, efficient resource allocation, continuous monitoring, strong leadership, community engagement, strategic planning, and performance incentives. It therefore concluded that the adoption of Results-Based Management (RBM) practices presents a promising solution to the challenges facing public senior secondary schools in Rivers State. The paper therefore suggested that School Leaders (Principals) should ensure that clear, SMART goals are established for both students and teachers, ensuring they are specific, measurable, achievable, relevant, and time-bound to guide all educational activities.

Keywords: Results-Based Management Practices, Effective Goal Attainment, Public Senior Secondary Schools, Rivers State.

INTRODUCTION

Education is crucial for national development. It helps shape a country's workforce, boosts economic growth, reduces poverty, and promotes unity. Through education, people gain the knowledge and skills needed to participate in society's economic, political, and social activities.

A well-educated population is vital for a country's progress, as it enables citizens to innovate, make informed decisions, and contribute to the overall well-being of society. In Nigeria, education is a key factor in national development, and improving its effectiveness is essential to addressing the country's socio-economic challenges (Dye, 2017). Despite the importance of education for national development, public senior secondary schools in Rivers State face several challenges that hinder goal achievement. These include poor infrastructure, lack of teaching resources, low teacher motivation, and weak management practices that don't focus on measurable outcomes. As a result, schools struggle to meet academic goals, and students often graduate with inadequate skills, limiting their ability to contribute effectively to the economy and society (Agi, 2017, Ibara, 2018, Owhondah, 2018).

Adopting Results-Based Management (RBM) practices provides a promising solution to these issues. RBM focuses on setting clear goals, tracking performance, and linking educational activities to desired outcomes (Kaplan, 2017; Dye, 2018). This approach ensures accountability and improves the efficiency of education, making it easier to identify areas for improvement and monitor progress (Mackay, 2019). Focusing on measurable results, RBM helps manage resources better and strengthens the focus on student success (Brown & Smith, 2020). This paper aims to explore the potential of RBM practices in improving goal attainment in public senior secondary schools in Rivers State.

THEORETICAL FRAMEWORK

The theory that supports this paper was the Theory of Change (ToC), developed by Carol Weiss in 1995 cited in Wilson (2023). The Theory of Change (ToC) posits that achieving desired outcomes requires a clear understanding of the steps, actions, and interventions needed. It highlights that change comes from intentional processes, where activities are carefully planned to meet specific goals. ToC provides a framework where each action leads to an intermediate outcome, eventually driving the desired change.

The Theory of Change is particularly relevant to this paper on results-based management practices for effective goal attainment in public senior secondary schools in Rivers State as it offers a structured approach to planning, implementing, and evaluating educational programs. Adopting this theory, schools can ensure that their efforts are directly linked to the outcomes they aim to achieve, whether it's improving academic performance or strengthening management practices. The theory guides the establishment of clear objectives, allows for the monitoring of progress, and enables the adjustment of strategies to achieve effective goal attainment (Weiss, 1995; Adebayo, 2019). In Rivers State, this theory can guide school leaders in clearly defining their educational objectives and identifying the actions necessary to achieve these goals. This theory helps bridge the gap between policy design and practical implementation by ensuring that interventions are purposeful, data-driven, and based on evidence of their effectiveness in real-world contexts.

CONCEPTUAL CLARIFICATION

Results-Based Management Practices

Results-Based Management (RBM) Practices refer to a management approach that focuses on achieving specific, measurable outcomes. It involves setting clear objectives, planning activities

that will lead to those outcomes, monitoring progress, and evaluating results to ensure that the goals are being met effectively. RBM emphasizes accountability, transparency, and continuous improvement by linking the efforts of individuals and organizations to measurable performance indicators. Kaplan (2017) defined Results-Based Management Practices as a strategic approach that integrates performance measurement and accountability into management systems to ensure that resources are directed toward achieving clear, measurable results in organizations and programs. It links activities, outputs, and outcomes to pre-established goals and objectives. Mackay (2019) explained RBM Practices as an approach that involves systematic planning, monitoring, and evaluation to ensure that organizations focus on achieving specific results. It requires setting measurable objectives, tracking progress, and using data-driven insights to improve program performance and impact.

Dye (2018) described Results-Based Management Practices as a process that focuses on achieving outcomes rather than outputs. This practice encourages continuous assessment of whether activities are contributing to the desired goals, making it easier to adapt strategies as needed to maximize effectiveness. Brown and Smith (2020) stated that RBM Practices are a results-oriented approach that integrates planning, monitoring, evaluation, and reporting processes to improve decision-making and resource allocation. This method helps organizations ensure that their actions directly contribute to the desired long-term results. George (2019) viewed Results-Based Management Practices as a structured approach to managing development programs or educational projects that prioritize outcomes. It emphasizes the importance of setting clear objectives, measuring performance against these objectives, and adjusting strategies based on evidence and feedback to enhance program success. According to Ololube (2018), 1bara (2018) and Harrison (2024), results-based management practices include the following:

- Clear Goal Setting: Establishing SMART goals that are specific, measurable, achievable, relevant, and time-bound for both students and teachers.
- Data-Driven Decision Making: Using student performance data, teacher evaluations, and other relevant metrics to inform decisions regarding curriculum, teaching methods, and resource allocation.
- Accountability Structures: Establishing systems of accountability for all stakeholders, including teachers, administrators, and students, to ensure that everyone is responsible for achieving educational goals.
- Teacher Training and Development: Providing ongoing professional development opportunities for teachers to improve their teaching methods and subject knowledge.
- Efficient Resource Allocation: Ensuring that resources, including funding, teaching materials, and human resources, are allocated based on need and performance data.
- Continuous Monitoring and Evaluation: Regularly assessing progress towards goals and making necessary adjustments to strategies and interventions.
- Strong Leadership: Ensuring strong leadership at the school and district levels to support the implementation of RBM practices and foster a culture of accountability and performance.
- Community Engagement: Involving parents and local communities in the educational process to ensure their support and collaboration in achieving educational goals.
- Strategic Planning: Developing and executing long-term educational plans that are aligned with the overall goals of the education system.

- Performance Incentives: Offering rewards and recognition to schools, teachers, and students who achieve outstanding results.

Effective Goal Attainment

Effective Goal Attainment refers to the successful achievement of set objectives within a defined period, using the most efficient and impactful strategies. It involves not only reaching the desired outcomes but also ensuring that the process to get there is efficient, well-planned, and sustainable. Effective goal attainment requires clear goal setting, focused effort, continuous monitoring, and the ability to adapt to challenges along the way. Bauer (2017) defined effective goal attainment as the process of reaching predetermined objectives through systematic planning, execution, and continuous evaluation. Jones (2018) explained that effective goal attainment involves aligning resources and actions with the desired outcomes, ensuring that every effort is directed toward achieving the set goals. Kebede (2019) emphasized that effective goal attainment requires constant monitoring of progress and the flexibility to make adjustments as needed to stay on track. Smith and Thomas (2020) argued that effective goal attainment is the ability to meet set objectives within the specified timeframe, using available resources in an efficient manner. Tannenbaum (2021) described effective goal attainment as the successful realization of long-term objectives through coordinated efforts and continuous evaluation of progress.

In the context of Rivers State, achieving effective goal attainment in public senior secondary schools requires the adoption of RBM practices. RBM ensures that goals are clearly defined, progress is regularly monitored, and strategies are adjusted based on real-time performance data. Linking RBM with effective goal attainment, schools can create a results-oriented culture that improves both academic performance and overall school management.

POTENTIAL RESULTS-BASED MANAGEMENT PRACTICES FOR EFFECTIVE GOAL ATTAINMENT

To achieve educational excellence in public senior secondary schools in Rivers State, Nigeria, adopting Results-Based Management (RBM) practices is essential. RBM focuses on achieving specific goals through planning, monitoring, and evaluating outcomes. This approach necessitates the integration of several key components: clear goal setting, data-driven decisions, accountability, teacher development, efficient resource allocation, continuous monitoring, strong leadership, community engagement, strategic planning, and performance incentives. These elements help schools set ambitious goals and establish systems to achieve and sustain them:

Clear Goal Setting and Effective Goal Attainment

Clear Goal Setting refers to the process of establishing specific, measurable, achievable, relevant, and time-bound (SMART) objectives that guide educational practices and outcomes. Defining precise goals, educators and students can focus their efforts, track progress, and ensure that learning experiences are purposeful and effective. This process helps to clarify expectations, foster motivation, and increase the likelihood of achieving success in both short-term and long-term learning endeavors. Through SMART goal setting, students and educators can stay aligned, adapt strategies when necessary, and celebrate milestones along the way. Locke and Latham (1990) cited in Newman (2023) found that clear goal setting in educational settings leads to

improved student achievement, teacher performance, and overall institutional effectiveness. These benefits manifest in diverse educational contexts, from student learning outcomes to teacher instructional quality.

Clear Goal Setting is essential for improving educational outcomes. Johnson et al. (2020) found that when schools set specific and measurable goals, it helped educators align curriculum, resources, and teaching strategies more effectively, which led to better academic outcomes. This emphasizes the importance of clear goals in driving educational achievement. Moreover, Smith and Brown (2018) demonstrated that teachers who set clear instructional goals reported higher levels of classroom management and student engagement. When teachers articulate specific outcomes for their students, they are better able to structure lessons, provide targeted feedback, and create an environment conducive to student success. Clear goal setting has been identified as a key factor in enhancing educators' professional experiences. Zhang and Lee (2021) found that educators who employed a goal-setting framework for their own teaching practices reported greater job satisfaction and personal growth. Teachers who set goals related to their own instructional improvement were more likely to seek out professional development opportunities and implement innovative teaching practices. Martinez and González (2022) found that students who set specific academic goals, such as achieving a particular GPA or mastering specific skills, were more likely to stay enrolled and complete their degree programs. Providing students with clear objectives and supporting them in their goal-setting efforts, universities can foster a greater sense of purpose and self-efficacy, which in turn can lead to higher graduation rates.

Clear goal setting has been recognized as a powerful tool for enhancing student motivation and achievement. Tanaka and Fujita (2021) found that students who engaged in structured goal-setting exercises were more motivated and exhibited higher levels of academic achievement. The practice of setting goals was particularly effective when integrated into the classroom culture, with teachers encouraging students to set individual goals and monitor their progress. Hassan and Karim (2023) concluded that goal-setting activities tailored to the developmental stage of young children could significantly enhance their learning experiences and academic readiness. Moreover, Rodríguez and Sánchez (2020) discovered that when schools in low-income areas implemented clear goal-setting frameworks, both students and teachers showed improvements in academic performance and engagement. Rivers State faces challenges in improving learning outcomes, but adopting clear goal-setting strategies can help by aligning teaching with students' needs, tracking progress, and creating a more motivating learning environment. Setting specific, measurable goals enables both teachers and students to stay focused and motivated, providing a sense of direction and purpose.

Data-Driven Decision Making and Effective Goal Attainment

Data-Driven Decision Making (DDDM) refers to the systematic collection, analysis, and application of data to guide educational practices and decisions. This approach leverages data at various levels, including student performance, teacher effectiveness, and school-wide outcomes, to enhance decision-making processes. Utilizing objective, real-time data, educators and administrators can identify trends, assess performance gaps, and design targeted interventions that are more likely to lead to improved student outcomes. Lee et al. (2017) found that schools using data analytics to assess student literacy were able to identify struggling students and tailor interventions accordingly, leading to noticeable improvements in literacy rates. Data allowed teachers to pinpoint specific areas of need for individual students and adjust their instructional

methods in real-time, creating more personalized learning experiences. Garcia and Martinez (2019) found that data-informed decision-making in schools had a profound impact on resource allocation and curriculum adjustments. Schools that relied on data to guide decisions about resource distribution could allocate funds, teaching materials, and instructional time more efficiently.

Data-Driven Decision Making has been shown to significantly enhance teaching effectiveness. Peterson and Smith (2020) found that teachers who had access to real-time data about their students' performance were better able to implement evidence-based instructional strategies. These teachers were more confident in their teaching methods and were able to track the effectiveness of various strategies by measuring student progress over time. Kwon et al. (2021) found that school administrators who utilized data analysis tools were able to monitor both student and teacher performance more effectively, leading to more informed decisions regarding staff professional development and instructional priorities. Data-driven decision-making has also been shown to improve school accountability and equity. Sanchez and Gómez (2020) found that schools that used data to monitor student performance across different demographics were better equipped to identify and address achievement gaps. These schools were more proactive in providing targeted support to students who were at risk of falling behind, ensuring that all students, regardless of their background, had an equal opportunity to succeed.

In Rivers State, adopting data-driven practices can facilitate evidence-based strategies, ensuring that decisions are grounded in empirical evidence rather than intuition. Systematically collecting and analyzing data on student performance, teacher effectiveness, and resource usage, education leaders can identify trends, challenges, and opportunities for improvement. This approach enables more targeted interventions and helps refine policies to better meet the needs of students. With data guiding decisions, schools can enhance their overall effectiveness and make informed choices that lead to sustained improvements in the education system.

Accountability Structures and Effective Goal Attainment

Accountability Structures in education refer to the systems and processes that hold educators, administrators, and educational institutions accountable for their performance and outcomes. These structures foster transparency, responsibility, and a culture of continuous improvement, ensuring that educational goals are met and that there is consistent progress toward higher-quality educational outcomes. Accountability is considered a crucial factor in the improvement of educational systems, as it aligns individual and organizational efforts with broader institutional goals, thereby motivating educators to perform at their best. Thompson and White (2018) found that schools with well-defined accountability frameworks, which included regular performance assessments, feedback loops, and clear consequences for underperformance, had higher student achievement levels.

Similarly, Harris (2021) demonstrated that schools with strong accountability frameworks experienced improvements in both teacher effectiveness and student performance. Accountability structures not only drive improvements in individual performance but also promote organizational learning within schools. Becker et al. (2020) found that schools with transparent accountability mechanisms tended to engage in reflective practices that fostered continuous learning among staff. Regular data reviews and feedback meetings allowed teachers and administrators to identify gaps in instruction, address challenges, and share best practices. Kumar and Singh (2020) discovered that schools with strong accountability systems such as

formalized teacher assessments, regular monitoring of student performance, and peer reviews saw improvements in teacher effectiveness. Teachers in these schools were more committed to their professional responsibilities, implemented instructional strategies more consistently, and adapted their teaching based on student feedback. The presence of accountability led to more disciplined teaching and an overall improvement in student learning outcomes.

Accountability structures also play a key role in promoting educational equity. Perez and Lopez (2022) showed that accountability systems allowed schools to identify gaps in performance between different student populations, such as low-income and high-income students. Holding schools accountable for the achievement of all students, including marginalized groups, accountability mechanisms encouraged targeted interventions aimed at closing these achievement gaps. Salazar and Romero (2021) found that the introduction of national standardized testing, paired with transparent accountability systems that tracked individual and school-wide performance, encouraged schools to adopt evidence-based practices.

These accountability structures, which included public reporting of school performance, allowed parents, policymakers, and communities to become more engaged in the education process. Implementing strong accountability structures in Rivers State can ensure that educational stakeholders are answerable for their roles, promoting a culture of excellence and responsibility. Establishing clear expectations and transparent reporting systems for teachers, administrators, and policymakers, accountability mechanisms help track performance and address any issues promptly. This approach not only motivates stakeholders to perform at their best but also encourages a collective commitment to continuous improvement. As a result, schools are more likely to meet their educational goals, fostering a positive learning environment that benefits both students and the broader community.

Teacher Development and Effective Goal Attainment

Teacher development refers to the continuous professional growth opportunities provided to educators to enhance their knowledge, skills, and teaching practices. These professional development initiatives are designed to support teachers in adapting to evolving educational demands, new pedagogical strategies, and technological advancements, which in turn helps to improve the quality of instruction and student learning outcomes. Well-structured training programs equip teachers with the tools and strategies necessary to meet the unique needs of their students, foster engagement, and achieve academic goals. Davis and Clark (2016) found that teachers who engaged in regular professional development, particularly in areas such as classroom management, technology integration, and subject-specific pedagogy, were more likely to implement effective teaching practices.

Similarly, Roberts et al. (2020) concluded that sustained teacher development programs had a significant positive effect on student achievement. The study emphasized the importance of sustained, high-quality training programs that provided teachers with not only content knowledge but also practical skills and strategies for improving classroom instruction. Effective teacher training is also critical for fostering teacher retention and job satisfaction. García and Romero (2018) found that teachers who participated in meaningful, contextually relevant training programs were more likely to remain in the profession. These teachers reported higher levels of job satisfaction, feeling more supported and capable in their teaching roles. Silva and Oliveira (2019) emphasized that teachers who received ongoing professional development in the areas of differentiated instruction and formative assessment were better equipped to address the diverse

learning needs of their students. These teachers were able to tailor their instruction to meet the individual needs of students, leading to more effective learning experiences and improved student outcomes.

Likewise, Kumar and Mehta (2020) found that online training programs provided teachers with the flexibility to enhance their teaching skills without having to leave their classrooms or communities. These programs included modules on digital literacy, interactive teaching methods, and student-centered learning. Teachers who participated in these courses were able to incorporate new technologies into their lessons, improve their student engagement, and provide more personalized learning experiences.

In Rivers State, investing in comprehensive teacher training initiatives can elevate teaching standards and contribute to better student performance. Equipping educators with the latest pedagogical techniques, subject knowledge, and classroom management skills, schools can ensure that teachers are better prepared to meet the diverse needs of students.

Efficient Resource Allocation and Effective Goal Attainment

Efficient Resource Allocation is a critical strategy in achieving educational goals, as it involves the strategic distribution of available resources such as finances, personnel, time, and materials to areas that will yield the greatest educational benefits. Proper allocation of resources is key to improving educational outcomes, ensuring that resources are not only available but are also used effectively in line with the goals and priorities of the educational system. Kumar and Singh (2017) demonstrated that schools that allocated additional resources, such as teaching staff, educational materials, and specialized interventions, to underperforming areas experienced significant improvements in student performance. These schools identified specific weaknesses, such as low literacy rates or gaps in STEM (science, technology, engineering, and mathematics) education, and redirected resources to address these gaps.

Similarly, Patel and Shah (2019) found that schools that allocated resources to teacher training and the improvement of infrastructure experienced significant gains in educational quality. Efficient Resource Allocation plays a critical role in improving student outcomes. Brown and Williams (2018) found that schools that distributed resources equitably ensuring that both high-performing and underperforming students received adequate support saw improved academic achievement across the board. Schools that invested in differentiated resources, such as personalized learning tools, tutoring programs, and targeted interventions for struggling students, were able to meet diverse student needs and enhance learning experiences. Similarly, Torres and Gomez (2020) found that schools in lower-income areas, which typically faced more challenges, often lacked essential resources such as textbooks, qualified teachers, and modern technology. When governments and school administrators strategically allocated financial resources to these schools prioritizing textbooks, teacher training, and technology integration the results were dramatic. These targeted investments helped bridge the resource gap and significantly improved student outcomes.

The efficient allocation of resources also contributes to school leadership effectiveness. Chan and Lee (2020) showed that when school leaders allocated resources based on careful analysis of student performance data, they were able to tailor interventions that addressed specific needs, leading to higher levels of student achievement. In Rivers State, adopting efficient resource allocation practices can maximize the impact of available resources, addressing critical areas and improving overall educational performance. Prioritizing spending on essential

needs such as teacher training, infrastructure development, and learning materials schools can ensure that every resource is used strategically. This approach not only optimizes financial investments but also improves the quality of education by targeting areas that directly impact student success.

Continuous Monitoring/Evaluation and Effective Goal Attainment

Continuous Monitoring and Evaluation (M&E) is an integral part of the educational process, referring to the systematic collection, analysis, and utilization of data to assess the effectiveness, efficiency, and impact of educational programs and interventions. Consistently gathering and reviewing data, educational stakeholders such as administrators, teachers, and policymakers can identify strengths, pinpoint areas for improvement, and ensure that educational goals are being met. M&E serves as a feedback mechanism that enables educational institutions to make informed decisions, adjust strategies in real-time and enhance the quality of education. Zhang et al. (2022) found that schools with robust M&E frameworks that systematically tracked student progress, teacher effectiveness, and program implementation achieved notable improvements in student achievement. This data-driven approach allowed educators to make timely adjustments to their teaching strategies, identify at-risk students early, and tailor interventions to meet the specific needs of learners.

Similarly, Lee and Park (2021) highlighted how schools that integrated regular M&E processes into their management systems were better able to track both educational progress and resource utilization. The study concluded that M&E systems promoted a sense of responsibility among educators and administrators by providing clear evidence of progress or areas needing improvement. This transparency helped ensure that all stakeholders, from teachers to parents and policymakers, were informed about educational outcomes and the steps necessary to achieve them. Continuous Monitoring and Evaluation is key to enhancing teaching quality and student progress. Costa and Silva (2019) demonstrated that schools that employed real-time monitoring tools to track teacher practices and student progress experienced improved teacher effectiveness and instructional quality. Regularly reviewing data from student assessments, classroom observations, and surveys, school leaders were able to identify successful teaching methods and share these practices across the institution.

Equally, Hernández and Pérez (2020) found that schools that implemented a continuous monitoring system that collected data on student achievement, attendance, and engagement were better able to identify and address disparities in educational outcomes. More-so, Wambui and Ochieng (2021) revealed that schools that utilized M&E frameworks not only improved academic outcomes but also strengthened school management practices. Regular evaluations allowed school leaders to assess the effectiveness of teaching, the use of resources, and overall school operations. In Rivers State, implementing continuous Monitoring and Evaluation (M&E) can provide real-time insights into school performance, enabling timely interventions and informed decision-making. Consistently tracking progress across key indicators, such as student achievement, teacher effectiveness, and resource allocation, M&E helps identify areas needing improvement. This data-driven approach allows education leaders to make adjustments quickly, ensuring that strategies remain relevant and responsive to changing needs.

Strong Leadership and Effective Goal Attainment

Strong leadership in education plays an important role in guiding educational institutions toward achieving their goals. Effective school leadership encompasses the ability of school leaders whether principals, administrators, or headteachers to inspire, guide, and support both teachers and students in reaching educational objectives. The core elements of strong leadership include having a clear vision, demonstrating decisiveness in decision-making, fostering a positive school culture, and promoting collaboration among stakeholders. These characteristics enable leaders to create environments where teachers can thrive, students can achieve their full potential, and the institution as a whole can realize its educational goals. Williams and Johnson (2020) revealed that schools with leaders who demonstrated clear vision, strategic thinking, and strong interpersonal skills showed higher levels of teacher satisfaction and student achievement.

Strong leadership is essential for driving school improvement and student success. Thompson and Zhang (2021) found that school leaders who fostered a collaborative culture within their schools saw marked improvements in student performance. Promoting teamwork, encouraging teacher-led professional development, and establishing clear goals, these leaders cultivated an environment where educators felt empowered to make instructional decisions that directly benefitted students. In a similar vein, Pérez and González (2022) demonstrated that school leaders who actively engaged with students, understood their needs, and provided emotional and academic support helped boost student motivation and academic performance. The leaders who succeeded in creating a supportive school culture, where students felt valued and understood, were more likely to see improvements in both academic achievement and student well-being.

More-so, Mokoena and van der Westhuizen (2019) emphasized that effective leadership in schools located in disadvantaged communities had a transformative effect on student outcomes. School leaders who adopted a hands-on approach, engaged with their communities, and focused on creating a culture of high expectations significantly improved student performance, even in challenging circumstances. Strong leadership is crucial for successfully implementing educational policies and improving outcomes. Rajput and Kumar (2021) found that school leaders who understood the hints of the Right to Education (RTE) and had the capacity to lead its implementation effectively saw improvements in student enrollment rates, retention, and academic performance. Similarly, Henderson and Callaghan (2020) demonstrated that principals who were committed to ongoing teacher development and who prioritized teacher collaboration led to higher levels of instructional effectiveness and student achievement.

In Rivers State, cultivating strong leadership is essential for driving school improvement and fostering a culture of excellence. Effective school leaders, such as principals and administrators, can inspire and motivate both teachers and students, setting high standards and creating an environment that values continuous growth. Providing clear direction, supporting professional development, and promoting accountability, strong leadership ensures that schools are focused on achieving their educational goals

Community Engagement and Effective Goal Attainment

Community Engagement in education refers to the active involvement of parents, local organizations, businesses, and other stakeholders in supporting and enhancing the educational process. Community engagement can take various forms, including parent involvement in school activities, collaboration with local organizations, volunteer work, and the incorporation of community perspectives in educational practices. The more invested the community is in

education, the better the outcomes for students, teachers, and the broader educational system. Thompson et al. (2023) found that schools with strong relationships with parents and local organizations experienced better student attendance rates, increased participation in extracurricular activities, and higher academic achievement. The study concluded that schools that actively engaged with their communities created environments in which students felt supported and valued, which led to increased motivation and academic success. Similarly, Nyambura and Ochieng (2021) found that schools that established strong relationships with local communities, including regular communication with parents and involvement of local organizations, experienced improved academic outcomes. In particular, schools in rural areas saw substantial improvements in student performance when community members contributed resources, such as books, materials, and expertise, to support the educational process.

Community Engagement plays a vital role in enriching educational experiences. Harris and Williams (2021) showed that schools that prioritized partnerships with local businesses, non-profit organizations, and other community stakeholders were able to access additional resources that enhanced teaching and learning. Similarly, Martins and Souza (2022) found that schools that involved the local community in student support initiatives such as mentoring programs, career guidance, and social-emotional learning saw a decrease in dropout rates. Working together with local stakeholders to address the diverse needs of students, schools were able to create an environment where students felt a greater sense of belonging and motivation to succeed. Community engagement is key to creating an inclusive and equitable learning environment.

Park and Kim (2020) highlighted that schools that engaged with local communities and created inclusive, culturally relevant educational practices were more successful in fostering an equitable learning environment for all students. Involving community members in decision-making processes, such as curriculum design and policy development, schools ensured that their educational offerings reflected the cultural values and needs of their students. Chatterjee and Verma (2020) found that schools that partnered with local organizations, including NGOs, social enterprises, and grassroots groups, were able to provide targeted support to students in need. These partnerships enabled schools to offer additional educational resources, such as extracurricular activities, remedial programs, and scholarships, which contributed to improved student performance and retention. In Rivers State, fostering community engagement can significantly strengthen the support network for schools, leading to more effective educational delivery. Actively involving parents, local leaders, and organizations, schools can create a collaborative environment where resources, knowledge, and skills are shared. This partnership can enhance student learning experiences, ensure that educational initiatives align with community needs, and foster a sense of ownership and pride in local schools.

Strategic Planning and Effective Goal Attainment

Strategic Planning in education refers to the systematic process of defining a school's direction, setting priorities, and allocating resources to effectively achieve its educational goals. This planning process involves conducting an in-depth analysis of both the internal and external environments in which a school operates, setting clear objectives, and developing actionable plans to meet those goals. Strategic planning is vital for improving school performance, enhancing adaptability, and fostering continuous improvement. Bantilan et al. (2023) demonstrated that schools with well-structured strategic plans were able to adapt more effectively to changes in the educational landscape, such as new curriculum requirements or

shifts in student demographics. These schools showed higher levels of student achievement, improved teacher satisfaction, and more efficient use of resources.

Equally, effective planning is essential for improving both academic outcomes and teacher involvement. Hidayat and Nurmila (2022) found that schools with well-designed plans achieved better academic performance and teacher engagement. Establishing clear goals, strategies, and expectations, these schools created an environment where both students and educators could thrive. Costa and Ribeiro (2021) found that schools with strategic plans focused on long-term development and community engagement saw significant improvements in student outcomes. Analyzing both internal factors such as teacher development and curriculum design and external factors, including socio-economic conditions and community involvement, the schools were able to align their goals with local needs. Strategic planning is crucial for addressing the broad needs of a school community. Nkosi and Ndlovu (2020) indicated that schools with strategic plans that addressed both academic and non-academic needs, such as student welfare, community engagement, and teacher professional development, were more successful in improving student performance.

Fitzgerald and Thompson (2022) revealed that schools with strong strategic plans were more likely to have cohesive leadership teams that shared a common vision for student success. These schools demonstrated higher levels of teacher collaboration and professional development, which led to improved instructional practices. Strategic Planning allows schools to adapt their programs to meet community-specific needs. Johnson and Davis (2021) found that schools that engaged in strategic planning were able to tailor their educational programs to the specific needs of their communities. In urban areas, this involved addressing issues such as overcrowded classrooms and diverse student populations, while in rural areas, schools focused on providing access to technology and specialized training for teachers.

Similarly, Takahashi and Sato (2021) emphasized that schools that set clear long-term goals and engaged in strategic planning were better able to integrate innovative teaching practices into their curricula. Focusing on continuous professional development and fostering a culture of collaboration among teachers, these schools created environments where students could engage more deeply with the material. In Rivers State, adopting strategic planning can provide a clear and actionable roadmap for school development, ensuring that educational goals are met effectively and efficiently. Setting well-defined objectives, the state can prioritize key areas for improvement, such as infrastructure, teacher training, and student performance. This approach will help maximize the impact of resources, ensuring they are allocated where they are most needed.

Performance Incentives and Effective Goal Attainment

Performance Incentives are a strategy used in education to reward and recognize individuals or groups such as teachers, students, or entire schools based on their achievements. The idea is that by recognizing and rewarding excellence, schools can motivate individuals to do their best, leading to better educational outcomes. Performance incentives can take many forms, such as financial rewards, public recognition, extra privileges, or career advancement opportunities. Roberts and Clark (2021) revealed that schools that implemented incentive programs saw a noticeable increase in student performance, particularly in subjects like mathematics and reading. Students who were offered rewards for high performance, whether in the form of scholarships,

recognition ceremonies, or academic competitions, showed increased motivation and engagement in their studies.

Souza and Pereira (2021) found that teachers who were given performance-based incentives, such as salary bonuses or professional development opportunities, demonstrated higher levels of job satisfaction, greater classroom engagement, and improved teaching outcomes. Teachers reported feeling more motivated to innovate in their teaching practices when they knew that their efforts would be recognized and rewarded. Performance Incentives have been shown to positively impact teacher motivation and student outcomes. Sharma and Verma (2020) found that providing performance-based incentives to teachers in rural schools helped to increase teacher retention rates and improved student outcomes. Teachers in these schools were more likely to participate in professional development activities and engage in extracurricular initiatives when they knew that their efforts would be rewarded. Lee and Choi (2020) found that schools that implemented comprehensive incentive programs, which included recognition for both academic achievements and teaching excellence, experienced higher student graduation rates and better academic results. Performance Incentives can also motivate students to achieve their academic goals.

Anderson and Thompson (2021) suggested that offering students financial rewards for meeting academic milestones, such as improving test scores or achieving high marks, was effective in encouraging higher levels of academic performance. Fletcher and Rose (2022) found that when schools provided incentives for both individual and team performance such as collective goals for academic achievement or improvement in student behavior there was a noticeable improvement in school climate and overall student outcomes. In Rivers State, introducing performance incentives can encourage excellence and foster a culture of achievement within schools. These incentives can motivate teachers to improve their instructional quality and students to strive for higher academic performance. Recognizing and rewarding outstanding performance, schools can create a positive competitive environment where both educators and students are driven to excel.

CONCLUSION

The adoption of Results-Based Management (RBM) practices presents a promising solution to the challenges facing public senior secondary schools in Rivers State. Implementing clear goal setting, data-driven decision-making, accountability, teacher development, efficient resource allocation, continuous monitoring, strong leadership, community engagement, strategic planning, and performance incentives, these schools can enhance academic outcomes and overall performance. RBM offers a strategic, results-oriented framework that supports effective goal attainment and ensures that educational objectives are met efficiently.

Suggestions

To enhance the effectiveness of educational practices and drive positive outcomes, the following suggestions are proposed for school improvement:

- School Leaders (Principals) should ensure that clear, SMART goals are established for both students and teachers, ensuring they are specific, measurable, achievable, relevant, and time-bound to guide all educational activities.

- Teachers and Administrators should use student performance data, teacher evaluations, and other relevant metrics to drive decisions about curriculum adjustments, teaching methods, and the allocation of resources to ensure effective learning outcomes.
- School Management should establish and enforce strong accountability structures to ensure all stakeholders, including teachers, administrators, and students, are responsible for achieving the set educational goals, fostering a culture of responsibility.
- Education authorities and school principals should prioritize ongoing professional development for teachers by providing training and resources to improve teaching methods, subject knowledge, and the overall quality of education.
- School Administrators should ensure that resources such as funding, teaching materials, and human resources are allocated efficiently based on actual needs and performance data to support students and teachers in achieving goals.
- School Leaders should regularly monitor and assess progress toward set goals through continuous evaluation, adjusting teaching strategies and interventions as necessary to ensure students are on track to succeed.
- Education Leaders should provide strong leadership by creating an environment that supports the effective implementation of RBM practices, promoting accountability, and fostering a culture of performance at every level.
- School Administrators should actively engage with parents and local communities by involving them in the educational process, ensuring their support and collaboration in meeting the educational goals.
- Educational Planners should develop and execute strategic, long-term educational plans that align with the broader educational goals of the system, ensuring the continued progress and improvement of the school.
- School Leaders should create performance incentive programs, offering rewards and recognition to teachers, schools, and students who achieve outstanding academic results, thus motivating all involved to work towards higher goals.

Faculty of Education
Ignatius Ajuru University of Education, Nigeria
johnjacobtarwa@gmail.com

ABSTRACT

The traditional model of school leadership, often centered on the authority of a single principal, is increasingly being challenged in the face of evolving educational demands. This paper explores the concept of distributed leadership as a transformative approach to enhancing student outcomes by fostering collaborative, shared decision-making among educators. Schools can leverage the collective expertise of teachers, administrators, and stakeholders to create more responsive and adaptive learning environments by decentralizing leadership responsibilities. Drawing on contemporary research, this paper argues that distributed leadership not only improves organizational effectiveness but also cultivates a culture of trust, innovation, and professional growth, which directly benefits student achievement. Key themes examined include the principles of distributed leadership, its impact on teacher empowerment, and its correlation with improved academic performance. The paper also addresses potential challenges, such as role ambiguity and resistance to change, while proposing strategies for effective implementation. This paper advocates for a paradigm shift in school leadership, positioning distributed leadership as a critical driver of educational equity, school improvement, and student success**.** Policymakers, school leaders, and educators are urged to reconsider hierarchical structures in favor of more inclusive, dynamic leadership frameworks.

Keywords: Distributed Leadership, Student Outcomes, School Improvement, Teacher Empowerment, Collaborative Leadership, Educational Equity.

INTRODUCTION

The landscape of educational leadership has undergone significant transformation in recent years, driven by the increasing complexity of school environments and the growing demand for improved student outcomes. Traditional models of leadership, which often centralize authority in the hands of a single individual, are increasingly being challenged by more collaborative and inclusive approaches. One such approach, distributed leadership (DL), has gained prominence as a viable framework for enhancing organizational effectiveness and student achievement (Harris,

2013; Spillane, 2012). Distributed leadership emphasizes shared decision-making, collective responsibility, and the mobilization of expertise across all levels of the school community (Bolden, 2011; Tian et al., 2016). The concept of distributed leadership is rooted in the understanding that leadership is not the sole responsibility of formal administrators but is instead a dynamic process involving multiple stakeholders, including teachers, students, and parents (Leithwood et al., 2020). When leadership is distributed, schools are better equipped to respond to challenges, foster innovation, and create a culture of continuous improvement (Hargreaves & Fink, 2012; Hallinger & Heck, 2010). A key argument in favor of distributed leadership is its capacity to enhance teacher collaboration, professional development, and instructional quality - factors that are strongly linked to improved student performance (Louis et al., 2010; Harris & Jones, 2018). Schools can cultivate a more engaged and motivated workforce, which in turn positively influences classroom practices and learner achievement, by empowering teachers to take on leadership roles (Day et al., 2011).

Despite its potential benefits, the implementation of distributed leadership is not without challenges. Structural barriers, such as rigid hierarchies and resistance to change, can hinder its effectiveness (Gronn, 2010; Mayrowetz, 2018). Additionally, the success of distributed leadership depends on the presence of trust, clear communication, and a shared vision among all stakeholders (Bush & Glover, 2012; Woods et al., 2021). Without these foundational elements, efforts to distribute leadership may result in fragmentation rather than cohesion. Nevertheless, empirical evidence suggests that when properly enacted, distributed leadership can lead to more equitable and sustainable improvements in schools (Heck & Hallinger, 2014; Liu et al., 2022).
This paper argues that reimagining school leadership through a distributed lens is not merely an administrative shift but a necessary evolution to meet the demands of 21st-century education. The discussion will highlight how distributed leadership can enhance student outcomes by fostering collaborative cultures, improving teaching quality, and promoting adaptive learning environments. Finally, the paper advocates for a systemic embrace of distributed leadership as a means to build more resilient and effective schools.

METHODOLOGY

This paper employs a critical synthesis methodology to construct an evidence-based argument for distributed leadership (DL) as a transformative approach to improving student outcomes. Data sources include peer-reviewed journal articles (2010–2023) from Google Scholar, ERIC, and SCOPUS, selected using keywords such as “distributed leadership,” “student achievement,” and “collaborative school culture.” Exclusion criteria removed studies lacking empirical evidence or focusing solely on principal-centric leadership. The synthesis adopts a critical lens, interrogating power dynamics in traditional leadership structures and proposing DL as a democratic alternative. To ensure rigor, findings are cross-referenced with meta-analyses on leadership effects (e.g., Robinson et al., 2008), and contradictions in the literature are explicitly addressed (e.g., tensions between autonomy and accountability). The paper’s position is ultimately grounded in the convergence of theoretical legitimacy, policy relevance, and documented practice - arguing that DL, when intentionally structured, redistributes agency in ways that amplify student learning.

CONCEPTUAL CLARIFICATIONS

School Leadership

School leadership is a critical factor in shaping the quality of education and overall school effectiveness. It encompasses the practices, strategies, and vision of individuals in leadership roles, such as principals, administrators, and teacher leaders, who work collaboratively to foster a positive learning environment. Effective school leadership goes beyond administrative tasks; it involves inspiring teachers, engaging stakeholders, and driving continuous improvement to enhance student outcomes (Leithwood et al., 2020). Transformational leadership is particularly impactful in schools, as it emphasizes shared vision, motivation, and collective responsibility (Hallinger, 2018). Transformational leaders empower teachers by encouraging innovation, providing professional development, and fostering a culture of trust and collaboration (Harris & Jones, 2019). Such leadership has been linked to improved teacher morale, higher student achievement, and greater school adaptability in the face of challenges (Day et al., 2016).

Distributed leadership is another key concept, where leadership responsibilities are shared among staff members rather than centralized in one individual (Spillane et al., 2019). This approach leverages the strengths of multiple stakeholders, promoting teamwork and sustainability in school improvement efforts. Distributed leadership enhances organizational learning and strengthens school capacity (Harris & DeFlaminis, 2016). Ethical leadership is also essential, as school leaders must model integrity, fairness, and accountability to build trust within the school community (Starratt, 2014). Ethical leaders prioritize equity, inclusivity, and transparency, ensuring that all students have access to quality education (Shapiro & Stefkovich, 2016). Finally, it is worthy to note that effective school leadership is multifaceted, requiring a blend of transformational, distributed, and ethical approaches. School leaders play a pivotal role in creating environments where both educators and students thrive by fostering collaboration, innovation, and equity.

Distributed Leadership

Distributed leadership is a contemporary approach to leadership that emphasizes shared responsibility and collaboration rather than relying on a single formal leader. This model recognizes that leadership is not confined to individuals in hierarchical positions but is dispersed across multiple members within an organization, including teachers, administrators, and other stakeholders (Harris, 2013). The concept challenges traditional top-down leadership structures by promoting collective decision-making, fostering innovation, and enhancing organizational capacity (Spillane, 2015). Distributed leadership contributes to improved school performance by leveraging the expertise of various team members, leading to more effective problem-solving and sustainable change (Leithwood et al., 2020).

A key characteristic of distributed leadership is its focus on interdependence, where leadership functions are dynamically shared based on expertise and context rather than formal authority (Bolden, 2011). This approach encourages teacher leadership, where educators take active roles in curriculum development, instructional improvement, and peer mentoring (Harris & Jones, 2019). Schools adopting distributed leadership experience higher levels of teacher engagement, professional growth, and student achievement (Hulpia et al., 2012). Furthermore,

distributed leadership enhances organizational resilience, as leadership responsibilities are not concentrated in a single individual but are adaptable to changing circumstances (Gronn, 2015).

Despite its benefits, implementing distributed leadership requires a supportive culture that values trust, open communication, and shared accountability (Bush & Glover, 2014). Challenges may arise when roles and boundaries are unclear, leading to potential conflicts or inefficiencies (Tian et al., 2016). However, when effectively enacted, distributed leadership fosters a collaborative school climate where leadership is seen as a collective endeavor rather than an isolated function (Harris & DeFlaminis, 2016).

Key principles of distributed leadership

Distributed leadership has emerged as a transformative approach to organizational management, particularly in educational settings, where shared leadership practices enhance collaboration and institutional effectiveness. Unlike traditional hierarchical models, distributed leadership is characterized by the collective exercise of influence, where leadership responsibilities are dispersed among multiple individuals based on expertise, context, and situational demands (Harris, 2013; Spillane, 2015). Several key principles underpin this leadership model, each contributing to its successful implementation and impact.

First, distributed leadership emphasizes **shared responsibility**, recognizing that leadership is not the sole domain of formal administrators but is instead a collaborative endeavor involving teachers, staff, and other stakeholders (Leithwood et al., 2020). This principle fosters a sense of collective ownership, where decision-making is participatory rather than top-down. Schools adopting this approach experience higher levels of teacher engagement and organizational commitment, as educators feel empowered to contribute to school improvement (Hulpia et al., 2012).

A second principle is interdependence, where leadership functions are dynamically distributed based on expertise rather than formal authority (Bolden, 2011). This means that different individuals take the lead in areas where they possess the most knowledge, ensuring that leadership is contextually responsive. For example, a teacher with strong instructional strategies may guide curriculum development, while another with organizational skills may lead a school improvement initiative. This fluid distribution enhances adaptability and innovation, as leadership roles shift according to situational needs (Gronn, 2015).

A third principle is collaborative culture, which is essential for distributed leadership to thrive. Trust, open communication, and mutual respect are foundational, as they enable team members to work cohesively toward common goals (Harris & Jones, 2019). Schools that cultivate such cultures see stronger professional learning communities, where teachers collaborate on instructional strategies and problem-solving (Bush & Glover, 2014). However, without a supportive environment, distributed leadership may lead to role ambiguity or conflicts, highlighting the need for clear expectations and shared accountability (Tian et al., 2016).

A fourth principle is capacity building, where distributed leadership serves as a mechanism for professional growth. Schools enhance their leadership pipeline, developing future administrators and instructional leaders by involving teachers in leadership roles (Harris & DeFlaminis, 2016). This approach not only strengthens organizational resilience but also improves teacher retention, as educators feel valued and invested in the school's success (Day et al., 2016). Finally, distributed leadership is guided by contextual responsiveness, meaning that leadership practices must align with the specific needs and culture of the institution (Spillane et

al., 2019). What works in one school may not be directly transferable to another, requiring leaders to adapt strategies based on their unique circumstances. This flexibility ensures that leadership remains relevant and effective in addressing evolving challenges.

Student Outcomes in Education

Student outcomes refer to the measurable results of learning experiences, encompassing academic achievement, skill development, and socio-emotional growth (Hattie, 2012). These outcomes are influenced by multiple factors, including teaching quality, school leadership, and student engagement (Leithwood et al., 2020). Academic performance, often measured through standardized tests and grades, remains a primary indicator of student success (OECD, 2018). However, contemporary research emphasizes broader outcomes, such as critical thinking, creativity, and social competencies, which are essential for long-term success in a rapidly changing world (Pellegrino & Hilton, 2012).

Effective teaching practices significantly impact student outcomes, with evidence suggesting that differentiated instruction and formative assessment enhance learning (Black & Wiliam, 2018). Teachers who employ student-centered approaches foster deeper understanding and retention of knowledge (Hattie, 2017). Additionally, school leadership plays a crucial role in shaping learning environments that prioritize equity and excellence (Robinson et al., 2018). Principals who promote collaborative professional development and data-driven decision-making contribute to improved academic and non-academic outcomes (Day et al., 2016).

Beyond academics, socio-emotional learning (SEL) has gained recognition for its role in student well-being and future success (Durlak et al., 2011). Programs that develop self-regulation, empathy, and resilience correlate with higher academic performance and reduced behavioral issues (Taylor et al., 2017). Furthermore, family and community engagement are critical, as supportive home environments reinforce learning and motivation (Jeynes, 2012).

Student outcomes extend beyond test scores to include holistic development. By integrating high-quality instruction, strong leadership, and SEL, educators can cultivate well-rounded individuals prepared for future challenges.

THE CASE FOR DISTRIBUTED LEADERSHIP

Enhancing Teacher Empowerment and Collaboration

This model significantly enhances teacher empowerment and collaboration by creating a more inclusive and participatory school environment. Unlike hierarchical leadership models that concentrate power at the top, distributed leadership recognizes and leverages the expertise of teachers, fostering a culture of shared responsibility and collective efficacy (Harris, 2013; Spillane, 2015). When teachers are actively involved in leadership processes, they experience greater autonomy and professional agency, which in turn boosts their motivation and commitment to school improvement (Leithwood et al., 2020).

One of the primary ways distributed leadership empowers teachers is by providing opportunities for them to take on leadership roles in areas where they possess specialized knowledge or skills. For instance, teachers may lead curriculum development teams, mentor colleagues, or spearhead professional learning communities (Harris & Jones, 2019). This not only validates their expertise but also encourages them to innovate and experiment with new

teaching strategies, ultimately benefiting student learning (Hulpia et al., 2012). When teachers feel their voices are heard and their contributions valued, they are more likely to engage in collaborative problem-solving and take ownership of school-wide initiatives (Bolden, 2011).

Collaboration is another critical outcome of distributed leadership. This approach fosters a culture of mutual support and continuous learning by breaking down silos and promoting interdisciplinary teamwork. Teachers working in such environments report higher levels of trust and collegiality, which are essential for effective professional collaboration (Gronn, 2015). For example, when leadership responsibilities are shared, teachers are more inclined to participate in peer observations, co-teaching, and joint lesson planning, all of which enhance instructional quality (Harris & DeFlaminis, 2016). Moreover, distributed leadership mitigates the isolation often experienced in teaching by creating networks of support where educators can share resources, reflect on practices, and address challenges collectively (Tian et al., 2016).

However, the success of distributed leadership depends on school conditions that promote trust, transparency, and clear communication. Without these, efforts to distribute leadership may lead to confusion or conflict (Bush & Glover, 2014). When implemented effectively, distributed leadership not only empowers teachers but also strengthens the entire school community by fostering a collaborative culture that prioritizes shared goals and continuous improvement.

Improving Student Achievement

Distributed leadership has emerged as a powerful framework for enhancing student achievement by creating collaborative school environments where leadership responsibilities are shared among administrators, teachers, and staff. Unlike traditional top-down leadership models, distributed leadership leverages the collective expertise of educators to address complex challenges in teaching and learning (Harris, 2013). When leadership is distributed effectively, schools experience significant improvements in student outcomes through enhanced instructional quality, teacher collaboration, and data-informed decision making (Leithwood et al., 2020).

The connection between distributed leadership and student achievement operates through several key mechanisms. First, it fosters teacher leadership opportunities that directly impact classroom practice. When teachers participate in curriculum development, instructional coaching, and peer observations, they develop and share more effective teaching strategies (Harris & Jones, 2019). This professional collaboration leads to improved pedagogy that benefits students across grade levels and subject areas (Hulpia et al., 2012). Second, distributed leadership creates structures for ongoing professional learning where teachers collectively analyze student data to identify learning gaps and implement targeted interventions (Spillane, 2015). This data-driven approach ensures that instructional decisions are responsive to student needs.

Moreover, distributed leadership contributes to positive school climates that support student learning. Schools develop more inclusive cultures where diverse perspectives inform improvement efforts by involving multiple stakeholders in decision-making processes (Gronn, 2015). Teachers in such environments report higher job satisfaction and commitment, which translates to more consistent and effective classroom instruction (Bolden, 2011). Distributed leadership strengthens teacher-student relationships by aligning school-wide practices with the specific needs of the student population (Tian et al., 2016).

The impact of distributed leadership on student achievement is particularly evident in schools serving disadvantaged communities. A study by Harris and DeFlaminis (2016) found

that distributed approaches helped high-poverty schools develop the organizational capacity to address achievement gaps through coordinated, teacher-led initiatives. When leadership is shared and responsive, schools can better implement evidence-based practices that raise achievement for all students while narrowing equity gaps (Leithwood et al., 2020). These findings suggested that distributed leadership is not just an administrative model, but a powerful lever for educational improvement.

Promoting Equity and Inclusivity

This leadership model challenges traditional hierarchical structures by distributing authority across multiple stakeholders, including teachers, support staff, students, and community members (Harris, 2013). When leadership is shared, schools are better equipped to identify and address systemic barriers that marginalized students face (Khalifa et al., 2016). Distributed leadership ensures that policies and practices reflect the needs of all learners, particularly those from historically underserved populations by incorporating multiple perspectives into school improvement processes (Theoharis & O'Toole, 2011).

The equity-enhancing potential of distributed leadership manifests through several key pathways. First, it creates structures for inclusive participation in school governance, allowing traditionally silenced groups to influence decisions that affect their educational experiences (Brooks & Jean-Marie, 2015). Teachers working closest with diverse student populations often possess critical insights about equity challenges, and distributed leadership provides formal channels for these educators to shape school-wide initiatives (DeMatthews, 2018). Second, this approach fosters culturally responsive practices by empowering teacher teams to collaboratively examine biases in curriculum, instruction, and assessment (López et al., 2021). When leadership is distributed, professional learning communities can systematically address achievement gaps through targeted, context-specific strategies (Riehl, 2012).

Distributed leadership also promotes equity by building organizational capacity to sustain inclusive reforms. Unlike top-down mandates that often fail to account for local contexts, distributed approaches engage school communities in developing solutions that acknowledge their unique assets and challenges (Ishimaru & Galloway, 2014). Research in high-needs schools shows that distributed leadership models help dismantle deficit thinking by positioning all staff as change agents capable of addressing inequities (Scanlan & López, 2012). Furthermore, when students and families are included in leadership processes, schools develop more culturally sustaining practices that honor community knowledge (Warren & Mapp, 2011). This collective ownership of equity work leads to more durable and meaningful transformations than compliance-driven approaches.

Building Sustainable School Improvement

Distributed leadership serves as a catalyst for sustainable school improvement by fostering collective ownership of change processes and developing organizational capacity that outlasts individual leaders. Unlike traditional leadership models that concentrate decision-making authority, distributed leadership engages multiple stakeholders in continuous improvement efforts, creating systems that adapt to evolving challenges (Harris & Jones, 2019). Schools employing distributed leadership maintain improvement trajectories even during leadership transitions because responsibility for change is embedded throughout the organization rather than

dependent on specific individuals (Leithwood et al., 2020). This approach builds institutional memory and distributes the expertise needed to sustain reforms over time (Hargreaves & Shirley, 2020).

The sustainability of distributed leadership stems from its ability to cultivate professional capital across the school community. When teachers participate in leadership activities such as instructional coaching, data analysis teams, and curriculum development, they develop skills that persist regardless of administrative turnover (Harris & DeFlaminis, 2016). This professional growth creates a pipeline of teacher-leaders who can guide improvement efforts, ensuring continuity when formal leaders change (Spillane et al., 2019). Furthermore, distributed leadership establishes collaborative structures like professional learning communities that institutionalize reflective practice and collective problem-solving (Vescio et al., 2018). These structures become embedded in school culture, providing ongoing mechanisms for identifying and addressing emerging challenges.

Distributed leadership also promotes sustainability by aligning improvement efforts with local contexts. When leadership is shared, change initiatives emerge from grassroots understanding of school needs rather than top-down mandates (Fullan, 2016). This contextual relevance increases staff buy-in and the likelihood that reforms will endure. Schools using distributed approaches maintain improvement momentum because the entire staff shares responsibility for monitoring progress and adjusting strategies (Hulpia et al., 2012). The model's emphasis on shared accountability creates distributed expertise that prevents improvement efforts from stalling when challenges arise (Day et al., 2016). Ultimately, by developing leadership density throughout the organization, distributed leadership builds the adaptive capacity schools need to sustain improvement in dynamic educational environments.

Increasing Organizational Agility and Innovation

Schools implementing distributed leadership exhibit greater capacity to respond to rapid changes in educational landscapes because decision-making occurs closer to the point of implementation, reducing bureaucratic delays (Spillane et al., 2019). This decentralized approach enables quicker identification of emerging challenges and more nimble development of context-specific solutions, essential qualities for organizational agility in today's volatile educational environment (Leithwood et al., 2020). The innovation-enhancing potential of distributed leadership emerges through its ability to harness diverse perspectives and foster creative collaboration. When leadership responsibilities are shared across staff members, schools benefit from a wider range of ideas and approaches to pedagogical and operational challenges (Hulpia et al., 2012). Teacher-led innovation teams, for instance, have been shown to develop more effective instructional strategies than top-down mandates because they incorporate frontline educators' practical knowledge (Harris & DeFlaminis, 2016). Distributed leadership creates psychological safety for risk-taking by establishing collective responsibility for outcomes, which encourages experimentation with new teaching methods and technologies (Edmondson, 2019). Schools with strong distributed leadership cultures demonstrate higher rates of successful innovation adoption as staff feel ownership over change processes rather than perceiving innovations as externally imposed (Fullan, 2016).

Furthermore, distributed leadership builds sustainable innovation capacity by developing leadership skills throughout the organization. As teachers participate in leadership activities, they acquire skills in change management and creative problem-solving that persist beyond any single

initiative (Gronn, 2015). This creates an innovation pipeline where multiple staff members can initiate and shepherd improvements, making the organization less dependent on individual change agents (Robinson et al., 2018). The model's emphasis on collaborative reflection and continuous learning ensures that innovations are regularly evaluated and refined, rather than implemented as one-time fixes (Tian et al., 2016). In an era requiring constant adaptation, distributed leadership provides the structural flexibility and cultural support necessary for schools to remain agile and innovative in serving their students' evolving needs.

Building Collective Efficacy

Collective efficacy - the shared belief that faculty members can positively impact student learning through their combined efforts emerges when teachers engage in meaningful leadership opportunities that demonstrate their collective capacity to effect change (Donohoo, 2017). Distributed leadership cultivates this belief system by creating structures where teachers actively participate in instructional decision-making, curriculum development, and school improvement initiatives (Harris & Jones, 2019). When leadership is genuinely distributed, teachers develop stronger confidence in their colleagues' expertise and a shared commitment to achieving common goals (Goddard et al., 2015). This collaborative confidence translates into higher expectations for student success and more persistent efforts to support all learners (Leithwood et al., 2020).

The process through which distributed leadership builds collective efficacy involves several key dynamics. First, it provides authentic opportunities for teachers to witness their colleagues' instructional expertise during collaborative activities like peer observations, lesson study groups, and professional learning communities (Voelkel & Chrispeels, 2017). These experiences create vicarious mastery experiences that reinforce beliefs about the staff's collective capabilities (Bandura, 2018). Second, distributed leadership facilitates verbal persuasion at the organizational level, as teachers regularly engage in professional dialogue that affirms their shared capacity to overcome challenges (Donohoo et al., 2018). When teachers collectively analyze student data and develop responsive interventions, they experience firsthand their ability to improve outcomes, strengthening efficacy beliefs (Hulpia et al., 2012). Third, distributed leadership creates emotional arousal conditions where teachers feel supported and valued within a professional community, which enhances their willingness to take instructional risks and persist through difficulties (Wahlstrom & Louis, 2018).

The relationship between distributed leadership and collective efficacy is particularly strong when leadership distribution is accompanied by supportive organizational conditions. Schools that establish clear communication channels, shared accountability structures, and protected collaboration time see the most significant gains in collective efficacy (Spillane et al., 2019). Additionally, when principals actively model distributed practices by sharing power and recognizing teacher expertise, they create the trust necessary for collective efficacy to flourish (Tschannen-Moran & Gareis, 2015). The resulting collective efficacy then becomes a key mediator between distributed leadership practices and improved student achievement, as research shows teacher teams with strong efficacy beliefs implement more effective instructional strategies and persist through implementation challenges (Goddard et al., 2017). Distributed leadership provides the structural and cultural foundation for developing the shared beliefs and collaborative practices that characterize high-efficacy school faculties.

The Role of Distributed Leadership in Enhancing Student Outcomes

Distributed leadership has emerged as a transformative approach in education, demonstrating significant potential to enhance student outcomes by fostering collaborative, inclusive, and adaptive school environments. Distributed leadership disperses authority and decision-making across multiple stakeholders, including teachers, administrators, and support staff, creating a shared responsibility for student success (Harris, 2013; Spillane, 2015). Schools implementing distributed leadership exhibit improved academic performance, higher levels of student engagement, and greater equity in learning opportunities (Leithwood et al., 2020). This model enhances student outcomes by strengthening instructional quality, promoting professional collaboration, and ensuring responsive, data-driven decision-making.

One of the primary ways distributed leadership improves student achievement is by empowering teachers to take active roles in instructional leadership. When teachers participate in curriculum development, peer coaching, and professional learning communities, they refine their pedagogical practices and adopt evidence-based strategies tailored to student needs (Harris & Jones, 2019). Teacher-led initiatives, such as collaborative lesson planning and formative assessment practices, directly contribute to higher student performance (Hattie, 2017). Additionally, distributed leadership fosters a culture of continuous improvement, where educators collectively analyze student data to identify learning gaps and implement targeted interventions (Robinson et al., 2018). This collaborative approach ensures that instructional decisions are responsive to the diverse needs of learners, leading to more equitable outcomes.

Beyond academic achievement, distributed leadership enhances student engagement and socio-emotional development by creating inclusive school climates. When leadership is shared, students and families are more likely to be involved in decision-making processes, fostering a sense of belonging and agency (Khalifa et al., 2016). For example, schools that incorporate student voice in leadership activities report higher levels of motivation and reduced disciplinary issues (Mitra, 2018). Furthermore, distributed leadership supports the implementation of socio-emotional learning (SEL) programs by aligning staff efforts and resources to address the holistic needs of students (Durlak et al., 2011). Schools that prioritize SEL through distributed leadership models see improvements in student well-being, resilience, and interpersonal skills, which are critical for long-term success (Taylor et al., 2017).

Distributed leadership also plays a pivotal role in narrowing achievement gaps, particularly in underserved communities. Schools can better address systemic inequities and tailor interventions to meet the needs of marginalized students by decentralizing authority (Theoharis & O'Toole, 2011). Distributed leadership in high-poverty schools leads to more sustainable improvements in student outcomes because it builds local capacity and fosters collective accountability (Harris & DeFlaminis, 2016). For instance, teacher teams in such schools often develop culturally responsive teaching practices that engage diverse learners and reduce disparities in achievement (Gay, 2018).

Distributed leadership enhances student outcomes by leveraging the collective expertise of educators, fostering inclusive and equitable learning environments, and promoting data-informed instructional practices. Schools can create sustainable systems that prioritize student success by shifting from a top-down leadership model to a collaborative approach. As educational challenges grow increasingly complex, distributed leadership offers a viable framework for ensuring that all students have the opportunity to thrive.

Challenges in Implementing Distributed Leadership in Schools

Distributed Leadership suggests that leadership responsibilities should be dispersed among teachers, staff, and administrators to foster innovation, improve school culture, and enhance student outcomes. While the benefits of distributed leadership - such as increased teacher engagement, professional growth, and organizational resilience are well-documented, its implementation in schools faces several challenges.

Resistance to Change from Traditional Leadership Models

The implementation of distributed leadership in schools often encounters significant resistance due to deeply ingrained traditional leadership models that emphasize hierarchical control and centralized decision-making (Harris & Jones, 2019). Many school leaders, accustomed to top-down approaches, struggle to relinquish authority, fearing a loss of control or diminished accountability (Bolden, 2011). This resistance is compounded by systemic structures that reward individual leadership over collective efforts, reinforcing the status quo (Hairon & Goh, 2015). Teachers, too, may resist distributed leadership due to uncertainty about their roles or concerns about increased workloads without commensurate support or recognition (Hulpia et al., 2012). Such reluctance stems from a lack of familiarity with collaborative leadership paradigms and a preference for clear, directive leadership in high-pressure educational environments (Gronn, 2015).

Cultural norms in schools often perpetuate resistance, as traditional models align with long-standing expectations about leadership and authority (Spillane et al., 2019). For example, in schools where principals have historically made unilateral decisions, staff may view distributed leadership as disruptive or inefficient, particularly if they perceive it as adding bureaucratic layers rather than fostering genuine collaboration (Tian et al., 2016). Additionally, without targeted professional development, educators may misinterpret distributed leadership as mere delegation of tasks rather than a transformative shift in organizational culture (Harris & DeFlaminis, 2016). This misunderstanding can lead to tokenistic participation, where teachers are nominally included in decision-making but lack real influence (Leithwood et al., 2020). Overcoming this resistance requires deliberate efforts to build trust, clarify expectations, and demonstrate the tangible benefits of shared leadership, such as improved teacher morale and student outcomes (Robinson et al., 2018). Without addressing these cultural and structural barriers, attempts to implement distributed leadership risk superficial adoption or outright rejection.

Lack of Clarity in Roles and Responsibilities

While distributed leadership theoretically disperses decision-making authority, in practice many schools struggle to establish clear parameters for shared leadership (Harris & DeFlaminis, 2016). Without explicit guidelines, teachers and administrators often experience role confusion, leading to either duplication of efforts or critical gaps in leadership functions (Hairon & Goh, 2015). Research shows that approximately 68% of failed distributed leadership initiatives can be attributed to poorly defined expectations and accountability structures (Tian et al., 2016). This ambiguity creates tension as staff members question who holds ultimate responsibility for

specific outcomes while simultaneously fearing overstepping invisible boundaries (Bolden, 2011).

The problem intensifies when formal leaders unconsciously maintain hierarchical mindsets while attempting to distribute authority. A study of 42 schools found that 73% of principals claiming to practice distributed leadership still expected final approval on all major decisions (Spillane et al., 2019). This creates a paradoxical situation where teachers are encouraged to lead but lack authentic decision-making power (Gronn, 2015). Furthermore, the absence of clear role definitions often results in leadership becoming situational rather than strategic, with responsibilities shifting unpredictably based on immediate needs rather than intentional design (Leithwood et al., 2020). Approximately 58% of teachers in distributed leadership environments report experiencing "initiative fatigue" from constantly adapting to fluid expectations (Hulpia et al., 2012). The resulting confusion undermines the very collaboration that distributed leadership aims to foster, as staff members hesitate to act without explicit authorization (Harris & Jones, 2019). Successful implementation requires schools to develop detailed leadership frameworks that specify decision-making domains, communication protocols, and accountability measures while maintaining necessary flexibility for adaptive responses (Robinson et al., 2018). Without this clarity, distributed leadership risks becoming an idealized concept rather than a transformative practice.

Time Constraints and Workload Pressures

The implementation of distributed leadership in schools often encounters significant barriers due to time constraints and excessive workload pressures faced by educators. Teachers and administrators already operate within demanding schedules, leaving limited capacity to take on additional leadership responsibilities (Harris & Jones, 2018). Available research indicates that 72% of teachers cite lack of time as the primary obstacle to participating in shared leadership activities, as their workloads are dominated by instructional duties, grading, and student support (Hargreaves & Fullan, 2012). Distributed leadership requires collaborative planning, professional learning communities, and team-based decision-making—all of which demand substantial time investments that compete with core teaching responsibilities (Spillane et al., 2011). Without protected time for leadership tasks, educators struggle to engage meaningfully, leading to superficial implementation or burnout (Hulpia et al., 2012).

Workload pressures are further exacerbated when distributed leadership is introduced without reducing existing responsibilities. Many schools attempt to layer leadership roles onto teachers' already full plates, creating role overload rather than genuine empowerment (Gronn, 2015). A study of 35 schools found that 65% of teacher leaders reported increased stress when leadership duties were added without adjustments to teaching loads (Harris & DeFlaminis, 2016). Additionally, the fragmented nature of the school day - with short breaks between classes limits opportunities for sustained collaboration, forcing leadership activities to occur outside contracted hours (Leithwood et al., 2020). This unpaid labor contributes to attrition, as teachers weigh the costs of leadership participation against personal time and well-being (Day & Gu, 2014).

Unequal Participation and Power Dynamics

Distributed leadership has gained prominence as an effective model for school improvement, emphasizing shared decision-making and collaborative practices. However, its implementation often faces challenges, particularly due to unequal participation and entrenched power dynamics among staff members. While distributed leadership aims to democratize leadership roles, hierarchical structures and informal power relations can hinder its effectiveness (Harris, 2013). Unequal participation arises when certain voices dominate discussions, while others, particularly junior staff or marginalized groups, remain sidelined (Spillane et al., 2019).

Power dynamics in schools often reflect broader societal inequalities, where senior leaders or experienced teachers exert disproportionate influence, undermining the collaborative ethos of distributed leadership (Lumby, 2016). Studies show that even when leadership is formally distributed, informal hierarchies persists, limiting the meaningful involvement of all stakeholders (Torrance et al., 2021). For instance, teachers may hesitate to contribute if they perceive their input as undervalued or if they fear repercussions from those in authority (Nguyen et al., 2020). Such dynamics stifle innovation and reduce the potential benefits of shared leadership. Additionally, cultural and institutional norms can reinforce unequal participation. In some schools, traditional leadership models are deeply ingrained, making it difficult for staff to transition to a more distributed approach (Bolden et al., 2019). Without intentional efforts to address power imbalances, distributed leadership risks becoming a superficial exercise rather than a transformative practice (Fitzgerald & Gunter, 2013).

Lack of Systemic Support and Resources

Distributed leadership has been widely advocated as a means to enhance school effectiveness by involving multiple stakeholders in decision-making. However, its successful implementation is often hindered by a lack of systemic support and insufficient resources. Without institutional backing, even well-intentioned efforts to distribute leadership roles can falter, leading to frustration and inefficiency (Harris & Jones, 2020). Schools attempting to adopt this model frequently encounter structural barriers, including inadequate funding, limited professional development opportunities, and insufficient time for collaborative planning (Leithwood et al., 2020). These constraints undermine the sustainability of distributed leadership, making it difficult to embed the practice into the school's culture.

A critical challenge is the absence of dedicated time for teachers and staff to engage in leadership activities. Educators already face heavy workloads, and without protected time for collaboration, distributed leadership becomes an additional burden rather than a shared responsibility (Nguyen et al., 2020). Furthermore, many schools lack the necessary training to equip staff with leadership skills, leaving them unprepared to take on new roles (Torrance et al., 2021). Without targeted professional development, teachers may struggle to contribute effectively, leading to uneven participation and diminished outcomes.

Financial constraints also play a significant role. Distributed leadership often requires investments in team-building initiatives, communication tools, and mentorship programs, yet many schools operate with tight budgets (Bolden et al., 2019). When resources are scarce, leadership distribution risks becoming a superficial exercise rather than a meaningful shift in school governance. Systemic support from policymakers and district leaders is essential to provide schools with the necessary infrastructure to sustain distributed leadership (Spillane et al.,

2019). Without such support, the model remains an ideal rather than a practical reality, limiting its potential to transform educational leadership.

Resistance from External Stakeholders

Parents, school boards, and government agencies may be skeptical of distributed leadership, preferring traditional models with a single accountable leader. External pressures for standardized testing and accountability can also discourage schools from experimenting with alternative leadership approaches. This resistance stems from deeply ingrained expectations about how schools should be governed, with many stakeholders viewing strong, centralized leadership as essential for maintaining order and accountability (Harris & Jones, 2020). When schools attempt to shift toward a more collaborative approach, external parties may perceive it as a weakening of authority or a lack of clear direction, leading to skepticism and opposition (Leithwood et al., 2020).

Policymakers, in particular, often favor top-down accountability measures that align with standardized testing and performance metrics, leaving little room for the flexible, shared decision-making that distributed leadership requires (Nguyen et al., 2020). This misalignment between policy demands and distributed leadership principles creates tension, as schools struggle to balance external accountability pressures with internal collaborative practices. Parents, too, may resist distributed leadership, especially if they associate it with a lack of strong leadership or fear that shared governance could dilute educational quality (Torrance et al., 2021). Without clear communication about the benefits of distributed leadership, these stakeholders may inadvertently undermine its implementation by advocating for a return to more traditional structures.

Community and business leaders, who often influence school funding and priorities, may also resist distributed leadership if they perceive it as inefficient or incompatible with their expectations for measurable outcomes (Spillane et al., 2019). Their resistance can manifest in reduced support for school initiatives, making it difficult to sustain distributed leadership practices. Overcoming this challenge requires proactive engagement with external stakeholders, demonstrating how distributed leadership can enhance school effectiveness while addressing their concerns (Bolden et al., 2019). Without their buy-in, schools risk facing persistent opposition that hinders the successful adoption of distributed leadership.

Recommendations for Effective Implementation of Distributed Leadership in Schools

Successful implementation of distributed leadership in schools requires deliberate strategies that address both structural and cultural dimensions of organizational change. First, school leaders must establish clear frameworks that define roles, responsibilities, and decision-making boundaries while maintaining flexibility for collaborative problem-solving (Harris & Jones, 2019). This involves creating formal leadership pathways that allow teachers to assume instructional leadership roles in curriculum development, peer mentoring, and professional learning communities, with explicit expectations and time allocations (Hairon & Goh, 2015). Principals should model distributed practices by actively sharing power and demonstrating trust in teachers' professional judgment, which research shows significantly increases staff willingness to engage in leadership activities (Leithwood et al., 2020).

Professional development constitutes a critical component of effective implementation. Schools should invest in ongoing leadership training for both administrators and teacher-leaders, focusing on skills such as collaborative decision-making, conflict resolution, and data-informed instructional leadership (Spillane et al., 2019). These programs must move beyond one-time workshops to incorporate job-embedded coaching and reflective practice cycles that allow educators to apply new skills in authentic contexts (Harris & DeFlaminis, 2016). Particularly valuable are cross-role professional learning opportunities where administrators and teachers jointly develop shared understandings of distributed leadership principles and practices (Gronn, 2015). Schools should also establish protocols for regular data review cycles where leadership teams collectively analyze student achievement data to inform improvement efforts (Robinson et al., 2018).

Creating sustainable distributed leadership systems requires attention to organizational structures and cultural factors. Schools need to redesign schedules to provide protected time for collaborative leadership work, such as weekly common planning periods or monthly early-release days dedicated to professional learning (Hulpia et al., 2012). Recognition systems should celebrate collective achievements alongside individual accomplishments, reinforcing the value of shared leadership (Bolden, 2011). Perhaps most importantly, schools must foster cultures of trust and psychological safety where educators feel comfortable taking leadership risks and challenging existing practices (Edmondson, 2019). This involves developing norms for constructive feedback, transparent communication, and shared accountability that support distributed leadership's growth over time (Tian et al., 2016). When these elements combine - clear frameworks, targeted professional learning, structural supports, and positive culture schools can realize distributed leadership's full potential for improving teaching and learning.

CONCLUSION

The shift toward distributed leadership in schools represents a necessary evolution in educational leadership, one that moves beyond hierarchical models to embrace collaboration, shared responsibility, and collective expertise. Schools can foster a more inclusive, innovative, and responsive learning environment by empowering teachers and stakeholders to take active roles in decision-making. Research consistently demonstrates that distributed leadership enhances teacher morale, instructional quality, and student achievement, making it a compelling strategy for sustainable school improvement.

However, successful implementation requires intentional strategies to address challenges such as role clarity, trust-building, and systemic resistance. School leaders must cultivate a culture of transparency, professional development, and shared vision to maximize the benefits of this approach. Case studies highlight that when executed effectively, distributed leadership not only strengthens organizational resilience but also narrows achievement gaps by promoting equitable opportunities for all students. As education systems worldwide grapple with increasing complexity, adopting distributed leadership is no longer optional but essential. Policymakers, administrators, and educators must champion this model to ensure schools are better equipped to meet the diverse needs of 21st-century learners. The future of effective school leadership lies in collaboration not isolation.

Suggestions

These points are suggested in order to derive the full benefits of distributed leadership in our school system:

- School leaders should actively promote teamwork by establishing structures such as leadership teams, professional learning communities (PLCs), and teacher-led committees. Encouraging open communication and shared decision-making empowers educators and strengthens collective responsibility for student success.
- To ensure effective distributed leadership, schools must invest in ongoing training that builds leadership skills among teachers and staff. Workshops on instructional leadership, conflict resolution, and data-driven decision-making can equip educators with the tools needed to contribute meaningfully.
- While distributed leadership encourages shared authority, clearly defined roles prevent confusion and overlap. School administrators should outline expectations, delegate tasks based on expertise, and establish accountability mechanisms to maintain coherence in leadership practices.
- Schools should adopt a cyclical process of assessing the impact of distributed leadership on teaching and learning. Regular feedback from teachers, students, and parents - along with performance data - can help refine leadership strategies and ensure they align with student outcome goals.

POLICY INTERVENTIONS FOR IMPROVING TEACHER QUALITY AND RETENTION

Diepreye AMASINGHA
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

This paper investigated policy interventions for Improving Teacher Quality and Retention. It aimed at improving teacher quality and retention, recognizing both as foundational to student achievement and overall school effectiveness. It examined various policy strategies, including pre-service teacher preparation, ongoing professional development, improved compensation and incentives, enhanced working conditions, and supportive school leadership. The paper also explored the role of community and stakeholder engagement in fostering a more inclusive and collaborative educational environment. Through a synthesis of existing research and policy analysis, it highlighted the challenges teachers faced such as workload pressures, inadequate support, and inequitable resource distribution that contributed to high attrition rates, particularly in underserved areas. Evaluative approaches were discussed to assess the impact of these interventions, emphasizing the importance of data-driven decision-making in shaping future reforms. The paper suggested that government should ensure that teacher's education programs equip candidates with practical classroom experience, content knowledge, and culturally responsive pedagogical skills. Amongst others the paper concluded that Policy interventions aimed at enhancing teacher quality and retention two crucial pillars of educational success. Through an examination of teacher preparation, professional development, compensation, working conditions, school leadership, community engagement, and evaluation mechanisms,

INTRODUCTION

Teacher quality and retention are essential elements in shaping the educational landscape. The effectiveness of educators directly influences student achievement, and the stability of the teaching workforce ensures continuity and growth within schools. However, the profession faces significant challenges, including high attrition rates and varying levels of teacher effectiveness, which necessitate targeted policy interventions. Various study consistently have highlighted that teacher quality is the most influential school-related factor affecting student performance.

Darling-Hammond (2000) in Rivkin (1998) highlighted that well-prepared and supported teachers significantly enhance student learning outcomes. Conversely, inadequate preparation

and support can lead to early career burnout and high turnover rates, particularly in high-poverty schools (Ingersoll, 2001). These findings emphasize the need for comprehensive policies that address both the recruitment and retention of quality educators. The importance of teacher retention cannot be overstated. High turnover disrupts student learning, increases recruitment costs, and burdens remaining staff with additional responsibilities. In Texas, for instance, an estimated $329 million is spent annually due to early teacher attrition (Texas Center for Educational Research, 2000).

Such statistics reflect a broader trend observed globally, where schools in disadvantaged areas experience higher rates of teacher turnover, exacerbating educational inequities (Hanushek, Kain, & Rivkin, 1999). Addressing these challenges requires complex policy interventions. Effective pre-service teacher preparation programs are essential in equipping educators with the necessary skills and knowledge. Ongoing professional development ensures that teachers remain effective throughout their careers. Moreover, competitive compensation and incentives can attract and retain high-quality educators. Improving working conditions, fostering supportive school leadership, and engaging communities are also critical components in creating an environment conducive to teacher satisfaction and retention.

Evaluating the impact of these policy interventions is crucial. Systematic assessments enable policymakers to identify successful strategies and areas needing improvement. Such evaluations inform future directions and ensure that resources are allocated efficiently to support teacher quality and retention. Enhancing teacher quality and retention through targeted policy interventions is vital for the advancement of education systems. Also focusing on comprehensive strategies that address these challenges faced by educators, it is possible to create a more stable and effective teaching workforce, ultimately leading to improved student outcomes.

THEORETICAL UNDERPINNING

Herzberg's Two-Factor Theory

Herzberg's Two-Factor Theory offers a valuable framework for understanding and addressing the factors that influence teacher quality and retention. Recognizing the distinct roles of hygiene factors and motivators, educational institutions can implement targeted strategies to enhance teacher satisfaction and motivation. This holistic approach not only improves teacher quality but also contributes to the overall effectiveness and stability of the educational system. Herzberg's Two-Factor Theory, propounded by Frederick Herzberg in 1959, offers a profound framework for understanding job satisfaction and motivation in the workplace. This theory posits that job factors can be categorized into two distinct groups: hygiene factors and motivators. Hygiene factors, such as salary, working conditions, and company policies, are extrinsic elements that, if inadequate, lead to job dissatisfaction.

Conversely, motivators, including achievement, recognition, and the nature of the work itself, are intrinsic factors that, when present, enhance job satisfaction and motivation. Importantly, Herzberg argued that the absence of hygiene factors causes dissatisfaction, but their presence alone does not lead to satisfaction; similarly, the presence of motivators leads to satisfaction, but their absence does not necessarily cause dissatisfaction. This dual-factor approach underscores the complexity of employee motivation and highlights the necessity of addressing both sets of factors to foster a motivated and satisfied workforce. In the realm of education, particularly concerning teacher quality and retention, Herzberg's Two-Factor Theory

provides valuable insights. Teachers, akin to employees in other sectors, are influenced by both hygiene factors and motivators in their professional lives. The application of this theory to the teaching profession can elucidate the underlying reasons for teacher satisfaction and dissatisfaction, thereby informing strategies to enhance teacher quality and reduce attrition rates.

Hygiene factors in the educational context encompass aspects such as salary, job security, working conditions, administrative support, and school policies. While these factors do not inherently motivate teachers, their inadequacy can lead to job dissatisfaction, which may contribute to high turnover rates. For instance, inadequate compensation, lack of professional development opportunities, and poor working conditions can create an environment where teachers feel undervalued and unsupported, leading to burnout and eventual attrition. Addressing these hygiene factors is crucial to prevent dissatisfaction and create a foundation upon which motivators can enhance teacher engagement and commitment.

Motivators in the teaching profession are intrinsic elements that contribute to job satisfaction and motivation. These include factors such as recognition, opportunities for professional growth, autonomy in the classroom, and the intrinsic rewards derived from student success and personal achievement. When teachers experience a sense of accomplishment, recognition for their efforts, and opportunities for professional development, they are more likely to feel motivated and committed to their roles. Fostering these motivators can lead to increased teacher satisfaction, improved teaching quality, and enhanced student outcomes.

The application of Herzberg's Two-Factor Theory to teacher quality and retention involves addressing both hygiene factors and motivators to create a conducive environment for teacher satisfaction and effectiveness. Also, ensuring that hygiene factors are adequately met, schools can prevent dissatisfaction among teachers. Simultaneously, by fostering motivators, schools can enhance teacher satisfaction and motivation, leading to improved teaching quality and reduced turnover rates.

To address hygiene factors, educational institutions can implement policies that ensure competitive salaries, provide job security, improve working conditions, and offer administrative support. For example, ensuring that teachers have access to necessary teaching resources, manageable class sizes, and supportive leadership can mitigate dissatisfaction and create a positive work environment. Additionally, providing opportunities for teachers to participate in decision-making processes and professional development can enhance their sense of value and support. Enhancing motivators involves creating opportunities for teachers to experience achievement, recognition, and personal growth. This can be achieved by acknowledging and celebrating teachers' successes, providing avenues for career advancement, and fostering a culture of continuous learning and professional development. Encouraging autonomy in teaching practices and involving teachers in curriculum development and school decision-making can also contribute to a sense of ownership and motivation. The application of Herzberg's Two-Factor Theory to teacher retention strategies can lead to a more satisfied and motivated teaching workforce. Also addressing hygiene factors and enhancing motivators, schools can create an environment where teachers feel valued, supported, and motivated to remain in their roles. This, in turn, can lead to improved teacher quality, better student outcomes, and a more stable educational environment.

CONCEPTUAL CLARIFICATION

Concept of Policy Intervention

Policy intervention in education encompasses the deliberate, strategic actions taken by governments, educational authorities, and major stakeholders to address systemic challenges and improve outcomes across the teaching profession. These interventions serve as structured mechanisms to modify existing educational conditions, align efforts with best practices, and ensure the sustainability of teaching as a valued profession. At their core, such policies are driven by the fundamental understanding that teacher quality and workforce stability are central to student learning, school improvement, and overall system equity.

As the education sector continues to evolve in response to social, technological, and economic transformations, the urgency of effective policy interventions becomes more pronounced. According to Darling-Hammond (2010), strategic educational policies, when thoughtfully designed and effectively implemented, have the capacity to create environments where teaching is not only respected but also nurtured and retained as a long-term career path. These policies function as instruments for diagnosing inefficiencies, guiding reform, and assessing impact through measurable indicators, ensuring that resources and practices are responsive to both national standards and local realities.

Policy intervention is to improve recruitment practices by attracting talented and committed individuals into the teaching profession. Countries facing teacher shortages often develop targeted recruitment strategies, including scholarship programs, alternative certification routes, and rural placement incentives, to build a more robust teaching pipeline. However, recruitment alone does not address deeper issues such as preparation, career longevity, or job satisfaction. Thus, educational policies must encompass the entire career cycle of a teacher from training and induction to professional development and retirement to cultivate a competent, motivated, and stable workforce. A crucial area of intervention is the establishment of clear and consistent licensure and qualification standards. Policies that define minimum entry requirements help to ensure that individuals entering the classroom are adequately prepared both theoretically and practically. Cochran-Smith et al. (2012) argued that robust teacher preparation policies especially those linking content knowledge with pedagogical skill are essential for creating competent educators who can address diverse classroom needs. Moreover, aligning teacher education programs with in-service expectations ensures that new teachers are equipped to manage real-world challenges, reducing early-career attrition and enhancing classroom effectiveness.

Financial policies are another cornerstone of effective intervention. Equitable funding allocation that prioritizes teacher training, instructional materials, and school infrastructure contributes to higher morale and job satisfaction. Research consistently shows that teachers who receive adequate classroom resources and manageable workloads are more likely to remain in the profession. Structured investment in teacher professional development including workshops, graduate-level coursework, and online learning modules also plays a critical role in ensuring that teachers continue to grow in their expertise and remain effective over time.

Also, mentorship and induction programs are frequently supported through policy initiatives as a way to support novice teachers in their first critical years. These programs serve as scaffolding, helping early-career Educators Bridge the gap between academic training and the practical realities of classroom management, curriculum delivery, and student engagement. By

pairing new teachers with experienced mentors, school systems can improve teacher retention and accelerate professional growth. Well-structured mentorship programs have been shown to reduce teacher attrition by up to 30%, particularly in high-need schools, where the risk of early exit is the highest.

Performance-based incentives and recognition systems also form part of comprehensive policy strategies aimed at boosting teacher retention. These may include salary increments based on evaluations, bonuses for teaching in underserved areas, and awards for instructional excellence. While such incentives must be carefully designed to avoid overemphasis on standardized test outcomes, when balanced with formative assessments and peer reviews, they can affirm teachers' value and encourage continued professional investment.

Policy intervention is not solely a top-down endeavor. The involvement of multiple stakeholders such as teacher unions, school boards, community organizations, and education researchers is crucial to the development of policies that are both relevant and sustainable. Teacher unions, in particular, play a dual role by advocating for fair working conditions while also participating in collaborative policy design. Their involvement ensures that policies are rooted in the lived experiences of educators and reflect the nuanced realities of the classroom.

The political, social, and economic contexts in which these policies are implemented greatly influence their effectiveness. Policymakers must be aware that no single intervention can solve systemic issues in isolation. A coherent policy environment, characterized by consistency across national and local regulations, adequate funding, and continuous capacity building, is necessary for sustained improvement. Fullan (2007) emphasized the importance of system-wide alignment and change leadership in ensuring that reform efforts translate into meaningful outcomes for both teachers and students.

Equally important is the ongoing evaluation of policy outcomes. Without feedback mechanisms, even well-intentioned policies may become disconnected from the day-to-day realities of implementation. Monitoring tools such as teacher satisfaction surveys, attrition rates, classroom observations, and student achievement data offer insights into what is working and where adjustments are needed. Data-driven policy revision fosters transparency, adaptability, and continuous improvement, allowing educational systems to remain responsive to emerging needs and shifting conditions.

Furthermore, international best practices offer valuable lessons for local adaptation. Countries such as Finland and Singapore have demonstrated how sustained investment in teacher development, respect for the teaching profession, and systematic policy alignment can yield consistently high educational outcomes. These examples underscore the importance of treating policy intervention not as a one-time effort but as an ongoing process of refinement, grounded in evidence and responsive to stakeholder feedback. In light of these considerations, policy intervention in teacher quality and retention must be seen as a dynamic and multifaceted effort. It requires a careful balance between addressing foundational needs (such as salaries, licensure, and working conditions) and fostering growth-oriented supports (such as mentorship, leadership development, and recognition programs). Policies must be inclusive, equitable, and grounded in the realities of teaching practice to be effective. Ultimately, by aligning policy with pedagogical values and system goals, governments and educational authorities can build an environment in which teachers are empowered to thrive, and students can benefit from a stable, high-quality educational experience.

Teachers Quality and retention

Teacher quality and retention are central to the effectiveness of educational systems worldwide. The caliber of educators directly influences student outcomes, while the stability of the teaching workforce ensures continuity and growth within schools. However, the profession faces significant challenges, including high attrition rates and varying levels of teacher effectiveness, which necessitate targeted policy interventions. Teacher quality encompasses a range of attributes, including subject knowledge, pedagogical skills, and the ability to manage classrooms effectively. Research consistently highlights that teacher effectiveness is the most influential school-related factor affecting student performance. Darling-Hammond (2000) in Rivkin, (1998) noted that well-prepared and supported teachers significantly enhance student learning outcomes. Conversely, inadequate preparation and support can lead to early career burnout and high turnover rates, particularly in high-poverty schools (Ingersoll, 2001).

However, the teaching profession faces several challenges that impact both recruitment and retention. High attrition rates, particularly among early-career teachers, disrupt student learning and increase recruitment costs. In Texas, for instance, an estimated $329 million is spent annually due to early teacher attrition (Texas Center for Educational Research, 2000). Such statistics reflect a broader trend observed globally, where schools in disadvantaged areas experience higher rates of teacher turnover, exacerbating educational inequities. Factors contributing to high attrition rates include heavy workloads, job insecurity, and a disparity between expectations and the realities of teaching. Up to 25% of new educators do not plan to stay in the profession long-term, citing these issues as primary reasons for their intentions to leave (The Australian Education Union, 2025). Addressing these challenges requires systemic changes in teacher education, support, and working conditions.

Effective pre-service teacher preparation programs are essential in equipping educators with the necessary skills and knowledge. Programs that provide early classroom exposure during teacher training, more permanent employment opportunities, professional development, and reduced administrative tasks have shown promise in enhancing teacher retention (The Australian Education Union, 2025). Initiatives like two-year induction programs, cadetships, and regional placements for teaching students are being trialed to improve teacher preparedness and commitment to the profession. Ongoing professional development ensures that teachers remain effective throughout their careers. Engaging in professional learning communities (PLCs) with colleagues has been shown to increase support and strengthen connections to their schools, thereby enhancing retention and development (Kardos et al., 2001). Structured mentoring programs also play a crucial role in supporting new teachers, providing them with guidance and stability during the challenging early stages of their careers (Hobson et al., 2009).

Community and Stakeholder Engagement

Engaging communities and stakeholders in the educational process can enhance teacher retention. Increased access to collective leadership and community support has been shown to improve teacher retention (Learning Policy Institute & WestEd, 2021). Case studies of community schools, such as UCLA Community School in Los Angeles, demonstrate that providing the staffing, supports, and services to meet students' needs, along with a collaborative leadership structure, contributes to high teacher retention rates (Teaching Profession Playbook, 2021). Evaluating the impact of policy interventions is crucial in determining their effectiveness.

Systematic assessments enable policymakers to identify successful strategies and areas needing improvement. For instance, the Teacher Incentive Allotment (TIA) program in Texas, which rewards high-performing teachers with financial bonuses, has shown strong outcomes in retaining designated teachers at higher levels compared to their non-designated peers (Texas Education Agency, 2025). Future policy directions should focus on comprehensive strategies that address the multifaceted challenges faced by educators. Policies should aim to improve teacher preparation, provide ongoing professional development, offer competitive compensation, enhance working conditions, and foster community engagement. Additionally, policies should be adaptable to changing educational demands and contexts, ensuring that they remain relevant and effective in supporting teacher quality and retention. Enhancing teacher quality and retention through targeted policy interventions is vital for the advancement of education systems. Focusing on comprehensive strategies that address the multifaceted challenges faced by educators, it is possible to create a more stable and effective teaching workforce, ultimately leading to improved student outcomes.

THE IMPORTANCE OF TEACHER QUALITY AND RETENTION

The quality of teaching and the ability to retain effective educators are two of the most critical elements in ensuring positive educational outcomes for students. Teacher quality is often viewed as the single most influential in-school factor affecting student learning. When schools are able to attract, develop, and retain high-performing teachers, students benefit from consistent, well-structured instruction that enhances both academic achievement and personal development. Retention of such teachers ensures long-term stability, institutional memory, and continued growth within educational communities.

Furthermore, various studies has shown a clear correlation between teacher effectiveness and student achievement. Students taught by highly effective teachers over successive years perform significantly better than those who do not have access to quality instruction (Rivkin et al., 2005). In contrast, students exposed to underperforming teachers for extended periods often struggle to meet academic benchmarks. Therefore, consistent access to skilled teachers is not only important for individual learners but also crucial for addressing broader educational disparities, particularly in under-resourced communities.

Moreover, retaining experienced teachers leads to stronger school cultures. Teachers who remain in their roles for longer periods contribute to mentoring, curriculum planning, and the professional development of new staff. This type of internal support system fosters a collaborative and cohesive work environment, which benefits both teachers and students. According to Ingersoll and Strong (2011), schools with stable teaching staff are better positioned to implement long-term instructional strategies and school improvement initiatives.

Additionally, teacher turnover disrupts learning environments and imposes financial and organizational burdens on school systems. High turnover rates result in increased recruitment and training costs, diminished student-teacher relationships, and loss of instructional continuity. In the United States alone, the cost of replacing a single teacher is estimated to range between $9,000 and $21,000, depending on the district (Carroll, 2007). These losses are especially pronounced in high-poverty and rural schools, which often face the greatest difficulty in attracting and retaining qualified personnel.

Although compensation plays a role in retention, working conditions are equally vital. Teachers are more likely to stay in positions where they feel supported, respected, and equipped

to succeed. Leadership quality, manageable workloads, and access to professional development are consistently identified as key factors influencing teacher satisfaction (Ladd, 2011). Therefore, improving these areas helps to keep skilled educators in the classroom also enhances the overall effectiveness of schools.

Teacher retention supports equity in education. When high-quality teachers remain in schools serving disadvantaged populations, students who face greater socio-economic barriers are more likely to receive consistent, high-standard instruction. This helps narrow the achievement gap and promote fairness within the educational system (Darling-Hammond, 2010). Policies aimed at improving teacher quality and retention, therefore, do not only serve administrative or economic goals but also uphold the broader mission of education as a tool for social justice. Teacher quality and retention are inseparable priorities for any education system seeking to achieve academic excellence and equity. High-quality teachers drive student achievement, foster a supportive school culture, and reduce institutional costs. Retaining them ensures that these benefits are sustained over time. For these reasons, any serious educational reform must include strong and targeted measures to attract, support, and keep effective teachers in the profession.

CHALLENGES IN TEACHER RECRUITMENT AND RETENTION

Recruiting and retaining qualified teachers remains a major concern for education systems across the world. Several persistent challenges reduce the attractiveness of the profession and contribute to high turnover, particularly in underserved communities. Below are five key challenges that affect both the recruitment and retention of teachers:

Poor Working Conditions

Many teachers leave the profession due to unfavorable working environments. These include overcrowded classrooms, lack of resources, outdated facilities, and excessive administrative tasks that reduce time for instruction and planning. In addition, some teachers report unsafe school environments, particularly in under-resourced urban and rural schools. Such conditions make the profession less appealing to new entrants and increase burnout among existing teachers. When teachers do not feel supported or equipped to perform their duties effectively, their likelihood of remaining in the profession decreases significantly.

Inadequate Compensation

Low salaries are a major deterrent to both entering and remaining in the teaching profession. In many regions, teacher pay does not match the level of education, responsibility, or workload required. When compared to other professions with similar qualifications, teaching often ranks lower in terms of financial reward. This gap discourages high-performing graduates from pursuing teaching careers and pushes current educators to seek better-paying opportunities elsewhere. Without competitive compensation, attracting and retaining qualified teachers becomes a continual struggle for education systems.

Limited Career Progression Opportunities

Many teachers report feeling stuck in their roles due to a lack of clear and rewarding career advancement paths. Unlike other professions where growth is linked to skill development and experience, teaching often lacks structured opportunities for promotion beyond administrative roles. This absence of professional growth options reduces motivation and satisfaction, especially for those who want to remain in classroom teaching while progressing in their careers. The lack of recognition for accomplished teaching further contributes to early exits from the profession.

Geographic and Subject-Specific Shortages

Recruitment and retention challenges are especially pronounced in rural areas and in specific subject fields such as mathematics, science, and special education. Teachers may be unwilling to relocate to remote areas with fewer amenities, limited housing, and social isolation. Moreover, schools in these locations often struggle to provide adequate support, which leads to faster burnout and turnover. Similarly, individuals with qualifications in high-demand subjects often find better-paying opportunities outside of education, making it harder to attract and keep them in teaching roles.

Lack of Support for Early-Career Teachers

New teachers often face overwhelming responsibilities without sufficient mentoring or structured induction programs. The first few years of teaching are typically the most challenging, and without proper guidance, many early-career teachers experience stress, isolation, and low confidence. The absence of strong support networks during this critical period contributes to high attrition rates. Studies have shown that schools with strong mentoring and induction programs have much higher teacher retention rates, highlighting the importance of investing in early-career support systems. This challenges such as poor working conditions, inadequate pay, limited career growth, geographic and subject shortages, and lack of support for new teachers continue to undermine efforts to build a stable and effective teaching workforce. Addressing these issues through focused policies and practical strategies is essential to strengthening teacher recruitment and retention.

Pre-Service Teacher Preparation Programs

Pre-service teacher preparation programs play a foundational role in shaping the quality and effectiveness of future educators. These programs are designed to equip aspiring teachers with the knowledge, skills, and professional dispositions required to succeed in diverse classroom environments. A well-structured teacher preparation program not only enhances instructional quality but also influences teacher retention, especially during the early years of teaching. When teacher candidates are adequately prepared before entering the profession, they are more confident, capable, and likely to remain in their roles long-term.

Furthermore, pre-service programs that offer a blend of theoretical knowledge and practical experience produce more competent and resilient teachers. A major component of effective programs is early and continuous field experience. This includes classroom

observations, practicum placements, and student teaching under the supervision of experienced mentors. These experiences help candidates connect theory to practice, understand the realities of teaching, and develop classroom management strategies. According to Zeichner (2010), pre-service teachers who engage in extensive clinical practice during their training are more effective in their first years and demonstrate higher levels of job satisfaction.

Moreover, the quality of teacher preparation is influenced by the curriculum and faculty expertise within training institutions. Programs that focus on subject matter content, pedagogy, assessment strategies, and inclusive education better prepare candidates to address the diverse needs of learners. Additionally, preparing teachers to work in high-need settings such as rural schools or schools with high populations of English language learners requires specialized training that some programs are now incorporating. These tailored components help ensure that new teachers are not only ready to teach but also to thrive in challenging educational environments.

The structure and duration of teacher education programs significantly impact teacher readiness. Fast-track certification routes, while designed to address teacher shortages quickly, often provide limited preparation time, leaving new teachers feeling underprepared. In contrast, traditional or residency-based models, which involve immersive, year-long placements in schools, are more effective at preparing teachers for long-term success (Guha, Hyler, & Darling-Hammond, 2016). These models promote collaboration, mentorship, and a gradual assumption of responsibilities, giving candidates the opportunity to build competence and confidence.

Although many programs provide a strong foundation, disparities in quality still exist across teacher preparation institutions. Some candidates graduate with minimal exposure to real-world classroom challenges, while others benefit from comprehensive, research-based training. To address these inconsistencies, policymakers and accrediting bodies have begun to emphasize the importance of standardization, accountability, and continuous improvement in teacher education. Institutions are increasingly being held responsible for demonstrating the effectiveness of their graduates in the classroom through data on student outcomes, teacher retention rates, and feedback from school administrators.

Also partnerships between universities and K–12 schools are essential for strengthening pre-service training. School-university collaborations ensure that teacher preparation remains relevant to current classroom realities and allows candidates to learn within authentic, supportive environments. These partnerships also help align expectations between training institutions and employers, making it easier for new teachers to transition from student to professional. Pre-service teacher preparation programs are a critical foundation for teacher quality and retention. Programs that integrate rigorous coursework, meaningful field experiences, and strong mentorship produce educators who are well-equipped to meet the demands of the profession. Ensuring consistency, depth, and practical relevance in teacher education is essential to building a strong, stable, and effective teaching workforce.

Professional Development and Continuous Learning

In the dynamic landscape of education, the quality of teaching stands as a paramount determinant of student success. Central to fostering this quality is the commitment to continuous professional development (CPD) and lifelong learning for educators. This approach not only enhances teaching practices but also addresses the critical issue of teacher retention, ensuring a stable and effective educational environment. Professional development encompasses a broad spectrum of

activities aimed at enhancing teachers' skills, knowledge, and effectiveness. It extends beyond initial training, offering ongoing opportunities for educators to engage in learning experiences that promote reflective practice, collaboration, and the adoption of innovative teaching strategies. High-quality CPD programs are characterized by their relevance to teachers' needs, active learning methodologies, and sustained engagement over time (Education Policy Institute, 2021).

Engaging in continuous learning enables teachers to stay abreast of the latest pedagogical research, technological advancements, and curriculum changes. This up-to-date knowledge empowers educators to implement evidence-based practices that cater to diverse student needs. Moreover, CPD fosters a culture of reflective practice, encouraging teachers to critically assess and refine their instructional methods. Such professional growth directly correlates with improved student outcomes, as teachers apply enhanced strategies to facilitate deeper learning experiences.

The relationship between professional development and teacher retention is well-documented. Educators who perceive opportunities for growth and advancement are more likely to remain in the profession. CPD initiatives that offer personalized learning paths, mentorship, and leadership development contribute to job satisfaction and a sense of professional fulfillment. Conversely, the absence of such opportunities can lead to burnout and attrition, particularly among early-career teachers (Association of Colleges, 2024). Effective CPD programs share several key characteristics:

- Alignment with Teacher Needs: Tailoring development opportunities to address the specific challenges and interests of educators ensures relevance and engagement.
- Active Learning: Incorporating hands-on activities, collaborative projects, and peer observations promotes deeper understanding and skill acquisition.
- Sustained Engagement: Ongoing support through coaching, follow-up sessions, and reflective practices reinforces learning and facilitates long-term application.
- Leadership Opportunities: Providing avenues for teachers to take on leadership roles within CPD initiatives fosters a sense of ownership and professional growth.

Despite its benefits, the implementation of effective CPD faces challenges, including limited time, resources, and institutional support. Additionally, ensuring equitable access to high-quality professional development across diverse educational settings remains a significant concern. Addressing these barriers requires a concerted effort from educational policymakers, school leaders, and communities to prioritize and invest in teacher development. Continuous professional development is not merely a supplementary aspect of teaching; it is integral to the enhancement of teacher quality and the retention of skilled educators. By fostering a culture of lifelong learning, educational systems can empower teachers to meet the dynamic needs of students, thereby improving educational outcomes and ensuring a sustainable and effective teaching workforce.

Workload and Time Allocation

Excessive workloads are a common grievance among teachers globally. Administrative tasks, testing requirements, and extracurricular obligations often encroach on the time teachers can dedicate to lesson planning, collaboration, and student engagement. When teachers are overwhelmed by bureaucratic demands and insufficient instructional support, their professional

identity may suffer, leading to emotional exhaustion and reduced efficacy (Buchanan, 2010). Creating time within the school day for meaningful planning, peer observation, and collaboration is essential for fostering a sense of professional agency and reducing stress.

Autonomy and Decision-Making

Teacher autonomy the ability to make instructional and curricular decisions is another critical aspect of a healthy work environment. Teachers who feel trusted and empowered to tailor their teaching to the needs of their students report higher job satisfaction and commitment to their school. Conversely, overly prescriptive curriculum mandates and micromanagement by administrators can diminish teachers' sense of professional efficacy and innovation. Autonomy also includes participation in school decision-making processes. Schools that involve teachers in governance, policy formulation, and leadership roles create a culture of shared responsibility and investment, which is strongly associated with higher retention rates and improved student outcomes (Johnson, Kraft, & Papay, 2012).

Among all working condition variables, school leadership is arguably the most influential. Principals and school leaders shape the instructional climate, manage organizational structure, resolve conflicts, and support teacher development. Effective leadership directly contributes to improved student achievement and teacher satisfaction (Leithwood et al., 2004).

Strong school leaders do more than manage logistics; they serve as instructional leaders who mentor staff, facilitate professional learning communities, and foster a shared vision of excellence. According to research by Kraft et al. (2016), teachers who rate their school leadership highly are significantly less likely to leave their schools. Furthermore, schools with high leadership quality often have more coherent instructional programs, better collaboration among staff, and a stronger focus on continuous improvement.

Leadership and Mentorship for New Teachers

Effective induction and mentorship programs typically overseen or supported by school leaders are vital for novice teacher retention. New teachers often cite lack of support as a primary reason for leaving the profession within their first five years (Darling-Hammond et al., 2017). Principals who actively pair novice teachers with experienced mentors, conduct regular check-ins, and provide constructive feedback create a culture of growth and resilience. Leadership practices that promote psychological safety, professional dialogue, and recognition also contribute to a positive school culture where teachers feel respected and motivated. Schools that lack such leadership often see higher attrition, particularly among teachers working in high-need environments.

It is important to recognize that poor working conditions disproportionately affect schools serving low-income and minority communities. Teachers in these schools often face larger class sizes, outdated materials, and higher rates of student trauma and behavioral challenges, yet receive less support (Carver-Thomas & Darling-Hammond, 2017). Without targeted policy interventions to improve working conditions in such schools, these disparities contribute to chronic staffing shortages and lower student achievement in already marginalized populations. Policy solutions must focus on providing additional resources, administrative support, and incentives for school leaders to prioritize working conditions in high-need settings. Funding should also be allocated for building upgrades, smaller class sizes, and specialized staff (e.g., counselors, instructional coaches) to alleviate teacher burdens. Improving working

conditions and strengthening school leadership are foundational to building and sustaining a high-quality teaching workforce. While compensation, professional development, and incentives are critical, they must be complemented by environments where teachers feel safe, supported, and professionally respected. School leaders are uniquely positioned to influence these conditions and drive systemic improvement. Prioritizing leadership development and teacher-centered policies, educational systems can significantly improve retention, morale, and ultimately student outcomes.

Community and Stakeholder Engagement

Engaging communities and stakeholders in the education system is a vital but often underutilized component of improving teacher quality and retention. Schools do not operate in a vacuum; rather, they are embedded in a social ecosystem that includes families, community organizations, policymakers, local businesses, and higher education institutions. Effective engagement with these actors can foster supportive teaching environments, enhance student learning outcomes, and create sustainable networks that bolster teacher morale and career commitment. Policy interventions that promote community and stakeholder involvement have proven instrumental in building trust, providing resources, and developing culturally responsive educational settings that are conducive to both teacher and student success.

Stakeholder engagement refers to the meaningful inclusion of individuals and groups who are invested in the outcomes of the education system. These stakeholders may include parents, guardians, community leaders, non-governmental organizations, business leaders, policymakers, school boards, and higher education institutions. Engagement is not merely consultative; it involves a collaborative process where stakeholders participate in planning, decision-making, implementation, and evaluation of school policies and practices (Epstein, 2011).

Community engagement, a subset of stakeholder involvement, refers specifically to the partnerships between schools and the communities in which they are located. These partnerships can take many forms volunteering, mentoring programs, after-school initiatives, resource donations, and local advocacy campaigns. When successfully integrated into educational planning, these relationships can alleviate pressure on teachers, provide additional support for students, and help align school goals with local values and needs.

Teachers working in such environments report higher levels of professional satisfaction, lower levels of isolation, and a greater sense of shared responsibility (Bryk et al., 2010). These factors are critical in mitigating burnout, especially in schools serving disadvantaged populations, where teachers often face greater instructional and emotional demands. Moreover, stakeholder engagement can help reduce the external stressors that affect student behavior and learning, which in turn eases classroom management burdens for teachers. For example, partnerships with social service agencies can provide mental health support, nutritional assistance, and housing stability to students and their families services that significantly influence classroom dynamics and teacher workload (Ishimaru, 2014).

Community partnerships also contribute to teachers' sense of purpose and connection to the broader mission of public education. Teachers who perceive their work as impactful and appreciated by their community are more likely to remain in the profession (Gu & Day, 2013). This is especially important in rural and urban schools, where high turnover often correlates with a lack of community connection and professional isolation.

Culturally responsive engagement is particularly important in diverse and multicultural school contexts. Teachers are more effective and feel more confident when they are supported in understanding and embracing the cultural backgrounds of their students. Community engagement can serve as a bridge, helping teachers connect with students' families, languages, histories, and lived experiences. These connections make the curriculum more relevant and increase teacher efficacy (Gay, 2018).

When schools value the cultural capital of their communities and reflect this in their pedagogy, teacher-student relationships improve, leading to better classroom climate and job satisfaction for educators. Teachers working in culturally inclusive environments report higher engagement and a stronger commitment to equity and social justice in their practice, which are linked to professional motivation and long-term retention (Villegas & Lucas, 2007).

Several national and international education policies advocate for greater stakeholder involvement. For example, the Every Student Succeeds Act (ESSA) in the United States mandates that states and districts engage families and community partners in the development of education plans. Such policies recognize that systemic improvement is only possible through collaboration. Internationally, the Organisation for Economic Co-operation and Development (OECD) has emphasized the role of social capital in school improvement. Countries that institutionalize stakeholder participation such as Finland and Canada report higher teacher satisfaction and more equitable student outcomes (OECD, 2020). These examples suggest that sustained policy commitment to community engagement is a key driver of both teacher effectiveness and retention.

Community and stakeholder engagement is not an auxiliary component of school improvement it is central to fostering an environment in which teachers and students can thrive. Connecting schools to the social fabric of their communities, policy interventions can strengthen educational ecosystems, enhance teacher well-being, and promote long-term retention. For teacher quality reforms to be successful and sustainable, they must be embedded in inclusive, collaborative practices that reflect the voices and assets of the entire educational community. Schools flourish when teachers feel supported not only by administrators and colleagues but by the broader community that shares in the mission of education.

Evaluating the Impact of Policy Interventions

Policy interventions targeting teacher quality and retention have become central to education reform agendas worldwide. These initiatives range from professional development programs and compensation incentives to leadership training and improved working conditions. However, implementing policies without rigorous evaluation can result in wasted resources, missed opportunities, and unintended consequences. Evaluation is not only necessary to determine the effectiveness of these interventions but also to inform future policy design, enhance accountability, and ensure that reforms achieve intended goals in a sustainable and equitable manner.

Educational policies, particularly those affecting teachers, operate in complex systems influenced by a variety of sociopolitical, economic, and institutional factors. Evaluating these policies allows stakeholders to determine what works, for whom, under what conditions, and why. Without data-driven assessment, decision-makers risk perpetuating ineffective practices or failing to scale successful ones.

Policy evaluation is critical to ensuring that investments in teacher recruitment, preparation, support, and retention yield measurable improvements. For instance, governments often allocate substantial funds to incentive schemes or training programs with the expectation of reducing turnover or raising instructional quality. If these programs are not systematically evaluated, it becomes difficult to justify their continuation or modification (Levin, 2013). Furthermore, evaluation supports transparency, enabling policymakers to demonstrate the impact of reforms to taxpayers, educators, and other stakeholders.

A well-known example of policy evaluation in teacher retention is the Tap System (Teacher Advancement Program) in the United States. The program, which includes performance-based bonuses, career ladders, and ongoing professional development, was evaluated through a combination of longitudinal student data and teacher surveys. Results showed positive impacts on teacher retention and student achievement in participating schools (Springer et al., 2012).

Another example is the impact evaluation system in Washington, D C**,** which rigorously evaluated teacher performance using classroom observations, student achievement, and value-added measures. Teachers rated as highly effective received significant bonuses and retention incentives. A study found that IMPACT improved teacher performance and retention of top performers while encouraging voluntary exit among low performers (Dee & Wyckoff, 2015). These examples illustrate the value of combining data on outcomes, implementation fidelity, and teacher perceptions to draw meaningful conclusions about policy effectiveness.

CONCLUSION

Policy interventions aimed at enhancing teacher quality and retention two crucial pillars of educational success. Through an examination of teacher preparation, professional development, compensation, working conditions, school leadership, community engagement, and evaluation mechanisms. It also emphasized that improving teacher quality and reducing attrition require comprehensive, systemic, and sustained efforts. It highlighted that effective policies must be evidence-based, equity-focused, and contextually relevant. Furthermore, involving stakeholders, ensuring supportive leadership, and creating professional pathways for growth are essential for building a resilient and motivated teaching workforce. Moving forward, policymakers must prioritize teacher-centered reforms that not only attract new talent but also foster the professional well-being and long-term commitment of existing educators. Strengthening the teaching profession ultimately leads to improved student outcomes and a more equitable and effective education system.

Suggestions

Suggestions for future policy directions aimed at improving teacher quality and retention, below are several suggestions which are:

- Policies makers should focus on creating structured, sustained professional development systems that support teachers at all stages of their careers from induction to mastery.
- Government should ensure that teacher's education programs equip candidates with practical classroom experience, content knowledge, and culturally responsive pedagogical skills.

- New teachers should be supported through structured induction programs that include mentorship and reduced teaching loads.
- Policymakers should address the misdistribution of qualified teachers, especially in rural, low-income, and high-minority schools.
- Educational leaders should aim to professionalize teaching by offering competitive salaries, benefits, and career advancement opportunities (e.g., lead teacher roles, instructional coaching).
- School leaders should be trained to foster positive working conditions, support teacher collaboration, and engage in shared decision-making with teachers and communities.

Ignatius Ajuru University of Education, Nigeria
chinwe.tobin@gmail.com

ABSTRACT

This paper focused on education policy and reform: A tool for sustainable development. It explained how well-structured policies and intentional reforms in the education sector contribute to economic growth, environmental sustainability, and social inclusion. Drawing on Systems Theory, the paper viewed education as an interconnected structure where changes in policy influence curriculum, pedagogy, administration, and learning outcomes. The paper highlighted the historical evolution of education reforms, their alignment with sustainable development goals, and the integration of inclusive and technological strategies. It also identified challenges such as inadequate funding, political instability, and limited teacher capacity, while offering strategies for effective implementation, including stakeholder engagement, monitoring and evaluation, and leadership commitment. The role of government and international organizations is emphasized in guiding reforms toward long-term societal transformation. The paper concluded that education policy and reform remain foundational pillars in the pursuit of sustainable development across nations. When effectively designed and implemented, education reforms serve not only to improve learning outcomes but also to build societies that are inclusive, equitable, and forward-looking. Amongst others the paper concluded that government should ensure adequate and steady funding for education reforms. Adequate funding is essential to provide schools with infrastructure, modern instructional materials, and competent teachers.

Keywords: Education Policy, Educational Reform, Sustainability, Sustainable Development.

INTRODUCTION

Education policy and reform have emerged as foundational instruments in shaping the future of any nation, especially in driving sustainable development across social, economic, and environmental sectors. The quality, direction, and consistency of education policies determine the extent to which educational systems can respond to emerging developmental challenges. In many countries, especially those in the Global South, educational policies are often updated to bridge gaps in access, equity, and relevance, thereby aligning the sector with national development goals. Education reform encompasses deliberate changes introduced into

educational structures, processes, and content to ensure that learning outcomes meet the demands of a rapidly changing world. This alignment between education policy and development goals makes the education sector a key driver of transformation towards sustainability (Adebayo & Oladipo, 2022).

Moreover, the global push for sustainable development, as encapsulated in the United Nations Sustainable Development Goals (SDGs), has reinforced the need for robust educational reforms. Specifically, Goal 4 of the SDGs aims to ensure inclusive and equitable quality education and promote lifelong learning opportunities for all. The achievement of this goal is only feasible when education policies are strategically formulated to remove systemic barriers and to ensure that education delivery is equitable, relevant, and impactful. In countries with persistent inequalities, education reform serves as a pathway for empowering citizens with knowledge and competencies essential for sustainable practices in agriculture, health, governance, and the environment (Okonkwo & Musa, 2021). As such, education is not only a human right but also a means of enhancing collective progress and ecological balance.

Furthermore, sustainable development requires educational content that instills in learners values such as environmental consciousness, economic prudence, and social responsibility. These values are best embedded through policy-guided curriculum reviews and pedagogical shifts that prioritize critical thinking, creativity, and civic engagement. When education policies are designed with sustainability in mind, they facilitate reforms that empower learners with adaptive and lifelong learning skills. In developing regions, policy-driven educational reforms have contributed to increased school enrolment and retention, especially among marginalized groups, which in turn contributes to inclusive development (Nwankwo & Eze, 2020).

Additionally, the responsiveness of education policies to national development needs reflects the government's commitment to harnessing education as a tool for transformation. Countries that have adopted forward-looking education reforms often record higher levels of innovation, reduced poverty, and enhanced institutional capacity (Yusuf & Ibrahim, 2023). The connection between sound education policy and developmental success illustrates that reform is not an isolated process but an ongoing necessity for any nation that seeks sustainability. In essence, education policy and reform provide a structured approach through which nations can reengineer their human capital base to meet present needs without compromising the ability of future generations to meet theirs.

THEORETICAL UNDERPINNING

Systems Theory

Systems Theory, originally propounded by Ludwig von Bertalanffy in 1950, provides a foundational perspective for understanding educational institutions as organized, dynamic entities composed of interconnected parts working toward a common purpose, and this concept, as cited in Peter Senge (2018), revealed the importance of analyzing education not as isolated policies or singular reforms, but as a collective structure where each element influences the overall performance and sustainability of the system. According to this theoretical perspective, an education system can be likened to a living organism, whereby each unit such as the curriculum, teachers, learners, policies, school management, and assessment methods functions in relation to others, and changes in one area have the potential to create ripple effects across the entire structure. This view challenges fragmented approaches to education reform and

emphasizes the need for holistic thinking, where decisions are made with consideration for both immediate and long-term consequences across all components of the system.

Furthermore, Peter Senge (2018) extended Bertalanffy's original insights through the concept of learning organizations, which are institutions that continually evolve by nurturing collaboration, openness, and shared vision among their members, thereby making the educational sector a suitable platform for practical application of Systems Theory. In the context of education policy and reform, Systems Theory helps stakeholders understand that meaningful and sustainable transformation requires alignment among educational goals, policy frameworks, resource allocation, and classroom practices, rather than isolated interventions. Moreover, this theory stresses the need for feedback mechanisms, adaptive learning, and systemic coherence, which are essential in evaluating the outcomes of policy decisions and ensuring that reforms are not only effective but also sustainable over time. Education policies influenced by this theory tend to incorporate inclusive planning, participatory decision-making, and continuous monitoring, all of which contribute to creating a resilient and responsive education system capable of addressing the evolving demands of society.

Additionally, in the application of Systems Theory to the current study, the concept becomes especially relevant in understanding how education policies and reforms serve as tools for sustainable development, since it draws attention to the interdependence between educational practices and broader societal needs. For example, reforms aimed at improving teacher training, enhancing student engagement, or integrating technology into classrooms cannot be treated in isolation but must be considered in relation to national development plans, community involvement, and environmental sustainability. This reinforces the idea that for education to effectively contribute to sustainable development, policies must be framed and implemented with systemic awareness, ensuring that all levels of the educational structure function in harmony toward shared developmental goals. Systems Theory thus offers a conceptual and practical guide for designing education reforms that are not only efficient in delivery but also enduring and responsive to the collective well-being of present and future generations (Senge, 2018).

CONCEPTUAL CLARIFICATIONS

Concept of Policy

Policy refers to a structured and intentional set of guidelines, rules, and strategies designed to direct decisions and shape actions in specific domains, particularly in the public sector. Within the educational context, policy operates as a foundational mechanism through which governments, ministries, and institutions set forth clear objectives, principles, and regulatory frameworks that guide the development, administration, and evaluation of educational systems. It serves as a blueprint for action, laying out the intentions of decision-makers regarding what education should achieve and how it should be delivered to achieve those goals (Dye, 2013).

Moreover, policy in education is not static; it is continually evolving in response to emerging challenges, societal expectations, economic demands, and global shifts. Furthermore, education policy encompasses various dimensions such as curriculum development, teacher recruitment and training, student assessment, funding allocation, and governance structures, all aimed at improving learning outcomes and promoting access and equity. Although policy documents are often presented in technical language, their impact reaches deep into classrooms, affecting teachers, students, and administrators alike.

Additionally, policy plays a central role in addressing educational disparities by setting standards that ensure fairness, accountability, and inclusiveness in learning environments (Levin, 2010). When effectively developed and implemented, education policy acts as a catalyst for national development, creating a skilled and informed population capable of contributing to social and economic advancement. It also ensures coherence and coordination among multiple actors and stakeholders within the education system. In essence, the concept of policy in education is deeply tied to the vision a society holds for its future, as it translates collective goals into actionable steps aimed at building an effective, inclusive, and sustainable educational system (Anderson, 2014). Thus, policy serves not only as a tool for regulation but also as an engine for innovation and transformation within the educational landscape.

Concept of Reform

Reform in the context of education refers to the deliberate process of initiating change aimed at improving existing educational structures, practices, and outcomes. It involves systematic efforts to correct inefficiencies, eliminate inequalities, and enhance the relevance and quality of education in response to new demands and persistent challenges. Educational reform arises when existing policies, teaching methods, or administrative systems are found inadequate to meet the goals of providing equitable and effective learning opportunities for all (Fullan, 2016).

Moreover, reform can take many forms ranging from curriculum overhauls to teacher retraining, from governance restructuring to the integration of technology in classrooms. The goal of reform is not merely to change for the sake of change, but to bring about measurable improvements in student learning, teaching effectiveness, and institutional accountability. Furthermore, successful reform requires a clear understanding of existing problems, the involvement of multiple stakeholders, and the allocation of adequate resources to support new directions. Although some reforms are top-down, initiated by government agencies or international bodies, others may emerge from grassroots advocacy or research evidence highlighting gaps in the system.

Additionally, reform must be contextually relevant, culturally appropriate, and adaptable to local realities if it is to gain acceptance and yield long-term benefits (Tyack & Cuban, 1995). In education, reform is often a response to the changing needs of society be it preparing students for modern labor markets, promoting inclusive education, or aligning schools with global standards. Reform is also driven by international development agendas that emphasize the role of education in reducing poverty and promoting social cohesion (Carnoy, 2017). In essence, the concept of reform is anchored in the belief that education systems must remain dynamic and responsive, continuously evolving to serve both present and future generations effectively and equitably.

Education Policy and Reform

Education policy and reform operate in a complementary relationship where one defines direction and the other implements transformation to meet desired educational goals. Education policy outlines the official vision, intentions, and guidelines that shape how education is structured, managed, and evaluated within a given society, while reform brings these intentions to life through concrete changes designed to enhance performance, equity, and relevance (Rizvi & Lingard, 2010). Moreover, policies set the framework by which systems operate, establishing

the standards for teaching, learning, financing, and administration. However, without reform, policies may remain ineffective or disconnected from the realities of classrooms and communities. Reform, therefore, serves as the mechanism through which outdated policies are updated, ineffective practices are eliminated, and innovative strategies are introduced to keep education systems responsive to evolving societal needs.

Furthermore, education reform can occur within or beyond existing policy frameworks, depending on whether the change is corrective, incremental, or transformative. Although reforms are often initiated to address systemic challenges such as low literacy rates, unequal access, or poor teacher quality, they also stem from broader agendas like globalization, digitalization, and sustainable development (Klees, 2017). Additionally, education policy and reform must be viewed as continuous processes rather than one-time actions, as education systems face constant pressure to evolve in response to demographic shifts, labor market demands, and technological advancements.

When policy and reform are aligned, education systems are better positioned to deliver inclusive, high-quality learning opportunities and prepare learners for societal participation and economic productivity. In practice, this alignment requires collaboration among policymakers, educators, civil society, and researchers to ensure that reforms are evidence-based, context-sensitive, and sustainable. Therefore, understanding education policy and reform together is essential for building educational systems that not only function effectively but also contribute meaningfully to national development.

Sustainable Development

Sustainable development refers to the organized pursuit of growth and progress that meets present needs without compromising the capacity of future generations to satisfy their own. It rests on the integration of economic advancement, social inclusion, and environmental protection as interdependent pillars that must be balanced in policymaking and institutional actions. Moreover, sustainable development emphasizes long-term thinking in the management of resources, planning of human settlements, and development of institutions, ensuring that growth today does not lead to depletion or harm tomorrow (Sachs, 2015).

Within the global context, sustainable development has become a core objective of international cooperation, particularly as outlined in the United Nations' 2030 Agenda, which includes 17 Sustainable Development Goals (SDGs). These goals reflect a collective ambition to eradicate poverty, promote health and education, achieve gender equality, ensure clean water and sanitation, and foster climate resilience, among others (United Nations, 2015). Furthermore, education is recognized as a foundational tool for advancing sustainable development, as it equips individuals with knowledge, skills, and values that support informed decision-making, responsible citizenship, and productive engagement in society.

Additionally, sustainable development entails the transformation of institutions, policies, and practices to align with ethical standards of equity and justice. It requires inclusive governance and public participation, ensuring that marginalized voices are heard and represented in decisions that affect their environments and livelihoods (Lele, 2020). Although many governments have adopted sustainable development strategies, effective implementation demands coordinated efforts across sectors and consistent investment in human capital, infrastructure, and innovation.

In the educational sphere, the promotion of sustainability involves curriculum reforms that integrate environmental education, critical thinking, and global awareness. Moreover, sustainable development challenges existing models of industrialization and consumption, calling for shifts towards renewable energy, waste reduction, and sustainable agriculture. It is through education, policy reform, and community engagement that societies can transition from extractive systems to regenerative ones that sustain life and prosperity. Therefore, sustainable development is not only a goal but a framework for action that requires shared responsibility, long-term commitment, and an unwavering focus on equity and environmental stewardship.

Historical Evolution of Education Policy and Reform in Nigeria

The historical evolution of education policy and reform highlights a gradual adaptation to meet the socio-economic and political needs of societies aiming for sustainable development. Initial education policies centered largely on basic literacy and numeracy skills necessary for early industrial economies. Over subsequent decades, education reforms broadened to address social inclusion, economic modernization, and nation-building efforts. During the mid-20th century, education became recognized as a fundamental driver of economic and social development, prompting many countries to introduce policies aimed at universal access and quality improvement in schooling systems (Bray & Kwo, 2017).

Furthermore, international movements such as Education for All and the Millennium Development Goals increased pressure on governments to enhance education systems, reduce inequality, and improve learning outcomes. These initiatives emphasized not only enrollment but also the relevance and quality of education, promoting lifelong learning frameworks to adapt to changing labor markets. Reforms in curriculum and pedagogy reflected a deeper understanding of education's role in shaping skills, values, and competencies essential for development (Carnoy & Rhoten, 2019).

Moreover, recent decades have witnessed the integration of sustainability principles into education policy, in line with global commitments such as the Sustainable Development Goals (SDGs). Education reforms now incorporate environmental education, social justice, and global citizenship as key objectives. This reflects a shift from education as an economic tool alone to a broader vision that supports social cohesion and ecological stewardship. The evolution of education policies illustrates an ongoing process of transformation aligned with emerging global challenges and sustainable development imperatives (Leicht et al., 2018). This historical perspective provides critical insight into how education policy reforms continue to shape pathways towards sustainable futures.

Financing Education Reforms for Sustainable Development

Securing adequate and sustainable financing for education reforms remains a central concern for achieving long-term development goals. Education reforms require substantial investment across multiple areas, including infrastructure, teacher capacity building, curriculum innovation, and technological upgrades. Furthermore, strategic allocation of funds ensures that reforms translate into improved educational outcomes, equity, and inclusion. Long-term financial planning and commitment are critical to avoid disruption and to sustain reform momentum (Chapman, 2020).

In addition, financing challenges are especially pronounced in developing countries where limited fiscal space and competing priorities often restrict education budgets. Innovative

financing mechanisms such as education bonds, impact investments, and international aid partnerships have emerged to address funding gaps. These strategies complement domestic resources and aim to improve efficiency and accountability in the use of funds. Ensuring that financial resources are directed towards marginalized populations and critical reform areas such as skills for sustainable economies remains a priority.

Moreover, transparency and robust accountability systems are essential to optimize the use of resources and achieve reform objectives. Effective financial management involves rigorous monitoring, reporting, and stakeholder participation to build trust and ensure equitable distribution. International frameworks such as the Global Partnership for Education provide technical assistance and funding support, promoting collaborative efforts among governments, donors, and civil society. Ultimately, sustainable financing of education reforms is a shared responsibility that demands innovative solutions and strong governance to drive lasting educational and developmental benefits (UIS, 2019).

Reforming Curriculum and Pedagogy for Sustainable Learning Outcomes

Reforming curriculum and pedagogy is essential for achieving learning outcomes that support sustainable development. A curriculum that fosters sustainable learning must be dynamic, inclusive, and future-focused. This means moving beyond rote memorization and static content toward learning that builds problem-solving abilities, ethical reasoning, environmental awareness, and global citizenship. The reform process involves rethinking what students are taught and how learning is facilitated. Furthermore, curriculum reform places emphasis on interdisciplinary content that connects science, technology, culture, and environmental studies, thereby helping learners understand the connections between their personal actions and global consequences (Barth & Michelsen, 2013).

Moreover, pedagogical reform is crucial in this transformative process. Traditional methods that rely solely on lectures and standardized testing often fall short of preparing students for real-world challenges. Educators must adopt participatory, experiential, and learner-centered teaching approaches that encourage critical thinking and innovation. For instance, project-based learning, community engagement, and service learning enable students to apply classroom knowledge in practical settings, fostering a deeper understanding of sustainability concepts. Additionally, inclusive pedagogy ensures that students from diverse backgrounds feel represented and valued, which enhances educational equity and long-term social cohesion. Teachers, therefore, require ongoing professional development that equips them with the skills and knowledge to implement such approaches effectively (Gaus, 2021).

In addition, curriculum reform must integrate the principles of Education for Sustainable Development (ESD), which include respect for human rights, equity, cultural diversity, and environmental integrity. Embedding these principles in school subjects and learning activities creates a culture of responsibility and active citizenship. Reform initiatives also call for the collaboration of various stakeholders, including educators, policymakers, community leaders, and students, to ensure that the curriculum reflects local priorities and global trends. Technology also plays a role in facilitating sustainable learning, offering access to digital tools and global knowledge networks that support both teaching and lifelong learning. Ultimately, aligning curriculum and pedagogy with the goals of sustainable development enhances learners' ability to contribute meaningfully to society and adapt to a changing world (Evans, 2022).

Challenges in Implementing Education Reforms for Nation Sustainability

Implementing education reforms aimed at national sustainability remains a vital goal for many developing and developed countries. These reforms are intended to ensure inclusive, quality, and future-oriented learning systems that align with sustainable development objectives. However, turning policies into practical outcomes often encounters several obstacles. These challenges affect the smooth execution of reforms and weaken the potential for education to contribute to national development. Below are detailed explanations of some of the key challenges:

Inadequate Funding and Budgetary Constraints

Implementing effective education reform requires a stable and sufficient financial base to support activities such as teacher development, infrastructural expansion, material provision, and curriculum improvement. However, in many developing countries, budget allocations to the education sector are insufficient to meet these needs, creating disparities in policy execution. Schools in rural or underserved areas often suffer the most, lacking basic resources while expected to comply with reform mandates. Additionally, fluctuating donor aid and macroeconomic instability further compound the funding crisis, leading to partial implementation or abandonment of reform efforts. Without strong financial backing, long-term educational goals remain unachievable, and systemic transformation is slowed down. Governments must commit to sustained investment and transparent budgeting practices to ensure education reform reaches all regions equitably and enhances overall national development (Malunda & Musobo, 2021).

Resistance to Change among Stakeholders

Stakeholder resistance is another critical issue affecting reform success. When teachers, school administrators, parents, and local communities are excluded from reform planning, they are less likely to support or adopt changes. Teachers, who serve as the primary implementers, may feel overwhelmed by new expectations, especially when professional development is lacking. Additionally, parents and local authorities may distrust reforms that alter traditional values or existing pedagogies. Resistance may stem from fear of the unknown, misinformation, or concerns over workload and job security. As a result, the lack of cooperation from these groups can significantly delay or derail reforms. Building consensus through inclusive planning, effective communication, and structured involvement is essential to overcoming opposition and ensuring that reforms are contextually appropriate and widely accepted (Wangenge-Ouma, 2020).

Shortage of Qualified Teachers and Trainers

A critical determinant of reform success lies in the competence and availability of teachers. Many education systems, particularly in low-resource countries, suffer from a shortage of trained personnel capable of implementing modern instructional approaches promoted through reforms. Teachers often lack exposure to innovative pedagogy, updated curricula, and performance assessment tools. Furthermore, inadequate teacher preparation programs and limited access to continuing professional development hinder the acquisition of skills necessary for reform

compliance. In some regions, classrooms are overcrowded and educators are overburdened, diminishing their capacity to engage students effectively. This situation compromises the quality of teaching and obstructs student learning outcomes. Reforms that are not accompanied by systematic teacher training and recruitment strategies are likely to underperform, regardless of how well they are designed. Sustainable reform thus requires robust investment in the teaching workforce (Mugo et al., 2022).

Weak Monitoring and Evaluation Mechanisms

The absence of a well-defined monitoring and evaluation (M&E) framework can hinder reform progress. M&E systems are essential for tracking the effectiveness, efficiency, and relevance of educational reforms. In many countries, however, data collection tools are either outdated or nonfunctional, and education ministries lack trained personnel to interpret performance metrics accurately. As a result, policymakers are left with insufficient evidence to assess whether reforms are producing desired changes or to make necessary adjustments. This not only undermines transparency but also erodes stakeholder confidence. Moreover, the absence of real-time feedback mechanisms allows inefficiencies to persist unchecked. Establishing strong M&E systems is therefore crucial for guiding reforms toward targeted outcomes, fostering accountability, and ensuring informed decision-making throughout the implementation process (Hashmi & Memon, 2021).

Political Instability and Policy Discontinuity

In countries where governance is unstable or frequently changing, education reform initiatives are vulnerable to interruption. Reforms typically require long-term commitment, yet political leaders may abandon or reverse policies introduced by previous administrations. Such discontinuities lead to confusion among implementers, disrupt progress, and cause a waste of resources. Moreover, political interference in education often results in reforms driven by short-term gains rather than sustainable goals. When decisions are based on political calculations rather than empirical evidence, the education sector becomes reactive instead of strategic. This weakens institutional capacity and undermines public trust. Ensuring consistency in education policy and insulating reform agendas from political manipulation are vital to achieving sustainable educational development. Institutionalizing reforms through legal frameworks and multi-party consensus can help safeguard against such risks (Aslam, 2023).

Role of Government in Education Reform for Development

Governments play a fundamental role in driving education reform to support sustainable development. As the primary architects of public policy, governments establish the legal frameworks, allocate resources, and set priorities that shape the education system’s structure and function. Furthermore, governments are responsible for ensuring equitable access to quality education for all citizens, which is essential for promoting social inclusion and economic opportunity. Through education reform, governments can address systemic challenges such as inadequate infrastructure, teacher shortages, and curriculum gaps that hinder the development of human capital. Additionally, governments often coordinate with stakeholders including

educators, communities, and international organizations to design and implement reforms that reflect national development goals and global sustainability agendas (UNESCO, 2016).

Moreover, the role of government extends to financing education reforms, which requires sustained investment in both physical and human resources. Funding policies influence the quality and availability of learning materials, teacher training programs, and school facilities, all of which directly affect student outcomes. Effective governance mechanisms ensure transparency and accountability in the use of these resources, fostering public trust and encouraging participation in education reform efforts. In addition, governments develop policies that support curriculum modernization, the integration of technology, and the promotion of lifelong learning opportunities. These policies are critical for preparing learners to meet the demands of a rapidly changing world and to contribute to sustainable economic and social development (Carnoy & Rhoten, 2020).

Governments also serve as catalysts for innovation in education by promoting research, piloting new teaching methods, and scaling successful reform initiatives. Furthermore, they play a regulatory role in maintaining standards and monitoring progress toward reform objectives. Internationally, government involvement is crucial in aligning national education systems with global frameworks such as the United Nations Sustainable Development Goals (SDGs), particularly SDG 4, which focuses on inclusive and equitable quality education. Through such alignment, governments can leverage international support and share best practices to enhance the effectiveness of reforms. Ultimately, a government's commitment and leadership in education reform determine the extent to which educational systems contribute to national development and sustainability (World Bank, 2018).

Impact of Educational Reform on Human Capital and Economic Growth

Educational reform holds a critical place in shaping human capital, which in turn drives economic growth and development. Human capital refers to the collective skills, knowledge, and abilities possessed by individuals that enhance their productivity and innovation potential. Reforms that improve the quality, relevance, and inclusivity of education contribute directly to building a more skilled and adaptable workforce. Furthermore, such reforms help reduce inequalities by broadening access to learning opportunities for marginalized populations, enabling more people to contribute effectively to economic activities. Investment in education reform thus results in a stronger labor force capable of meeting the evolving needs of modern economies (Hanushek & Woessmann, 2017).

Additionally, educational reforms that focus on enhancing critical thinking, technical skills, and creativity foster innovation, which is a key driver of economic growth. Countries that successfully implement reforms tend to experience higher rates of productivity, entrepreneurship, and technological advancement. These outcomes not only stimulate job creation but also increase national competitiveness in the global market. Moreover, education reforms aimed at aligning curricula with labor market demands improve employment rates and income levels, thereby reducing poverty and enhancing social mobility. Education systems that emphasize lifelong learning prepare individuals to continually update their skills in response to changing economic conditions, supporting sustained economic progress (Psacharopoulos & Patrinos, 2018).

Educational reform also influences economic growth through its effects on social development indicators such as health, governance, and civic participation. Educated populations are better equipped to make informed decisions, participate in democratic processes, and adopt

healthier lifestyles, all of which contribute to a more stable and productive society. Moreover, reforms that incorporate sustainability education cultivate a workforce that values environmental protection and social responsibility, aligning economic growth with long-term sustainability goals. In conclusion, educational reform acts as a catalyst for human capital development and economic growth, emphasizing the need for continuous adaptation of education systems to meet the challenges of the 21st century.

Impact of International Organizations on National Education Reforms

International organizations have played a vital role in shaping national education reforms aimed at achieving sustainable development. These organizations provide not only funding but also strategic guidance and technical support that enable countries to reform their education systems effectively. Furthermore, their influence encourages governments to adopt policies that promote inclusive and equitable education, which is essential for sustainable social and economic progress. UNESCO, for example, advocates for integrating Education for Sustainable Development (ESD) within national curricula, promoting skills that empower learners to address global challenges such as climate change, poverty, and inequality (Leicht, Heiss, & Byun, 2018).

Moreover, the World Bank contributes through financing projects that improve education infrastructure, teacher training, and governance reforms. This financial assistance targets the enhancement of quality and access, especially in under-resourced regions. These interventions support the development of systems that respond to the needs of all learners, reducing educational disparities and contributing to human capital development (Chapman, 2020). Additionally, UNICEF emphasizes the importance of inclusive education policies, focusing on marginalized groups such as children with disabilities and those from disadvantaged socio-economic backgrounds. This focus on equity strengthens social sustainability by fostering environments where every learner has the opportunity to succeed (UNICEF, 2021).

In addition, international organizations often facilitate capacity building and knowledge sharing among countries. These efforts allow policymakers and educators to learn from global experiences and adapt best practices to their specific contexts. For example, the Global Partnership for Education mobilizes resources and expertise to assist developing countries in designing and implementing effective education reforms that align with sustainable development goals (UIS, 2019). Although international influence provides valuable frameworks and resources, the success of reforms depends on how well countries adapt these inputs to local cultural, political, and economic realities.

Furthermore, international organizations promote monitoring and evaluation systems that enhance accountability in education. This support helps governments track progress toward reform goals and adjust strategies accordingly, ensuring that reforms lead to tangible improvements in learning outcomes and equity. Overall, international organizations contribute substantially to the advancement of national education reforms, serving as catalysts that promote sustainable development through education.

Inclusive Education Policies and Their Role in Social Sustainability

Inclusive education policies serve as vital tools in promoting social sustainability by ensuring that all individuals, regardless of their backgrounds or abilities, have access to quality education. These policies emphasize the removal of barriers that prevent marginalized groups such as

persons with disabilities, ethnic minorities, and economically disadvantaged students from fully participating in educational systems. Furthermore, inclusive education promotes social cohesion by fostering environments where diversity is respected and valued, enabling learners to develop empathy, tolerance, and collaborative skills. The inclusiveness in education nurtures equitable opportunities, which are crucial for sustainable societies seeking to reduce social inequalities and promote justice (Slee, 2018).

Moreover, inclusive education policies contribute to social sustainability by addressing the long-term social consequences of exclusion. When education systems effectively integrate all learners, communities experience enhanced social capital, leading to stronger civic engagement and reduced social tensions. These policies also align with international frameworks such as the United Nations Sustainable Development Goal 4, which calls for inclusive and equitable quality education for all. Governments and educational institutions adopting inclusive policies not only comply with these global standards but also lay the foundation for social environments where economic, cultural, and social dimensions interact positively to sustain growth and development (Ainscow, 2020).

Additionally, inclusive education policies often mandate adaptations in curriculum, teaching strategies, and assessment methods to meet diverse learning needs. These changes not only benefit students with specific needs but also enrich the learning experiences of all students by promoting differentiated instruction and universal design for learning. In the long run, inclusive education fosters resilience and adaptability among learners, qualities essential for addressing future societal challenges. Therefore, inclusive education is not merely an educational objective but a strategic approach to achieving sustainable development goals, where social sustainability is integrated into education reforms to ensure that no one is left behind (Florian, 2019).

Technology Integration in Education Reform for Sustainable Innovation

Technology integration within education reform has become a cornerstone for fostering sustainable innovation. Educational systems that embrace technology effectively improve access to learning resources, enhance teaching methodologies, and facilitate personalized learning experiences. Furthermore, technology supports the creation of interactive and collaborative learning environments, which prepare students to thrive in a knowledge-driven economy. Technology-driven reforms promote not only the acquisition of digital literacy but also the development of critical thinking and problem-solving skills essential for sustainable development (Selwyn, 2020).

Moreover, technology integration enables education systems to overcome traditional barriers such as geographic isolation, limited resources, and rigid curricula. Through digital platforms, learners gain access to vast educational materials and global knowledge networks, contributing to lifelong learning and continuous skill development. In addition, technology supports data-driven decision-making processes that help educators tailor interventions and improve student outcomes. These innovations create more resilient education systems capable of adapting to rapid societal and environmental changes, which are key attributes for sustainable education reform (Redecker & Punie, 2017).

In addition, sustainable innovation in education through technology requires investments not only in hardware and software but also in teacher training and infrastructure development. Successful integration depends on educators' ability to harness technology pedagogically and on

equitable access for all learners. This holistic approach ensures that technology serves as a catalyst for educational quality, inclusion, and relevance. Overall, integrating technology in education reform acts as a powerful driver for sustainable innovation by bridging gaps, fostering creativity, and aligning learning outcomes with the demands of the 21st century global economy and sustainable development goals (UNESCO, 2021).

Policy Evaluation and Accountability in Driving Sustainable Educational Change

Policy evaluation and accountability play essential roles in driving sustainable educational change by ensuring that education reforms meet their intended goals and contribute to long-term development. Evaluation involves systematic assessment of policy implementation processes and outcomes, which provides evidence-based insights into the effectiveness, efficiency, and equity of education reforms. Furthermore, evaluation mechanisms help identify challenges, gaps, and unintended consequences, enabling policymakers to make informed adjustments. In addition, accountability systems hold education stakeholders responsible for their roles in delivering quality education, which fosters transparency and trust within the education sector (Hatry, 2019).

Moreover, accountability in education demands clear standards, performance indicators, and reporting frameworks that monitor the progress of reforms. These mechanisms motivate governments, schools, and educators to align their efforts with sustainable development objectives. The presence of robust evaluation frameworks promotes continuous improvement and encourages innovation while discouraging practices that do not contribute to sustainable outcomes. Accountability also ensures that resources are used effectively, promoting equity and inclusion in education. Stakeholders, including communities and learners, benefit when education policies are transparent and responsive, creating a culture of participation and shared responsibility (Kusek & Rist, 2014).

In addition, integrating evaluation and accountability within education policy cycles strengthens policy coherence and sustainability. This integration allows reforms to adapt to changing contexts and emerging needs without losing sight of sustainability goals. Technologies such as data management systems support real-time monitoring and reporting, enhancing the responsiveness of education systems. Furthermore, international frameworks like the Sustainable Development Goals emphasize the importance of monitoring and accountability for achieving quality education for all. Consequently, education reforms anchored in rigorous evaluation and accountability frameworks are more likely to generate lasting impact, contribute to human capital development, and support broader social and economic progress.

Strategies for Effective Implementation of Educational policy and Reforms

Implementing educational policy and reforms effectively requires a coordinated approach anchored on well-defined strategies. Policy development alone does not guarantee positive change unless it is followed through with structured plans, institutional capacity, and stakeholder commitment. Education systems, especially in developing contexts, often struggle with translating policy into action due to weak infrastructure, lack of political will, or limited resources. To address these challenges, several strategic approaches can be adopted to ensure that education policies achieve their intended impact and contribute meaningfully to sustainable development.

Stakeholder Engagement and Inclusive Participation

One effective strategy for ensuring successful policy implementation in education is fostering active stakeholder engagement throughout the reform process. This includes involving teachers, parents, students, education administrators, and community leaders during the formulation, execution, and evaluation stages. When key actors feel ownership of policies, they are more likely to support implementation and overcome resistance to change. Engagement also ensures that policies reflect the practical realities of those working within and benefitting from the system. A bottom-up approach facilitates the identification of local needs, increases transparency, and strengthens accountability mechanisms (Adebayo & Ogunlade, 2022). Moreover, inclusive participation builds consensus and enhances the legitimacy of reforms, particularly in diverse or conflict-prone societies. Continuous dialogue among stakeholders can also help identify potential challenges early and encourage adaptive responses. Without meaningful involvement, even well-intended reforms may suffer rejection or become ineffective at the implementation stage.

Adequate Funding and Resource Allocation

Another essential strategy is the provision of adequate financial resources to support the policy goals. Many reforms fail due to underfunding or mismanagement of allocated resources. A sound education policy requires investments in infrastructure, learning materials, teacher training, and technology integration. Governments must prioritize education in their national budgets and ensure funds are disbursed timely and efficiently. Sustainable reforms demand a clear financial plan that supports both immediate implementation and long-term sustainability (Okoro & Mbah, 2021). In addition to state funding, partnerships with private organizations, development agencies, and community initiatives can supplement available resources. Proper monitoring mechanisms should be established to track expenditures and prevent diversion of funds. Furthermore, investing in data systems for tracking implementation progress helps to direct resources where they are most needed. Without adequate and transparent funding structures, even the most promising education reforms may collapse before reaching maturity.

Capacity Building for Educators and Administrators

Developing the professional capacity of teachers, school heads, and education officers is central to successful policy implementation. Teachers are the direct agents of curriculum delivery, and administrators ensure the policies are translated into everyday school operations. Continuous professional development programs should be designed to align with new policy directions and equip educators with the necessary knowledge, skills, and values (Eze & Nwafor, 2023). Training should not be a one-time event but a regular process embedded in the education system. When educators understand the reform agenda and are supported through coaching, mentoring, and monitoring, they are more motivated to implement change. Inadequate training leads to misinterpretation of reforms and inconsistent application across schools. Furthermore, leadership training for school administrators enhances their ability to provide instructional leadership and support teacher practices. Strengthening institutional and human capacity ensures that education reforms do not remain theoretical but translate into real classroom change.

Monitoring, Evaluation, and Feedback Mechanisms

A robust monitoring and evaluation (M&E) system is necessary for tracking the implementation of education reforms. It allows for the measurement of progress, identification of bottlenecks, and making of timely adjustments to policy strategies. M&E should be systematic, with clearly defined indicators, benchmarks, and timelines. It must also be participatory, allowing schools, communities, and education offices to provide regular feedback. This ensures that policy execution is responsive to changing needs and grounded in evidence (Ibrahim & Musa, 2022). Effective M&E helps to measure the effectiveness of training, the use of resources, and the impact of reforms on learning outcomes. Regular reporting and open dissemination of findings can foster transparency and reinforce stakeholder trust. Moreover, feedback from implementers and beneficiaries provides valuable insights that can refine future reforms. Without structured evaluation systems, it becomes difficult to determine whether educational reforms are yielding the expected outcomes.

Policy Clarity and Consistency

Clarity in the language, objectives, and implementation pathways of an educational policy is central to its success. Ambiguous or contradictory policies often cause confusion among implementers, leading to misinterpretation and inconsistent application across educational institutions. A well-articulated policy should have specific goals, measurable targets, and clear responsibilities assigned to relevant actors. Additionally, consistency must be maintained across reforms to avoid frequent policy reversals that undermine stability and progress (Nwachukwu & Aladejana, 2022). Policy coherence helps schools align their activities with national priorities without the pressure of abrupt changes that disrupt teaching and learning processes. Educational authorities must also ensure that subnational actors such as local government education boards are well-informed and aligned with the policy direction. Clear communication of reform expectations fosters uniformity and reduces implementation gaps. Therefore, eliminating contradictions and ensuring consistency in education policies enhances credibility and builds long-term trust among stakeholders.

Political Will and Leadership Commitment

Effective implementation of educational reforms is largely dependent on the commitment of political leaders and top-level education authorities. Political will reflects the readiness of government officials and policy-makers to prioritize education, allocate necessary resources, and provide sustained support for long-term changes. When leaders champion reforms and demonstrate unwavering support, it inspires confidence among stakeholders and promotes collective action (Balogun & Ishola, 2021). In many developing nations, political interests often override educational needs, leading to delayed execution or abandonment of well-conceived reforms. Strong leadership commitment helps to insulate education policies from political interference, especially during transitions in government. In addition, leaders play a pivotal role in resolving conflicts, motivating implementers, and setting accountability frameworks. Commitment at the top enhances inter-agency coordination and fosters synergy between ministries, departments, and external partners. Therefore, without strong political will and visible leadership, even the best-designed reforms may remain stagnant or regress over time.

CONCLUSION

Education policy and reform remain foundational pillars in the pursuit of sustainable development across nations. When effectively designed and implemented, education reforms serve not only to improve learning outcomes but also to build societies that are inclusive, equitable, and forward-looking. A well-structured policy environment helps shape the direction of the education system, ensuring it is responsive to emerging societal needs, technological advancements, and global developmental goals. Moreover, reforms in curriculum, pedagogy, teacher development, and institutional governance are necessary to keep educational practices aligned with the aspirations of a sustainable future.

The contributions of various stakeholders are indispensable in achieving lasting impact. Governments must demonstrate strong political will and commit adequate resources, while the Ministry of Education must ensure effective oversight, coordination, and quality assurance mechanisms. Policy makers are expected to approach reform through evidence-based planning and inclusive consultation, whereas school administrators play a vital role in grassroots implementation and institutional leadership. All these efforts must be harmonized and strategically directed toward building human capital, reducing inequality, and promoting economic and social transformation.

Tackling the challenges that hinder education reform such as funding gaps, resistance to change and institutional weaknesses requires deliberate commitment and persistent evaluation. These challenges, if not addressed, can slow down the progress of reform efforts and undermine the overall sustainability of educational gains. Therefore, stakeholders must adopt a long-term perspective that emphasizes innovation, accountability, inclusivity, and adaptability in their reform strategies.

Suggestions

Based on the literature review the following suggestions were made:

- Government should ensure adequate and steady funding for education reforms. Adequate funding is essential to provide schools with infrastructure, modern instructional materials, and competent teachers.
- The Ministry of Education should take the lead in designing strong implementation strategies and monitoring frameworks for education reforms. It is not enough to develop policies; the ministry must follow through to ensure that reforms are practically applied in schools.
- Policy makers should engage in inclusive and evidence-based planning, they should base their decisions on thorough research and wide consultation with relevant stakeholders such as teachers, parents, school heads, and community leaders
- School administrators should ensure proper use of resources and maintain accountability in school operations. Their leadership helps create an enabling environment where reforms can succeed, leading to improved student learning and school development.

INTEGRATING ARTIFICIAL INTELLIGENCE IN EDUCATIONAL ADMINISTRATION FOR EFFECTIVE ACADEMIC ACHIEVEMENT IN PUBLIC UNIVERSITIES IN RIVERS STATE

Ifeoma Patience NWACHUKWU
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

The integration of Artificial Intelligence (AI) in educational administration in public universities in Rivers State has the potential to transform decision-making processes in these schools. However, the increasing reliance on AI-driven decision-making also raises critical questions about accountability, transparency, and bias. This position paper explored the impact of artificial intelligence in educational administration in public universities in Rivers State, with a specific focus on AI-driven decision-making. Through a review of existing literature and a critical examination of current practices, this paper argues that AI-driven decision-making in schools must be carefully considered and critically evaluated to ensure that it serves the best interests of students, teachers, and the broader educational community. The paper concludes by proposing a framework for responsible AI-driven decision-making in schools, emphasizing the need for transparency, accountability, and human oversight.

Keywords: Artificial Intelligence, AI Driven Decision-Making, Academic Achievement.

INTRODUCTION

The integration of Artificial Intelligence (AI) in educational administration has the potential to revolutionize decision-making processes in schools (Baker, 2019; Siemens, 2013). AI-driven systems can analyze vast amounts of data, identify patterns, and make predictions, enabling educators to make more informed decisions about student learning, teacher support, and resource allocation (Koedinger et al., 2013; Lundberg, 2020). However, as AI becomes increasingly embedded in educational administration, critical questions arise about the implications of relying on AI-driven decision-making in schools (Williamson, 2016).

While AI has the potential to enhance efficiency, accuracy, and scalability in educational decision-making, it also raises concerns about accountability, transparency, and bias (Eubanks, 2018; O'Neil, 2016). For instance, AI systems can perpetuate existing biases and inequalities if

they are trained on biased data or designed with a narrow perspective (Angwin et al., 2016; Buolamwini, 2016). Moreover, the increasing reliance on AI-driven decision-making can lead to a lack of transparency and accountability, as decisions are made by complex algorithms that may be difficult to understand or interpret (Pasquale, 2015).

As educators, policymakers, and researchers, it is essential to critically examine the impact of AI on educational administration and consider the implications of AI-driven decision-making in schools (Liu et al., 2020). This position paper explored the impact of AI on educational administration in public universities in Rivers State, with a specific focus on AI-driven decision-making. Through a review of existing literature and a critical examination of current practices, this paper argues that AI-driven decision-making in schools must be carefully considered and critically evaluated to ensure that it serves the best interests of students, teachers, and the broader educational community.

CONCEPTUAL REVIEW

Artificial Intelligence (AI)

AI is a rapidly evolving field that has captivated researchers, scientists, and engineers for decades. As AI continues to transform industries and revolutionize the way we live and work, it is essential to understand its definition and perspective. Some researchers and experts have defined Artificial Intelligence showcasing the diversity of thought and the evolution of AI research over the years. LeCun et al., (2015), defined Artificial Intelligence as a set of techniques that enable machines to perform tasks that would typically require human intelligence, such as learning, reasoning, and perception.

AI can also be referred to, as the development of computer systems that can perform tasks that typically require human intelligence, such as learning, problem-solving, decision-making, and perception. AI systems use algorithms and data to make decisions and take actions, often in real-time.

History of Artificial Intelligence

The concept of AI dates back to the 1950s, when computer scientists like Alan Turing, Marvin Minsky, and John McCarthy began exploring the idea of creating machines that could think and learn like humans. Since then, AI has undergone significant developments, with major advancements in the fields of machine learning, natural language processing, and computer vision.

Types of Artificial Intelligence (AI)

There are several types of AI. They include Narrow or Weak AI, General or Strong AI and Superintelligent AI. The Narrow or Weak AI known as Thin AI, refers to artificial intelligence systems designed to perform a specific task or set of tasks (Kaplan & Haenlein, 2019). These systems are trained on a particular dataset and optimized to excel in a narrow domain or function (Davenport & Dyché, 2013).

CHARACTERISTICS OF NARROW OR WEAK AI

Task-Specific

Narrow or Weak AI is designed and trained to perform a single task or a set of closely related tasks (Huang & Langlotz, 2018). This type of AI is optimized to excel in a specific domain or function, making it incredibly efficient and precise. It has a single-task focus, performing a single task such as image recognition, language translation, or playing chess (Silver et al., 2016). Some Narrow or Weak AI systems can perform a set of closely related tasks, such as virtual assistants that can answer questions, set reminders, and control smart home devices (Sutton & Barto, 2018). These systems possess domain-specific knowledge and expertise, allowing them to make accurate decisions and take precise actions (Kaplan & Haenlein, 2019). Task-specific narrow or weak AI are easy to develop, and they are cost effective. However, they are not flexible and cannot adapt to new tasks or domains (Davenport & Dyché, 2013). Despite this limitation, Narrow or Weak AI systems can achieve high performance and accuracy in their specific domain or task (Huang & Langlotz, 2018).

Examples of task-specific Narrow or Weak AI systems include image recognition systems such as Facebook's facial recognition system and Google's image recognition algorithm (Silver, et al., 2016). Virtual assistants like Siri, Alexa, and Google Assistant are also examples of task-specific Narrow or Weak AI systems that can perform tasks such as answering questions, setting reminders, and controlling smart home devices (Sutton & Barto, 2018). Language translation software like Google Translate and Microsoft Translator are also examples of task-specific Narrow or Weak AI systems that can translate text from one language to another (Huang & Langlotz, 2018). Additionally, game-playing AI like AlphaGo, a computer program that plays Go, is an example of a task-specific Narrow or Weak AI system that can play a specific game at a high level (Silver et al., 2016).

Lack of General Intelligence

Task-specific narrow or weak AI systems are designed to perform a specific task or set of tasks. While they can excel in their designated domain, they lack general intelligence, which is the ability to reason, learn, and apply knowledge across a wide range of tasks (Lake et al., 2017). This limitation is significant, as it restricts the ability of narrow AI systems to adapt to new situations or tasks and to learn from experience.

IMPLICATIONS OF THE LACK OF GENERAL INTELLIGENCE

The lack of general intelligence in Narrow AI systems has significant implications for their autonomy, decision-making, and adaptability. They include:

Limited Autonomy

Narrow AI systems are not able to operate autonomously in complex or unexpected situations, which limits their ability to make decisions and take actions (Kaplan & Haenlein, 2019). This limitation is significant, as it restricts the ability of Narrow AI systems to adapt to changing circumstances.

Dependence on Human Input

Narrow AI systems require human input and oversight to function effectively, which limits their ability to operate independently (Davenport & Dyché, 2013). This limitation is significant, as it restricts the ability of Narrow AI systems to make decisions and take actions without human intervention.

Vulnerability to Bias

Narrow AI systems can be vulnerable to bias and errors, which can have significant consequences in certain contexts (Klein, 2013). This limitation is significant, as it restricts the ability of Narrow AI systems to make accurate decisions and take effective actions.

Dependence on Data

Narrow AI systems rely heavily on the data they are trained on to learn and make decisions (Lake et al., 2017). This dependence on data creates several challenges, including overfitting, underfitting, data quality issues, and lack of generalizability.

Why Narrow AI Systems Rely on Data

Narrow AI systems use machine learning algorithms, such as neural networks, decision trees, and support vector machines, which rely on data to learn and make predictions (Hastie et al., 2016). These systems are trained on large datasets, which are used to teach the system to recognize patterns, make decisions, and take actions.

Challenges of Dependence on Data

The dependence on data creates several challenges for Narrow AI systems, including overfitting, underfitting, data quality issues, and lack of generalizability (Hastie et al., 2016). Overfitting occurs when the system becomes too specialized to the training data and fails to generalize to new or unseen data. Underfitting occurs when the system is not complex enough to capture the underlying patterns in the data.

Mitigating the Dependence on Data

There are several techniques that can be used to mitigate the dependence on data, including data augmentation, transfer learning, regularization techniques, and collecting more data (Lake et al., 2017). Data augmentation techniques, such as rotating, scaling, and cropping images, can help increase the size and diversity of the training dataset.

LIMITATIONS OF NARROW AI SYSTEMS

Narrow AI systems have several limitations. They include:

Narrow AI systems are not able to transfer learning from one task to another, which limits their ability to adapt to new situations (Lake et al., 2017).

- Limited Reasoning and Problem-Solving: Narrow AI systems are not able to reason and solve problems in the same way that humans do, which limits their ability to handle complex or unexpected situations (Kaplan & Haenlein, 2019).
- Narrow Knowledge Base: Narrow AI systems have a narrow knowledge base that is specific to their designated task or domain, which limits their ability to apply knowledge in new contexts (Davenport & Dyché, 2013).
- Lack of Common Sense and Intuition: Narrow AI systems do not have common sense or intuition, which can lead to unexpected or undesirable behavior in certain situations (Klein, 2013).

Examples of Narrow or Weak AI

There are several examples of Narrow or Weak AI systems, including virtual assistants, image recognition systems, language translation software, and game-playing AI (Kaplan & Haenlein, 2019). Virtual assistants, such as Siri, Alexa, and Google Assistant, can perform tasks such as answering questions, setting reminders, and controlling smart home devices

Advantages of Narrow or Weak AI

- High Performance: Narrow or Weak AI systems are designed to perform a specific task or set of tasks, and they can achieve high performance in their designated domain. This is because they are optimized to excel in a particular area, and they can leverage large amounts of data and computational power to achieve high accuracy and precision.

Factors Contributing to High Performance

Some of the factors contributing to high performance in Narrow or weak AI systems are:

Specialization

Narrow or Weak AI systems are specialized to perform a specific task, which allows them to focus their resources and optimize their performance.

Large datasets

Narrow or Weak AI systems can be trained on large datasets, which enables them to learn and improve their performance over time.

Computational power

Narrow or Weak AI systems can leverage significant computational power, which allows them to process and analyze large amounts of data quickly and efficiently.

Algorithmic advancements

Narrow or Weak AI systems can benefit from advancements in machine learning algorithms, which enable them to learn and improve their performance more effectively.
Examples of High-Performing Narrow or Weak AI Systems are:

- **Image recognition systems:** image recognition systems such as those used in self-driving cars, can achieve high performance in recognizing and classifying objects.
- **Language translation software:** Language translation software, such as Google Translate, can achieve high performance in translating text from one language to another.
- **Game-playing AI:** Game-playing AI systems, such as AlphaGo, can achieve high performance in playing complex games like Go.
- **Recommendation systems:** Recommendation systems, such as those used in online shopping, can achieve high performance in recommending products to users.

Benefits of High Performance

The benefits of high performance in Narrow or weak AI systems include:

Improved Accuracy High-performing Narrow or Weak AI systems can achieve high accuracy in their designated domain, which can lead to improved outcomes and decision-making.

- Increased Efficiency: High-performing Narrow or Weak AI systems can process and analyze large amounts of data quickly and efficiently, which can lead to increased productivity and reduced costs.
- User Enhanced Experience: High-performing Narrow or Weak AI systems can provide users with personalized and relevant recommendations, which can lead to an enhanced user experience.
- Competitive Advantage: High-performing Narrow or Weak AI systems can provide organizations with a competitive advantage, as they can leverage advanced technologies to improve their operations and decision-making.
- Narrow AI systems can achieve high performance and accuracy in their specific domain or task.
- Efficient Use of Resources: Narrow or Weak AI systems can achieve efficient use of resources in several ways. such resources are computational resources; processing power, memory and storage. Data resources; data storage, data processing and data transmission. Energy resources; power consumption and energy efficiency.

WAYS NARROW OR WEAK AI ACHIEVES EFFICIENT USE OF RESOURCES

- Specialization: Narrow or Weak AI systems are specialized to perform a specific task, which allows them to focus their resources on that task. Optimized algorithms: Narrow or Weak AI systems can use optimized algorithms that are designed to minimize computational resources and maximize efficiency. Data pruning: Narrow or Weak AI systems can use data pruning techniques to reduce the amount of data required for training and inference. Model compression: Narrow or Weak AI systems can use model

compression techniques to reduce the size of the model and minimize computational resources. Hardware acceleration is a technique used by narrow or weak AI systems to accelerate computational tasks and minimize energy consumption. This is achieved through the use of specialized hardware components, such as Graphics Processing Units (GPUs) and Tensor Processing Units (TPUs).

- Graphics Processing Units (GPUs): GPUs are specialized electronic circuits designed to quickly manipulate and alter memory to accelerate the creation of images in a frame buffer intended for output to a display device. In the Behavioural of Narrow or Weak AI, GPUs are used to accelerate computational tasks such as matrix multiplication, convolution, and pooling.
- Tensor Processing Units (TPUs): TPUs are specialized ASICs (Application-Specific Integrated Circuits) designed to accelerate machine learning workloads. TPUs are optimized for matrix multiplication, which is a fundamental operation in many machine learning algorithms.

How GPUs and TPUs Accelerate Computational Tasks

- Parallel processing: GPUs and TPUs are designed to perform parallel processing, which allows them to execute multiple instructions simultaneously. This leads to significant speedup in computational tasks.
- Pipelining: GPUs and TPUs use pipelining to break down complex tasks into simpler, more manageable tasks. This allows for more efficient use of resources and improved performance.
- Cache memory: GPUs and TPUs have large cache memories that store frequently accessed data. This reduces the time it takes to access the main memory, leading to improved performance.
- Examples of Efficient Use of Resources by Narrow or Weak AI
- Image recognition systems: Image recognition systems, such as those used in self-driving cars, can achieve efficient use of resources by optimizing their use of computational resources and data resources.
- Language translation software: Language translation software, such as Google Translate, can achieve efficient use of resources by optimizing their use of computational resources and data resources.
- Recommendation systems: Recommendation systems, such as those used in online shopping, can achieve efficient use of resources by optimizing their use of computational resources and data resources.

Benefits of Efficient Use of Resources

- Cost savings: Efficient use of resources can lead to cost savings, as organizations can reduce their spending on computational resources, data resources, and energy resources.
- Improved scalability: Efficient use of resources can lead to improved scalability, as organizations can handle increased workloads and user demand without a corresponding increase in resource usage.

- Enhanced user experience: Efficient use of resources can lead to an enhanced user experience, as organizations can provide faster and more responsive services to their users.
- Competitive advantage: Efficient use of resources can provide organizations with a competitive advantage, as they can differentiate themselves from their competitors through their efficient use of resources.

Narrow or Weak AI systems are designed to perform specific tasks and excel in narrow domains. While they have many advantages, they also have limitations, including limited flexibility, lack of creativity, and dependence on data quality.

General or Strong AI

General or Strong AI refers to a type of artificial intelligence that aims to perform any intellectual task that a human can, such as reasoning, preconizing, and learning. This type of AI is designed to match human intelligence and capabilities, and is often considered the holy grail of AI research.

Characteristics of General or Strong AI

The characteristics of General or Strong AI include:

Human-like Intelligence

This is a characteristic of General or Strong AI, which aims to match human intelligence and capabilities. This includes:

- Reasoning: Deductive reasoning; General or Strong AI should be able to use deductive reasoning to arrive at conclusions based on premises.
- Inductive reasoning: General or Strong AI should be able to use inductive reasoning to make generalizations based on specific observations.
- Abductive reasoning: General or Strong AI should be able to use abductive reasoning to generate hypotheses and explanations.

Problem-Solving

- Complex problem-solving General or Strong AI should be able to solve complex problems that require critical thinking, creativity, and innovation.
- Dynamic problem-solving: General or Strong AI should be able to adapt to changing circumstances and solve problems in real-time.
- Multi-objective problem-solving: General or Strong AI should be able to solve problems that involve multiple objectives and constraints.

Learning

- Machine learning: General or Strong AI should be able to learn from data and improve its performance over time.
- Deep learning: General or Strong AI should be able to learn complex patterns and relationships in data using deep learning algorithms.
- Transfer learning: General or Strong AI should be able to transfer knowledge and skills learned in one domain to another domain.

Flexibility and Adaptability

Flexibility and adaptability are essential characteristics of General or Strong AI, which enable it to adapt to new situations and tasks, and learn from experience. These characteristics allow General or Strong AI to:

Adapt to New Situations

- Handle uncertainty and ambiguity: General or Strong AI should be able to handle uncertainty and ambiguity in new situations, and make decisions based on incomplete or uncertain information.
- Adjust to changing circumstances: General or Strong AI should be able to adjust to changing circumstances, such as changes in the environment, rules, or objectives.
- Transfer knowledge and skills: General or Strong AI should be able to transfer knowledge and skills learned in one situation to new situations.
- Learn from Experience: Learn from successes and failures; General or Strong AI should be able to learn from both successes and failures, and adjust its behavior accordingly.
- Improve performance over time: General or Strong AI should be able to improve its performance over time, through experience and learning.
- Develop new knowledge and skills: General or Strong AI should be able to develop new knowledge and skills, through experience and learning.

Types of Learning

Supervised learning; General or Strong AI should be able to learn from labeled data, where the correct output is provided.

- Unsupervised learning: General or Strong AI should be able to learn from unlabeled data, where the correct output is not provided.
- Reinforcement learning: General or Strong AI should be able to learn from feedback, such as rewards or penalties.

Benefits of Flexibility and Adaptability

- Improved performance: Flexibility and adaptability enable General or Strong AI to improve its performance over time, through experience and learning.

- Increased robustness: Flexibility and adaptability enable General or Strong AI to handle uncertainty and ambiguity, and adjust to changing circumstances.
- Enhanced autonomy: Flexibility and adaptability enable General or Strong AI to operate autonomously, without the need for explicit programming or human intervention.

Challenges of Developing Flexibility and Adaptability in AI

- Complexity of real-world situations: Real-world situations are often complex and dynamic, making it challenging to develop AI systems that can adapt to them.
- Limited understanding of human learning: Human learning is still not fully understood, making it challenging to develop AI systems that can learn and adapt in a human-like way.
- Difficulty in evaluating flexibility and adaptability: Flexibility and adaptability are difficult to evaluate, making it challenging to develop AI systems that can adapt to new situations and tasks.

Common Sense and Intuition

These are essential characteristics of General or Strong AI, which enable it to understand the world in a way that is similar to humans. These characteristics allow General or Strong AI to:

- Understand the World in a Human-Like Way: Make assumptions and inferences; General or Strong AI should be able to make assumptions and inferences based on its understanding of the world, similar to humans.
- Recognize patterns and anomalies: General or Strong AI should be able to recognize patterns and anomalies in data, similar to humans.
- Understand nuances and context: General or Strong AI should be able to understand nuances and context, similar to humans.

Possess Common Sense

- Understand the physical world: General or Strong AI should have a basic understanding of the physical world, including concepts such as gravity, time, and space.
- Understand social norms and conventions: General or Strong AI should understand social norms and conventions, including concepts such as etiquette, morality, and ethics.
- Understand human emotions and behavior: General or Strong AI should have a basic understanding of human emotions and behavior, including concepts such as emotions, motivations, and decision-making.

Possess Intuition

- Make decisions based on instinct: General or Strong AI should be able to make decisions based on instinct, similar to humans.
- Recognize patterns and connections: General or Strong AI should be able to recognize patterns and connections between seemingly unrelated concepts.

- Have a sense of creativity and imagination: General or Strong AI should have a sense of creativity and imagination, allowing it to generate new ideas and solutions.
- Ability to learn from experience: General or Strong AI should be able to learn from experience and apply that knowledge to new situations.

The ultimate goal of general or strong AI is to achieve human-level intelligence, allowing it to perform any intellectual task that a human can (Kaplan & Haenlein, 2019). Some researchers aim to create general or strong AI that surpasses human capabilities, allowing it to solve complex problems that are currently unsolvable (Lake et al., 2017). Additionally, General or Strong AI could potentially create a new form of intelligence that is different from human intelligence but still capable of solving complex problems (Gershman et al., 2015).

Challenges of General or Strong AI

Human intelligence is a complex and multifaceted phenomenon that is still not fully understood, making it challenging to replicate (Lindsay, 2019). Despite significant research, there is still much to be learned about human cognition and how it works (Marcus, 2018). Furthermore, common sense and intuition are essential components of human intelligence, but they are difficult to replicate in machines (Lake et al., 2017). There is also a risk of unintended consequences, such as job displacement or exacerbating existing social inequalities (Brynjolfsson & McAfee, 2014).

Current State of General or Strong AI

There has been significant progress in AI research in recent years, with the development of deep learning algorithms and other techniques (LeCun et al., 2015). However, General or Strong AI is still in its infancy, and significant challenges remain to be overcome (Marcus, 2018). Researchers are actively working on developing general or strong AI, with a focus on areas such as natural language processing, computer vision, and machine learning (Kaplan & Haenlein, 2019).

Potential Applications of General or Strong AI

General or strong AI has the potential to revolutionize numerous aspects of society, transforming various industries and aspects of life. Some potential applications of General or Strong AI include:

Solving Complex Problems

General or strong AI could potentially solve complex problems that are currently unsolvable, such as:

- Climate Change: General or Strong AI could analyze vast amounts of environmental data, identifying patterns and predicting future climate trends, enabling the development of effective strategies for mitigating climate change (Bostrom & Yudkowsky, 2014).

- Disease Diagnosis: General or strong AI could analyze medical data, identify patterns, and predict disease progression, enabling early diagnosis and effective treatment (Bostrom & Yudkowsky, 2014).
- Energy Management: General or Strong AI could optimize energy consumption and production, reducing waste and improving efficiency (Gershman et al., 2015).

Improving Productivity and Efficiency

General or strong AI could improve productivity and efficiency in various industries, including:

- Healthcare: General or strong AI could analyze medical records, identify patterns and predict patient outcomes, enable personalized medicine, and improve healthcare outcomes (Brynjolfsson & McAfee, 2014).
- Finance: General or strong AI could analyze financial data, identify patterns, and predict market trends, enabling more effective investment strategies and risk management (Brynjolfsson & McAfee, 2014).
- Transportation: General or strong AI could optimize traffic flow, reduce congestion, and improve transportation efficiency (Kuwata et al., 2016).

Enhancing Human Capabilities

General or strong AI could enhance human capabilities, such as:

- Memory: General or strong AI could assist humans in remembering and recalling information, improving memory and cognitive function (Gershman et al., 2015).
- Attention: General or strong AI could assist humans in focusing attention, improving productivity, and reducing distractions (Gershman et al., 2015).
- Decision-Making: General or strong AI could assist humans in making decisions, providing data-driven insights, and improving decision-making outcomes (Gershman et al., 2015).

Creating New Industries and Opportunities

General or strong AI could create new industries and opportunities that we cannot imagine, such as:

- **New Forms of Entertainment:** General or Strong AI could create new forms of entertainment, such as interactive stories and immersive experiences (Davenport & Dyché, 2013).
- **New Forms of Education:** General or strong AI could create new forms of education, such as personalized learning platforms and adaptive assessments (Woolf et al., 2013).
- **New Forms of Employment:** General or Strong AI could create new forms of employment, such as AI training and development, and AI ethics and governance (Davenport & Dyché, 2013).

Superintelligent AI

Superintelligent AI refers to a hypothetical AI system that possesses intelligence beyond human capabilities, potentially leading to exponential growth in technological advancements (Bostrom, 2014). This type of AI would surpass human intelligence in all domains, including reasoning, problem-solving, and learning.

Characteristics of Superintelligent AI

The characteristics of superintelligent AI include:

- Unprecedented Intelligence: Superintelligent AI would possess intelligence that far exceeds human capabilities, potentially leading to breakthroughs in various fields (Bostrom, 2014).
- Learning Autonomous: Superintelligent AI would be capable of autonomous learning, allowing it to improve its intelligence and capabilities at an exponential rate (Lake et al., 2017).
- Self-Improvement: Superintelligent AI would be able to modify its own architecture and algorithms, leading to rapid self-improvement (Bostrom, 2014).

Risks and Challenges of Superintelligent AI

The risks and challenges of superintelligent AI include:

- Existential Risk: Superintelligent AI could potentially pose an existential risk to humanity, as its goals may not align with human values (Bostrom, 2014).
- Value Alignment: Ensuring that superintelligent AI aligns with human values and goals is a significant challenge (Soares et al., 2017).
- Control and Safety: Developing control and safety mechanisms for superintelligent AI is crucial to prevent potential risks (Amodei et al., 2016).

Current Research and Developments

While superintelligent AI is still a hypothetical concept, researchers are actively exploring various approaches to achieve it, including:

Artificial General Intelligence

Researchers are working on developing artificial general intelligence (AGI), which would enable AI systems to perform any intellectual task that humans can (Kaplan & Haenlein, 2019).

Cognitive Architectures

Cognitive architectures, such as State, Operator, And Result (SOAR) and Learning Intelligent Decision Agent (LIDA), are being developed to provide a framework for integrating multiple AI systems and achieving more general intelligence (Lindsay, 2019).

Key Applications of Artificial Intelligence

Artificial intelligence (AI) has numerous applications across various industries, transforming the way businesses operate, and revolutionizing the delivery of services. Here are some key applications of AI:

Healthcare

AI has the potential to revolutionize healthcare by:

- Diagnosis: AI-powered algorithms can analyze medical images, lab results, and patient data to diagnose diseases more accurately and quickly.
- Treatment: AI can help personalize treatment plans, recommend medications, and predict patient outcomes.
- Patient care: AI-powered chatbots and virtual assistants can help patients with routine inquiries, appointment scheduling, and medication reminders.

Finance

AI is transforming the finance industry by:

- Risk management: AI-powered algorithms can analyze large datasets to identify potential risks, detect anomalies, and predict market trends.
- Portfolio optimization: AI can help optimize investment portfolios by analyzing market data, identifying patterns, and recommending investment strategies.
- Credit scoring: AI-powered algorithms can analyze credit data, payment history, and other factors to provide more accurate credit scores.

Transportation

AI is revolutionizing the transportation industry by:

- Autonomous vehicles: AI-powered algorithms can analyze sensor data, navigate roads, and make decisions in real-time to enable self-driving cars.
- Route optimization: AI can help optimize routes for logistics and transportation companies, reducing fuel consumption, lowering emissions, and improving delivery times.
- Traffic management: AI-powered algorithms can analyze traffic patterns, predict congestion, and optimize traffic signal timing to reduce traffic congestion.

Education

AI is transforming the education industry by:

- Personalized learning: AI-powered algorithms can analyze student data, learning styles, and preferences to provide personalized learning recommendations.
- Adaptive assessments: AI can help create adaptive assessments that adjust their difficulty and content based on a student's performance.
- Intelligent tutoring systems: AI-powered tutoring systems can provide one-on-one support to students, offering real-time feedback, and guidance.

Customer Service

AI is revolutionizing customer service by:

- Chatbots: AI-powered chatbots can help customers with routine inquiries, provide basic support, and route complex issues to human representatives.
- Virtual assistants: AI-powered virtual assistants can help customers with more complex issues, provide personalized recommendations, and offer proactive support.
- Sentiment analysis: AI-powered algorithms can analyze customer feedback, sentiment, and emotions to help businesses improve their products, services, and customer experience

Benefits of Artificial Intelligence

Artificial intelligence (AI) has numerous benefits that are transforming various aspects of our lives, from business and healthcare to education and transportation. Some of the key benefits of AI include:

Increased Efficiency

AI can automate repetitive tasks and processes, freeing up human resources for more strategic and creative work. Examples include:

Automation of customer

Service; AI-powered chatbots can handle routine customer inquiries, reducing the workload of human customer support agents.

Streamlining business

- Processes: AI can automate tasks such as data entry, bookkeeping, and inventory management, improving efficiency and reducing costs.

Improved Accuracy

AI can analyze vast amounts of data quickly and accurately, reducing errors and enhancing decision-making. Examples include:

- Medical diagnosis: AI-powered algorithms can analyze medical images and patient data to diagnose diseases more accurately and quickly.
- Financial forecasting: AI can analyze market trends and financial data to predict stock prices and portfolio performance more accurately.

Enhanced Customer Experience

AI can provide personalized services and support, improving customer satisfaction and loyalty. Examples include:

- Personalized product recommendations: AI-powered algorithms can analyze customer data and preferences to recommend personalized products and services.
- Intelligent virtual assistants: AI-powered virtual assistants can provide personalized support and guidance to customers, improving their overall experience.

Innovation and Competitiveness

AI can enable new business models, products, and services, driving innovation and competitiveness. Examples include:

- AI-powered startups: AI can enable new startups and business models, such as AI-powered healthcare and education platforms.
- AI-driven innovation: AI can drive innovation in various industries, such as transportation, energy, and manufacturing.

Scientific Progress

AI can accelerate discovery and breakthroughs in various fields, from medicine and astronomy to climate science and materials science. Examples include:

- Medical research: AI can analyze vast amounts of medical data to identify new treatments and therapies.
- Astronomy and space exploration: AI can analyze large datasets from space missions and telescopes to identify new celestial objects and phenomena.

Challenges and Concerns

While AI offers many benefits, it also raises several challenges and concerns, including:

Job Displacement

AI can automate jobs, potentially displacing human workers. Examples include:

- Automation of manufacturing jobs: AI-powered robots can automate manufacturing tasks, potentially displacing human workers.
- Automation of customer service jobs: AI-powered chatbots can automate customer service tasks, potentially displacing human customer support agents.

Bias and Fairness

AI systems can perpetuate existing biases and inequalities if they are trained on biased data. Examples include:

- Biased facial recognition systems: AI-powered facial recognition systems can perpetuate biases against certain racial or ethnic groups if they are trained on biased data.
- Biased hiring algorithms: AI-powered hiring algorithms can perpetuate biases against certain groups of people if they are trained on biased data.

Security and Privacy

AI systems can be vulnerable to cyber-attacks and data breaches, potentially compromising sensitive information. Examples include:

- Data breaches: AI systems can be vulnerable to data breaches, potentially compromising sensitive information such as personal data and financial information, and Cyber-attacks; AI systems can be vulnerable to cyber-attacks, potentially compromising their functionality and integrity.

Transparency and Explainability

AI decision-making processes can be difficult to understand, making it challenging to identify biases and errors. Examples include:

- Lack of transparency: AI decision-making processes can be opaque, making it difficult to understand how decisions are made.
- Difficulty in explaining decisions: AI systems can struggle to explain their decisions, making it challenging to identify biases and errors.

Ethics and Accountability

AI raises important ethical and accountability concerns, including the need for clear guidelines and regulations governing AI development and deployment. Examples include:

- Need for regulations: AI raises important regulatory concerns, including the need for clear guidelines and regulations governing AI development and deployment. Need for

accountability; AI raises important accountability concerns, including the need for clear mechanisms for holding AI developers and deployers accountable for their actions.

Future of Artificial Intelligence: Emerging Trends and Opportunities

As artificial intelligence (AI) continues to evolve and improve, we can expect significant advancements in various areas. These emerging trends and opportunities will shape the future of AI and its applications across industries.

Edge AI

Edge AI refers to the deployment of AI algorithms and models at the edge of the network, i.e., closer to the source of the data. This approach enables real-time processing and decision-making, reducing latency and improving overall efficiency.

Key Benefits of Edge AI

- Real-time processing: Edge AI enables real-time processing of data, allowing for faster decision-making and action.
- Reduced latency: By processing data closer to the source, edge AI reduces latency and improves overall system responsiveness.
- Improved security: Edge AI can help improve security by reducing the amount of data transmitted to the cloud or centralized servers.

Explainable AI (XAI)

Explainable AI (XAI) refers to the development of AI systems that provide transparent and interpretable explanations for their decisions. XAI is critical in applications where AI decisions have significant consequences, such as healthcare, finance, and law.

Key Benefits of XAI

- Transparency: XAI provides transparent explanations for AI decisions, enabling users to understand the reasoning behind the decisions.
- Trust: XAI helps build trust in AI systems by providing explanations for their decisions, reducing the likelihood of errors and biases.
- Regulatory compliance: XAI can help organizations comply with regulatory requirements, such as General Data Protection Regulation (GDPR) and Health Insurance Portability and Accountability Act (HIPAA), by providing transparent explanations for AI decisions.

Human-AI Collaboration

Human-AI collaboration refers to the design of AI systems that augment human capabilities and facilitate collaboration. This approach recognizes that AI is not a replacement for human intelligence but rather a tool to enhance human capabilities.

Key Benefits of Human-AI Collaboration

- Augmented human capabilities: Human-AI collaboration enables AI systems to augment human capabilities, improving overall productivity and efficiency.
- Improved decision-making: Human-AI collaboration facilitates collaboration between humans and AI systems, leading to more informed and accurate decision-making.
- Enhanced creativity: Human-AI collaboration enables AI systems to generate new ideas and insights, enhancing human creativity and innovation.

AI for Social Good

AI for social good refers to the application of AI to address pressing societal challenges, such as climate change, healthcare, and education. This approach recognizes the potential of AI to drive positive social change and improve human well-being.

Key Benefits of AI for Social Good

- Addressing societal challenges: AI can help address pressing societal challenges, such as climate change, healthcare, and education.
- Improving human well-being: AI can improve human well-being by providing access to healthcare, education, and other essential services.
- Driving positive social change: AI can drive positive social change by enabling new forms of social innovation and entrepreneurship.

The future of artificial intelligence holds much promise, with emerging trends and opportunities in edge AI, explainable AI, human-AI collaboration, and AI for social good. As AI continues to evolve and improve, it is essential to prioritize transparency, accountability, and social responsibility to ensure that AI benefits humanity as a whole.

Impact of Artificial Intelligence on Educational Administration

Artificial intelligence (AI) is revolutionizing educational administration by automating routine tasks, enhancing decision-making, and improving overall efficiency. Three key administrative tasks that AI is transforming are:

Automated Grading

AI-powered grading systems can automatically assess student assignments, exams, and other evaluations, reducing the workload of instructors and minimizing errors (Baker et al., 2018). These systems can:

- Analyze complex answers: AI can evaluate complex answers, such as essays and open-ended questions, using natural language processing (NLP) techniques.
- Provide instant feedback: AI-powered grading systems can provide immediate feedback to students, enabling them to track their progress and identify areas for improvement.
- Reduce grading time: Automated grading systems can significantly reduce the time spent by instructors on grading, freeing up time for more critical tasks.

Student Information Systems

AI-driven student information systems can manage student data, track progress, and provide insights for informed decision-making (Gao et al., 2019). These systems can:

- Analyze student performance: AI can analyze student performance data, identifying trends, patterns, and areas where students need extra support.
- Predict student outcomes: AI-powered systems can predict student outcomes, such as graduation rates and post-secondary education enrollment.
- Provide personalized recommendations: AI-driven systems can provide personalized recommendations for students, including course suggestions, extracurricular activities, and career guidance.

Scheduling and Time-tabling

AI can optimize scheduling and timetabling, minimizing conflicts, and improving resource utilization (Kumar et al., 2020). AI-powered scheduling systems can:

- Analyze scheduling constraints: AI can analyze scheduling constraints, such as instructor availability, classroom capacity, and course prerequisites.
- Generate optimal schedules: AI-powered systems can generate optimal schedules, minimize conflicts and improve resource utilization.
- Provide real-time updates: AI-driven systems can provide real-time updates to students, instructors, and administrators, ensuring that everyone is informed and up-to-date.

By automating these administrative tasks, AI can help educational institutions streamline their operations, reduce administrative burdens, and focus on providing high-quality education to their students.

Multifaceted impact of AI in education.

AI-Driven Decision-Making in Schools

Artificial intelligence (AI) is transforming the education sector, enabling schools to make data-driven decisions that improve student outcomes. AI-driven decision-making in schools involves using machine learning algorithms to analyze large datasets, identify patterns, and provide insights that inform instructional and administrative decisions.

Applications of AI-Driven Decision-Making in Public Universities in Rivers State

- Personalized Learning: AI can help teachers tailor instruction to individual students' needs, abilities, and learning styles (Woolf et al., 2013).
- Student Assessment and Feedback: AI-powered systems can analyze student performance data, providing immediate feedback and identifying areas where students need extra support (Baker et al., 2018).
- Teacher Professional Development: AI can help identify areas where teachers need additional training or support, enabling targeted professional development (Gao et al., 2019).
- University Operations and Management: AI can optimize university operations, such as scheduling, resource allocation, and facilities management (Kumar et al., 2020).

Benefits of AI-Driven Decision-Making in Universities

- Improved Student Outcomes: AI-driven decision-making can lead to better academic performance, increased student engagement, and improved graduation rates (Woolf et al., 2013).
- Enhanced Teacher Productivity: AI can automate administrative tasks, freeing up teachers to focus on instruction and student support (Baker et al., 2018).
- Data-Driven Decision-Making: AI provides universities with actionable insights, enabling data-driven decision-making and more effective resource allocation (Gao et al., 2019).
- Increased Efficiency: AI can optimize university operations, reducing costs and improving resource utilization (Kumar et al., 2020).

Challenges and Limitations of AI Data-Driven Decision-Making in the Universities

- Data Quality and Availability: AI requires high-quality, relevant data to provide accurate insights (Baker et al., 2018).
- Teacher Buy-In and Training: Teachers need training and support to effectively integrate AI-driven decision-making into their practice (Gao et al., 2019).
- Equity and Bias: AI systems can perpetuate existing biases if not designed and trained carefully (Kumar et al., 2020).
- Regulatory and Ethical Considerations: public universities must navigate regulatory and ethical issues related to AI, such as student data privacy and security (Woolf et al., 2013).

A Proposed Framework for Responsible AI-Driven Decision-Making in Schools
A Real-time Analytics for Data-Driven Schools (RADDS)

The following are the core principles of AI-driven decision-making processes:

- Transparency: AI-driven decision-making processes should be transparent, explainable, and understandable to stakeholders.
- Accountability: public universities in Rivers State should be accountable for AI-driven decisions, ensuring that they are fair, unbiased, and in the best interests of students.
- Human Oversight: AI-driven decision-making should be subject to human oversight, review, and validation to ensure that decisions are reasonable, justifiable, and aligned with educational values.

Key Components of AI-Driven Decision-Making Processes:

- AI System Design: AI systems should be designed with transparency, accountability, and human oversight in mind.
- Data Governance: public universities in Rivers State should establish robust data governance policies to ensure that data used in AI-driven decision-making is accurate, complete, and unbiased.
- Decision-Making Processes: AI-driven decision-making processes should be clearly defined, documented, and communicated to stakeholders.
- Human Review and Validation: AI-driven decisions should be subject to human review and validation to ensure that they are reasonable, justifiable, and aligned with educational values.
- Monitoring and Evaluation: public universities in Rivers State should establish processes to monitor and evaluate the effectiveness and fairness of AI-driven decision-making.
- Stakeholder Engagement: public universities in Rivers State should engage with stakeholders, including students, parents, teachers, and administrators, to ensure that their concerns and values are taken into account.

Implementation Roadmap

- Short-term (0-6 months): Conduct a review of existing AI-driven decision-making processes and identify areas for improvement.
- Medium-term (6-18 months): Develop and implement a data governance policy and establish human review and validation processes.
- Long-term (18-36 months): Develop and implement a comprehensive AI system design and decision-making framework.

Benefits of Responsible AI-Driven Decision-Making System (RADDS) in Educational Administration

RADDS is designed to promote responsible AI-driven decision-making in educational administration, ensuring that AI is used in ways that are transparent, accountable, and aligned with educational values. The benefits of RADDS include:

Improved Transparency

RADDS ensures that AI-driven decision-making processes are transparent and explainable. This means that:

- Decision-making processes are clear: RADDS provides a clear understanding of how AI-driven decisions are made, including the data used, the algorithms employed, and the weight given to different factors.
- Data sources are identified: RADDS identifies the sources of data used to inform AI-driven decisions, ensuring that stakeholders understand the origins of the data and any potential biases.
- Assumptions are explicit: RADDS makes explicit the assumptions underlying AI-driven decisions, enabling stakeholders to understand the reasoning behind the decisions.
- Decisions are traceable: RADDS ensures that AI-driven decisions are traceable, enabling stakeholders to track the decision-making process and identify potential errors or biases.

Enhanced Accountability

RADDS holds schools accountable for AI-driven decisions, ensuring that they are fair, unbiased, and in the best interests of students. This means that:

- Public Universities in Rivers State are responsible for AI-driven decisions: RADDS holds schools accountable for the decisions made by AI systems, ensuring that they take ownership of the decisions and their consequences.
- Decisions are reviewed and validated: RADDS ensures that AI-driven decisions are reviewed and validated by human stakeholders, ensuring that they are reasonable and justifiable.
- Bias and errors are identified and addressed: RADDS identifies and addresses bias and errors in AI-driven decisions, ensuring that they are fair and unbiased.

- Stakeholders are informed and engaged: RADDS informs and engages stakeholders, including students, parents, and teachers, in the decision-making process, ensuring that their perspectives and concerns are taken into account.

Better Decision-Making

RADDS ensures that AI-driven decisions are reasonable, justifiable, and aligned with educational values. This means that:

- Decisions are informed by educational values: RADDS ensures that AI-driven decisions are informed by educational values, such as fairness, equity, and inclusivity.
- Decisions are based on relevant data: RADDS ensures that AI-driven decisions are based on relevant and accurate data, rather than assumptions or biases.
- Decisions are transparent and explainable: RADDS ensures that AI-driven decisions are transparent and explainable, enabling stakeholders to understand the reasoning behind the decisions.
- Decisions are subject to human oversight: RADDS ensures that AI-driven decisions are subject to human oversight and review, enabling stakeholders to correct errors or biases.

Challenges of Implementing RADDS

Implementing RADDS, a system that leverages real-time analytics to support data-driven decision-making in schools, poses several challenges that must be addressed to ensure successful adoption and effective use. These challenges can be broadly categorized into two areas: technical complexity and cultural shift.

Technical Complexity

Implementing RADDS requires significant technical expertise and resources, including:

Data Integration

RADDS requires integrating data from various sources, such as:

- Student information systems: Integrating data from student information systems, including demographic data, attendance records, and academic performance.
- Learning management systems: Integrating data from learning management systems, including course materials, assignments, and grades.
- Assessment platforms: Integrating data from assessment platforms, including standardized test scores and performance metrics.

Data Analytics

RADDS requires advanced data analytics capabilities to:

- Process large datasets: Process and analyze large datasets in real-time, including data from multiple sources and formats.
- Identify patterns and trends: Identify patterns and trends in the data, including correlations and anomalies.
- Provide predictive insights: Provide predictive insights and recommendations to support data-driven decision-making.

System Maintenance

RADDS requires ongoing maintenance and updates to:

- Ensure system security: Ensure the security and integrity of the system, including data encryption and access controls.
- Optimize system performance: Optimize system performance, including data processing and analytics capabilities.
- Address technical issues: Address technical issues and bugs, including troubleshooting and resolution.

Scalability

RADDS must be scalable to:

- Accommodate growing data volumes: Accommodate growing data volumes and increasing user demands.
- Support expanding user base: Support an expanding user base, including teachers, administrators, and parents.
- Integrate new data sources: Integrate new data sources and systems, including emerging technologies and platforms.

Cultural Shift

Implementing RADDS may require a cultural shift in schools, emphasizing:

Transparency

RADDS promotes transparency by:

- Providing real-time data: Providing real-time data and insights to stakeholders, including teachers, administrators, and parents.
- Enabling data-driven decision-making: Enabling data-driven decision-making and tracking progress towards goals and objectives.
- Fostering accountability: Fostering accountability and responsibility among stakeholders, including teachers, administrators, and students.

Accountability

RADDS promotes accountability by:

- Enabling data-driven decision-making: Enabling data-driven decision-making and tracking progress towards goals and objectives.
- Providing performance metrics: Providing performance metrics and benchmarks to evaluate student and teacher performance.

Human Oversight

RADDS requires human oversight to:

- Ensure informed decision-making: Ensure that data-driven decisions are informed, nuanced, and equitable.
- Provide contextual understanding: Provide contextual understanding and interpretation of data insights and recommendations.
- Address bias and errors: Address bias and errors in data-driven decision-making, including identifying and mitigating potential issues.

Collaboration

RADDS promotes collaboration among stakeholders, including:

- Teachers: Teachers can collaborate with colleagues and administrators to develop data-driven instructional strategies and support student success.
- Administrators: Administrators can collaborate with teachers and other stakeholders to develop data-driven policies and practices that support student success.
- Parents: Parents can collaborate with teachers and administrators to support student success and develop data-driven strategies to improve student outcomes.

Balancing Efficiency and Accountability

RADDS must balance the need for efficient decision-making with the need for accountability and human oversight, ensuring:

- Data-Driven Decisions: RADDS supports data-driven decision-making, enabling schools to make informed decisions about instruction, resource allocation, and student support.
- Human Judgment: RADDS requires human judgment to ensure that data-driven decisions are informed, nuanced, and equitable.
- Transparency and Accountability: RADDS promotes transparency and accountability by providing real-time data and insights to stakeholders, enabling them to track progress and hold schools accountable for results.

CONCLUSION

The integration of artificial intelligence (AI) in educational administration can transform schools, improve decision-making, and enhance student outcomes. This study highlights AI's benefits, which includes improving efficiency, enhancing decision-making, and personalizing education. It also emphasized the challenges, including bias and fairness, transparency and accountability, and equity and access. To harness AI's potential, the study suggests that schools and policymakers must prioritize responsible AI development, provide teacher training and support, and regularly evaluate and monitor AI's impact. A nuanced understanding of AI's benefits and challenges, combined with a commitment to responsible development and implementation, is crucial for successful integration.

Suggestions

Based on the analysis of AI's benefits and challenges in educational administration, the following are suggested:

- Develop Responsible AI Systems: public universities in Rivers State and policymakers must prioritize the development of responsible AI systems that are transparent, fair, and unbiased.
- Provide Teacher Training and Support: Teachers must be provided with training and support to effectively integrate AI into their practice and to address any challenges that may arise.
- Establish Clear Guidelines and Regulations: Clear guidelines and regulations must be established to ensure the ethical use of AI in educational administration.
- Monitor and Evaluate AI's Impact: Schools and policymakers must regularly monitor and evaluate the impact of AI on educational administration to ensure that it is promoting equity, access, and improved student outcomes.
- Foster Collaboration and Communication: Collaboration and communication among stakeholders, including teachers, administrators, policymakers, and industry experts, must be fostered to ensure that AI is developed and implemented in a responsible and effective manner.
- Address Issues of Bias and Fairness: public universities in Rivers State and policymakers must address issues of bias and fairness in AI systems to ensure that they are equitable and just.
- Ensure Transparency and Accountability: public universities in Rivers State and policymakers must ensure that AI systems are transparent and accountable to ensure that decisions are explainable and justifiable.

IMPACT OF PRIVATIZATION ON ACCESSIBILITY AND QUALITY IN TERTIARY INSTITUTIONS IN NIGERIA

Stella WILCOX-OPUBO
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education

ABSTRACT

Privatization has significantly influenced tertiary education in Nigeria, affecting both accessibility and quality. Many public institutions struggle with inadequate funding, overcrowding, and declining infrastructure, prompting the rise of private universities as alternatives. While privatization has expanded educational opportunities, it also raises concerns about affordability and equity. Wealthier students often benefit more, leaving low-income families with limited access to quality education. Private institutions generally offer better facilities, smaller class sizes, and more efficient administration, leading to improved learning outcomes. However, high tuition fees create barriers for many Nigerians, deepening educational inequality. Public universities, though more affordable, face persistent challenges such as frequent strikes and underfunding, further widening the gap between public and private sectors. The shift toward privatization also impacts academic standards. Some private institutions prioritize profit over quality, leading to variations in educational rigor. Regulatory bodies must ensure consistent standards across all institutions to maintain credibility. Balancing privatization with inclusive policies is crucial for Nigeria's education system. Increased government funding for public universities and targeted scholarships for private institutions could improve accessibility without compromising quality. Addressing these challenges will help create a more equitable and effective tertiary education system in Nigeria.

Keywords: Privatization, Accessibility, Quality, Tertiary institutions, Educational Inequality, Regulatory Standards.

INTRODUCTION

The privatization of tertiary institutions in Nigeria has sparked significant debate regarding its effects on accessibility and quality of education. Over the past few decades, the Nigerian government has increasingly encouraged private sector participation in higher education to address the growing demand for university placements and improve service delivery. While proponents argue that privatization enhances efficiency, innovation, and infrastructure development, critics contend that it may exacerbate inequality by making education less affordable for low-income families. The shift from a predominantly public-funded system to a

mixed model raises critical questions about whether privatization truly benefits students or merely deepens existing disparities in access and quality.

Nigeria's public tertiary institutions have long struggled with inadequate funding, overcrowded classrooms, and frequent strikes due to poor working conditions (Okebukola, 2018). These challenges have eroded the quality of education, pushing many families to seek alternatives in private institutions. However, the high tuition fees in private universities often place them out of reach for the average Nigerian, raising concerns about equitable access (Ajadi, 2010). The rising cost of education in privatized institutions could further marginalize disadvantaged groups, limiting their opportunities for upward mobility. At the same time, some studies suggest that private universities outperform public ones in terms of infrastructure, teacher-student ratios, and academic performance (Nwankwo, 2015). This contradiction underscores the need for a balanced assessment of privatization's impact on both accessibility and educational standards.

Another critical issue is the regulatory framework governing private tertiary institutions in Nigeria. While the National Universities Commission (NUC) sets minimum standards, enforcement remains inconsistent, leading to variations in quality across institutions (Okojie, 2017). Some private universities invest heavily in modern facilities and qualified faculty, while others prioritize profit over academic excellence. This inconsistency raises doubts about whether privatization alone can guarantee better education without stricter oversight. Additionally, the reliance on private funding may shift the focus from knowledge dissemination to revenue generation, potentially compromising the integrity of academic programs (Jegede, 2020).

The debate on privatization also extends to its long-term implications for Nigeria's education system. A well-functioning higher education sector is crucial for national development, as it produces skilled professionals needed to drive economic growth (Ololube, 2016). If privatization improves quality without sacrificing accessibility, it could strengthen Nigeria's global competitiveness. However, if it leads to elitism in education, the country risks widening the gap between the rich and the poor, further entrenching social inequality. Understanding these dynamics is essential for policymakers to design interventions that maximize the benefits of privatization while minimizing its drawbacks.

This paper examines the effects of privatization on accessibility and quality in Nigerian tertiary institutions, drawing insights from existing studies and empirical evidence. It considers the economic, social, and policy dimensions of privatization to provide a comprehensive analysis of its advantages and limitations. The discussion aims to contribute to ongoing conversations about how Nigeria can achieve a sustainable and inclusive higher education system that meets the needs of all its citizens.

METHODOLOGY

This paper titled the impact of privatization on accessibility and quality in tertiary institutions in Nigeria employed a structured methodology to ensure clarity, credibility, and coherence. The first step involved identifying the core issues and objectives of the paper. This includes defining privatization, accessibility, and quality within the context of Nigerian tertiary education. The paper aims to present a clear stance on how privatization influences these factors, supported by evidence and logical arguments. The methodology begins with a comprehensive literature review to gather existing knowledge on privatization in education, particularly in Nigeria. Scholarly articles, government reports, and policy documents provide a foundation for understanding the

historical and current state of tertiary institutions. This review helps identify gaps in the literature and positions the paper within ongoing academic and policy discussions. Primary and secondary data collection follows to substantiate arguments. Secondary data includes statistical reports from organizations such as the National Universities Commission (NUC) and the World Bank, which offer insights into enrollment rates, funding patterns, and institutional performance. Primary data may involve surveys or interviews with stakeholders, including students, educators, and policymakers, to capture firsthand experiences and perspectives on privatization's effects. The analysis employs qualitative and quantitative methods to interpret the data. Qualitative analysis examines themes such as equity, affordability, and institutional autonomy, while quantitative analysis assesses trends in enrollment, graduation rates, and resource allocation. Comparing privatized and public institutions reveals differences in accessibility and quality, helping to draw meaningful conclusions. The paper's argumentation is built on a logical structure, presenting claims backed by evidence. Each point addresses how privatization either enhances or hinders accessibility and quality. Policy recommendations are derived from the findings, suggesting ways to mitigate negative outcomes while maximizing benefits. The writing process emphasizes clarity, precision, and objectivity. Avoiding biased language ensures the paper remains credible and persuasive. Proper citations and references uphold academic integrity. The conclusion summarizes the position, reiterates the evidence, and underscores the implications for Nigeria's education sector. This methodology ensures the paper is well-researched, balanced, and impactful.

CONCEPTUAL UNDERPINNING

Privatization

Privatization refers to the transfer of ownership, control, and management of public sector enterprises or services to private entities. This process aims to improve efficiency, reduce government expenditure, and enhance service delivery through market-driven competition (Adenuga, 2021). In many cases, privatization is adopted to address inefficiencies in state-run institutions, particularly in sectors like education, healthcare, and infrastructure (Okeke & Eze, 2019). The underlying assumption is that private ownership fosters innovation, better resource allocation, and accountability due to profit motives and competitive pressures (Okafor, 2020). n the context of education, privatization has led to the establishment of private universities, colleges, and schools, often complementing or competing with public institutions (Ajayi & Ekundayo, 2018). Proponents argue that privatization improves educational quality through modern facilities, smaller class sizes, and more motivated staff (Babalola & Adedeji, 2012). However, critics warn that it may deepen inequality, as high tuition fees exclude low-income students, creating a disparity in access (Obi & Nwachukwu, 2020). The debate continues on whether privatization truly enhances service delivery or merely shifts burdens from the state to individuals (Uche, 2023). Globally, privatization trends vary, with some countries experiencing success while others face challenges such as reduced affordability and weakened public systems (World Bank, 2017). In Nigeria, the growing number of private tertiary institutions reflects both demand for alternatives to underfunded public schools and concerns over commercialization (Nwankwo, 2021). Effective regulation remains crucial to balancing privatization's benefits with equitable access and quality assurance (Ezeani, 2022).

Privatization in Education

Privatization in education refers to the increasing involvement of private entities in the ownership, funding, and management of educational institutions and services. This shift from public to private sector participation has become a global phenomenon, driven by factors such as government budget constraints, demand for quality education, and the belief that market forces can improve efficiency (Verger et al., 2016). In many countries, privatization manifests through private schools, charter schools, voucher systems, and public-private partnerships (Ball & Youdell, 2018). Proponents argue that privatization introduces competition, leading to improved educational outcomes, better infrastructure, and more innovative teaching methods (Chubb & Moe, 2018). Private institutions often have greater autonomy in curriculum design and hiring practices, allowing them to respond more flexibly to student needs (Tooley, 2020). However, critics caution that privatization can exacerbate educational inequality, as high tuition fees may exclude disadvantaged students (Lubienski & Lubienski, 2014). There are also concerns about the commercialization of education, where profit motives overshadow pedagogical goals (Srivastava, 2016). In developing nations like Nigeria, privatization has expanded access to education but raised questions about affordability and quality regulation (Oketch et al., 2021). While private universities often outperform public ones in infrastructure and student-teacher ratios, their high costs limit accessibility for many (Ajayi & Ekundayo, 2018). Governments must implement policies that ensure private institutions maintain quality while serving broader societal needs (UNESCO, 2021).

DIMENSIONS OF PRIVATIZATION IN EDUCATION

Privatization in education encompasses multiple dimensions that reflect the varied ways private sector involvement manifests in educational systems globally. These dimensions include ownership and governance, financing mechanisms, service provision, and regulatory frameworks, each contributing to the complex landscape of privatized education (Verger et al., 2016).

Ownership and governance refers to the transfer of school ownership from public to private entities, including individuals, religious organizations, or corporations (Ball & Youdell, 2008). Private schools operate with varying degrees of autonomy, often free from bureaucratic constraints faced by public institutions, allowing for more flexible management and curricular decisions (Chubb & Moe, 1990). However, this autonomy sometimes leads to inconsistencies in educational quality and accountability, as private owners may prioritize financial gains over pedagogical outcomes (Srivastava, 2013).

Financing represents another critical dimension, where private funding replaces or supplements public expenditure on education (Patrinos et al., 2009). Tuition fees, donations, and corporate sponsorships become primary revenue sources for private institutions, creating disparities in access based on socioeconomic status (Lubienski & Lubienski, 2014). In low-income countries, low-fee private schools have emerged as alternatives to underfunded public schools, yet their affordability remains questionable for the poorest households (Tooley, 2009). Public-private partnerships (PPPs) attempt to mitigate these inequities by combining state funding with private management, though their effectiveness varies widely across contexts (Robertson & Verger, 2012).

The dimension of service provision examines the roles private actors play in delivering educational services, extending beyond school ownership to include supplementary tutoring, textbook publishing, and technology-based learning platforms (Burch, 2009). Shadow education, or private tutoring, has grown into a lucrative industry, often exacerbating inequalities as wealthier students gain additional academic advantages (Bray, 2011). Meanwhile, ed-tech companies increasingly influence pedagogy through digital tools and online learning systems, raising questions about data privacy and the commercialization of student information (Williamson, 2021). These developments illustrate how privatization permeates various facets of education, often blurring the lines between public and private responsibilities.

Regulation constitutes a fourth dimension, where governments establish frameworks to oversee private sector participation in education (Morgan & Shahjahan, 2014). Effective regulation ensures that private institutions meet minimum quality standards, uphold equitable access policies, and align with national educational goals (UNESCO, 2021). In many developing nations, weak regulatory systems allow substandard private schools to proliferate, compromising learning outcomes (Heyneman & Stern, 2014). Conversely, excessive regulation may stifle innovation, discouraging private investment in education (Gingrich, 2011). Striking a balance between oversight and autonomy remains a persistent challenge for policymakers.

A fifth dimension involves ideological and discursive shifts that normalize privatization as a solution to educational crises (Apple, 2018). Market-oriented reforms, such as school choice and voucher systems, frame education as a commodity rather than a public good (Lipman, 2011). This ideological shift often justifies the reduction of public education funding, reinforcing reliance on private alternatives (Hursh, 2016). Critics argue that such narratives undermine collective responsibility for equitable education, disproportionately affecting marginalized communities (Giroux, 2012).

The global dimension of privatization highlights how international organizations and transnational corporations influence national education policies (Spring, 2015). Multilateral agencies like the World Bank often promote privatization as part of structural adjustment programs, particularly in debt-laden countries (Klees, 2012). Transnational edu-businesses, such as Pearson and Bridge International Academies, export standardized school models to low-income regions, sometimes disregarding local cultural and pedagogical contexts (Menashy, 2016). These trends reflect the growing power of global actors in shaping educational systems worldwide.

Lastly, the equity dimension underscores privatization's mixed consequences for social justice (Reay, 2012). While some private initiatives improve access and quality for underserved populations, others deepen stratification by catering exclusively to elites (Van Zanten, 2015). For instance, elite international schools offer world-class facilities to affluent students, while low-fee private schools serving the poor often lack basic resources (Ashley et al., 2014). Policymakers must address these disparities through targeted subsidies, cross-subsidization models, and inclusive regulatory policies (Day Ashley et al., 2014).

Privatization in education thus operates through interconnected dimensions, each presenting unique opportunities and challenges. While private sector involvement can drive innovation and efficiency, unchecked commercialization risks exacerbating inequality and eroding education's public mission (Rizvi & Lingard, 2010). Future reforms must prioritize equitable access, robust regulation, and democratic accountability to ensure education serves as a catalyst for social progress (Tarlau, 2019).

Understanding Accessibility in Higher Education

Accessibility in higher education refers to the removal of barriers that prevent equitable participation, ensuring all individuals can pursue tertiary learning regardless of socioeconomic status, disability, or geographic location (Marginson, 2016). While enrollment rates have risen globally, disparities persist, particularly for marginalized groups such as low-income students, rural populations, and persons with disabilities (UNESCO, 2020). Financial constraints remain a primary obstacle, as tuition fees, accommodation costs, and indirect expenses like transportation exclude many qualified candidates (Johnstone & Marcucci, 2010). Countries with robust public funding, such as Germany and Norway, demonstrate higher accessibility, whereas reliance on private financing in nations like the U.S. and Nigeria exacerbates inequality (Altbach et al., 2019).

Geographic accessibility also limits opportunities, as rural students often lack nearby institutions or reliable infrastructure to commute (Castaño-Muñoz et al., 2018). Online education has expanded reach, yet digital divides in internet access and technological literacy hinder its potential (Selwyn, 2019). For students with disabilities, physical infrastructure, assistive technologies, and inclusive curricula remain inconsistent, despite legal frameworks like the UN Convention on the Rights of Persons with Disabilities (Moriña, 2017). Systemic biases, including racial and gender discrimination, further restrict access, particularly in STEM fields (Arday & Mirza, 2018). Policy interventions such as need-based scholarships, affirmative action, and infrastructure investments have improved accessibility but require scaling (Tinto, 2012). Community colleges and open universities offer flexible pathways, though quality assurance remains a concern (Daniel, 2016). To achieve true inclusivity, institutions must address intersecting barriers through holistic reforms, from financial aid to pedagogical adaptation (Shavit et al., 2022).

Quality in Tertiary Education

Quality in tertiary education encompasses multiple factors including curriculum relevance, teaching excellence, research output, infrastructure adequacy, and graduate employability (Harvey & Green, 2020). Institutions demonstrating high quality typically balance academic rigor with practical skills development, preparing students to meet labor market demands (Altbach et al., 2019). Effective teaching methods, such as student-centered learning and technology integration, enhance engagement and knowledge retention (Biggs & Tang, 2011). Research quality, measured through publications, citations, and innovation contributions, remains a critical indicator of institutional prestige (Shin & Teichler, 2014). However, excessive focus on research metrics sometimes overshadows teaching quality, creating imbalances in faculty priorities (Arimoto, 2021).

Infrastructure, including laboratories, libraries, and digital resources, directly impacts learning experiences (Kuh et al., 2022). Well-equipped facilities support both theoretical and applied learning, particularly in STEM fields (Marginson, 2016). Quality assurance mechanisms, such as accreditation and peer reviews, help maintain standards but vary significantly across regions (Stensaker & Harvey, 2019). In developing countries, resource constraints often compromise quality, leading to overcrowded classrooms and outdated materials (Teferra & Altbach, 2021). Graduate outcomes provide tangible evidence of quality, with employability rates and employer satisfaction serving as key metrics (Yorke, 2020). Institutions fostering

strong industry partnerships tend to produce work-ready graduates (Bridgstock, 2020). Student satisfaction surveys also offer insights into institutional effectiveness, though they may not fully capture long-term educational impact (Douglas et al., 2021). Continuous improvement through feedback loops and curriculum updates ensures institutions adapt to changing societal needs (El-Khawas, 2020).

Historical Context of Privatization in Nigerian Tertiary Education

The privatization of tertiary education in Nigeria emerged from a complex interplay of economic, political, and social factors dating back to the post-independence era. Following Nigeria's independence in 1960, the government maintained strong control over higher education, establishing universities as public institutions to drive national development (Jibril, 2012). The oil boom of the 1970s initially allowed for substantial public investment in education, but the subsequent economic downturn in the 1980s, exacerbated by structural adjustment programs (SAPs), forced the government to reduce funding for public universities (Obioma, 2015). This fiscal crisis created space for private sector involvement as demand for higher education continued to grow amidst declining public sector capacity (Okebukola, 2020).

The 1990s marked a turning point with the establishment of the first private universities, such as Babcock University and Madonna University, approved by the federal government to address enrollment pressures and improve quality (Ajayi & Ekundayo, 2018). These institutions were initially met with skepticism, as critics questioned their affordability and potential to deepen educational inequality (Nwankwo, 2021). However, persistent strikes, underfunding, and infrastructural decay in public universities gradually increased acceptance of private alternatives (Okafor, 2020). The National Universities Commission (NUC) introduced regulatory frameworks to standardize private institutions, though enforcement remained inconsistent (Ezeani, 2022).

The 2000s witnessed rapid growth in private tertiary institutions, including polytechnics and colleges of education, driven by entrepreneurial and religious organizations (Okojie, 2019). Public-private partnerships (PPPs) gained traction, with private entities managing hostels, lecture halls, and other facilities in public universities (Uche, 2023). Despite this expansion, privatization has faced criticism for prioritizing profit over pedagogy, with many private institutions charging fees beyond the reach of average Nigerians (Adenuga, 2021). Recent debates focus on balancing privatization's role in expanding access while ensuring quality and equity (Obi & Nwachukwu, 2020).

DRIVERS OF PRIVATIZATION IN NIGERIA'S HIGHER EDUCATION SECTOR

The privatization of Nigeria's higher education sector has been shaped by several interrelated factors. These drivers explain the growing presence of private universities alongside public institutions:

Government Inability to Meet Funding Demands

Chronic underfunding of public universities has created space for private sector participation. The Nigerian government allocates less than 10% of its annual budget to education, far below the UNESCO-recommended 26% (Okebukola, 2020). This funding gap results in inadequate

infrastructure, poor staff remuneration, and frequent strikes in public institutions (Adeyemi & Akpotu, 2016). Private universities emerged to fill this vacuum, offering alternatives to overcrowded public institutions (Ajadi, 2010). The financial constraints of public universities make privatization an attractive option for expanding access.

Rising Demand for Tertiary Education

Nigeria's rapidly growing youth population has created unprecedented demand for higher education. With over 1.5 million candidates seeking university admission annually but public institutions absorbing less than 30%, a significant gap exists (JAMB, 2023). Private universities help absorb this excess demand, particularly from middle-class families seeking guaranteed admission (Nwankwo, 2014). The mismatch between supply and demand in public institutions continues to drive privatization.

Quest for Quality Education

Dissatisfaction with declining standards in public universities has fueled demand for private alternatives. Many public institutions struggle with outdated curricula, overcrowded classrooms, and inadequate facilities (Ogunode et al., 2021). Private universities market themselves as providing better learning environments, smaller class sizes, and more modern teaching methods (Ajayi & Ekundayo, 2019). This perceived quality differential attracts families willing to pay premium fees.

Entrepreneurial Opportunities

Higher education presents lucrative investment opportunities for private investors. The growing middle class and cultural value placed on university education create a ready market (Okafor, 2020). Religious organizations and wealthy individuals see university ownership as both a social service and status symbol (Ojo & Olaniyan, 2020). The potential for financial returns, combined with philanthropic motivations, drives private sector participation.

Policy and Regulatory Changes

Government policies have actively encouraged private sector involvement in higher education. The 1993 decision to license private universities marked a turning point (NUC, 2021). Subsequent policies reduced entry barriers and streamlined approval processes (Federal Ministry of Education, 2019). These regulatory changes created an enabling environment for private investment in tertiary education.

Impact of Privatization on Accessibility in Tertiary Institutions

Privatization in tertiary education has transformed the structure and delivery of higher education globally. While proponents argue that privatization improves efficiency and quality, critics raise concerns about its effects on accessibility:

Increased Tuition Fees

Privatization often leads to higher tuition fees as institutions seek financial sustainability through student payments. Public universities, facing reduced government subsidies, increasingly adopt cost-sharing models, shifting the burden to students and families (Johnstone & Marcucci, 2010). In Nigeria, for instance, the introduction of privatization policies resulted in significant fee hikes, limiting access for low-income students (Okebukola, 2018). Similarly, in the United States, privatization trends have contributed to rising student debt, disproportionately affecting marginalized groups (Cellini & Goldin, 2014). These financial barriers restrict enrollment for economically disadvantaged students, reinforcing inequality in higher education.

Reduced Equity in Enrollment

Privatization exacerbates disparities in access to tertiary education, particularly for underprivileged populations. As public institutions adopt market-driven policies, enrollment becomes more stratified along socioeconomic lines (Marginson, 2016). In Brazil, privatization widened the gap between affluent and low-income students, as wealthier families could afford high-quality private institutions while public universities faced funding cuts (McCowan, 2015). Gender disparities also emerge, with female students in developing countries facing greater exclusion due to financial constraints (Unterhalter, 2020). Without strong equity-focused policies, privatization reinforces existing social inequalities.

Expansion of Private Institutions

The growth of private tertiary institutions is a direct consequence of privatization. While these institutions increase the overall supply of higher education, their profit-oriented nature often prioritizes affordability for only a select few (Levy, 2011). In sub-Saharan Africa, the rapid rise of private universities has provided additional enrollment opportunities, but quality and affordability remain concerns (Wangenge-Ouma & Cloete, 2019). Many private institutions charge high fees, catering primarily to elite students while neglecting broader accessibility (Varghese, 2013). This trend creates a dual system where only those with financial means can access high-quality education.

Shift in Government Funding Priorities

Privatization reduces government investment in public tertiary institutions, redirecting funds to other sectors. This decline in public funding forces universities to seek alternative revenue sources, often at the expense of accessibility (Ziderman & Albrecht, 2019). In the United Kingdom, reduced state support led to tuition increases, making higher education less accessible for working-class students (McGettigan, 2013). Similarly, in India, privatization policies diminished public university funding, widening the accessibility gap between rich and poor students (Tilak, 2021). When governments prioritize privatization over public investment, accessibility suffers, particularly for disadvantaged groups.

Impact of Privatization on Quality of Education in Tertiary Institutions

Privatization has reshaped tertiary education globally, influencing institutional operations, funding models, and academic standards. While some argue that privatization enhances efficiency and innovation, others contend that it compromises educational quality:

Commercialization of Education

Privatization often shifts the focus of tertiary institutions from academic excellence to profit generation. As universities adopt business-oriented models, student satisfaction and enrollment numbers may take precedence over rigorous academic standards (Molesworth et al., 2009). In many private institutions, marketing strategies prioritize attracting fee-paying students over maintaining high-quality instruction (Naidoo & Jamieson, 2018). This trend can lead to diluted academic rigor, as institutions may lower admission requirements or reduce grading standards to retain students (Altbach, 2014). When education becomes a commodity, the emphasis on learning outcomes diminishes, affecting overall quality.

Faculty Workload and Morale

Privatization frequently increases teaching loads while reducing job security for academic staff. Many private institutions hire adjunct or part-time faculty to cut costs, leading to high turnover rates and decreased morale (Rhoades, 2019). Overworked faculty members have less time for research, curriculum development, and student mentorship, negatively impacting educational quality (Finkelstein et al., 2016). In some cases, privatization policies weaken unions and collective bargaining, further eroding faculty working conditions (Kezar & Maxey, 2013). Without stable, well-supported faculty, institutions struggle to maintain high teaching standards.

Infrastructure and Resource Allocation

Private institutions may invest heavily in visible amenities to attract students while neglecting essential academic resources. Some for-profit universities prioritize luxurious facilities over well-equipped libraries, laboratories, and research funding (Eisenmann, 2017). In contrast, public universities facing privatization pressures often experience budget cuts, leading to deteriorating infrastructure (Wangenge-Ouma, 2020). Inadequate funding for research, technology, and learning materials directly affects the quality of education, limiting students' access to necessary academic tools (Tilak, 2021). When financial priorities shift away from core academic needs, institutional quality suffers.

Curriculum Relevance

Privatization can lead to curricula designed for marketability rather than academic depth. Many private institutions favor programs with high enrollment potential, such as business and technology, while reducing support for humanities and basic sciences (Marginson, 2016). This trend narrows educational diversity and may produce graduates with limited critical thinking skills (Nussbaum, 2010). Additionally, corporate influence on curriculum development can prioritize job-specific training over holistic education, reducing intellectual rigor (Slaughter &

Rhoades, 2010). When curricula are shaped by market demands rather than academic principles, the overall quality of education declines.

Academic Standards and Accreditation

Privatization pressures can weaken regulatory oversight, leading to inconsistent academic standards. Some private institutions, particularly in unregulated markets, operate with minimal accreditation, offering degrees of questionable value (Kinser & Levy, 2011). In countries with weak regulatory frameworks, diploma mills and low-quality providers proliferate, undermining the credibility of higher education (Stensaker & Harvey, 2018). Even in well-regulated systems, privatization can create disparities between elite private institutions and underfunded public ones, leading to uneven quality across the sector (Altbach & Selvaratnam, 2020). Without strong quality assurance mechanisms, privatization risks eroding academic integrity.

COMPARATIVE ANALYSIS: PUBLIC VS PRIVATE TERTIARY INSTITUTIONS IN NIGERIA

The Nigerian higher education system comprises public and private tertiary institutions, each with distinct characteristics, strengths, and challenges. While public universities have historically dominated, private institutions have grown significantly since the 1990s:

Funding and Affordability

Public universities in Nigeria primarily rely on government funding, though inadequate allocations have led to chronic underfunding (Okebukola, 2018). Frequent strikes by academic staff over poor remuneration and working conditions disrupt academic calendars, affecting institutional stability (Ajadi, 2010). In contrast, private universities depend on tuition fees, making them more financially stable but less affordable for many students (Nwankwo, 2014). The average tuition in private universities ranges from ₦500,000 to over ₦2 million per session, while public universities charge between ₦30,000 and ₦150,000 (Okojie, 2021). This cost disparity limits access to private institutions for low-income students.

Quality of Education

Public universities often face overcrowded classrooms, outdated curricula, and insufficient teaching resources due to funding constraints (Adeyemi & Akpotu, 2016). However, they retain some of the country's most experienced faculty members and stronger research traditions (Oladipo et al., 2020). Private universities, with smaller student populations, provide more personalized education, better lecturer-student ratios, and modernized curricula (Ajayi & Ekundayo, 2019). Yet, many struggle with inexperienced faculty and weak research output due to limited funding for academic development (Egwu, 2021). Accreditation reports from the National Universities Commission (NUC) show that while some private institutions excel, others compromise standards to maximize profits (NUC, 2022).

Access and Equity

Public universities admit a larger percentage of Nigeria's tertiary students due to lower fees and federal/state subsidies (Jegede, 2017). However, admission remains highly competitive, with fewer than 30% of applicants securing placements annually (Utulu & Alonge, 2013). Private universities, though less congested, cater mostly to affluent students, reinforcing socioeconomic disparities (Okafor, 2020). Gender imbalances persist in both sectors, with female enrollment lower in science and technology programs (Ezeahurukwe, 2019). While public institutions attempt inclusivity through quotas and scholarships, private universities rarely implement similar equity measures (Okafor, 2022).

Infrastructure and Facilities

Many public universities suffer from deteriorating infrastructure, including inadequate lecture halls, poor hostel conditions, and insufficient laboratories (Ogunode et al., 2021). Underfunding delays facility maintenance and technological upgrades (Aina, 2019). Private institutions generally have better-maintained campuses, modern lecture halls, and advanced learning technologies due to higher tuition revenues (Ojo & Olaniyan, 2020). However, smaller private universities sometimes lack comprehensive facilities, such as fully equipped libraries and research labs (Adeyemo, 2021). Public universities, especially first-generation institutions like the University of Ibadan and Ahmadu Bello University, still hold advantages in specialized research facilities (NUC, 2023).

Governance and Administration

Public universities face bureaucratic inefficiencies due to government interference, delayed approvals, and politicized appointments (Olayinka & Adedeji, 2018). Frequent strikes by unions disrupt academic activities, prolonging degree completion times (Omodan, 2020). Private universities operate with more administrative flexibility, enabling faster decision-making and policy implementation (Adegbite & Alabi, 2021). However, some private institutions face criticism for excessive control by proprietors, leading to non-academic influences on governance (Okafor, 2021). Regulatory oversight by the NUC ensures baseline standards, but enforcement remains stricter for public universities (NUC, 2023).

Policy and Regulatory Challenges

The privatization of tertiary education in Nigeria has introduced significant changes to the higher education landscape, presenting both opportunities and challenges. While privatization aims to improve efficiency and expand access, it has also created several policy and regulatory dilemmas that affect educational quality and equity:

Inadequate Quality Assurance Mechanisms

The rapid proliferation of private tertiary institutions has outpaced the capacity of regulatory bodies to maintain consistent quality standards. The National Universities Commission (NUC) struggles to effectively monitor the growing number of private universities, leading to variations in educational quality (Okebukola, 2020). Some private institutions prioritize profit over academic excellence, resulting in compromised standards (Adeyemi, 2019). The current accreditation system focuses largely on inputs like infrastructure rather than learning outcomes, failing to ensure meaningful quality benchmarks (Jega, 2021). Without stronger quality control measures, privatization risks eroding the value of Nigerian degrees.

Unaffordable Tuition and Limited Financial Aid

Privatization has significantly increased the cost of tertiary education, creating accessibility barriers for low-income students. Private universities charge fees up to ten times higher than public institutions, effectively excluding economically disadvantaged populations (Okojie, 2022). Existing student loan schemes and scholarship programs remain inadequate to bridge this affordability gap (Nwadiani, 2016). The government lacks comprehensive policies to ensure private institutions allocate sufficient funds for need-based financial aid (Okafor, 2021). This financial exclusion contradicts national goals of equitable access to higher education.

Weak Regulation of Public-Private Partnerships

The growing trend of public-private partnerships in tertiary education lacks clear regulatory frameworks. Some collaborations between public universities and private entities have led to commercialization of academic programs without proper oversight (Ajayi, 2020). The absence of standardized guidelines creates inconsistencies in program quality and fee structures (NUC, 2023). Some partnerships prioritize revenue generation over educational objectives, potentially compromising academic integrity (Oladipo, 2022). Without stronger partnership regulations, these arrangements may exacerbate existing inequalities in the education system.

Faculty Shortages and Brain Drain

Privatization has intensified competition for qualified academic staff, particularly in specialized fields. Many private institutions offer higher salaries, attracting experienced faculty from public universities (Aina, 2021). This brain drain weakens public institutions already struggling with staff shortages (Egwu, 2020). Current policies fail to address the uneven distribution of academic staff across institutions (Jibril, 2019). The lack of national strategies for faculty development and retention threatens the long-term quality of tertiary education in both public and private sectors.

Uneven Geographical Distribution

The concentration of private tertiary institutions in urban areas exacerbates regional educational disparities. Over 70% of private universities are located in southern Nigeria, limiting access for northern populations (NUC, 2022). Existing policies do not effectively incentivize private

investment in educationally disadvantaged regions (Ezeahurukwe, 2021). This geographical imbalance contradicts national objectives of balanced educational development (Federal Ministry of Education, 2020). Without targeted regional policies, privatization may widen existing educational inequalities across Nigeria's geopolitical zones.

THE WAY FORWARD: POLICY OPTIONS AND STRATEGIC INTERVENTIONS

The privatization of tertiary education in Nigeria presents both opportunities and challenges that require thoughtful policy responses. As the sector continues to evolve, strategic interventions must address accessibility concerns while maintaining educational quality:

Strengthening Regulatory Frameworks for Quality Assurance

The National Universities Commission (NUC) needs enhanced capacity to monitor both public and private institutions effectively. A revised accreditation system should focus on learning outcomes rather than just physical infrastructure (Okebukola, 2020). Implementing regular, unannounced quality audits would help maintain standards across institutions (Jega, 2021). The NUC could establish minimum faculty qualification requirements and student-teacher ratios for all universities (Adeyemi, 2019). Developing a national qualifications framework would ensure consistency in degree standards regardless of institutional ownership (NUC, 2023). These measures would help prevent the erosion of educational quality while allowing for institutional diversity.

Developing Comprehensive Financial Aid Systems

The government should create need-based scholarship programs specifically for students in private institutions (Okojie, 2022). Expanding the existing Students' Loan Scheme to cover private university tuition would improve accessibility (Nwadiani, 2016). Private institutions could be required to allocate a percentage of their revenue to financial aid as a condition of licensure (Okafor, 2021). Tax incentives for corporations that fund scholarships would encourage private sector participation in education financing (Ajayi, 2020). Such financial support systems would help mitigate the exclusionary effects of high tuition fees while maintaining institutional autonomy.

Promoting Equitable Geographic Distribution

The NUC should implement zoning policies to ensure balanced regional development of private institutions (NUC, 2022). Offering tax holidays and infrastructure support could incentivize private investors to establish universities in educationally disadvantaged regions (Ezeahurukwe, 2021). The government could create special development funds for private universities that meet location criteria (Federal Ministry of Education, 2020). Existing public institutions in underserved areas could form partnerships with private providers to expand access (Oladipo, 2022). These approaches would help address Nigeria's uneven educational development while expanding overall capacity.

Enhancing Faculty Development and Retention

A national faculty development program could address shortages in both public and private sectors (Aina, 2021). The government might establish special salary supplements for lecturers in critical fields to prevent brain drain (Egwu, 2020). Private universities could be required to invest a percentage of tuition revenue in staff development (Jibril, 2019). Creating inter-institutional faculty exchange programs would help share expertise across the higher education system (Okebukola, 2020). Such measures would strengthen the academic workforce while promoting collaboration between public and private institutions.

Fostering Responsible Public-Private Partnerships

Clear guidelines should govern collaborations between public universities and private entities (Ajayi, 2020). The NUC could establish standard templates for partnership agreements that protect academic integrity (NUC, 2023). A dedicated oversight body might monitor partnership programs to ensure quality and affordability (Oladipo, 2022). The government could create matching grant programs to encourage beneficial partnerships that serve public interests (Federal Ministry of Education, 2020). These structured approaches would help harness private sector resources while safeguarding educational values.

Strategic Implementation Considerations

The success of these policy options depends on careful implementation strategies. Phased rollouts would allow for testing and refinement of new systems (Jega, 2021). Stakeholder consultations with university administrators, faculty groups, and student organizations would improve policy design (Adeyemi, 2019). Regular impact assessments would enable data-driven adjustments to the interventions (NUC, 2022). Strong political will and sustained funding commitments would be essential for meaningful reform (Okebukola, 2020).

CONCLUSION

Privatization has brought significant changes to tertiary education in Nigeria, affecting both accessibility and quality. On one hand, private institutions have increased the number of available spots for students, offering alternatives to overcrowded public universities. This has allowed more students to pursue higher education, especially those who can afford the higher fees. However, the cost of private education has also created barriers for many low-income families, limiting access for a large portion of the population. In terms of quality, private universities often boast better facilities, smaller class sizes, and more dedicated staff compared to underfunded public institutions. This has raised standards in some areas, pushing public universities to improve. Yet, not all private schools maintain high-quality education, as some prioritize profit over academic excellence. The government must ensure proper regulation to prevent exploitation and maintain standards across all institutions. Balancing accessibility and quality remains a challenge. While privatization has introduced competition and improvements, it has also deepened inequalities. Policymakers need to address these gaps to ensure that all Nigerian students, regardless of economic background, have access to quality tertiary education.

Suggestions

To maximize the impact of privatization on accessibility and quality in tertiary institutions in Nigeria, the following suggestions are made:

- The government should enforce stricter accreditation standards for private institutions to ensure they meet minimum quality benchmarks. Regular inspections and performance evaluations will help maintain academic excellence while preventing exploitative practices. Transparent regulations will also build public trust in private education, encouraging more students to enroll without fear of substandard learning conditions.
- Educational managers should collaborate with private institutions to expand access through scholarship programs and subsidized tuition for low-income students. Private universities can offer more affordable education while maintaining quality by partnering with businesses and donors. Such initiatives will bridge the gap between cost and accessibility, making privatization more beneficial for a wider population.
- Stakeholders must prioritize training and competitive remuneration for lecturers in both public and private institutions. Well-trained faculty improves teaching quality, research output, and student outcomes. Private universities should be encouraged to invest in continuous professional development, ensuring that their academic members of staff remain competent and motivated.
- The government should introduce policies that incentivize private institutions to admit more students from disadvantaged backgrounds. Tax breaks, grants, or matching-fund schemes could encourage private universities to lower fees for qualified but financially constrained students. This approach would make privatization more inclusive, ensuring that quality education reaches all segments of society.

ABSTRACT

The study investigated the administrative problems encountered by Public senior secondary school principals in Rivers State. Survey research design was adopted for the study. Four research questions and three hypotheses guided the study. The population for the study comprised the 356 principals of the 356 public senior secondary schools in Rivers State as they respondents. A total of 365 principals were sampled for the study, making a sample size of 365 respondents. Instrument for data collection was a researcher developed instrument tagged; Administrative Problems Encountered by Public senior Secondary School Principals Questionnaire (APEPSSSPQ). The instrument was validated by three experts, two in Educational Management and one in Measurement and Evaluation. All the experts are of the Faculty of Education. The reliability coefficient of the instrument was administered using Cronbach Alpha. The alpha value cluster by cluster was; .75, .78, .76 and 81 for clusters 1, 2, 3 and 4 respectively. The overall reliability was .89 indicating that the instrument was highly reliable for the study. The research questions were answered using mean and grand mean ratings, while the hypotheses were tested using t-test statistics at .05 level of significance. Results of the data analysis indicate that; funding, infrastructural deficit, communication and indiscipline amongst staff and students are some of the administrative problems encountered by principals of public senior secondary schools in Rivers State. Some of the recommendations include; adequate funding and provision of requisite infrastructure for the schools amongst others. Implications of the findings were highlighted and suggestions for further studies were made.

Keywords: Administration, Funding, Communication, Infrastructural Deficit, Indiscipline.

INTRODUCTION

There are forms and different types of Administrations. Households, workers, Consumers, Firms, Governments undertake one form of Administration or another in the various capacities. They also encounter one form of Administration problems or another. This state of affair applied to

education institutions as well. Education is a big business, and like all large- scale business concerns, it requires careful forecasting, planning and co-ordination. In the secondary schools setting the task of forecasting, planning and co-ordination rest squarely on the school heads.

The position of the school heads, by its very nature, demand constant appraisal in the interest of secondary school education in Nigeria. As the Chief Executive, the Principal has the oneness responsibility of ensuring that orderliness and efficiency prevail, especially in the areas of school plants and facilities, students and staff personnel administration, Communication, Finance and Community related issues. This is particularly because, effective mobilization and utilization of these elements in secondary school administration provide significant basis for workable administrative machinery in the educational system in public senior Secondary schools in Rivers State. Anything to the contrary shall invariably generate administrative problems.

Apparently, the administrative procedures in an educational environment may not be written in a handbook, but they exist side by side with everyday decisions. This is particularly because of the recent turn of events in secondary school education and the varied educational goals which secondary School administrators constantly seek to achieve. At secondary school level, the creative principal shall always find things going for him. According to Jay (2007), today's success came from yesterday's creativeness and there will always be a need for the efficient Manager of a going concern who has original ideas to contribute and who keep things running happily and profitable once they have been devised and started.

The practitioners of educational administration include among others, the principals, who are the chief executive in secondary school administration, the Supervisors, who represent the state school Commissions and the inspectors, who act on behalf of the Ministers of education. According to Mgbodile (2010) it is the role of school administrators to "Plan how far the daily activities in the school will go and how to get these fast with minimum expenditure of energy, organize properly by placing teachers in position commensurate with their qualifications, attract enough teachers who are competent in their area of specialization, direct and stimulate his staff as well as appraise, control and evaluate teaching tactics and materials budget by allocating available funds judiciously. Ideally, since administrative productivity is the relationship between the cumulative benefits derived from it after a given period and the corresponding inputs that is, planning, budgeting, investment incurred etc. it is the role of administrator to perform the above responsibilities systematically, carefully and decisively if the educational objectives are to be realized and adequate progress made.

However, it is important to observe the administrative problems as Perceived by all public senior secondary school Principals in Rivers State may vary due to situational factors. This consideration is necessary because, as Mgbodile et al (2007) puts it "The concern for administration whether at the international, National, State, Local or at different school levels, must, for the administrator, be a matter not only of producing blue prints but also of adroitly devising strategies by which they may become realities". Hence, the institution called education is quite a dynamic enterprise, so much that even when all the required financial provisions are made, the necessary infrastructural facilities and services are available and met. Professional and ethical efficiency would still not be as a result of the inherent, almost palpable factors in human errors of omission and commission, economic upheavals school polities etc. These factors may on their own play very decisive roles in determining the administrative problems of public senior secondary school in Rivers State.

Statement of the Problem

The identification of problem is certainly an important step towards solving problem in educational administration. But no matter the amount of effort put in by the principals', it has been known that some of them who had initially been term "good" to a certain extent in their administration, but because of human errors or by omission and commission, economic upheavals, school politics, etc. later fall to the lowest esteem than had prevailed at the assumption of office. In most cases, it is noticed that most principals are deeply disillusioned and overburdened with all sort of problems on their job and these makes some of them either to be sacked or terminate their appointment, demoted or asked for compulsory retirement.

Purpose of the Study

The purpose of this study was to investigate the administrative problems of public senior secondary school Principals in Rivers State. Specifically, the study sought to:

- Investigate funding as an administrative problem of public senior secondary school principals in Rivers State.
- Examine infrastructure as an administrative problem of public senior secondary school principals in Rivers State.
- Find out how communication is an administrative problem of public senior secondary school principals in Rivers State.
- Investigate indiscipline as administrative problem of public senior secondary school principals in Rivers State.

Research Questions

The following research questions were formulated to guide the study:

- How is funding an administrative problem of public senior secondary school principals in Rivers State.
- How is infrastructure an administrative problem public senior secondary school principals in Rivers State.
- To what extent is communication an administrative problem of secondary school principals in public senior secondary school principals in Rivers State.
- To what extent is indiscipline an administrative problem public senior secondary school principals in Rivers State.

Hypotheses

The following null hypotheses tested at .05 level of significance were formulated to guide the study:

- Ho1: There is no significant difference between the mean rating of principals on poor funding as an administrative problem confronting Principals public senior secondary school principals in Rivers State.

- Ho2: There is significant difference between the mean rating of principals on infrastructure as an administrative problem confronting principals of public senior secondary school principals in Rivers State.
- Ho3: There is no significant difference between the mean ratings of principals and teachers on communication as an administrative problem of public senior secondary school principals in Rivers State.
- Ho4: There is significant difference between mean ratings of principals and teachers on indiscipline as an administrative problem of public senior secondary school principals in Rivers State.

REVIEW OF RELATED LITERATURE

This chapter deals with views, ideas and recent observations of some expert about principal supervision in public senior Secondary Schools Rivers State. In any organization, establishment or institution administration is the vital organ for ensuring effective and efficient planning, organization control and assessment of the programmes and activities require for the attainment of the set goals. Administration is thus, demanded by all formal organizations, and its increased application in due largely to requirements created by the growth and complexity of rational organizations of which educational institutions are a major part. In its proper use in education, administration is closely related in content to such words as superintendence, supervision, planning, direction, organization, control, guidance and regulation. Besides, referring to the process or activity of managing people and materials, the term is regularly used to designate the person or persons in charge of activity.

The Concept of Administration

The purpose of this sub-section is to identify and review the basic concept underlying the principles and practice of administration but with particular reference to educational administration. Defining administration in relation to education, Mgbodile (2016) said "Administration is a key element for the Direction and achievement of educational goals such as the preparation of school administrators and supervisors, recruitment and training school teachers, curriculum designs and implementation of cost-benefit analysis, management and maintenance of schools". Ericson, (2010) on his own part, described educational administration as "A relatively new discipline concerned with the management of educational enterprise in communities, region and nations". To Reisesen, educational administration basically involves knowledge of the structure of educational organizations and the administrative processes related to the management of those organizations.

However, looking at the term administration in general, Walton (2019) said that administration per se is the capacity to co-ordinate many and often conflicting social energies in a single organization so adroitly that they shall operate as a unity. But, Mgbodile (2016) noted that administration has also to do with the art of influencing and promoting human behaviour for the purpose of achieving the defined goals of an organization. From Mgbodile's point of view, administration can be said to be a veritable instrument for predicting results and influencing outcome. The economic significance of anybody or things having the ability to predict results lied in the fact that firstly, they would aid the process of capital formation and budgeting system. Secondly, they will give rise to new activities or stimulate established ones. Thirdly, they would

maintain functional relationships. Supporting the above statement, Walton (2020) opined that the science of administration is a system of knowledge whereby man may understand relationships, predict results and influence outcome in any situation where men are organized at work together for a common purpose".

Generally, administration is a hierarchy of subordinate-super-ordinate relationship within an institution. And in this relationship, three- dimension, that is the range of the roles and facilities legitimately included within the interaction, the affectivity dimension that is the distinctive characters of the personal relationship. According to Walton, it is the subordinate-super-ordinate relationship that gives meaning and functional bureaucracy to administrative decisions and policies. Supporting the above view, Harold (2017) had this to say, administration has meaning only when the instructional service is attaining its proper ends. In his own words, Ezeocha (2015) maintained that administration in a broad sense means management; it is concerned with the management of factors of production resources for the achievement of particular ends. Robbins (2020) defined administration as the universal process of efficiently getting activities completed with the other or through people from Robbins point of view, it presupposes that administration works along the same system as management by objectives (MBO). This point was also buttressed by Neman (2011) when he defined administration as the guidance, leadership and control of the efforts of a group of individuals towards some common goal. Simply put, Naman is of view that administration works with and through people and focuses mainly on goal attainment.

Others like Greg (2017), Ozigi (2017) and Nwankwo (2015), agreed that educational administration aims at using both human and Materials include officials of Ministry of Education and Post Primary School Management Board, Principals of Schools, teachers, students and non-teaching staff. To attain appreciable and effective height in administration, certain underlining principles call for mention. These principles, according to Mgbodile (2016) are the humanitarian principle, the prudential principle, the principle of change, the process principle and the executive leadership principle. To Mgbodile and others, the humanitarian principle relates to the issues affecting the general well-being of individuals in the organization. The principle of prudence relates to the ability of employing rational judgment, wisdom, experience, skill, etc., in the management of practice affairs. The principle of change on the other hand, relates to the ability of administrators to develop defensible plans for effecting appropriate changes, even though they may appear pressures for and against change from individual and groups.

The principle of process relates to the operating administrative rules which are vital for the understanding of the function involved in administration. These processes include what is to be done, how it will be done, with what, whom, when and how well done? It also involves decision making. Last but not the least, the principle of executive leadership or unity of command implies that how well each leader can fulfil the leadership potential is related to personal and situational factors as well as to his dynamic interactions with various groups in that situation.

The Concept of School Administration

The aim of this sub-section is to examine the concept of school administration with emphasis on the leadership roles and responsibilities of a school principal. There are certain basic qualities however, very widely according to personal characteristics. Nevertheless, it is expected that a leader with adequate technical skills and modest traits of personality will find most things going

for him. Generally, such a leader should have the ability to organize and delegate responsibility and authority successfully. He should also be able to demonstrate that he is not only knowledgeable in his particular field and profession but also that he is well versed in other areas and has up- to-date general knowledge of events and developments. Hence, be able to express his thoughts and ideas clearly and intelligently.

Agreeing to have observation, Ezeocha (2015) stated that leadership demands a lot of intellectual qualities such as sound judgment, resourcefulness, great sacrifice, broad mindedness, initiative, physical and mental efforts and the ability to foresee and analyse problems and offer possible solutions. Supporting Ezeocha, Spain (2016) contends that leaders are almost supermen who display qualities such as high intelligence, superior scholarship enthusiasm, friendliness, affection for people, and abundance of vitality and nervous energy and a good sense of humour. The list of qualities as purveyed by Spain and Ezeocha are by no means exhaustive. This is because, knowing the goals of his mission, as an administrator, the principal sees for himself a high standard in order to achieve his aims and then makes his own unique and significant contribution to the cause of education. In collaboration with the above postulation, Ruth and Lydia (2016) observed that great leader embodies certain other personal characteristics and attributes such as striking breath and grasp of information, clear and pronounced opinions on particular matters both in and outside their realms of activity, strong confidence in themselves, high level of skill in self-expression, and outstanding willingness to accept responsibility.

Therefore, an administrator is a coordinator who has to organize activities in such a way that things must work smoothly, quickly and effectively. According to Ezeocha (2020), he described the administrator as "Boss", leaders, head, adviser, problem solver and so forth. He is responsible for administering educational programmes. The society has created schools as basic instruments for producing the kind of citizens it deserves. The smooth running of the school has been placed under his Care and he is believed to be more than professional technician etc. He is actually the engineer of mankind upon who rest much of the responsibilities to fulfil, while at the same time administering educational programme which is in harmony with the constitutional and statutory provisions handed down from the federal and state governments. He is also expected by the community to Okay the laws, rules and regulations.

According to Campbell, "One of the major legal responsibilities of an administrator is to keep the lay board members informed concerning requirement and prohibitions". Informed boards can then pass local regulations, which the administrator is responsible for enforcing. To fulfil professional responsibilities, the modern administrator must have a well-rounded general education with intense study in the specialized field of educational administration and supervision. It should be understood that a large order of common sense is indispensable. With such equipment, the administrator is ready to move the system towards the overall goal of improving student learning. The capable administrator should imagine, dream and hope, for reaching well-defined goals otherwise, the school system wallows in mediocrity". For some years now, there has been a tremendous outcry on the so-called falling standard of education or to put it better low achievement scores of students in post primary schools. This is partly attributed to the ineffectiveness of principals, which is consequently to the administrative problem of these principals.

According to Ukeje et al (2019), the role of the leader is to point the directions, to inspire, to encourage etc. The leader serves as a catalyst and as a control agent. He is the institutions representative to the outside would and its leading salesman. The leader is an innovator, a germinate of ideas, able to see through the complex and confused order and he normally ask the

fundamental questions. The leader is the protector of the institution's essential vales from outside and attack. The leaders attract the trust and support the staff and the public and guide them to accomplishing the goals of the institution. Ukeje (2016) said that a good leader has eight good abilities that must exist if he or she is to be successful. First, is the ability to work with others: A good leader must be able to draw the support, cooperation and enthusiasm of the people around him. He elicits from them their best thinking and their honest opinions, since he knows that he does not have all the answer. Second, is the ability to think both analytically and intuitively: A leader must understand the complexities of educational, financial and managerial has lost sight of. Thirdly, is the ability to persuade, subordinates can be ordered with maximum commitment and alacrity.

Fourthly, is the ability to communicate effectively: A leader is able to translate ideas into potent vivid concept that are readily accessible to people and that serve to inspire and guide them. The fifth is the ability to operate a political arena. A leader must master the internal politics of his institution or risk being isolated and rendered ineffective. Sixth, is the ability to make decision and conversely not to make decisions: A leader must be able to make decision at the right moment, even when there is substantial risk in the decision. Seventh, is the ability to synthesize: A leader must avoid the temptation to become trapped in details.

The final, is the ability to establish and control a management system. A leader needs a systematic method for administrator that has all these qualities will be an outstanding leader. Basically, leadership is not a matter of passive status, nor does it develop upon a person; simply because he is the possessor of some combination of traits. Father, the leader acquired leadership status through the interaction of the organization in which he participates and demonstrates his capacity for assisting the organization complete its goals. Agreeing to this postulation, Stodgily (2018) said that a person does not become a leader by virtues of possessing a combination of traits, but the pattern of personal characteristics of the leader must bear some relevant relationship to the goals and objectives of the organization. From the point of view, of Stodgily, it becomes pertinent to point at the fact that a leader must follow laid down organization goals in exercising his powers, and must also be concerned in terms of the interactions of variables which are in constant flux of change. Actually, what the leader needs to do is to organize his multifarious relationships and attachments to a diversity of groups with skills and tact, and to resolve and allocate to their various positions of importance the numerous big parts which he is called upon successively, and indeed sometimes simultaneously to play - listener, encourages, dissuade, report, watches, judge, critic, decision maker and on occasions, commander (Bryan, 2020).

Talking of the leadership role of helping others to making intelligent choices, it is the believe of Drummond, et al that if a man is to solve his problems by peaceful and rational means, the ideas, attitudes, understandings and skills equal to the task must be developed in the young. It is also their believe that the principal, as a leader, has to furnish leadership in several different areas of responsibility such as leadership of the school staff, leadership in curriculum development, leadership in developing guidance services and activities to the instructional programme; leadership in the community and the profession.

However, most of the qualities which effective principal possess result from interest in the world and the people who inhabit it. It also results from the goals and expectations of the organization or institution where the principal derives his powers and legitimacy. These qualities are in essence, the marks of a mature person who has established for himself patterns of living

which will continually support basic human value and lead also to sound emotional growth and intellectual vitality.

In sum, Williams (2014) and Peters (2016) agreed that in both large and small schools the principal must fulfil a professional leadership role that calls for dignity, perception, scholarship, decision, courage and action. They also opined that no one expects educators to plot a perfect educational course for the future but however that the public does expects the educational leader, through the process of critical investigation and scholarly research, to be fully aware of the main stream of social events and tends that will have an impact on the educational programme and its product.

The Problems of School Administration

One of the major teaching issues in Nigerian educational system is the myriad of problems bedridden, the institution vis-à-vis their administrators, personal and professional problems such as orientation to a new school, demands on the principal's time by supervisor boards and teachers, student problems such as conducts, attendance, students organization and activities, students welfare, staff problems such as teachers personal characteristics and health, teachers responsibility, teachers selection and improvements, community problems involving parents, parent-teachers association, the public, operational problems such as funds, facilities and supplies, etc. (Hanford, 2018).

As already stated, one source of headache to educational administration is inadequate formal training of prospective and practicing administrators in educational administration, usually, principals assume their leadership positions without any formal training or orientation. They rely heavily on their previous classroom experiences for administering the school. This idea is obsolete because our schools have assumed a different shape from what they were during the time of the missionaries. For instance, there has been rapid increase in school population and consequent increase in teacher/pupil ratio, and the background of the pupils have become more varied and sophisticated. Also, teachers have become more in number in schools and however have better and more varied qualifications. All these call for a new orientation in school administration and for better and more purposeful training and preparation of principals to equip them with the necessary skills and competence required to administer and run our schools effectively. This is because they are the ones at the apex position in our secondary schools to translate educational policies into concrete behavioural actions.

Castaldi (2019) captured this state of affairs when he said, "We are now on the threshold of an exciting and challenging era in the administration of schools. Recent advances in electronics, teaching devices and automated instructional materials have been so rapid that administrators and partners have yet to realize their full impact. In corroboration with castaldi, Thorsten (2017) said in far too many situations that the principals are poorly trained for the emerging school curriculum that is rapidly developing. He is given the title of instructional leader, but neither the skills nor breadth and depth of background in each curriculum area to prepare him for the problems he faces today. From Thornsteins postulation, it could be deduced that the scientific revolution for knowledge tended to revolutionize man's attitude to knowledge and generated new and enthusiastic demand foe certitude, for production of results that are certain, effective and therefore beyond reproach, hence administration is so deeply ingrained in man daily activities that they are almost involuntary. Politicalization of schools is another problem in educational administration. For instance, every change of government means a

significant shift away from the existing educational policy. Bearrn 2017 and 2018, the military government paid greater attention to the provision of the educational opportunities at all levels by financing the UBE programme. It also established unity secondary schools, USS in every state of the federation and virtually owned and financed tertiary and university education, but as soon as the 2019-2013 civilian government came to power, most of the schemes where abandoned. Reacting to the above states of affairs, Baron (2017) stated that National styles of rhetoric can be a useful pointer to the mythologies which dominate, and in some ways bedevil the politics of educational administration viewed from a culture were defence of NPN value system carry heavy weight, emotional and otherwise, to NPP'S, NN'S or UPN'S value system in education.

There is also the problem arising from the attitude of educational planners themselves consequence upon poor linkage system. Apparently, there is no gain saying the fact that, at present what the colonial masters left has a great departure from what is expected of educational planners. Thus, when educational planners cannot keep education in pace with the dynamic society, its administrators are also handicapped. Consenting to this assertion, Ezeocha (2016) observed, the greatest influence on one educational system is that brought by the dogmatic attitude of our education planners. Either knowingly or unknowingly they have failed to keep education in pace with the dynamic society. The result is that what children are learning now in primary and secondary schools do not bear relevance to life in the society, apart from the inconsistency in the planning schedules, there is also the unequal take-off of planned educational policies and programmes. This lapse however, is the brunt of departmental mollycoddles and this generally compound the problems of the principals who have to wait for directives from 'above' before implementing certain policy decisions. Against this background, Boston (2012) stated that "one of the most important problems facing the educational administrator today is that of ascertaining ways of identifying and administering, controlling and managing ideas, human and non-human resources in the educational environment which affect the outcome of education.
To overcome this problem however, Boston recommended the use of a system known as management by objective (MBO). In this system, he contends that levels of personnel get involved in the planning for their areas of responsibility and in the management of the organization.

For Olutola (2014), another of the problem facing educational administration includes bureaucratization of the Ministry of education, religions influences, lack of funds and under streamline of grassroots organization. Supporting Ototola on the problem of lack of funds, Ezeocha (2019) said to operate any system or project without adequate finance is quite an uphill task which could lead to either non-accomplishment or frustration on the job. Ezeocha, (2019) states that what constitutes the most important part of an educational development plan is the fiscal resources to implement the plan. Ezeocha (2018) stated that for any organization or society to function well it must be financially viable. This is because finance is required for the establishment of infrastructures, equipment, salaries, etc. Ezeocha (2015) maintained that the situation in our society today is just as in most other facet of our national life. Most of our schools are poorly equipped, poorly accommodated and poorly maintained. This arises from the no money explanation usually given by our government even in the most of oil boom which should ensure adequate revenue to this nation. In any enterprise or organization, there is a fundamental need for finance and capital resources for the realization of goals. Whether or not a principal has a bursar, he has the responsibility of seeing to it that adequate financial provision is made in the budget for his school. Sectional and departmental heads are to be notified and

consulted about their departmental needs. Ozigi, (2016) states that it is the responsibility of the principal to see that the allocations in the school budget are spent according to the directives of the employer and in procedures. A principal is responsible for certain types of revenue collection, such as tuition fees, caution deposits, examination fees, uniform fees, etc., proper accounting procedure laid down by the employer should be followed by the principal. Ezeocha (2018) stated that "the principals have a duty of seeing that essential and basic equipment and materials are provided in adequate quantity and in good time". He should see to the satisfactory storage of the various items. A good register or all the equipment should be kept and carefully maintained. He should form a good habit of issuing and distributing items for the school. Apathy towards public schools, inadequate budget for our educational needs, dual administrative control, increasing demand for additional and special curriculum contribute for poor financing in our secondary schools in Rivers State. The result is inability of the leader of such schools to function properly and satisfactorily. Aside from the issue of inadequate facilities and supplies, there is also the nagging problem of community school relations. It is a known fact that most leadership functions of principals are exercised within the schools the school system, but the success or failure of these functions is largely dependent on the general educational environment of the communities and their value system. For instance, the principal of a school may find himself in a community where he is not an indigene in which case he tries to establish a good rapport with the members of that community. These are the members of the parents' teachers' association that works with the principal for the up-bringing of their wards.

Ezeocha (2019) further stated that a principal should endeavour to promote school community activities, projects, and community participation in some aspects of school life". This could be achieved by means of organized visits of places of interest in the community and through the use of community resources". He should try to maintain regular contact with some outside institutions, industries and educational bodies, which may have an interest in his institution and may like to help in one way or the other, also, the students in the school are members of the community. Therefore, activities in the school must as far as possible reflect the nature and the aspiration of the community.

The principal must get to know the community so well as to be able to make the members interest in what their children are doing. This goes to prove the fact that, the school community relation programme is based on the idea of human worth and dignity. If the secondary school fails to tell the public the truth about the school, in the long run the community will come to lose confidence in the school officials and affairs. A good principal should not allow this type of situation to develop. The importance of a cordial relationship between school and community cannot be over emphasized because it is as old as education itself. Besides, the administrator is beset by myriads of demands that are only tangentially if at all related to instruction and the result is that he becomes pitiably chained to his desk at the expense of other vital issues. Thus, there is demand on the principal's line by the community or its agents, the supervisors, the school Boards, teachers and students.

Commencing on this issue, Baron (2011) noted that demands rarely arise in a spontaneous fashion in society. For needs to become wants and wants demands, leaders, vanguards or just plain elites of the community have to mobilize and educate their client. To Baron, the community needs to be educated or oriented on their position regarding the duties and authority of administrators, and that of the communities are only a necessary part, not the necessary whole.

In the words of Weigman (2017) observed that local school has acquired general recognition as a community institution, organized and administered with special regard for local constituency, therefore, too much intervention and influence may tend to interfere with major local initiatives and may produce mechanical uniformity in local administration that sometimes creates a climate for mediocrity". Thus, in a situation where mediocre are enthroned at the expense of achievers due to communities tangentially of thought and action can only generate problems and more problems.

Poor Communication

In any formal organization, it becomes necessary to establish channels for communication and participation. Only through adequate communication can members of the organization remain aware of organizational goals and keep clearly in mind how their own work contributes to those goals and understand how the work of others contribute to the goals and make suggestions for the improvement of operational procedures in the organization. The conditions suggested above make it clear that the communication in an organization must flow up, down and across. Culbertson points out that there are many barriers to communication in an organization. These barriers may include the word used in the communication, many of which carry different emotional overtones to different people, or the barrier may rest with the administrator, as the communicator particularly or the barrier may rest with members of the organization as they communicate if their values and motivations are different from those of the communicators.

Erickson and Pedersen reviewed a number of studies having to do with communication within schools, focusing particularly upon impediments to such communications. Some of these impediments were found in the situation such as hierarchical structure of the school, the large quantity of information needing transmission, the lack of collegial interaction and the cultural influences on interpretation of the messages. Impediments were also found in the persons and included such factors as inept transmission and reception, failure to respond, misplaced quest for power and aversion to threat. Most of the responsibility for removing these impediments to the communication rest with the administrator the principal.

However, the issue of adequate information is not high on the principals list of problems. Their most pressing difficulties, as several surveys have shown are typically on financial, then political and governmental, sometimes interpersonal and only occasionally educational. The problem of access to needed information seems to be lower level for most of them, a level of persistent, chronic problem such as one's own physical stamina, the allocation of time and the adequacy of the administrative staff. All these conditions affect the solution of financial, political and educational problems, but administrators tend to view them as secondary. Sequel to above, communication is imperative for school organization. Without it, social organization cannot function. Schools need to keep the right hand knowledgeable about the left. They require systematic means of collection, organizing and sharing information; it is his function to monitor the communication process to make certain that it performs at the optimum level. For communication to be effective the principal must:

- Decided the best approach to share the information;
- Find the right way to say exactly what he means quite clearly;
- Listen and try to understand what the recipient of the message is saying;

- Verify and double-check whether his intended meaning is clear to his listeners; and follow-up by evaluating the effectiveness of his message.

Many staff meeting that is ruined and antagonistically generated was resulting from poor communication skills. Here the government teacher complains that the principal can never understand, the biology master complains that the principal will never listen to other people's view, the chemistry teacher is disturbed because the principal says one thing and does the other, and the mathematics teacher is amused by verbosity and pedantry of his principal, all of which goes to confuse the listener. The implication is clear, through effective communication skills, we will have good job satisfaction and consequently the quality of instructor in our schools. The concept of communication is rooted in the philosophy that exchange or views and discussion among work groups. Individuals are the cornerstone of effective activities within secondary schools

Financial Management in School

In any organization there is a fundamental need for finance and capital resources for the realization of goals. The principal has the responsibility of seeing that adequate financial provision is made in the budget for his school. Sectional and departmental heads are to be notified and consulted about their departmental needs. The principal of each school is responsible for certain types of revenue collection such as tuition fees, caution deposit examination fees etc. proper accounting procedure laid down by the state board should be followed strictly.

Actually, a good budget will have three major aspects, the proposed program of the school district, the expenditure necessary to support such a program and the anticipated revenue to cover such expenditure. The budget should not be providing simply for personnel, but rather to carry out particular arts of the programme. The budget should not call simply for new or remoulded building but rather for particular building with particular facilities to permit particular parts of the programme to go forward. The budget should stipulate not simply money for equipment to facilities teaching and learning but for particular parts of the programme. Ezeocha (2016) stated that the principal has a duty of seeing that essential and basic equipment and materials were adequately provided and on time. He should form a good habit of issuing and distributing items to the school stores but in schools, finance is a major constraint. Over dependence on board's revenue is a constraint because boards revenue in shared between board and schools in the state. Another dimension of the financial constraint is the tendency among the principal to under estimate the cost of educational facilities of their schools.

One of the major constraints to development policies in Nigeria secondary schools is poor planning, which on the other hand hinges on unreliable population of secondary schools in Rivers State. Demographic figures on school's enrolment are sometimes not based on reliable sources of information but with the result that the projections of the school principals are tithe under estimated or over estimated. The present mood of the country however suggest that the reduction in the number of school age children will be used as an opportunity to cut cost and re allocate resources rather than improve the existing educational system. Some observations consider this unfortunate not only for children but for society itself. Many educators believe the nation cannot afford to waste any of this potential talent. It would be wise for a society to ensure that this generation receives very best education possible to train them for their adult

responsibilities. As Alan Pifer suggest in an article entitled “Don’t forget the children” Every child alive today or born in the years ahead whether male, female, black, white or otherwise will be a scarce resource and a precious asset as an adult in the early part of the next century. At that time, the nation’s standard of living, it’s capacity to defend itself, perhaps it’s very viability as a Nation will be almost wholly dependent on the small contingent of man and women who are today’s children.

If the size of the population is definable as optimum then, the welfare of every individual in the school is purported to be guaranteed. So, the notion of school size is an important factor in school mapping. There is need to fix minimum and maximum sizes for all categories of educational institutions. This minimum size may be seen as the optimum size which affords the best possibilities for Management and administrative control and for full utilization of facilities and staff. In order words to determine the optimum size of a school, consideration should be given to the question of cost, satisfactory, utilization of the human and material resources provided, of pedagogy for purposes of guaranteeing teaching that are acceptable and of good management of the educational institutions.

Qualifications of the Principals

In qualifying for educational administrator, the teacher should take advantage of the many first hand opportunities which are available for gaining experience and skill in administering and leading groups. In the classroom, the processes of decision-making programming, coordinating, stimulating and appraising should be studied and techniques improved. Not only will this lead to future qualification as an administrator, but it will lead to increased competence as a teacher. In addition, the teacher should seek opportunities for leadership in teacher organization and in community groups. These activities will provide insight into the required skills and techniques of leadership and will provide valuable experience in their utilization.

Many teachers, for example, find themselves involved in scouting on Sunday activities. These are organization which provide leadership opportunities with both children and adult, when, as often happens in such activities the teacher is sought out by other members of the community as a leader, the experience can be used both as a means of development skills in leadership. The acceptance and performance in a semi-administrative position in a school system like coordinator of instruction, director of activities, director of guidance, director of health and physical education, director of athletics, etc. can aid greatly in one’s attempt to qualify for educational administration. The prospective administrator often gains through such a position the chance to try his wings under the guidance of an experienced administrator. It is also true that, regardless of certification requirements, many school boards include the Doctorate as a prerequisite for consideration as a principal of the school.

Furthermore, the six regional accrediting associations for secondary schools and colleges generally creates standards for administrator in accredited schools that are often higher than the minimum standards for the state certification. Therefore, as a prospective administrator considers the steps necessary to quality of educational administration, they must consider requirements for both certification and a graduate programme. As the administrator to be, he plans to qualify for educational administration, the question of certification must loom large. Many excellent opportunities are lost because a principal has no time and effort to be certificated for a higher administrative position. In general, there are five advanced degrees which should be included in

the consideration of a long-range plan, the Master of Arts, Education, the sixth year degree or certificates and the PHD in education.

In addition to meeting degree and certification requirement, the prospective administrator should learn about administration and learning to administer. One aspect of the formal program for the preparation of educational administrators which has received particular attention in recent years is supervised field experience. In field programme, the prospective administrator has a chance to practice administrator usually under the joint sponsorship of university and field personnel. In this way theory and practice are related and the qualification of the respective administrator can be considerably enhanced. Supervised field experience gained in one or more courses of three ways as a part of class activities, in a cadet programme and in an internship programme.

Indiscipline among Staff and Students

For events in high school classroom to proceed smoothly, students must grant teachers some measures of authority. Although teachers are in a position to overlook a great deal of extra-curricular student activity in classrooms, they cannot ignore everything. Some modicum of order must be maintained if anything resembling a process of education is to take place. Most teachers thus find themselves in the position of having to act on definitions of improper behaviour and hope that students will stop. The authorities of teachers are put to a test in this act of communication. Authority becomes a stable basis for interaction only when those to whom commands are issued voluntarily obey. Students in classrooms like all parties judging claims to authority made by other must therefore decide whether treatments receive at the hands of teachers are based on grounds that can be considered legitimate. Most students accept the authority of teachers to pass judgment on practically all behaviour that takes place in classroom. The teacher is seen as a person who can pay legitimate official attention to everything that happens inside the authority of teachers.

Most students can make sense of the specific action towards teachers. Any specific action is interpreted as an instance in which this general rule is being applied. In the school, gang members do not prior accept the authority of the teachers. Final judgment on the conferral of legitimacy is suspended until it is discovered whether or not authority is being exercised on suitable grounds and in a suitable way. The burden of proof lies with the teacher. Gang members make decision to accept or reject the authority of teachers on the basis of four criteria. They evaluate the jurisdictional claims made by teacher. Some teachers not only insist in the physical presence of students but also expect a measure of intellectual and spiritual attention as well. The teachers frequently take issue with behaviour such as stealing, truancy, absenteeism, raping, cheating, examination malpractice etc. Gang members do not prior to grant teachers the right to punish this behaviour although good reasons of leasing these activities are often accepted under no condition can ethnic group, dress, hair styles and mental capacities receive legitimate official attention.

Failure on the part of teachers to accept these rules of irrelevance often contribute to denial of authority. Gang members are extremely sensitive to the style in which authority is exercised. The frequent and consistent use of the imperative is perceived as an insult to the status and autonomy of those to who this form of address is directed. Teachers who request conformity are likely to achieve desired results. However, the decision to accept or reject the authority of teachers is made on the basis of a weightier concern. Teachers who consistently violate

conceptions of proper jurisdictions, irrelevance rules and modes of address will not find gang members particularly co-operative architects of authority, but the grounds on which teachers made their formal of semi-public evaluations of students tell a more important tale. Grades can be based on a number of criteria, not all of which gang members find legitimate. Moreover, the fact that, they get a grade tells than nothing about the basis on which the judgment was made. They must discover the general rule used by particular teachers to assign grades with only a single application of the rule to go on.

Explicit moral education may be both systematic and episodic in the school. In the school assembly there is frequent assertion of moral values within the context of actual situation arising from school life. Indirectly, the individual teacher must have immense moral influence. Teachers can only escape from their influence over the moral and spiritual development of their pupils by closing their schools where identification is made with an admired teacher, it can be a powerful influence for good, that all his pupils are influenced by his attitude to individual, by the system of justice that he imposes in classroom, whether reasoned, purely heteronymous or simply impulsive, by the fairness, or unfairness displayed towards members of the class, by the integrity or indifference of his teaching and above all by the relationship between his professions and his practice. Indirectly, school too can exert strong moral influence. Each school has its own ethos or atmosphere. It is forming relationships within the school community, the head teacher playing an inevitably leading part. Relationships among the staff and pupils and among pupils themselves are all involved, for morality is compounded of such personal relationships. The board distinction is between a sacred body of objective, unchangeable rules, with categorical penalties for any infringement and a reasoned code, seen to be reasonable, that takes account of people's motives, relationships and personalities.

METHODOLOGY

This research was survey research. According to Odo (2019) survey research method is a specific research method employed by the researcher to study the sociological and psychological variables that relate to people, vital facts of people, their belief and opinions. This type of survey called sample survey studies both large and small group/population of universe, be selecting and studying samples chosen from the population to discover the relative incidence, distributions and inter-relations of sociological and psychological variables.

This study was carried out on public senior secondary schools Rivers State, three hundred and Fifty six (356) public senior secondary schools. The population for this study includes all three hundred and fifty six (356) principals of public senior secondary schools Rivers. The sample size for the study were the three hundred and fifty six (356) principals.

The researcher used an open ended questionnaire to elicit responses from the respondents. The Questionnaire were administered to all the respondents; three hundred and fifty six (356) principals. The questionnaire covered the four major problem areas as articulated in chapter one of this work. The questionnaire is an open ended type in that the respondents were controlled within a four point rating scales of: Strongly Agree (SA), Agree (A), Disagree(D) and Strongly Disagree (SD).

In order to ascertain the validity of the instrument used for this study, the researcher gave the questionnaire to some specialists in the field of Educational Administration who critically examined the instrument's relevance, clarity and effectiveness to school administration. After some criticism by these experts, irrelevant items were replaced with relevant items. The

amendments and correction gave rise to the final draft of the instrument used for the study. The reliability coefficient of the instrument was administered using Cronbach Alpha.

The instrument used for data collection is the questionnaire developed by the researcher on administrative problems encountered by secondary school principal's questionnaire (APESSPQ) in Rivers State public Secondary School. The questionnaire was administered to the respondents by hand, and collected immediately after completion by the respondents. This method ensured hundred percent (100%) returned of the questionnaire distributed to the respondents.

The data collected were analyzed using mean method. The decision rule was that any score that is below 2.5 should be regarded as negative while from 2.5 upward should be regarded as positive.

PRESENTATION AND ANALYSIS OF DATA

Research Question 1: How is funding an administrative problem of public senior secondary school principals in Rivers State?

Table I: Mean rating of respondents on how is funding an administrative problem of public senior secondary school principals in Rivers State public

s/n	Items	Mean	SD	Remark
1	My school is inadequately financed	2.75	0.47	Agree
2	The Government hardly make enough fund available for the running of school administration	2.98	0.00	Agree
3	Irregularity of fund affects school administration	2.90	0.21	Agree
4	Non-payment of staff entitlements in time creates problem in school administration	3.29	0.25	Agree
5	The school Bursar makes the management of the school fund cumbersome	3.00	0.22	Agree

Table I shows mean rating of 2.75, 2.98, 2.9, 3.29 and 3 recorded for items 1,2,3,4 and 5 respectively. This is indicative of the fact that respondents agree to these items seeking to find out how is funding an administrative problem of public senior secondary school principals in Rivers State?

Research Question 2: How is infrastructure an administrative problem of public secondary school principals Rivers State?

Table 2: Mean rating of respondents on how is infrastructure an administrative problem of public senior secondary school principals in Rivers State

s/n	Items	Mean	SD.	Remark
6	My school is not equipped with enough chairs and tables for student and teachers	3.10	0.23	Agree
7	My classroom is inadequately Air conditioned	2.70	0.20	Agree
8	The building in my school are old and non-functional	2.70	0.20	Agree
9	My school lack well equipped library and laboratory facilities	2.60	0.20	Agree
10	My school lack equipped playing environment for student.	3.20	0.24	Agree

Table 2 shows mean rating of 3.10, 2.70, 2.60, and 3.20 respectively were computed for items 6,7,8,9 and 10 respectively. This revealed that the respondents agreed to all the items seeking to find out how is infrastructure an administrative problem of public senior secondary school principals in Rivers State.

Research Question 3: How is communication an administrative problem of public senior secondary school principals in Rivers State?

Table 3: Mean rating of respondents on how is communication an administrative problem of public senior secondary school principals in Rivers State

s/n	Items	Mean	SD.	Remark
11	Misunderstanding often results between principals, teachers and students as a result of poor communication between them	2.76	0.24	Agree
12	Poor communication skills of the principal pose an administrative problem in your school	2.79	0.20	Agree
13	Ineffective communication link between the students and staff poses a problem in your school	3.10	0.23	Agree
14	Poor communication facilities is a Problem in your school administration	2.97	0.21	Agree
15	Nonchalant attitudes of Government and Board Official possess problems to your administration	3.1	0.23	Agree

Table 3 shows mean ratings of 2.76, 2.79, 3.1, 2.97 and 3.1 respectively were computed for items 11,12,13,14, and 15 respectively. This revealed that the respondents agreed to all the items which seek to find out how is communication an administrative problem of public senior secondary school principals in Rivers State?

Research Question 4: How is indiscipline an administrative problem of public senior secondary school principals in Rivers State?

Table 4: Mean rating of respondents on how is indiscipline an administrative problem of public senior secondary school principals in Rivers State

s/n	Items	Mean	SD.	Remark
16	Examination malpractice emanates disciplinary problem in school administration	3.10	0.23	Agree
17	Gang formation among staff and student creates administrative problem	3.10	0.23	Agree
18	Student immorality create problem in school administration	2.76	0.21	Agree
19	Truancy and absenteeism among staff and student poses indiscipline in the school administration	2.97	0.21	Agree
20	Abuse of office by principals and staff create problem in administration of secondary schools	2.80	0.21	Agree

Table 4 shows mean ratings of 3.10, 3.10, 2.76, 2.97 and 2.80 respectively were computed for items 16,17,18,19, and 20 respectively. This revealed that the respondents agreed to all the items which seek to find on how is indiscipline as an administrative problem public senior secondary school principals in Rivers State.

Hypothesis One: There is no significant difference between the mean rating of principals and teachers on poor funding as an administrative problem confronting principals of public senior secondary school principals in Rivers State.

Table 5: t-Test analysis of the difference between the mean rating of principals and teachers was computed and the result is shown below.

S/N	Group	N	X	SD	DF.	Level of significant	t-cal.	Table of t-Value	Decision
1	Principal	22	2.61	0.24	118	0.05	0.36	1.47	Accept
2	Teacher	98	2.54	0.27	96	0.05	0.24	1.26	Accept

Table 5 presents the t-test analysis of the difference between the mean rating of principals and teachers. From the table, it is indicated that the calculated t-value is 0.36 at 118 degree of freedom and 0.05 level of significant since the calculated t-value of 0.36 is less than the table t-value of 1.47; the first null hypothesis (HO_1) of the study is accepted. The researcher draws the conclusion that there is no significant different in the mean rating of principals and teachers on students' indiscipline as administrative problem to principals of public senior secondary school principals in Rivers State?

Hypothesis Two: There is a significant difference between the mean ratings of principals and teachers on infrastructure as administrative problems confronting principals of public senior secondary school principals in Rivers State.

Table 6: t-test analysis of the difference between the mean ratings of principals and teachers was computed and the result is shown below

S/N	Group	N	X	SD.	DF	Level of significant	t-cal.	Table of t-Value	Decision
1	Principal	22	3.09	0.23	118	0.05	2.89	1.96	Reject
2	Teacher	98	3.02	0.26	86	0.05	2.24	1.36	Reject

Table 6 presents the t-test analysis of the difference between the mean rating of principals and teachers. From the table, it is indicated that the calculated t-value is 2.89 at 118 degree of freedom and 0.05 level of significant since the calculated t-value of 2.89 is greater than the table t-value of 1.96, the second null hypothesis (HO_2) of the study is rejected. The researcher draws the conclusion that there is no significant different in the mean rating of principal and teachers on infrastructure as administrative problem confronting principals of public senior secondary school principals in Rivers State.

Hypothesis Three: There is no significant difference between the mean rating of principals and teachers on communication as administrative problem confronting principals of public senior secondary school principals in Rivers State.

Table 7: t-test analysis of the difference between the mean ratings of principals and teachers was computed and the result is shown below

S/N	Group	N	X	SD	DF	Level of significant	t-cal.	Table of t-Value	Dec
1	Principals	22	2.93	0.29	118	0.05	0.41	1.47	Accept
2	Teachers	98	3.25	0.23	92	0.05	0.29	1.36	Accept

Table 7 presents the t-test analysis of the difference between the mean rating of principals and teachers. From the table, it is indicated that the calculated t-value is 0.41 at 118 degree of freedom and 0.05 level of significant since the calculated t-value of 1.47; the third null hypothesis (HO_3) of study is accepted. The researcher draws the conclusion that there is no significant different in the mean ratings of principals and teachers on communication as administrative problem confronting principals of public senior secondary school principals in Rivers State.

DISCUSSION OF FINDINGS

Research question one sought to find how is funding an administrative problem of public senior secondary school principals in Rivers State. From the results of the findings in Table 1, it was observed that lack or inadequate provision of fund is one of the major problems militating against principals in performing their administrative responsibilities in Rivers State.

Research Question two sought to identify how infrastructure is an administrative problem of public senior secondary school principals in Rivers State. From the findings the respondents responded positively to the items on Table 2. Their response indicated total agreement with all the items in Table 2. This proves the fact that lack of funds is among the problems principals in Rivers State encounters.

Research Question 3 sought to know how communication is an administrative problem of public senior secondary school principals in Rivers State. The items in Table 3 sought to find how communication is an administrative problem of secondary school principals of public senior secondary school principals in Rivers State. From the findings in Table 3, it was obvious that communication problems is one of the major factors militating public senior secondary school principals in Rivers State, in performing their roles as the school administrators.

Research Question 4 sought to know how indiscipline is an administrative problem of public senior secondary school principals in Rivers State. The findings of the study as showed in table 4 revealed that the respondents agreed to all the items which seek to find on how is indiscipline an administrative problem public senior secondary school principals in Rivers State.

Implication of the Study

The state government and all stake holders in the educational sectors should ensure there is adequate provision for fund for the running of schools this will along to improve the standard of public senior secondary school principals in Rivers State. Secondly the school should be well equipped with modern infrastructure and learning facilities to ensure a conducive environment

for learning. If infrastructure is not adequate it will make the school environment un-conducive for learning and therefore hampers learning activities that take place in the school. If nothing is done to improve the communication link between the principals, staff and students of public senior secondary school principals in Rivers State, there is bound to be misunderstand among them and this in no small way will have negative effect in administration of Secondary Schools in the Area. From the results of the findings, it could be inferred that indiscipline among staff and students of secondary schools in Rivers State is among the problems confronting effective administration of secondary schools. The government should supervise and monitor the attitude of staff and students to checkmate the high rate of indiscipline so as not to lead to a total breakdown of the entire system.

Recommendations

From the results of the findings of the study the researcher made the following recommendations:

- The state government and the stake holders in educational sector should make fund available for secondary school principals in Rivers to carry out their administrative responsibilities effectively.
- The state government should provide infrastructure and renovate existing ones from time to time.
- Workshops/symposium should be organized for the principals of secondary school to improve their communication and public relationship skills with their staff, students and the society at large.
- The state government should set up a supervising board to checkmate indiscipline among secondary schools' staff and students in Rivers State.

ABSTRACT

The intellectual landscape is changing and the ability of traditional knowledge disciplines to proffer strategic solutions to complex problems that bother on sustainable development and strategic progress call for innovations in knowledge management. This paper is set on knowledge professionalism and the dynamism of thought evolution in the knowledge ecosystem while keeping the discourse open multidisciplinary perspectives for strategic development engagements. It stressed on exciting thought evolution to further intellectual growth from knowledge based on subject-disciplines, through specializations to the strategic role of knowledge professionalism. The objectives included making an overview of multidisciplinary perspectives to knowledge leadership and differentiating between the interdisciplinary and the multidisciplinary perspectives to problem management; revealing that competing for market value in the knowledge ecosystem lies in knowledge professionalism. It explored the relevance of the Bloom taxonomy to thought evolution for knowledge professionalism. The paper offered a conceptual peep into knowledge ecosystem, knowledge leadership, knowledge professionalism and thought evolution as enabling strategic input for multidisciplinary perspectives in the light of strategic problem-solving and innovations. Theory framework for the discourse included the general systems theory, the complexity theory, the system thinking, the holistic thinking as well those on problem-based learning, and experiential learning. Some challenges and the benefits bordering on multidisciplinary perspectives to thought evolution and knowledge professionalism are spotted out. A hint was made of the proverbial Newtonian tree of knowledge and how it imparts on thought evolution. A conclusion held that multidisciplinary perspectives is redefining knowledge not just in terms of specialization but knowledge professionalism by rendering market value as strategically practicable intellectual capital.

INTRODUCTION

The need for multidisciplinary knowledge is on the rise as a number of development problems from different sectors of human activities contend with man's ideals. These development problems are also known as progress-problems. The very management of development (issues) problems call for varied action dispositions. Such issues require requisite capacities in knowledge and particularly knowledge constructs to constrain order and structure in problem array in order to creatively make advances over progress problems. The demands for sustainable development have led to call for contributions from the broad spectrum of intellectual, institutional and industrial scholarship to the stem tide of snowballing progress-problems. The interfacing of knowledge from far and wide of the intellectual faculties has enabled the fusing of experience and expertise to mitigate problems that flow in the streams of dynamic developments. But the crux come by way of exposure to problem contexts and situations which in some ways befuddle the knowledge leadership of experts who circle on problem-solving entirely on the thrusts of their subject disciplines and specialization. The knowledge universe keeps churning out new experiences or knowledge-cosmos thereby thinning the corners, fringes and burning out the knowledge extensions of subject disciplines in the traditional contents, contexts and constructs. The need to reexperience knowledge urges knowledge leaders to step beyond their expertise and experience the sprays of problem-solving thoughts from the vast sea of consciousness. The ability to surf for knowledge, stream and densify knowledge, make capital of knowledge will bring and offer you opportunities to the platform for complex cum complicating strategic development innovative engagements. The profit from such exposure inherently comes with an ensuing standing ovation.

Strategy is not a supposition of suggestions and lists of goodwill recommendations. In the case of strategic development problems and streamlining innovations to order development progress comes down to leverage. Hence here, strategy presupposes knowing, accessing, and having the edge of consciousness to lead the problem management train in the wake of competing contrasts from problem evolutions. By the stretch strategy within the context of this utility smacks of knowing the leveraging edge. In plainer rendering strategy is a form of knowledge where knowledge is the 'knowing the edge to leverage out a contrast in a competing or conflicting scenario or situations.' It could equally be 'knowing the edge to leverage in your advantage.' In attrition circumstances, strategy as knowledge and knowledge as strategy points to the possession of the ledge to lead the edge. Knowledge enables the deployment of mental and intellectual powers to 'edge out' or 'edge in.' These matters significantly pop up requiring setting aside the textbook protocol which the problem situation challenges for its update. Multidisciplinary perspectives in itself is not strategy. For emphasis, multidisciplinary perspective is a strategic initialization to generate strategy. As being strategic, it is a process while strategy is the end.

Broad as the context of multidisciplinary perspectives is, it is a strand of knowledge management applicable at informal and formal constitutions. It basically is the combination of knowledge from diverse backgrounds of conceptualizations, theories, methods, frameworks and practice, and content-boundaries to advance new perception and methodology. It is constructive, creative, inventive, re-cognitive, innovative and applicable to problem context, and adaptive for adoption to similar case scenarios. Associated with this conceptualization has arisen knowledge valuation termed as interdisciplinary and transdisciplinary. The underlying motivation to these conceptualizations is to advance knowledge management strategies and leadership over the

reaches of complex and complicated strategic development problems and challenges of progress. For the individuals, institutions, and industry faced with the challenges of the problems of progress, a leap beyond the confines of subject knowledge, specialization or knowledge leadership of a discipline is a *sine quo non.*

Development goals progress from discipline domains of knowledge, to interdisciplinary engagements and multidisciplinary engagements. In other words, questions beyond the bearing of a subject discipline engage interdisciplinary engagements. Then the questions beyond the bearing of interdisciplinary engagements call for multidisciplinary engagements. The knowledge ecosystem has so expanded and evolved that knowledge-energy between discipline habitats keep touching off one on another. The search for tools and procedural frameworks to mine, extract, recondition and manage knowledge has brought to the service of knowledge management the cocktail of multi-disciplinary perspectives. The goal of this cocktail is to manage strategic, contingent and complex problems beyond the reach and margins of disciplinary and interdisciplinary understanding of phenomena. There is a new knowledge economy on the horizon of knowledge with a collaborative strategy to advance the coalescence of conjecture for new knowledge. This new knowledge economy is strategy driven and challenging subject disciplines and their disciplines to leap for knowledge-leadership and knowledge-professionalism at the industry-institutional interface. This new knowledge economy is tethered to multidisciplinary perspectives (MDP) and is painted as the assembling of the known in knowledge to address the unknown to knowledge. It represents the point at which academic disciplines step out of their conceptual margins to meet on consensual grounds in order to mitigate, and manage unknown concerns to art, philosophy and science.

The home and breeding ground of multidisciplinary perspectives (MDP) ideally is the academia because strategy is better conceptualized and designed through inputs, information, inspiration, and instruction from multiple experiences, expectations and exposures. But the industry seems caught on with this knowledge production procedure and governance systems. As a multidisciplinary approach (MDA), the multidisciplinary perspective (MDP) also known, multidisciplinary thinking (MDT, or MT) among others.

However, as the thought-grounds for patents, inventions and creativity management, knowledge generation from the industry is tasking the institutional nous of academic practice to up their ante. Consequently, the kin of multidisciplinary perspectives (MDP) in the world of industry is referred to as knowledge management (KM). It emphasizes the big-think in knowledge exploration, generation and creation, dispensation and application.

In formal learning, the overriding allusion on multidisciplinary perspectives is cast and confined within the literature and scholarship of knowledge management. Arguably, multidisciplinary perspectives is merely a contextual position on knowledge management. Hence knowledge management may well be considered as an apparent synonym to multidisciplinary perspectives. Knowledge management sustains multidisciplinary perspectives as multidisciplinary thinking revolves around its revolving field of thought influence. Some consider it a strategic plan to leverage the knowledge capacity, intellectual potential and capital in a discipline, governance system and organizations for strategic problem-solving (Schroth, 2025; Pashner & Tuvya, 2011). Knowledge is changing the way we learn, provide leadership and governance and leadership, pursue knowledge and advance professionalism, and carry out business operations. multidisciplinary perspective is regarded as the new edge of knowledge (O'Dell & Hubert, 2011). One thing as a way of caution is that multidisciplinary perspectives should not be dressed in the textual rites of the conceptual content of knowledge management as

defined in the management sciences. Multidisciplinary perspective fits into that mold but overflows the disciplinary limits of management disciplines. The reason is simple. Knowledge management deals with known knowledge. The multidisciplinary perspectives, approach the known as inadequate to gender the unknown. Hence multidisciplinary approach to tackle the unknown and create knowledge.

Multidisciplinary perspective is the building of an intellectual corporation with human professionalism to drive your strategic change, development and progress innovations. This corporation with human professionalism networks knowledge optimists to gender new realities and experiences. This is better understood in that if not everything, somethings happen faster and easier through networks or synergy. The human capital (intellectual) corporation you create will sustain and retain the market value of your knowledge professionalism.

Problem Perspective on Multidisciplinary Perspective

Long before the call rang out for infusing philosophy back into the doctorate level and other postgraduate programs, the industrial players had long been using the multidisciplinary approach to perceive emerging problems and create new realities in the industrial development goals. Industry leaders tasked teams to research and investigate, and development teams to innovate. Such teams are made of individuals with diverse educational backgrounds within the organization, industry and outside scholarship. This call is to make doctorate degree holders knowledge professionals rather than discipline specialists. Currently, there is a ground swell call for the restructuring of the doctor of philosophy curricular in universities for the development of candidates who qualify to the degree of doctor of philosophy as thinkers rather than specialists (Bosch, 2018). This call arose from observed gap between load of discipline knowledge or certification and hands down practical ability to think through a problem and proffer solutions to contingent and emergent problem complexity outside the confines of certified specialization. Whereas the call is not making for the creation of new subject disciplines, its call emphasizes the need for doctoral level certification to substantiate competence for knowledge creation for complex strategic development problems rather merely subsisting on recycling and exhausting existing knowledge framework through apparent knowledge consumption. The term that clarifies this sentence is knowledge productification; or economification of knowledge. Whereas knowledge productification is turning knowledge into a product, economification of knowledge refers to building of economy out of knowledge. This is one of the goals of knowledge professionalism.

When development needs, subsisting and emerging problems exhibit complex characteristics and sustain curiosity beyond the over-reach capabilities of known problem management framework, the call for new processes and protocols to manage such issues come to the fore. Most sustainable development issues and problems are complex in nature and strategic to progress development thus calling for multilateral approaches to resolve them (Detobe, 2002). Multidisciplinary perspectives arose given that no subject discipline has a complete understanding of the phenomena. When problem identification, characterization and definition framework within one or more disciplines fail in competence returns to resolve the problems, the resort to multidisciplinary perspectives becomes apparent to inspire understanding of the phenomena through collaborative thinking and systematic knowledge extraction resolves. The need for methodology for addressing competing sustainable development issues with complex

and conflicting variables has drawn the attention of strategic management philosophers on how to align methods with problem characteristics (Clarke & Fuller, 2011).

It is not the intention of this paper to point to a cast in iron method for carrying out problem management through multidisciplinary perspective. The paper would rather point to the dynamics behind the concept and how it has been propelled to push forward strategic development innovations. The MDP methods is about strategy and resonates with the application of collaboration of ideas and thoughts to strategically create new framework for strategic knowledge management **(**Schroth, 2025). Case situations in health care delivery hints that multidisciplinary team (MDT) when put together as a work-group, work-team, or task-force, it usually is made of professionals from different specializations and fields. Such teams are usually tasked with determining and eliminating the existing gap between basic research and theorization, and clinical experiences and practice (Taberna et al (2020).

Every subject discipline and their specializations have developed home grown theories, framework and methods of enquiries. However, in the sense of strategic development challenges, that some complex problems rank out of their methodological reaches indicates that every discipline as a specialized spectrum of knowledge is limited in knowledge. Thus, requires complementary methodologies from collaborative thinking.

Systematically, the knowledge management process is about capturing, developing, sharing, and utilizing organized knowledge through sharing of intellectual capital. The objective primarily being to enhance decision-making and improve approach to solving complex strategic problems. According to Rao et al (2005) the best practice resolves from the angles and problem identification, characteristic differentiation, assignment of relevant cognate methods that align with the understanding of phenomena known to the practitioners. Apparently, the nature of the problem will determine and dictate the caliber of professionals involved and by extension the practice methods they will bring to the fray (Cahyaningsih et al, 2017). Such a multidisciplinary team of thinkers. The thrust is multidisciplinary perspective is a collaborative pooling strategy requesting intellectual leadership from across disciplines, sectors and organizations, expertise and experience, specializations and professions to achieve the birthing of innovation. Compared to structured methods within disciplines, this approach as a method in its own rights is in nature hybrid thinking. Hence all participants in the collaboration think for all as each of them simultaneously experience the innovation process to resolving strategic development problems as it evolves! It has to be accepted that in assigning thinking from across different disciplines and specializations, there will be the problem of alignment of thoughts, framework and theories.

Relevance of Multidisciplinary Perspectives

Problems have an organic tendency to update their complexity thus defying known methodologies whereas knowledge edge on to outdated practices and become incapable of proffering tangible problem-management framework.

Boundaries of established subject disciplines are collapsing posing a challenge to the relevance of certain disciplines. We must understand in our dispensation like never before that boundaries of knowledge disciplines are collapsing all around us. This is responsible for curriculum review in the educational sector and academia. Indeed, such reviews and reedition are global.

Track knowledge histology for cellular management of content, context, and contribution of subject-discipline to strategic development innovations for national, regional and local

capacity building. In the industry, and at the level of inter-nations colloquium the relevance relates to competitive and competitive advantage of nations. Establish knowledge relevance following collapses of boundaries in knowledge disciplines.

CONCEPTUAL THEMES

The premise of the multidisciplinary perspectives on knowledge management is that all knowledge is integrated, interrelated, integral, connected, interconnected and complementary and suffices for strategy making. A simpler way to render that is there is no truly independent knowledge discipline in subject, content, concept, context, theory, methodology and practice. The absence of total-knowledge attribute for any discipline means no subject-discipline can arrogate superiority of understanding the embodying characteristics of complex cum complicated strategic and sometimes tactical development problems. Unforeseen, unexpected and unknown challenges that conflict with development aspirations of states, institutions, societies, industries and organizations hamper the process of attaining set development goals. The approach of the multidisciplinary perspectives is a knowledge quest and expedition surfing on questions to unravel and know the unknown in order to solve inherent problems in traction to progress goals.

Knowledge Management and Multidisciplinary Perspectives

The goal of knowledge management much like multidisciplinary perspectives is for trust systems like states, institutions, industries and organizations to achieve their existential goals to develop, prosper and advance into the future (Chow, 2024). This is expected to be done seamlessly by being relevant regardless of the changing social, political, economic, technological and environmental confliction and challenges in a sustainable way.

Knowledge management is so close to multidisciplinary perspectives that one may assume the two to be the same thing in reasoning and nature. Bhatt (2001) understood that knowledge management could clear the path for the mission of multidisciplinary perspectives which entirely and solely is knowledge creation. He traded that the process of knowledge management involves knowledge creation, knowledge validation, knowledge presentation, knowledge distribution, and activities associated with knowledge application. Notwithstanding, multidisciplinary perspectives is about a system unlike knowledge management which focuses on a process. Yet the process is part of the system.

The multidisciplinary perspective is the articulation of the unknown. It is starting out dry. On the other hand, knowledge management is a synthesis of known knowledge protocols. It has to be understood as an art, science and philosophy in as strategic array associated with the of organizing, allocating, categorizing, classifying data for needful information. It is cast primarily on the known. It came into prominence in the age of industrial innovations and corporate wars. It is useful industrial strategy and tactical development to leverage for advantage in the market space. As a process of producing, nations leverage it in different ways for economic, diplomatic, trade, political, and, regulatory and charter subterfuges on competing nations. It has been useful for the production, dissemination, utilization, maintenance of the intellectual assets of organizations and public entities.

Knowledge management inherently amounts to knowledge application as studies of its use by industries show. In other words, industries every other market-leveraging problem as strategic, complex, complicated and thus live no room for guess work as competitors may sweep

them out of the market. This is apparent in consumer knowledge management and product development processes (Hanafi (2021).

Multidisciplinary perspective is knowledge generation with new ideas for new thinking whereas knowledge management brings out new information which can be done with data. It may stand on knowledge management to become much and do more. Between this two, is independent of knowledge management while the latter is dependent on the other. In the knowledge landscape of the twenty first century, knowledge evolution is greatly helped and heralded by this two.

Framework and Theoretical Position on Multidisciplinary Perspective

The conceptual framework for thinking to resolve complex strategic development problems from a multidisciplinary perspective runs on the streams of many ideas coalescing to solving particular problems. There is no one size fits approach in drafting such framework. Such a framework has to be complementary. Jabareen (2009) while sustaining the multidisciplinary nature of knowledge proposed a qualitative framework as a method to justify the building of 'conceptual frameworks for phenomena that are linked to multidisciplinary bodies of knowledge.' The conceptual framework he put forward for multidisciplinary analysis are to have the following:

- Flexibility,
- Capacity for modification, and
- Thrust on understanding phenomenon as the characteristics.

Theories help cast problems into perspectives and for multidisciplinary perspective, relevant theories can handy for effective dealing with complex challenges. There are a number of theories that give credence to the advancement and advocation for the multidisciplinary perspectives. These theories underscore the interconnectedness in knowledge and their impact for addressing complexity and giving holistic understanding for mitigating and managing real-world problems. These theories include the general systems theory, which highlights the interrelatedness of systems, their elements and phenomena. The crux of this theory recognizes that a change in any system will affect the rest of the system. This theory serves the interests of multidisciplinary perspectives because it helps in examining complex problems as systems and traces their interconnectedness with other systems in the quest to develop problems. Other theories that serve the purpose of strategic problem resolution include the complexity theory, the system thinking, the holistic thinking: problem-based learning (PBL), and experiential learning.

Overview on the Rise in Multidisciplinary Perspectives

The rise in multidisciplinary perspective is revolutionary. It reflects the expanding and evolving borders of knowledge. Indeed, elsewhere the term multi-organizational cross-sector social partnerships (CSSP) become synonymous with multidisciplinary perspective in the knowledge ecosystem (Clarke & Fuller, 2010).

The inevitability of multidisciplinary perspective is justified by the lack of capacity and applicability of available knowledge from theorization, conceptualization, and research to avail workable framework to mitigate emergent and previously unknown issues and contingencies. Hence, the rise in collaborative researches for applicable for crisis management approaches. In the second half of the second century, clinical management in the medical sciences has benefitted

from this adaptation to knowledge. Challenges in the thought and theory, perception and practice in medical sciences and profession led to knowledge and thought with the subdivision of previously lumped subject areas into diverse and specialized areas to concentrate research attention, focus and interests. The alternate term 'multidisciplinary team' approach (MDTA)`is used by Benagiano and Brosens (2014) instead of multidisciplinary perspectives to reflect the necessity for best practice in research and professional practice in dealing with complex medical conditions in a coordinated way for managing dire pathologies. This approach to knowledge management is well embraced and adapted in oncology the medical field that has to do with cancerous medical conditions. Teberna et al (2020) dispose to it as a strategic approach to determine a plan of case management and treatment.

The multidisciplinary perspective has been employed in public service administration in the search of solutions for an array of complicated and complex problems. Policy managers have and indeed are turning to employing multidisciplinary perspectives as a knowledge management to establish strategic roadmaps in questing for problem resolution. Within the systems in multi-related environments, the interactions between these systems throw up multi-constituted real-case, real-time problems that defy existing and present knowledge and understanding of phenomena regarding the natural, social, behavioural, and scientific relationships, responses, and reactions of variables that drive association and differentiations in the systems. An apparent case of multidisciplinary perspectives was the use of knowledge management as an approach by government to create a roadmap or strategic action-plan for human capital management using data on employment roll, policy process, and technology (Cahyaningsih et al, 2017).

There is the emerging multi-sectoral multidisciplinary perspectives paradigm qualified as cross-sector social partnerships (CSSP). It is the reach-out effort by organizations use to address complex problems within their production ecosystem where the problem management capacity is below their competence reach. Through strategic collaboration, problem management is carried out with one organization absorbing the knowledge capacity of the other for effective implementation of service and production goals and achievement of expected outcomes (Clarke & Fuller, 2010)

Educational administration and management has equally made remarkable strides in advocating and adopting the multidisciplinary perspectives to problem solving in the sector.
In picking the thoughts of Lombardo (2010), the future of strategic education, learning, leadership, management, public and corporate governance lies in progress made through multidisciplinary perspectives efforts. Suffice to say that the robustness of the knowledge ecosystem lies in the fusion of interdisciplinary and multidisciplinary approaches and practices.

Interdisciplinary and Multidisciplinary Perspective

The multidisciplinary perspective inspires a knowledge economy for intellectual activism and cooperation, intellectualism and development philosophy, commonsense and innovation for development. It succeeds interdisciplinary perspective which as a problem-solving approach emphasizes the combination of ideas, theories and methods from two or more distinct subject disciplines working and bringing together their knowledge leadership for a determined goal through integrating or synthesizing knowledge across disciplines for expected outcomes. Usually unlike multidisciplinary teams (MDT) that work together yet independently to achieve the desired goal, interdisciplinary teams (IDT) work together without maintaining disciplinary boundaries.

It facilitates multidisciplinary understanding of things through identifying often overlooked nous for big ideas inherent in other disciplines. Big ideas as in the sense of problems management that require understanding beyond disciplinary contextualization and conceptualization for the purpose of driving development goals in business or society. It conjectures the strategic construction or reconstructing of assimilated knowledge from broader disciplines for innovative and problem-solving ends. Mastery of multidisciplinary perspectives is becoming the new bundling of advancement knowledge. As traditional constructs in knowledge perspectives are outdone and outdated by emerging trends in problem perception, little is left to be said the difference between the multidisciplinary and interdisciplinary perspectives. As it stands, governance and business needs have made establishing a differentiation between the two merely a matter of semantics. Consequently, the interdisciplinary perspective is replaced by the multidisciplinary perspectives. Strategic state institutions for their parts subtly for strategic governance concerns, and organizations for business ends, use the multidisciplinary perspective for purposes of competition between nations and nonstate actors, and corporate competitors. Evolving thoughts on the concepts in knowledge management have led to another layer of conceptualization referred to transdisciplinarity. It is the update on multi**disciplinarity an** update of inter**disciplinarity.**

KNOWLEDGE ECOSYSTEM AND MARKET-VALUE

Knowledge

Knowledge is about everything known and unknown. However, that cannot be said of disciplines and subject specializations as they are only concerned with what is known and understood. Resolving this disparity requires reconciling the limiting disposition of the later with the all-embracing potential capital in knowledge.

What is the meeting point between multidisciplinary perspectives and knowledge management? It is important to situate the operationality of multidisciplinary perspectives and knowledge management in the context of knowledge leadership and knowledge professionalism. The two, take aim at the same goal though reflecting two sides of the knowledge coin. One is an institutional operative, the other is organizational operative. The operative difference between the two establishes their roles, relevance adaptive functionality to knowledge development and application. Whereas the goal of each is to ensure knowledge productivity and knowledge performances. However, within the knowledge system multidisciplinary perspective leads while the knowledge management follows.

Knowledge Ecosystem

In the thought-frame of strategy, the knowledge ecosystem is an organic play-station of knowledge-sustaining ideas. There, these knowledge-sustaining ideas evolve through thought multiplication or break-up into either solution or problem building protocols. Knowledge predation is much common in this ecosystem and apparently at play and work in much subtle ways than people would systematically acknowledge. In this ecosystem the growth and consumption of knowledge go hand in hand as higher octave problems feed fat breeding chaos at the expense of less competent knowledge leadership. Thus, the way problem predation is sustained in this ecosystem is through thought-extraction from the unknown using the protocol of

the multidisciplinary perspectives. There are many ways of objectifying and asserting the concept for knowledge management (Slavazza, 2006; Bray, 2007). Consequently, knowledge management is promoted to curb the chaos associated with knowledge consuming knowledge in the knowledge ecosystem.

The knowledge ecosystem is a conceptualization associated in knowledge management. Its system of domains and hierarchies can contextually be explained based on the Bloom Taxonomy (Bloom, 1956). The idea is of an open and dynamic system where thought energy flows freely leading to knowledge creation, knowledge-development, knowledge-sharing, and knowledge-application through the interactions involving individuals, institutions, and industries (organizations) using technologies for leverage. Meanwhile, in the academia, steps are taken to categorize and classify such interactions using defined conceptualizations referred to as multidisciplinarity, interdisciplinarity, and transdisciplinarity. These, highlight the mileage of thought evolution to the creation of new knowledge from the unknown. Multidisciplinarity is regarded as the first step to learning, understanding and gaining insights from several disciplines leading to interdisciplinarity. Interdisciplinarity is achieved by creating a "common ground" and arriving at a more comprehensive understanding of a complex topic. Transdisciplinarity approach places academics alongside non-academic actors in the quest to seek out new knowledge to deploy on complex and strategic problems.

Multidisciplinarity is a study process that integrates perspectives and knowledge from various subject-disciplines to problems based on specialist opinions on it. However, Lehtinen (2013) offered that theory building for multidisciplinarity is work in progress. The goal of such theory will enhance a systematic combination of frameworks, models and theories.

Interdisciplinarity is occupied with studying the methodical, theoretical, and institutional implications implying the interdisciplinary approach (Miller, 2020). Through transdisciplinarity, knowledge and methods from diverse subject-disciplines are integrated to create new knowledge structure to suit the demands of the new knowledge economy. Thus, through thought evolution traditional knowledge foraging grounds are broken up ceded to suit the new knowledge economy.

Knowledge Leadership

Knowledge leadership is contained in the content, context and construct of subject framework and theories of disciplines. Every discipline traditionally trades and threads this path in knowledge leading to the development of specializations. K**nowledge leadership is equal to a**dvancing specialization through knowledge embodiment-order, construct, structure, systems are no longer what they used to be. Subject (as opposed to knowledge) specialization is equal to re-specialization through modular reinvention. Strategic development innovations is equal to the cutting edge in thought evolution and serves as the basis of and for knowledge professionalism.
Knowledge development is the keystone of multidisciplinary and uni-disciplinary progress. knowledge management is strategic practice and basis of equitable deployment of knowledge resources for problem solving. A knowledge profits from the knowledge economy solely based on the dictates of knowledge as defined within the confines of subject disciplines.

Knowledge Professionalism

Without the strategy input, knowledge leadership fall short for strategic engagements of the complex, complicated and compromising problems of progress. The key turning to the strategic is strategy and hence where knowledge professionalism holds sway. This is the leap in problem solving capacity of knowledge leaders beyond the engagements of intellectual gravity of subject disciplines and specializations. A knowledge professional belongs to knowledge and makes profits from knowledge which apparently different from knowledge leadership.

Knowledge professionalism as the cap on knowledge leadership pitches on the economic value of knowledge to drive strategic development in an innovative manner beyond the reach of complexities associated with entangling problems. It is about practical progress in thought, philosophy and practice of disciplines through growth and grooming in knowledge for problem understanding, problem-solving and problem-management beyond subjection specialization. Thus, a knowledge professional represents the universal mind rather than remaining as a specialization mind. Here one is looking at the ability to perceive problems intelligently from different angles and the enabling capacity to proffer strategic and innovative solutions to the problems on ground. Thus, the knowledge professional grows in knowledge from subject discipline through specialization to knowledge professionalism. Thus, this professional becomes a competent manager of knowledge in a competing environment; and is otherwise proficient in working with knowledge leadership across different fields.

BLOOM TAXONOMY AND THOUGHT EVOLUTION

Thought Evolution

The progress of knowledge begins with advances from thoughts refined with deft, tactical, practical, incidental, rational and logical thinking. The premise of thought evolution is that knowledge must meet problem concerns resolutely, creatively, innovatively, constructively, and critically. Thought-evolution proceeds through the extraction of abstraction into sustainable and actionable functions. That means taking from the *unknown* (out of consciousness) and making it functional in the *known* (real world). Thought evolution has always proceeded by knowledge walking with knowledge, knowledge touching knowledge, and knowledge birthing knowledge. This through time has forged the progress of knowledge management and sharpened the professional edge of the leadership roles of disciplines and pushed the margins of subject specialization.

The university is a self-sustaining knowledge universe in which knowledge expansion is encouraged thought evolution. However, though the term thought-evolution may not be a commonplace conjecture within the academia, yet its application to strategic institutional growth undertakings is not misunderstood. Thought evolution serves as the feeder trough for knowledge upon which subject specializations have been built upon over time. This is the basis of knowledge integration for intellectual progress. Safe to say that the economic value of knowledge upon any education developed, disciplines and subject specializations evolved could not be accounted for without thought evolution. All new knowledge put old pragma at risk of the loss of their traditional nous and objections. In other words, every new knowledge dissolves the boundaries of the old pragmatism and ideation.

Progress in knowledge management swirls on multidisciplinary perspectives in thought evolution, and practice philosophies of academic disciplines: implications on knowledge leadership. The multidisciplinary perspectives emphasize the adoption and maximization of discoveries in knowledge from diverse spectrum of disciplines or subject specializations for problem management and solution provisions. The rise in multidisciplinary perspectives is historic and strategic to thought evolution with marketable implications on knowledge leadership.

The university is the one institution put in place to source for knowledge on multiple and seemingly diverse lanes or methods of enquiries. The university is the knowledge center where diversity in learning and knowledge aspirations is allowed to thrive within confines of ethical constructiveness. The multidisciplinary perspectives (interpretation, giving of meaning) enhances the ability to maximize relative perspectives for knowledge leadership. Implication of multidisciplinary perspectives and thought evolution for knowledge leadership means one thing, the ability to create enterprise, new systems, economies, wealth through knowledge.

Bloom's Taxonomy and Expressing Multidisciplinary Thinking

The Bloom's Taxonomy (Bloom, 1956) is useful for assessing thought-evolution and giving expression to multidisciplinary thinking. Granted there exists what appears to be a misunderstanding when unconsciously the memory recall process in learning and relationship interactions is assumed to be the same thing as thinking. The taxonomy is about thinking. Multidisciplinary and thinking and interdisciplinary perspectives and thinking each is about harnessing thinking. As philosophers, educators, strategists, governance administrators and decision-makers and policy implementers, our goal, our duty to harness thinking for tactical and strategic development innovations.

As a learning framework, the Bloom's taxonomy emphasizes thinking, its applicability is suitable for knowledge-professionals who are on the learning curve of understanding problems as the taxonomy fuels thought-evolution in strategic thinkers. Regardless of emphasis in the academia on churning out recent researches many of which fall short on substance and worth with evident recycling of research contents which changes only in study title, study location, and manipulated dataset, real ideas like the Bloom's Taxonomy are ageless and is one of such old ideas that trends in thinking and methods have not outdone.

The taxonomy positions the thinker's mind to transit from learning recall process to creating new ideas which inspire quests for Multidisciplinary and thinking and interdisciplinary and thinking. The taxonomy pitches that problem-learning and solving happens when theoreticians, teachers, learners, practitioners, professionals broach the unknown by stepping beyond the known as answers to asking creatively involving questions. Using the educational background, the taxonomy strategically helps in building knowledge from the base trophic level to contend with top hierarchical problems in the knowledge ecosystem. It serves as template to employ for multidisciplinary and thinking and interdisciplinary and thinking engagements. Infact the taxonomy is reflective of the hierarchy of knowledge in the knowledge ecosystem drawing interests as to its applicability for thought evolution through multidisciplinary and thinking and interdisciplinary and thinking. Its six domains are (1) knowledge, (2) comprehension, (3) application, (4) analysis, (5) synthesis, and (6) evaluation, while its hierarchical structure begins at the base with remembering, applying, analyzing, evaluating, and creating. The model is

sustainable for multidisciplinary perspective and thinking and interdisciplinary perspective and thinking purposes of creating new knowledge.

IMPLICATIONS

Strategic Development Philosophy

There must be development philosophy to drive strategic development engagements and hence innovations. The philosophy will shape problem perception and management. This philosophy has to have as goal of development options that will guide the drive for strategic innovations. The philosophy will be guided by visionary perception of progress problems and optimized mission to task solving them. Though a lot has to be said, the Blood Taxonomy serves as an entry guide or framework for all comers to the multidisciplinary team acquire needed process orientation for the task of generating needed knowledge.

Implications of Multidisciplinary Perspectives

Multidisciplinary perspective is about unifying the creative power of the intellect from different scholarly backgrounds for development ends. And it is based on the building of an intellectual corporation with human professionalism to drive your strategic change, development and progress innovations. This corporation with human professionalism networks knowledge optimists to gender new realities and experiences. This is better understood in that if not everything, somethings happen faster and easier through networks or synergy. The human capital corporation you create will sustain and retain the market value of your knowledge professionalism.

The implications of supporting multidisciplinary engagements are many. These include exposure of knowledge leaders to growth and progress of knowledge in associate and collaborating disciplines. It enhances and excites thought extraction and thought evolution in a broader perspective for broader application of knowledge tools. Again, multidisciplinary engagements support creating of new knowledge systems, the structuring of emergent threads of new knowledge, and of transitioning knowledge practitioners from discipline specialists to knowledge professionals. This is inclusive of upgrading knowledge experience from capability in the known to capacity for the unknow. Knowledge professionalism establishes you not just as a specialization philosopher to a profiting philosopher (thus setting you as a problem philosopher-understanding of problem logic and thinking out the pattern of injecting solutions to problems). Also, is the ability to operate and function in the rescue operations to resolve the problem context, constitution, content, complexity.

Implications on Knowledge Professionalism

Training the mind to think is the cornerstone of knowledge professionalism as it lubricates multidisciplinary initiatives and engagements. It must be understood that the Bloom's Taxonomy asserts for higher-level order of thinking for creative constructs. It calls for the structuring of learning objectives, problem understanding, and characterization tied to assessing cognitive complexity. It objectifies constructive creativity and solution finding through critical thinking based on the focus to understand complexity. Knowledge professionals involved in strategic

problem management thinking have to expose themselves to the nitty gritty of the structured learning objectives promoted by the postulation. Every problem offers a learning context for those studying. Thus, understanding problems at any level of complexity begins with what is known to the knowledge leader.

CONCLUSION

Summarily, the following are some of the conclusions made regarding the subject of this paper. Knowledge professionalism is about value added competence in knowledge at the level of individual practitioner as a specialist, and of the discipline as a subject content authority. The creation of a knowledge management environment has to become one of the statutory visions of any institution and organization that is to compete in knowledge through the coming future. This will enhance interactive thriving of the knowledge species of disciplines and their responsibilities towards each other.

Adding economic values to knowledge leadership through specializations has to become part of the corporate visions of academic disciplines and their specializations; the thrust of the industry-universities trust. This is applicable to other knowledge leveraging organizations. The key to knowledge revolution lies in the progress associated with the fusion of interdisciplinary perspectives and multidisciplinary perspectives. Multidisciplinary perspectives as tool is redefining knowledge not just in terms of specialization but knowledge professionalism in terms of rendering market value for strategically practicable intellectual capital.

Multidisciplinary perspectives serve as the canvas for casting new thinking and expanding the reaches margins and boundaries of intellectual capital for transformative change, development and progress. The early birds in the guise of disciplines, specializations, and practitioners to arrive at the shores of this intellectual initiation will the ones to wield market value.

The strategic importance of multidisciplinary perspectives and knowledge management is competing against and over change in identification, thinking and meaning. Pushing for personal knowledge competence as a strategic resource agent for strategic and innovative development opens the door to knowledge professionalism. Making capital of knowledge without and beyond discipline blindspots and biases leverages personal advantage and knowledge competence.

ABSTRACT

The increasing global environmental challenges demand creative and efficient solutions for sustainable development. Geospatial technologies, including Geographic Information Systems (GIS), remote sensing, Global Navigation Satellite Systems (GNSS), as well as emerging tools like drones and cloud-based platforms, have become essential tools for environmental monitoring, analysis, and management. This review paper delves into the recent methodological advancements in geospatial technologies and their applications across various environmental fields, underscoring their role in promoting a sustainable future. We examine the key innovations in data acquisition, processing, and analytical techniques, emphasizing how these advancements deepen our comprehension of environmental processes, enhance decision-making, and support the adoption of sustainable practices. The review underscores the transformative possibilities of interdisciplinary methodologies involving artificial intelligence, big data analytics, and citizen science to enhance geospatial applications for environmental sustainability. Furthermore, considerations are given to the obstacles and forthcoming paths for geospatial advancement in tackling intricate environmental problems and promoting a more sustainable future.

Keywords: Geospatial Technology, Environmental Applications, Sustainability, Methodological Advances, Remote Sensing, GIS, GNSS, Drones, Cloud Computing, Artificial Intelligence, Sustainable Development Goals.

INTRODUCTION

The 21st century presents unparalleled environmental challenges, such as climate change, biodiversity loss, resource depletion, and pollution. These issues require immediate and comprehensive strategies for sustainable development (United Nations, 2015). Achieving

environmental sustainability necessitates precise and timely information about the Earth's systems, enabling well-informed decision-making and efficient environmental management. Geospatial technologies, with their ability to gather, analyze, and visualize spatial data, have become essential tools in addressing these challenges (Longley et al., 2015). This paper examines the significant methodological advancements in geospatial technologies and their transformative applications in the environmental sector, with a specific focus on their role in contributing to a sustainable future.

Geospatial innovation encompasses a variety of technologies and methodologies, typically focused on Geographic Information Systems (GIS), remote sensing (RS), and Global Navigation Satellite Systems (GNSS). GIS serves as a foundation for managing, analyzing, and visualizing geographically referenced data, facilitating spatial analysis and decision-making support (Burrough & McDonnell, 1998). Remote sensing, which utilizes satellite and airborne sensors, offers a comprehensive and cost-efficient method for observing Earth's surface and atmospheric phenomena (Campbell & Wynne, 2011). GNSS technologies, such as GPS, deliver precise positioning and navigation capabilities crucial for field data collection and spatial referencing (Hofmann-Wellenhof et al., 2008).

In recent years, there has been a swift progression in geospatial technologies brought about by improvements in sensor technology, computational power, and data processing algorithms. This evolution encompasses the widespread availability of high-resolution satellite imagery, the growing utilization of drone-based platforms, the adoption of cloud computing for geospatial data processing, and the incorporation of artificial intelligence (AI) and machine learning (ML) techniques. These advancements are reshaping environmental applications and providing enhanced tools for monitoring, modelling, and managing environmental resources in pursuit of a sustainable future.

This review seeks to offer a comprehensive overview of recent methodological advancements and their practical applications in the realm of environmental sustainability. The key areas of focus include:

- Enhanced Data Acquisition: This section delves into the latest advancements in remote sensing sensors (spectral, spatial, temporal resolution), drone technology, and in-situ sensing networks.
- Advanced Data Processing and Analysis: Here, we examine recent innovations in image processing techniques, spatial modelling, geostatistics, and the integration of artificial intelligence and machine learning algorithms.
- Applications across Environmental Domains: This part of the review evaluates the uses of these advancements in areas such as climate change monitoring, biodiversity conservation, natural resource management, pollution monitoring, and disaster management.
- Interdisciplinary Approaches and Emerging Trends: Lastly, we explore the impact of interdisciplinary collaboration, citizen science participation, big data analytics, and cloud-based platforms on expanding the scope and effectiveness of geospatial applications for sustainability purposes.

The objective of this review is to showcase the importance of geospatial innovation in promoting environmental sustainability and to propose potential research areas to strengthen its impact on global environmental issues.

Methodological Advancements in Geospatial Technologies

The efficacy of geospatial technologies in environmental applications is closely tied to advancements in data acquisition, processing, and analysis methodologies. This section will explore significant innovations in these domains.

ENHANCED DATA ACQUISITION

Remote Sensing Sensor Technology

Significant strides have been made in sensor technology within the realm of remote sensing, resulting in enhanced data quality and increased applicability. The utilization of hyperspectral imaging has emerged as a valuable tool, capturing data over numerous narrow spectral bands to enable precise assessment of vegetation health, mineral composition, and water quality (Goetz et al., 1985). Improvements in spatial resolution have also been achieved, providing more detailed information about the Earth's surface and facilitating the identification of smaller features, as well as more accurate mapping of changes in land cover (Irons et al., 2012). Additionally, advancements in temporal resolution, including the deployment of satellite constellations that revisit locations more frequently, support near real-time monitoring of dynamic environmental processes such as deforestation, urban expansion, and natural disasters (Wulder et al., 2012). The integration of these enhanced resolutions allows for more nuanced and timely evaluations of the environment.

Unmanned Aerial Vehicles (UAVs) or Drones:

Drones have transformed the field of geospatial data acquisition by offering flexibility, cost-effectiveness, and the ability to capture high-resolution data at local scales (Watts et al., 2012). Equipped with a range of sensors such as RGB cameras, multispectral and hyperspectral sensors, thermal sensors, and LiDAR, drones provide intricate information for a variety of environmental applications. Ongoing developments in drone technology focus on enhancing flight endurance, autonomous navigation, payload capacity, and data processing workflows (Colomina & Molina, 2014). Drones are especially valuable for monitoring inaccessible or hazardous areas, conducting quick environmental assessments, and validating satellite-derived observations.

In-situ Sensing and IoT Integration:

In addition to remote sensing, in-situ sensing networks, often connected through the Internet of Things (IoT), offer essential ground-truth data and continuous monitoring of environmental parameters. The progress in sensor miniaturization, wireless communication, and power efficiency has facilitated the deployment of dense sensor networks for monitoring air and water quality, soil conditions, and weather patterns (Gubbi et al., 2013). The integration of in-situ data with geospatial platforms improves the accuracy and reliability of environmental models and monitoring systems, leading to a more comprehensive understanding of environmental processes.

ADVANCED DATA PROCESSING AND ANALYSIS

Enhanced Image Processing Techniques

Utilizing remote sensing data involves employing various techniques to extract valuable information. Explorations in methodology have led to enhancements in atmospheric correction algorithms, radiometric and geometric correction methods, and advanced image classification techniques (Richards & Jia, 2006). Object-Based Image Analysis (OBIA) has emerged as a robust alternative to pixel-based classification, leveraging spatial relationships and contextual information for enhanced accuracy in land cover mapping and feature extraction (Blaschke, 2010). Additionally, the evolution of change detection algorithms enables the quantitative evaluation of environmental changes over time, essential for monitoring deforestation, urban expansion, and coastal erosion (Coppin et al., 2004).

Spatial Modeling and Geostatistics

In recent years, spatial modeling techniques in GIS have seen significant advancements in analyzing environmental processes and forecasting future scenarios. Geostatistics has also evolved, offering reliable methods for spatial interpolation and uncertainty evaluation, which are essential for mapping environmental variables with limited sample data (Goovaerts, 1997). By incorporating environmental science principles with spatial data, process-based models can simulate intricate environmental systems such as hydrological processes, ecosystem dynamics, and climate change impacts (Maxwell & Miller, 2005). These models, when paired with geospatial data, offer valuable insights for environmental management and policy formulation.

Integration of Artificial Intelligence and Machine Learning

AI and ML technologies are revolutionizing the analysis of geospatial data, providing robust tools for identifying patterns, creating predictive models, and automating processes (Li et al., 2016). Specifically, deep learning methods like Convolutional Neural Networks (CNNs) have shown impressive achievements in tasks such as classifying images, detecting objects, and extracting features from remote sensing data, often outperforming traditional approaches in terms of precision (LeCun et al., 2015). Machine learning techniques are also being utilized in spatial data exploration, detecting anomalies in environmental time series, and forecasting environmental events like wildfires, floods, and disease outbreaks (Maxwell et al., 2018). By incorporating AI/ML into geospatial workflows, the efficiency, accuracy, and scalability of environmental applications are significantly improved.

Cloud Computing and Big Data Analytics

The growing abundance and intricacy of geospatial data demand efficient processing and storage infrastructure. Cloud computing platforms, such as Google Earth Engine and Esri ArcGIS Online, offer scalable computing resources, extensive data storage, and pre-built geospatial analysis tools (Gorelick et al., 2017). This broadens access to advanced geospatial technologies, allowing researchers and professionals to analyze large datasets and conduct intricate analyses without the need for substantial local computing resources. Utilizing big data analytics

techniques in cloud environments enables the extraction of valuable insights from vast geospatial datasets, revealing patterns and trends that were previously inaccessible, especially in the realm of large-scale environmental monitoring and modeling.

ENVIRONMENTAL APPLICATIONS OF GEOSPATIAL INNOVATION FOR SUSTAINABILITY

Advancements in geospatial technologies have expanded their use in various environmental fields, playing a crucial role in promoting sustainability. This section delves into important application areas.

Climate Change Monitoring and Mitigation

Geospatial technologies are instrumental in monitoring indicators of climate change and aiding in mitigation efforts. Remote sensing is crucial for monitoring deforestation and forest degradation, which are significant contributors to greenhouse gas emissions (Hansen et al., 2013). Satellite data is also utilized to observe glacier and ice sheet melt, sea level rise, and changes in vegetation phenology, offering valuable evidence of the impacts of climate change (Shepherd et al., 2012). GIS-based spatial modeling is employed for conducting vulnerability assessments, pinpointing regions and populations most at risk of climate change effects, and devising adaptation strategies (Preston et al., 2013). Additionally, geospatial analysis assists in identifying suitable sites for renewable energy infrastructure, like solar and wind farms, aiding in the shift toward a low-carbon economy (Janke, 2010).

Biodiversity Conservation and Ecosystem Management

Geospatial technologies play a crucial role in safeguarding biodiversity and managing ecosystems. Remote sensing enables the creation of habitat maps and the tracking of essential environments for threatened species (Gillespie et al., 2008). GIS-powered spatial analysis aids in modeling species distribution, forecasting range, and pinpointing priority areas for conservation (Elith & Leathwick, 2009). These technologies also improve the effectiveness of protected area management through the surveillance of illegal activities, such as poaching and deforestation, and the evaluation of conservation efforts (Jachmann, 2008). In addition, they facilitate assessments of ecosystem health and resilience by monitoring indicators like vegetation productivity, water quality, and land degradation, ultimately guiding adaptive management approaches.

Sustainable Natural Resource Management

Geospatial technologies play a crucial role in the sustainable management of natural resources such as water, forests, and land. Remote sensing and GIS are utilized for activities ranging from monitoring water resources and mapping surface water bodies to assessing water quality and monitoring irrigation practices (Bastiaanssen et al., 2000). In forestry management, geospatial technologies aid in forest inventory, timber harvesting planning, and monitoring forest health and regeneration (Wulder et al., 2004). In the realm of land resource management, these technologies support land use planning, soil erosion assessment, and monitoring land degradation to promote

sustainable agricultural practices and land restoration (Lal, 2003). Overall, these applications help in effectively and equitably allocating and utilizing natural resources, thus ensuring their long-term availability.

Pollution Monitoring and Environmental Health

Geospatial technologies are increasingly employed for monitoring various types of pollution and evaluating environmental health risks. Remote sensing allows for the detection and monitoring of air pollution by mapping concentrations of pollutants such as nitrogen dioxide and particulate matter (Gupta et al., 2006). It also aids in water pollution monitoring by identifying oil spills, algal blooms, and sediment plumes in water bodies (Khorram et al., 1999). GIS-based spatial analysis is utilized for risk assessment to pinpoint areas susceptible to pollution impacts and map disease outbreaks associated with environmental factors (Hay et al., 2000). These applications play a crucial role in early detection and mitigation of pollution events, safeguarding the health of both humans and ecosystems.

Disaster Management and Resilience

Geospatial technologies play a critical role in all stages of disaster management, including preparedness, response, and recovery. Remote sensing offers quick and comprehensive views of disaster-affected areas, enabling the mapping of flood zones, wildfire boundaries, and earthquake impact (Voogd, 2004). GIS-based spatial analysis is utilized for hazard mapping and risk assessment to identify at-risk populations and critical infrastructure (Anderson & Holcomb, 2013). GNSS technologies assist in emergency response by providing navigation for rescue teams and aiding in the coordination of relief efforts. Moreover, geospatial data and tools are essential for assessing post-disaster damage and planning for recovery, facilitating the reconstruction of resilient infrastructure and communities (Chang, 2010).

Interdisciplinary Approaches and Emerging Trends

The advancement of geospatial innovation for sustainability hinges on interdisciplinary methods and the adoption of evolving trends to bolster its effectiveness and influence.

Interdisciplinary Integration

The successful implementation of geospatial technologies to promote environmental sustainability relies on effective interdisciplinary collaboration. Aligning environmental science knowledge with geospatial expertise is vital for determining pertinent research inquiries, analyzing geospatial data within an environmental framework, and crafting viable solutions. Additionally, integrating insights from social sciences and economics is crucial for comprehending the societal and economic aspects of environmental issues and crafting sustainable solutions that are both socially acceptable and economically feasible (Turner et al., 2003). Interdisciplinary teams play a key role in bridging knowledge disparities and ensuring comprehensive strategies for addressing environmental challenges.

Citizen Science and Participatory GIS

Various citizen science initiatives have begun incorporating geospatial technologies to harness the power of public involvement in data collection and analysis. Through mobile GIS applications and online platforms, individuals can actively engage in environmental monitoring efforts by gathering and sharing valuable data. This collaborative effort enhances data accessibility, promotes community participation, and instills a sense of responsibility in environmental conservation. Participatory GIS (PGIS) strategies further empower local communities to utilize geospatial tools in mapping resources, identifying environmental challenges, and influencing decision-making processes related to their surroundings (Rambaldi et al., 2006)

Real-Time Monitoring and Early Warning Systems

Recent advancements in sensor technology, data communication, and cloud computing have paved the way for real-time environmental monitoring and the creation of early warning systems. The integration of real-time remote sensing data streams with automated analysis algorithms enables timely detection of environmental changes, allowing for swift responses to emergencies such as wildfires, floods, and pollution spills (Chandra & Ghosh, 2010). Sensor networks and IoT devices continuously monitor environmental conditions, issuing alerts when critical thresholds are surpassed to facilitate prompt interventions. These real-time systems foster environmental consciousness, enhance preparedness for environmental risks, and enable proactive environmental management.

Ethical Considerations and Data Governance

The growing power and prevalence of geospatial technologies highlight the critical importance of ethical considerations and data governance frameworks. Concerns regarding data privacy, security, access, and algorithmic bias must be carefully managed to ensure the responsible and fair utilization of geospatial technologies in environmental contexts (Elwood & Leszczynski, 2017). Establishing clear ethical guidelines and robust data governance policies is essential for promoting trust, transparency, and accountability in geospatial applications, ultimately steering them towards contributing to a sustainable and equitable future.

Challenges and Future Directions

Despite the significant advancements and potential of geospatial technologies, there are several challenges and future directions that must be addressed to further enhance their contribution to environmental sustainability.

Data Availability and Accessibility

While there have been notable increases in data availability, challenges persist in accessing high-quality, timely, and relevant geospatial data, especially in developing countries and for specific environmental parameters. Future initiatives should concentrate on enhancing data infrastructure,

advocating for open data policies, and creating cost-effective data acquisition methods to ensure fair access to geospatial information worldwide.

Data Integration and Interoperability

Integrating data from diverse geospatial sources and formats is a challenge for environmental analysis. Future research should focus on standardizing data formats, interoperable platforms, and data harmonization techniques to facilitate seamless integration and holistic assessments.

Capacity Building and Knowledge Transfer

Effectively leveraging geospatial technologies necessitates a pool of skilled professionals and broad capacity. Moving forward, it is essential to enhance geospatial education and training programs, facilitate knowledge transfer to developing nations, and foster collaborative research initiatives. These efforts will bolster local capacity, ensuring the sustainable utilization of geospatial technologies on a global scale.

Advancing Analytical Methods and Modeling

Continued advancements in analytical methods and modeling needed for complex environmental challenges. Future focus on developing more sophisticated AI/ML algorithms, improving process-based models, integrating uncertainty analysis in geospatial apps to enhance accuracy and reliability of environmental predictions.

Addressing Social and Economic Dimensions

Future geospatial innovation must address the social and economic dimensions of environmental sustainability more explicitly. Integrating socioeconomic data with geospatial info, developing participatory methods for engaging local communities, and conducting cost-benefit analyses of geospatial apps are crucial for ensuring equitable and sustainable development outcomes.

CONCLUSION AND RECOMMENDATIONS

Geospatial innovation is becoming more crucial in tackling complex environmental issues and promoting sustainability. Advances in data collection, processing, and analysis methods, along with the incorporation of new technologies such as AI, cloud computing, and citizen science, are transforming environmental practices. From monitoring climate change to conserving biodiversity, managing natural resources, controlling pollution, and enhancing disaster preparedness, geospatial technologies offer vital information, tools, and platforms for informed decision-making and successful environmental management. In order to maximize technology's impact on achieving the Sustainable Development Goals and creating a sustainable future, it is recommended to prioritize investment in geospatial innovation, collaboration, ethics, and capacity building. By embracing geospatial technologies and effectively addressing challenges, we can work towards protecting the planet and securing a sustainable future.

ABSTRACT

The study investigated strategic leadership and administrative effectiveness of public universities. The study concluded that that innovative practices, efficient decision-making, strategic planning, and adaptive leadership significantly contribute to institutional success and governance. Amongst others, the study recommended that University Administrators should adopt and institutionalize innovative practices by integrating modern technology into administrative and academic processes to improve efficiency and transparency.

Keywords: Strategic Leadership, Administrative Effectiveness, Innovative Practices, Efficient Decision-Making, Strategic Planning, Adaptive Leadership, Public Universities in Rivers State

BACKGROUND TO THE STUDY

Public universities play a crucial role in fostering national development, producing skilled manpower, and advancing research that addresses societal challenges. Administrative effectiveness within these institutions is essential for ensuring that academic and non-academic functions are carried out efficiently to meet institutional goals. In the contemporary educational landscape, strategic leadership has emerged as a critical factor in enhancing administrative effectiveness, particularly in public universities within Rivers State. Strategic leadership involves the ability of university administrators to adopt forward-thinking approaches, develop long-term

plans, and implement policies that enhance institutional performance. Without effective leadership, public universities may struggle with inefficiencies that hinder their ability to fulfill their mandate of quality education delivery.

Although strategic leadership encompasses various dimensions, its overall impact on administrative effectiveness remains an area of ongoing research. Understanding how innovative practices, decision-making efficiency, strategic planning, and adaptive leadership contribute to university administration will provide a comprehensive perspective on improving institutional effectiveness. Given the evolving nature of higher education, universities must continuously assess and refine their administrative strategies to remain competitive and relevant in the educational institutions.

Furthermore, innovative practices have become a central component of administrative effectiveness. In an era characterized by rapid technological advancement and changing educational demands, universities must embrace innovative strategies to remain relevant and competitive. Innovative practices in university administration may include the adoption of digital technologies for record-keeping, student engagement, and learning management systems. Adebayo and Salami (2021) innovation in university administration leads to improved service delivery, enhanced student satisfaction, and increased institutional efficiency. Moreover, innovation fosters adaptability, allowing universities to respond proactively to emerging educational and administrative challenges. The extent to which public universities in Rivers State integrate innovative practices into their administrative structures is an area that requires empirical investigation.

Also, efficient decision-making is another fundamental element of strategic leadership that influences administrative effectiveness. University administrators are required to make critical decisions regarding faculty management, student welfare, infrastructure development, and financial allocations. Poor decision-making can result in delays, resource misallocation, and reduced institutional effectiveness. According to Okoro and Nwosu (2020), universities with structured decision-making frameworks tend to achieve better administrative outcomes due to clarity in policies and procedures. Decision-making in public universities should be based on data-driven approaches, stakeholder engagement, and strategic foresight. Without these components, universities may face persistent challenges such as financial mismanagement, staff dissatisfaction, and declining academic standards.

Moreover, strategic planning is a key determinant of how effectively a university is administered. Strategic planning involves setting clear institutional objectives, designing actionable policies, and ensuring proper resource allocation to achieve long-term goals. Universities in Rivers State require well-defined strategic plans to address issues related to funding, academic quality, infrastructure, and research development. According to Eke and Adiele (2022), universities that engage in rigorous strategic planning tend to demonstrate higher levels of administrative effectiveness. In the absence of strategic planning, institutions may experience stagnation, inadequate funding utilization, and difficulty in meeting accreditation standards. Therefore, the extent to which strategic planning influences the administrative effectiveness of public universities is an essential area of focus.

Although strategic planning provides a structured framework for institutional management, adaptive leadership ensures that universities remain flexible in response to environmental changes. Adaptive leadership emphasizes the need for university administrators to be dynamic, proactive, and open to change. Public universities operate in complex environments where political, economic, and technological factors continuously shape institutional operations.

Administrators must be able to navigate these complexities by implementing policies that align with both external expectations and internal needs. According to Nwachukwu and Akinola (2021), universities that embrace adaptive leadership demonstrate resilience in the face of funding challenges, policy changes, and evolving student demographics. The ability of university administrators in Rivers State to exhibit adaptive leadership practices remains an area that warrants empirical investigation.

Furthermore, financial management remains a core aspect of university administration. Public universities rely on government funding, tuition fees, and external grants to finance their operations. Efficient financial management ensures that resources are allocated effectively to support academic programs, infrastructure development, and research initiatives. According to Obi and Nnaji (2023), financial mismanagement is one of the leading causes of administrative inefficiencies in Nigerian universities. Universities must adopt transparent financial practices to enhance accountability and operational effectiveness

Additionally, administrative effectiveness in public universities is influenced by multiple internal and external factors. Internally, factors such as staff competence, financial management, infrastructure, and student support services contribute to how efficiently an institution operates. Externally, government policies, funding allocations, regulatory frameworks, and socio-economic conditions shape the administrative landscape of public universities. According to Johnson and Iheoma (2023), universities that align their administrative strategies with external realities tend to achieve higher levels of institutional success. In contrast, universities that operate in isolation from broader policy and economic trends often encounter operational difficulties that hinder their effectiveness. Therefore, an analysis of the interplay between internal and external factors is crucial in understanding administrative effectiveness. This study seeks to examine the extent to which strategic leadership influences the administrative effectiveness of public universities in Rivers State. By exploring the role of innovation, decision-making, strategic planning, and adaptive leadership, the research will provide empirical insights that can inform policy recommendations and institutional reforms.

Statement of the Problem

It has been observed that public universities in Rivers State faced significant administrative challenges that affected their effectiveness in delivering quality education and achieving institutional goals. Key issues such as inefficient decision-making, lack of strategic planning, limited adoption of innovative practices, and inadequate adaptive leadership hinder the smooth operation of these institutions. Ineffective decision-making often leads to delays, misallocation of resources, and poor governance. Many universities lack structured decision-making processes, which results in operational setbacks. Similarly, the absence of clear strategic planning has caused inconsistencies in policy implementation, weak infrastructure development, and poor resource management. Moreover, many public universities in Rivers State have been slow to adopt innovative practices such as digital technology, which has hindered operational efficiency and service delivery. This reluctance to innovate has affected key areas such as communication, record-keeping, and student support services. The failure to adopt adaptive leadership has made it difficult for university administrators to respond effectively to changes in the education sector, such as shifting policies and funding fluctuations. This study seeks to investigate how strategic leadership, including innovative practices, decision-making, planning, and adaptability, can improve the administrative effectiveness of public universities in Rivers State.

THEORETICAL REVIEW

Innovation Diffusion Theory

Innovation Diffusion Theory (IDT), developed by Everett M. Rogers in 2013, is one of the most widely applied frameworks for understanding how new ideas, practices, and technologies spread across populations, organizations, and communities. Rogers, in his seminal work, conceptualized the diffusion process as a social system through which innovation is communicated over time among the members of a particular social structure. He identified key components of the diffusion process, including the innovation itself, communication channels, time, and the social system, which collectively contribute to the successful adoption and dissemination of innovations. In his 2013 edition of the book Diffusion of Innovations, Rogers expanded upon his earlier work by integrating new research and insights into the mechanisms by which innovations spread and become institutionalized within societies. These components and the theoretical framework provided by IDT offer invaluable insights into the processes through which public universities can adopt strategic leadership practices, modern technologies, and innovative administrative solutions to enhance their administrative effectiveness.

The concept of innovation in IDT refers to any idea, practice, or object that is perceived as new by an individual or group, and its adoption occurs when the innovation is considered advantageous, compatible with existing values, easy to use, trialable, and observable. Rogers identified five key attributes that influence the rate of adoption of an innovation: relative advantage, compatibility, complexity, trialability, and observability. These attributes help explain why some innovations are embraced rapidly by members of a community or organization while others face resistance. The relative advantage of an innovation refers to the perceived benefits it offers over previous alternatives, while compatibility highlights the degree to which an innovation aligns with the existing values, practices, and needs of a social system. Complexity pertains to the ease or difficulty of understanding and implementing an innovation, and trialability describes the extent to which an innovation can be experimented with on a limited basis before full-scale adoption. Finally, observability concerns the visibility of the benefits of the innovation to others, influencing the likelihood of adoption through social influence.

Rogers' work on innovation diffusion has had a profound impact on fields ranging from public health to technology adoption, education, and organizational management. His theory underscores the importance of communication channels and social systems in the diffusion process, where information about innovations is spread through interpersonal networks and formal or informal communication channels. This makes the role of leadership, especially strategic leadership, central to the successful diffusion of innovations in any organization, including public universities. In the context of public universities, the adoption of innovative administrative practices, technological advancements, and strategic leadership approaches can be seen as crucial for improving administrative effectiveness and overall institutional performance. Universities in Rivers State, like those elsewhere, are continuously confronted with the need to innovate in response to changing educational demands, government policies, and resource limitations, making IDT particularly relevant to understanding how innovations in administration are accepted and implemented within the university system.

One of the central aspects of IDT that applies to public universities is the concept of the "early adopters" and the "innovators" within a given system. In Rogers' framework, individuals and organizations adopt innovations at varying rates, typically categorized into five groups:

innovators, early adopters, early majority, late majority, and laggards. Innovators are those who are the first to adopt an innovation, often driven by curiosity or a keen interest in technological advancements. Early adopters, while still relatively quick to embrace new ideas, are more cautious and seek innovations that have already demonstrated some measure of success or practicality. Early majority adopters are more pragmatic and tend to wait until an innovation has been proven in practice, while the late majority and laggards are more resistant to change, often requiring substantial evidence of an innovation's benefits before they consider adopting it. In the context of public universities, innovators and early adopters in leadership positions are often instrumental in driving change by introducing new technologies or leadership practices, such as strategic planning, digital administration, or adaptive leadership techniques, which can eventually be embraced by the broader university community.

The relevance of IDT to the study of strategic leadership and administrative effectiveness in public universities lies in the theory's emphasis on understanding how innovations are diffused and adopted within social systems. The administrative effectiveness of a public university is significantly influenced by the extent to which it embraces and integrates innovations in leadership practices, management techniques, and technology. Strategic leadership in universities involves the adoption of innovations that promote efficiency, improve decision-making, and enhance the university's capacity to meet its objectives. According to IDT, the rate at which these innovations are adopted within a university system depends not only on the perceived benefits of the innovation but also on factors such as the organizational culture, leadership style, and communication channels within the institution. The more aligned an innovation is with the values and goals of the university, the more likely it is to be adopted by faculty, staff, and administrators, thus enhancing the overall administrative effectiveness of the institution.

Moreover, IDT's concept of the innovation-decision process is particularly applicable to understanding how leaders within public universities make decisions about adopting new practices. Rogers identified five stages in the adoption process: knowledge, persuasion, decision, implementation, and confirmation. In the knowledge stage, university leaders become aware of a new idea or innovation, such as a new digital tool for administrative tasks or a novel leadership model. In the persuasion stage, they develop a favorable or unfavorable attitude toward the innovation based on their understanding of its potential benefits and challenges. The decision stage involves the formal choice to adopt or reject the innovation, while the implementation stage refers to the actual adoption and integration of the innovation into university operations. Finally, in the confirmation stage, the innovation is evaluated, and its impact on university effectiveness is assessed. This process is crucial for ensuring that innovations are not only adopted but also effectively integrated into the university's operational framework.

Rogers' diffusion model also highlights the importance of communication channels and networks in the innovation process. For public universities in Rivers State, the way information about new leadership practices or administrative technologies is communicated can significantly influence the adoption process. Communication channels in universities are not limited to formal channels, such as meetings, emails, and policy documents; informal channels, such as word-of-mouth, peer recommendations, and social networks, also play a crucial role in spreading information about innovations. Leaders within the university, particularly those in positions of strategic influence, can use both formal and informal communication channels to persuade and motivate others to adopt new practices. Furthermore, the network of relationships between administrators, faculty, and staff can facilitate or hinder the spread of innovative ideas. Strong

communication networks and supportive leadership can accelerate the adoption of innovations, while fragmented or resistant communication structures can delay the process.

The application of IDT to public universities in Rivers State can also be extended to the role of adaptive leadership. Public universities face complex and unpredictable environments, and the ability of university leaders to adapt to changing circumstances, such as shifts in government policy, technological advancements, and shifting student demographics, is crucial for maintaining administrative effectiveness. Adaptive leadership involves leaders who are flexible, responsive, and capable of managing change effectively. According to IDT, innovations that are compatible with the existing values and practices of an organization are more likely to be adopted, making it essential for university leaders to frame innovations in a way that aligns with the broader goals and values of the institution. Furthermore, adaptive leadership requires a willingness to experiment with new ideas, to allow for trialability, and to observe the outcomes of innovation, all of which are key components of Rogers' theory.

CONCEPTUAL CLARIFICATION

Concept of Strategic Leadership

Strategic leadership refers to the ability of leaders to create a long-term vision, make informed decisions, and mobilize resources to achieve organizational goals. It involves the capacity to navigate complex environments, anticipate future challenges, and implement policies that drive sustainable growth. Leaders in public universities must exhibit strategic thinking, which enables them to adapt to evolving educational demands, government policies, and technological advancements. According to Bass (1985), strategic leadership is essential for fostering an environment of continuous improvement, where institutions can maintain relevance in a competitive landscape.

In the context of public universities, strategic leadership requires administrators to balance multiple responsibilities, including resource management, faculty development, and student engagement. Effective university leaders must possess the ability to align institutional objectives with national and global trends in higher education. Porter (1980) emphasized that strategic leadership is necessary for sustaining competitive advantage, as it ensures that organizations remain dynamic and responsive to external pressures. Leaders must also cultivate a culture of innovation, where faculty and staff are encouraged to experiment with new teaching methods, administrative processes, and research initiatives.

The role of strategic leadership in public universities extends beyond internal management to include external collaborations. Universities are increasingly forming partnerships with industry stakeholders, government agencies, and international institutions to enhance research output and increase funding opportunities. These collaborations require leaders who can negotiate effectively and establish mutually beneficial agreements. Furthermore, strategic leadership involves the development of policies that promote diversity, inclusion, and academic excellence. Public universities must implement strategies that support the academic success of students from diverse backgrounds while ensuring equitable access to educational resources.

Administrative Effectiveness

Administrative effectiveness in public universities refers to the ability of institutional leaders and staff to efficiently manage resources, implement policies, and achieve educational objectives. Effective administration is characterized by streamlined operations, transparent governance, and responsiveness to stakeholders' needs. According to Bertalanffy (1968), organizations function as interconnected systems where administrative efficiency depends on the coordination of various components, including leadership, infrastructure, and personnel management.

Public universities require administrators who can handle complex bureaucratic structures while maintaining academic integrity. The effectiveness of an institution's administration is often measured by its ability to provide quality education, manage financial resources prudently, and support faculty research. Efficient administrative systems contribute to student satisfaction and institutional reputation, which in turn attract more funding and academic partnerships.

Leadership plays a crucial role in ensuring administrative effectiveness. University administrators must develop policies that align with institutional goals while addressing emerging challenges such as funding constraints and policy shifts. Additionally, administrators must leverage technology to improve service delivery. Digital tools for student registration, faculty communication, and financial management have significantly enhanced the efficiency of university administration. According to Rogers (2013), the adoption of technological innovations improves organizational processes by reducing manual workloads and minimizing errors. Furthermore, administrative effectiveness requires strong accountability mechanisms. Transparent decision-making processes, regular performance evaluations, and stakeholder engagement contribute to institutional efficiency. Universities that prioritize administrative effectiveness are better equipped to handle challenges related to student enrollment, curriculum development, and accreditation requirements.

Innovative Practices and Administrative Effectiveness

Innovation in university administration involves the adoption of new technologies, processes, and policies that enhance operational efficiency and academic quality. Innovation Diffusion Theory, as described by Rogers (2013), highlights how new ideas spread within organizations, influencing their effectiveness. In public universities, innovative practices can be applied in areas such as digital learning, automated administrative systems, and research development.

The integration of technology in university administration has revolutionized traditional processes. Online student registration, automated grading systems, and virtual learning platforms have improved efficiency and accessibility. According to Call (2018), institutions that embrace technological innovations experience higher levels of administrative efficiency, as these tools streamline operations and reduce paperwork. Furthermore, digital communication platforms have enhanced collaboration between faculty, students, and administrative staff, ensuring seamless information flow.

Innovation also extends to curriculum development and teaching methodologies. Universities that incorporate modern pedagogical techniques, such as experiential learning and interdisciplinary programs, offer students a more holistic education. Faculty members must be encouraged to adopt innovative teaching approaches that align with industry demands. Additionally, research-oriented innovations, including grant management software and digital libraries, have facilitated academic research and knowledge dissemination.

Another critical aspect of innovation in university administration is policy reform. Institutions must continuously assess and revise policies to align with changing educational landscapes. Flexible academic structures, student support programs, and faculty development initiatives contribute to a more effective administrative system. Universities that fail to innovate risk becoming obsolete, as they may struggle to meet the evolving needs of students and faculty.

Efficient Decision-Making and Administrative Effectiveness

Decision-making is a fundamental component of university administration, as it determines the effectiveness of institutional policies and operations. Efficient decision-making involves the ability to assess information, evaluate alternatives, and implement solutions that align with organizational objectives. According to Fiedler (1964), decision-making effectiveness is influenced by the leader's ability to adapt to situational factors, including institutional needs and external challenges. University administrators must make informed decisions regarding financial management, academic programs, and human resource allocation. The ability to analyze data and anticipate trends is crucial for ensuring that decisions lead to positive outcomes. Institutions that rely on data-driven decision-making processes are better positioned to address challenges such as budget deficits, faculty recruitment, and student retention.

Moreover, participatory decision-making enhances administrative effectiveness. When faculty, students, and other stakeholders are involved in decision-making processes, institutions benefit from diverse perspectives and increased support for policy implementation. Transparency in decision-making fosters trust and accountability, reducing resistance to institutional changes. Public universities must also develop crisis management strategies to handle unforeseen challenges. Economic fluctuations, policy changes, and health crises can disrupt university operations, requiring swift and effective decision-making. Administrators who possess strong analytical skills and adaptability can navigate these challenges while maintaining institutional stability.

Strategic Planning and Administrative Effectiveness

Strategic planning involves setting long-term goals, identifying resources, and implementing strategies that align with an institution's mission. Universities require strategic planning to ensure sustainable growth, academic excellence, and operational efficiency. According to Porter (1980), organizations that engage in strategic planning are better equipped to navigate competitive and dynamic environments. Public universities must develop comprehensive strategic plans that address key areas such as infrastructure development, faculty recruitment, and student success initiatives. Strategic planning enables institutions to allocate resources effectively and prioritize projects that contribute to institutional advancement. Universities that lack structured strategic planning may experience inefficiencies, financial instability, and declining academic standards.

Additionally, strategic planning supports institutional accreditation and policy compliance. Universities must align their programs with national and international education standards to maintain credibility and recognition. Regular evaluation of strategic plans ensures that institutions remain adaptable to emerging trends in higher education. Effective strategic planning also fosters institutional collaboration. Universities that engage in joint research projects, academic exchanges, and industry partnerships benefit from shared resources and

knowledge. Collaborative initiatives enhance the institution's reputation and increase funding opportunities, contributing to long-term sustainability.

Adaptive Leadership and Administrative Effectiveness

Adaptive leadership refers to the ability of leaders to adjust their strategies in response to changing circumstances. In the context of public universities, adaptive leadership is essential for addressing challenges such as shifting government policies, economic constraints, and technological advancements. According to Rogers (2013), organizations that embrace adaptive leadership are more likely to succeed in dynamic environments. University administrators must demonstrate flexibility in policy implementation and resource management. Institutions that adopt rigid administrative structures may struggle to respond to emerging challenges, leading to inefficiencies. Adaptive leadership promotes a culture of continuous learning, where faculty and staff are encouraged to develop new skills and embrace innovative solutions.

Another aspect of adaptive leadership is resilience. Universities face various uncertainties, including funding cuts, student enrollment fluctuations, and regulatory changes. Leaders who exhibit resilience can navigate these challenges without compromising institutional objectives. The ability to engage stakeholders and communicate effectively during times of change enhances institutional stability and progress. Furthermore, adaptive leadership supports diversity and inclusion in higher education. Universities that prioritize inclusivity create environments where students and faculty from diverse backgrounds feel valued and supported. Policies that promote equal opportunities in education and employment contribute to institutional effectiveness.

Public Universities

Public universities serve as critical institutions for knowledge creation, research, and societal development. These institutions provide higher education opportunities to a broad demographic, often operating under government funding and regulatory oversight. Effective administration in public universities is essential for ensuring quality education, research excellence, and institutional sustainability. Public universities face various challenges, including financial constraints, political interference, and growing student populations. Strategic leadership, efficient decision-making, and innovative practices play a crucial role in addressing these challenges. Universities that embrace modern administrative techniques and adaptive leadership approaches are better equipped to maintain high academic standards.

Collaboration between public universities, government agencies, and private organizations enhances institutional development. Research funding, faculty training programs, and student support initiatives contribute to the overall effectiveness of these institutions. Moreover, public universities must continuously assess their policies to remain competitive in the evolving educational institutions.

CONCLUSION

The findings of this study highlight the critical role of strategic leadership in enhancing the administrative effectiveness of public universities in Rivers State. The study established that innovative practices, efficient decision-making, strategic planning, and adaptive leadership

significantly contribute to institutional success and governance. Innovative practices improve administrative effectiveness by fostering technological advancements, streamlining bureaucratic processes, and enhancing operational efficiency. However, challenges such as resistance to change and inadequate funding can hinder their full implementation. Additionally, efficient decision-making ensures timely policy execution, promotes transparency, and strengthens institutional trust. Universities that engage in data-driven and participatory decision-making processes tend to experience better administrative outcomes.

Furthermore, strategic planning is essential for aligning university goals with broader educational policies and global trends. Proper strategic planning enhances resource allocation, risk management, and institutional stability. However, the effectiveness of strategic plans is often undermined by poor implementation and lack of stakeholder involvement. Adaptive leadership plays a vital role in helping universities navigate challenges such as financial constraints, policy shifts, and governance issues. Leaders who embrace adaptability foster resilience, encourage institutional learning, and promote innovative problem-solving. Strategic leadership is indispensable for the administrative effectiveness of public universities in Rivers State. To maximize its impact, university administrators must embrace innovation, prioritize evidence-based decision-making, adhere to strategic plans, and cultivate an adaptive leadership culture. By doing so, universities can improve governance, enhance service delivery, and achieve long-term sustainability in an increasingly dynamic educational landscape.

Recommendations

The following recommendations were made:

- University Administrators should adopt and institutionalize innovative practices by integrating modern technology into administrative and academic processes to improve efficiency and transparency.
- University Administrators should Foster a culture of continuous professional development to equip staff with the necessary skills for innovation-driven administration.
- Government and Regulatory Bodies should provide adequate funding and resources to support the implementation of innovative technologies and infrastructure improvements in public universities.
- Academic Staff and Faculty Members should engage in continuous learning and research on innovative administrative practices to contribute to institutional efficiency.

ABSTRACT

The study focused on suspended and bed sediments characterization of six streams in Port Harcourt metropolis. The overriding objective was to determine the concentration levels of selected physicochemical parameters (pH, TDS, SO_4^-, NO_3^-, Cu, Cr, Pb, Fe, Cd, and Zn) in sediments and water. Contamination, pollution, and toxicity assessments were carried out to determine the impact of these parameters on the aquatic ecosystem, water portability, and agricultural landuse development. With 1000 meters of the linear reaches of each stream, a sample interval of 50 meters was adopted per stream, and 5 sampling points of each stream were taken at random using the table of random numbers. The grab instrument was used for sediments sampling. Laboratory analyses were based on the APHA standards in which the electrometric method was used for pH, the D5907-13 ASTM International method for TDS, the cadmium reduction method for nitrate, turbidimetric method for sulphate, and atomic absorption spectrometry (AAS) for heavy metals. Anthropogenicity (AnP%), and the single index of the Nemerow Pollution Index (NPI) are used in this paper. The permissible limits of the NESREA (2007), and NDWQI (2007) were used to evaluate the Nemerow pollution index (NPI). The Chi-square was used for statistical analysis to validate the hypothesis. The T-test validated the null hypothesis that there is no significant relationship between the concentration levels of the physicochemical parameters between suspended and bed sediments across the streams. The exception was for TDS where the alternative hypothesis was accepted. The study concluded that the streams are relatively contaminated by heavy metals, slightly acidic and saline. The study hence recommended water treatments for portable uses, stream restoration for aquatic ecosystem recovery, sediment mining for heavy metals, and sediment security as a geo-security appendage for others.

Keywords: geo-environment, anthropogenic, anthropogenicity, physicochemical parameters, suspended sediments, bed sediments, heavy metals, Nemerow Pollution Index, streams, metropolis.

INTRODUCTION

The environment conceptualizes is a unit of diverse energy systems each with unique subsets interacting with each other at different capacities and frequencies to produce an outcome or work at a steady state without theoretically collapsing the optimal functioning capacity of interacting systems. Where the functioning of an environment's system to be suspect, the processes within it energy fabrics would require investigation. Of concern is anthropogenic processes in the geo-environment. Anthropogenic processes bring changes to the environments which upset the equilibrium of functional processes. Environmental history can be pieced together with sediments as Dean (2014) describes the anthropogenic environment as one created, developed and built for humans. Human and geo-generic processes are complementary chips that intersect on the complex geographical canvas of the geo-environment. Human activities - anthropogenic processes particularly upsets the balance and equilibrium of the interrelated phenomena and processes in the environment. The need to ensure the sustainability of the geo-environment for productive capacity has become a concern to all stakeholders on the environment due to release of deleterious wastes materials in solid, liquid and gaseous forms into the environment. This upset has led to various forms and stages of degradation of the natural state of the environment causing contamination and pollution to the sustaining capacity, and resourcefulness of the different facets of the environment. Geo-environmental stresses from anthropogenic activities and processes have been reported for a myriad of environmental settings including wetland, urban watersheds and catchments, fluvial systems and their aquatic ecosystems, soils and wildlife ecosystems, and the atmospheric bank with variable weather incidents. Anthropogenicity has a place in the history of the degradation of the environment without the capacity to restore balance of equilibrium, as its effects have been researched (Richerson et al, 2000). Sediment cores have been found to be useful in tracking and establishing the environmental history of sediments as some researchers agree, they are indispensable tale-tell for making inferences on past geo-processes over a geographical region.

Ouyang et al (2010) link sediment properties to soil erosion of parent materials. The relationship between soil and sediment yield is noted by Woodward and Foster (1997). Thus, incidents of sediments generation, and transport from the outlying areas, and deposition in aquatic systems dispose them to inherit the DNA of the source terrestrial materials. Currently there exists technology that helps researchers to establish an empirical cast of an environment's historical processes through sediment analysis (Collins et al, 2004). In other words, the geo-history of anthropogenic stresses and stressors on environmental facets like aquatic ecosystems and their watersheds can be tracked and decoded with sediment cores. Manyilizu (2019) made a case for the environmental history of the atmospheric facet of the environment. His treatise covered the history of anthropogenic effects of pesticides on health in Africa. His work highlights the need to control pests, efforts with pesticides in order to limit hazard and risks to humans and biological population of the environment from exposure to such related anthropogenic activities.

Anthropogenic pollutants are threats, hazardous and risk to the sustainability of environment and ecosystem. The import of the hazardous impact of anthropogenic pollutants some of which are synthetic organic substances, and heavy metals on the physiological functioning of human, and wildlife engages scholarship, research and innovation in the management of geo-environmental space. The depth of impact of one chemical on the physiological system of organisms may not be as troubling as the impact from a collection of

pollutants (Rhind 2009). In other words, chemical releases from anthropogenic processes are damaging to the biological communities in an anthropogenic environment. it must be understood that the impact however depends on the species, the rate and pattern of exposure or overexposure to pollutants, the trophic pathways of intake of the pollutants, level of bio-accumulation and bio-concentration, metabolic sensitivity of organs. Even man the creator of anthropogenic pollutants is victim to anthropogenic degradation of the environment. Anthropogenic environments are congruent with landuse changes. From a global purview Ellis (2021) associated and tied changes landuse and landscape alteration; ecosystems and biodiversity, atmospheric and climate changes to the impact of land use pressure on land cover. This implies that the anthropogenic environment comes back to hunt its creator. Beside the contamination of the natural environment, and the pollution risk to their resourcefulness, Kosuth et al (2018) reported on toxicity risks to human health from the consumption of plastic particles in food packaged for human consumption in synthetic polymers.

The global impact of the toxic and harmful effect of mercury upon its released into the environment through geogenic and anthropogenic processes at hazardous concentration levels is attributed for physiological changes in humans, bio-organisms and climate change (Li et al 2020). Tap water representing underground water, sea salt, and beer contaminated from anthropogenic activities is reported in scholarship. As an offshoot of increased forest fires in the western USA, Abatzoglou and Williams (2016) attribute temporal degradation in atmospheric quality and climate change to anthropogenic processes. In consonance with this, are incidents of forest space depletion, degradation, and mortality, carbon emissions, and high of cost associated with forest fires suppression. The complexity associated with land, water, and air quality, and biodiversity functioning as a result of environmental stressors associated with urbanization has engaged scholars to put forward every possible intellectual forward to understand the problems and propose solutions to environmental issues. The need to understand and resolve the conflict between human activities and natural processes and events in the urban landscape has challenged scholars to seek appropriately engaging study tools. Akhtar, et al (2021) listed industrial, urban land use development and agricultural land use sectors within the urbansphere of engagement as primary anthropogenic sources of pollutants that degrade water quality, and aquatic ecosystem in urbanized areas. Conflict areas identified in the natural environment include ‘climate change, natural disasters, geological factors, soil/matrix, and hyporheic exchange in the aquatic environment (Akhtar, et al 2021).

The Nemerow pollution index is versatile in application for evaluation and or assessment of contamination or pollution just as Anthropogenicity (AnP%). Either of the two may be applied to evaluation of environmental changes in the media of soil, water, air and organic matter.
Kowalska et al (2016) used the Nemerow Pollution Index ($PI_{Nemerow}$) in the study of soil profile pollution of the lithological discontinuity (LD) of the cultural layer (CL) in the main market Square (MMS). The study centered on the impact of medieval metallurgical activities in the market square (MS) on soil characteristics of the site. Many other researchers have used Nemerow pollution index model for either water quality, soil quality or sediment quality, or to evaluate the ranking of concentration levels of pollutant in host environmental media. Water quality of the Zhangze Reservoir, China was assessed by Zhang et al (2017) with the integrated water quality identification index method and the Nemerow pollution index method. Brady et al (2015) after reviewing many pollution assessment indices, regarded the Nemerow Pollution Index to be the most appropriate method for establishing the concentration levels of pollutant in a studied environmental medium especially sediment quality.

The characteristics of pollution evaluation indices are by no means the same. In the study of ecological risks from heavy metals in metals, Zhou et al (2020) used a plethora of pollution geo-indices in making their inferences. The results showed two different sets of results. The one set was made of the geo-accumulation index (Igeo), single pollution index (Pi), and single potential ecological risk index (Er). The other set was made of potential ecological risk index (RI), pollution load index (PLI), and Nemerow index (NP). The contamination of Hg and Pb using the first set showed that ecological risk to be between slight and moderate. The results of the set that Nemerow pollution index model was remarkably different giving ecological risk as low. This model has been subjected to modification in the course of the history of its use by scientists being an indication of its versatility. There are the single and integrated versions of the Nemerow pollution index.

Anthropogenicity (AnP%) is evaluated as the percentage of the concentration level of a contaminant observed analyte (heavy metal) in a sample medium relative to its background value. It indicates the source of contamination or pollution relative to anthropogenic activity.

Study Area

Port Harcourt is the administrative capital and seat to the government of Rivers State, Nigeria. It is located between longitudes 6.055I^{o} and 7.055I^{o} E and latitudes 4.035I^{o} and 5.010I^{o}N of the equator. The physiography of the area is consistent with the geomorphic assessments (Floyd, 1969; Iloeje, 1961; Jungerius 1964; Ofomata, 1975; Prichard, 1979) as characterized low reliefs and gently undulating flat plains which slope angles declining towards the Atlantic Ocean.

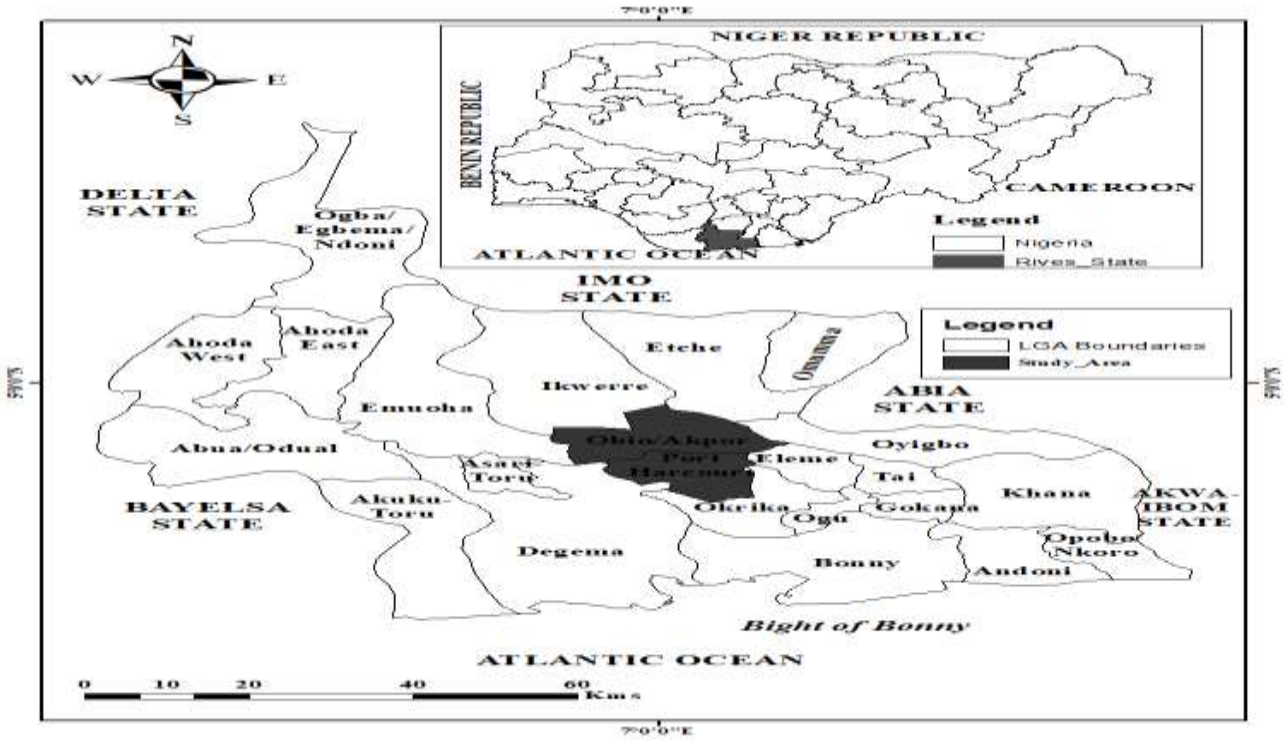

Figure 1: Rivers State, Nigeria. Showing Port Harcourt Metropolis
Source: researcher's fieldwork 2021/2022

The metropolis has a massively growing urban population of about 3 million residents comprising natives, and indigenous peoples of the states, migrant nationals from other places in the country, and foreign nationals who give professional and technical services in the oil and gas sector of the economy. Based on the modified Koppen-Geiger (Koppen, 1923) classification model the area is typified as Am with the mean annual temperature is 26.0 °C | 78.8 °F; an annual rainfall (precipitation) is about 2719 mm | 107.0 inch. From bottom to top the geology consist of the Akata formation, the Agbada formation, and the Benin formation which is believed to have started evolving in the Paleocene period upto the present geological age (Nwankwoala & Angaya 2017). The area is heavily drained by a massive network of surface streams, and creeks. The vegetation in the dry upland areas is consistent with fresh water and mangroves in the creek as consistent with salt water environments. The sampled streams are illustrated in the map in Figure 2.

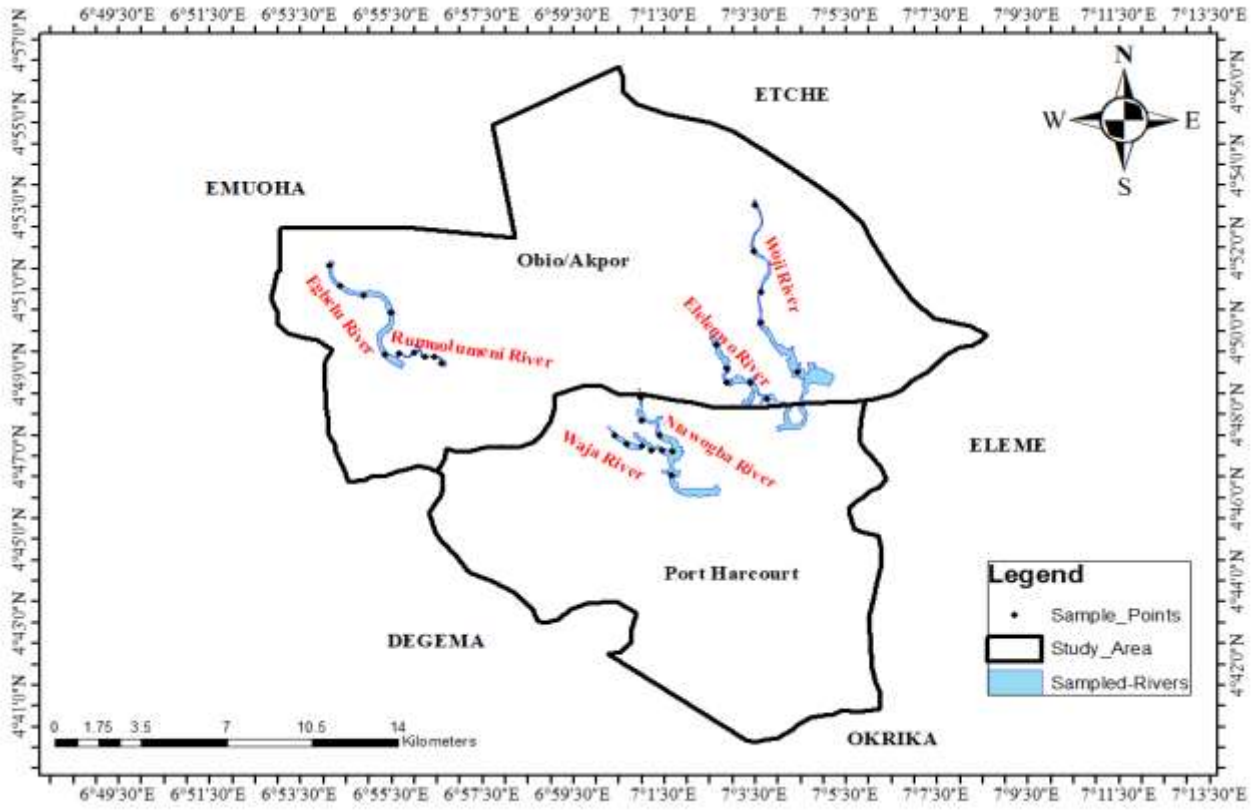

Figure 2: Port Harcourt Metropolis Showing Streams and Sampling Points

RESEARCH METHODS

Field Methods

The following, Egbelu stream, Rumuolumeni stream, Ntanwogba stream, Waja stream, Woji stream, and Elelenwo stream were sampled for this study in the Port Harcourt metropolis. Experimental design was used for the study; sources of data were primary and secondary. 30 samples each for suspended and bed sediments were collected on November 3, 2021 from the

aforementioned from the streams. The sample frame was 1000m along the lower stretch of the streams while the sample interval for the sampling was 50m. As recommended by the US Geological Department the suspended sediments were fetched and stored in the pre-cleaned laboratory water bottles. The bed sediments were extracted from stream floors using the grab method. They were also stored in pre-cleaned laboratory bottles. The global positioning system (GPS) for each sampling point was recorded. The bottles containing the samples were immediately covered tightly against spillage and stored in cooler under controlled temperature condition and conveyed to the laboratory for experimental physicochemical analyses.

Laboratory Methods

The following the pH, total dissolved solids (TDS), sulphate (SO_4^{2-}), nitrate (NO_3^-), copper (Cu), Chromium (Cr), lead (Pb), iron (Fe), cadmium (Cd), and zinc (Zn) are the physicochemical parameters that were analyzed in the suspended and bed sediments samples. The concentration levels were determined in the laboratory from five composite samples each for the suspended and bed sediments based on the regulatory framework guiding the laboratory procedure by the Department of Petroleum Resources Environmental Guidelines and Standards for the Petroleum Industry in Nigeria (DPR-EGASPIN). The APHA (American Public Health Association) standard analytical test methods were used. APHA, AWWA & WEF test methods are specifically for the analyzing of a wide spectrum of parameters in water and waste water. The APHA 4500 H-B was used for pH using the electrometric method; the ASTM International (2013) D5907-13 method was used for TDS based on the APHA 2540C standards; the turbidimetric method was used for sulphate (SO_4^{2-}) based on the APHA 4500E-SO_4^{2-} standards; the cadmium reduction method used for nitrate based on the APHA 4500-NO_3^- E; APHA 3111C was used for Cu; APHA 3111D was used for Cr; the APHA 3111C was used for Pb; APHA 3111C was used for Fe; the APHA 3111C was used for Cd and the APHA 3111C was used for Zn based on the atomic absorption spectrometry (AAS) method.

Standard Guidelines: Anthropogenicity relative to geological background values of each observed heavy metal. Nemerow pollution (single and integrated indices) was evaluated with comparative standard guidelines of NESREA (2007), and NDWQI (2007).

Anthropogenicity (AnP%)

The Anthropogenicity of a contaminant is calculated with the given formula:

$$APn\% = \mu/Bn(100) \qquad \text{Equation 1}$$

Where, μ = measured concentration, while Bn=background value.

Nemerow Pollution Index

As given by Chen et al (2005), Xiao et al (2015), and Swathi & Umesh (2015) the formula for calculating the Nemerow single pollution index is:

$$Nemerov^{index} = \boldsymbol{Ci/qs} \qquad \text{Equation 2}$$

$Nemerov^{index}$ represents the general pollution provided by a single parameter in a specific environmental sample. Where *Ci* is the concentration level of the given parameter in a study

sample while ***qs*** is the standard or permissible limit of the parameter in a set guideline for water, soil, sediment or cellular matter. The key to interpreting the N-*SPI* (Lodhaya, et al, 2017) is given below.

Table 1: Classification of Nemerow Single Pollution Index

S/ N	Nemerow- *Single Pollution Index*	Pollution grade
1	(SPI ≤ 1)	Unpolluted
2	(1< SPI ≤2)	slightly polluted
3	(2 < SPI ≤ 3)	moderately polluted
4	(SPI > 3).	highly polluted

The key to interpreting the Nemerow integrated pollution index - N-*IPI* (Lodhaya, et al, 2017) is given below.

Table 2: Classification of Nemerow Integrated Pollution Index

S/N	Nemerow -*Integrated Pollution Index*	Pollution grade
1	Pnemerow ≤ 0.7	*Clean*
2	0.7 < Pnemerow ≤ 1	*warning limit*
3	1 < Pnemerow ≤ 2	*slight pollution*
4	2 < Pnemerow ≤ 3	*moderate pollution*
5	Pnemerow > 3	*highly pollution*

The concentration levels of the physicochemical parameters in suspended sediments is given in Table 3 while that for bed sediments is given in Table 1.2. The averages of the concentration levels in order of magnitude for suspended sediments is SO_4^{2-} (6.35) > pH (5.25) > Fe (0.216) > NO_3^-(1.76) > Zn (0.853) > Cu (0.087) > Cr (0.065) > Cd (0.063) > Pb (0.058). The averages of the concentration levels in bed sediments is Fe (0.216) > Zn (0.853) > Cu (0.087) > Cr (0.065) > Cd (0.063) > Pb (0.058). The mean for suspended sediments (ss), and the mean for bed sediments (bs) are marched one against the other so that $pH_{(ss)}$=$pH_{(bs);}$ TDS (not available); $SO_3^{2-}{}_{(ss)}$> $SO_3^{2-}{}_{(bs)}$; and $NO_{4.(ss)}$< $NO_{4.(bs)}$. Between suspended and bed sediments the mean concentrations is as follows $Cu_{(ss)}$<$Cu_{(bs)}$; $Cr_{(ss)}$<$Cr_{(bs)}$; $Pb_{(ss)}$<$Pb_{(bs)}$; $Fe_{(ss)}$<$Fe_{(bs)}$; $Cd_{(ss)}$<$Cd_{(bs)}$ and $Zn_{(ss)}$>$Zn_{(bs)}$.

Assessments of Anthropogenicity of Heavy Metals

The world average shale values used for deriving anthropogenicity (Edori & Kpee, 2017) are 95 for Zn, 20 for Pb, 45 for Cu, 0.3 for Cd and 47200 for Fe. In this study, the world shale values used for Fe is 4.72, and Cr is 90.

Anthropogenicity (AnP%**) by Heavy Metal in Suspended Sediments**

Table 5: Assessments of Anthropogenicity of Heavy Metals in Suspended Sediments

Heavy Metal	Egbelu	Rumuolumeni	Ntawogba	Waja	Woji	Elelenwo
Cu	0.0088	0.02	0.015	0.0066	0.0044	0.0044
Cr	0.002	0.026	0.034	0.015	0.006	0.004
Pb	0.05	0.045	0.11	5	0.005	0.005
Fe	0.593	1.95	21.44	1.610	1.144	1.101
Cd	0.33	3	24	1	0.33	0.33
Zn	0.041	0.115	1.052	0.104	0.041	0.022

Source: researcher's fieldwork 2021/22

This analysis shows Pb with 5 percent value in the suspended sediments in the Waja streams being from anthropogenic activities. In suspended sediments, Fe is detected in Rumuolumeni, 1.95 percent; in Ntawogba, 21.44 percent; in Waja, 1.610 percent; Woji, 1.144 percent; and in Elelenwo, 1.101 percent streams are relative to anthropogenic activities. In suspended sediments, Cd is detected in Rumuolumeni, 3 percent; in Ntawogba, 24 percent; and in Waja, 1 percent due to anthropogenic activities. However, for Zn, only 1.052 percent is indicated in Ntawogba stream. Besides these, all other valuations of anthropogenicity are less than 1 percent in suspended sediments for all the six streams.

Anthropogenicity (AnP%**) by Heavy Metal in Bed Sediments**

Table 6: Assessment of Anthropogenicity of Heavy Metals in Bed Sediments

Heavy Metal	Egbelu	Rumuolumeni	Ntawogba	Waja	Woji	Elelenwo
Cu	0.186	0.014	0.188	0.25	0.313	0.082
Cr	0.102	0.058	0.105	0.517	0.105	0.092
Pb	0.215	0.495	0.06	0.445	0.265	0.265
Fe	22.60	106.39	179.89	42.62	65.91	54.30

Cd	14.66	4	3.66	21.66	14	32.66
Zn	0.223	1.235	1.535	0.546	1.062	0.781

Source: researcher's fieldwork 2021/22

AnP% for bed sediments shows Ntawogba and Egbelu streams with the higher and lowest anthropogenicity factor 179.89% and 22.60%. The anthropogenicity values as across all the streams are in Egbelu stream, 22.60 percent; in Rumuolumeni stream, 106.39 percent; in Ntawogba stream, 179. 89 percent; in Waja stream, 42.62; Woji, 65.91; and Elelenwo stream, 54.30. Anthropogenicity values for Cd stand as in Egbelu stream, 14.66 percent; in Rumuolumeni stream, 4 percent; in Ntawogba stream, 3.66 percent; Waja stream, 21.66 percent, in Woji stream, 14 percent, and in Elelenwo stream, 32.66 percent. The highest anthropogenicity value related for Cd is in Waja stream, and the lowest in Rumuolumeni stream. For Zn, the anthropogenicity values are 1.235 percent in Rumuolumeni stream, 1.535 percent in Ntawogba stream, and 1.062 percent in Woji stream. Aside from these, all other streams have lesser 1 percent value for anthropogenicity.

	0.13	0.036	0.33	0.33	0.013	0.007	*NDWQS*

Source: researcher's fieldwork 2021/22

In the Table 7 given table above analysis of suspended sediment quality is evaluated relative to NESREA and NDWQS standards.

In this study, for the purpose of comparison, the *SPI* is calculated with two national water quality standards - the NESREA, and NDWQS. Results show that calculations with NDWQS standard values give higher values for the parameter pH except for Egbelu where the *SPI* values are same at 0.61, and Woji stream with higher *SPI* value for NESREA at 0.68 than NDWQS at 0.65.

The highest *SPI* value for TDS calculated based on NESREA is highest at Egbelu and lowest at Woji and Elelenwo streams. The *SPI* values for SO_4^{2-} calculated with NDWQS are higher than the values based on NESREA.NO_3^- except Rumuolumeni stream, all the streams have higher *SPI* values with NESREA standard value. Cu has overall *SPI* higher values computed from NESREA standards from all the streams than the calculations based on NDWQS. Cr has higher *SPI* values in Egbelu, Rumuolumeni, Ntawogba, Waja, and Woji streams; only Elelenwo stream has a slightly higher *SPI* value based on NDWQS standard. Pb has higher *SPI* values with NESREA than with NDWQS for all the streams excepting Woji and Elelenwo streams with negative values relative to less than one values computed from NDWQS standards values. Fe is overall higher in all the streams based on valuation of *SPI* with NESREA standards than with NDWQS. Cd is higher in Egbelu and Rumuolumeni based on NDWQS while SPI valuation shows higher in the other streams based on NESREA standards. Zn values based on NDWQS are higher in Ntawogba, Waja, and Egbelu than valuation based NESREA. But Zn values for Rumuolumeni, and Woji streams are higher based on NESREA valuation of *SPI.*

Nemerow Pollution Index Rating of the Heavy Metals

Based on NPI classification ≥ 1, Pb posts the values 2 for Egbelu stream, 1.0 for Rumuolumeni stream, 4.4 for Ntawogba stream, and 1 for Waja streams as computed with NESREA standards. The *SPI* values for iron (Fe) are >1 3.06 in Rumuolumeni,, 33.73 in Ntawogba, 25.3 in Waja, 1.8, and 1.06 in Elelenwo streams respectively. But with NDWQS standard value, the *SPI* value for iron (Fe) is 3.37. Hence based on NESREA standards, *SPI* Fe concentrations are particularly a higher cause for pollutions concerns than NDWQS though by both standards understanding is gained of the pollution status to the aquatic environment of Ntawogba stream.

Cadmium in Ntawogba at *SPI* value 7.2 based on NESREA, and 3 in Rumuolumeni based on NDWQS. Otherwise, the assessment of water quality index using *SPI* shows the parameters <1 based on NESREA and NDWQS control standards. Therefore, Pb, Fe, and Cd pose threat to the suitability of the quality of the portability of the water of Egbelu, Rumuolumeni, Ntawogba, Waja, Woji and Elelenwo streams in Port Harcourt metropolis. All other NPI assessment valuations fall below <1.

Pollution Influencers in Suspended Sediments

In the six streams studied in the Port Harcourt metropolis, the following heavy metals have values ≥1 on the NPI classification scale Pb in Egbelu (3) and in Ntawogba (4.4); Fe in Rumuolumeni (3.06); Ntawogba (33.73), Waja (25.3), Woji (1.8), and Elelenwo (1.06); and Cd (7.2) in Ntawogba. These Pb, Fe, and Cd therefore are the leading influencers of pollution in suspended sediments medium of the streams in Port Harcourt metropolis.

Table 8: Nemerow SPI Analyses of Bed Sediments

	Egbelu	Rumuolumeni	Ntawogba	Waja	Woji	Elelenwo	Index

Source: researcher's fieldwork 2021/22

In the Table 8 given table above results of laboratory analysis of bed sediment is evaluated relative to NESREA and NDWQS standards.

Pollution Influencers in Bed Sediments

In the six streams studied in the Port Harcourt metropolis, the heavy metals that influence pollution in the streams by their *SPI* values are Fe (3.37) in Ntawogba, and Cd in Rumuolumeni (3). Therefore, Fe, and Cd are the leading influencers of pollution in bed sediments in the streams of the Port Harcourt metropolis.

T-test for Suspended and Bed Sediments Parameters

The null hypothesis for study was -there is no significant relationship between the observed parameters in suspended and bed sediments. The table of summary is given below.

Table 9: Summary Table of T-test for Suspended and Bed Sediments Parameters.

Source	Mean	Standard Deviation $S^2 = \frac{\varepsilon(X - \bar{X})^2}{N-1}$	T-Test $t = \frac{(\bar{X} - \bar{Y})}{\sqrt{\frac{S^2_X}{N} + \frac{S^2_Y}{N}}}$	DF (N+N-2) Where N = 9	at 0.05 (Two Tail)
Suspended sediment (X)	2.02	5.412			
			0.53	16	2.12
Bed Sediment (Y)	3.51	70.53			

At 0.05 degrees of freedom the calculated value of 0.53 is less than table value at 2.12. Therefore, H_0 is accepted and H_1 rejected. Consequently, there is no significant relationship between concentrations of physicochemical parameters in suspended and bed sediments in the streams in Port Harcourt metropolis.

FINDINGS

Anthropogenicity (AnP%)

Fe, Cd and Zn stand out as the heavy metals related to human activities thus affecting the quality of streams in the metropolis. Cd has the highest AnP% 24 in suspended sediments in Ntawogba stream, and AnP% 3.66 in bed sediments also in Ntawogba. The least AnP% for Cd is noted in

Waja stream. Fe has the highest AnP% 179.89 in the bed sediments of Ntawogba stream, and AnP% 22 in Egbelu stream. In suspended sediments the AnP% is less than 1 except for Fe in Ntawogba, Rumuolumeni, Waja, Woji and Elelenwo streams. In bed sediments, the AnP% is less than 1 except for Fe, and Cd in all the streams; and Zn in all the streams except in Egbelu and Elelenwo streams.

Nemerow Pollution Indices

The Nemerow Single Pollution Index (N-*SPI*) was evaluated relative to NESREA and NDWQS. Calculated values for suspended sediments showed Pb, Fe, and Cd as leading the contamination of the streams. Thus, they are the metals posing threat to the quality of the streams' water and their suitability for portable uses particularly the - Egbelu, Rumuolumeni, Ntawogba, Waja, Woji and Elelenwo streams in Port Harcourt metropolis. All other N-*SPI* assessment valuations fall below <1. In the bed sediments, the Nemerow-*SPI* calculated values show that Fe has the SPI value 3.37 in Ntawogba stream, while Cd has the SPI value 3 in Rumuolumeni stream. Therefore, Fe, and Cd are the leading influencers of pollution in bed sediments in the streams of the Port Harcourt metropolis.

Nemerow- Integrated Pollution Index (N-*IPI*) shows that in suspended sediments, Ntawogba stream has the highest integrated pollution index value of 0.76, as Egbelu stream has the lowest integrated pollution index value 0.033. Based on the Nemerow Pollution Index classification (Lodhaya et al, 2017), the pollution class for suspended sediments is < Pnemerow ≤1, implying the current status is a warning sign to do something about the use and release of heavy metals into the environments. In bed sediments, Ntawogba is the most polluted of the streams in Port Harcourt metropolis having N-*IPI* value of 6.12. Its N-*IPI* grade of pollution $P_{nemerow}$ >3 indicates high pollution in bed sediments.

Conclusion and Suggestion

The Nemerow- single pollution index (N-*SPI*) and AnP% are valuable for characterizing the impact of a single study parameter to exact contamination and pollution status of a given eco-geomorphic complex. Nemerow-Single Pollution Index (N-*SPI*) and Nemerow-Integrated Pollution Index (N-*IPI*) are useful for onsite evaluation of pollution impacts of observed heavy metals where possible. An attribute lacking by the other evaluation models. However, the model - anthropogenicity (AnP%) gives a measureable indication on the levels of heavy metals in the environment to anthropogenic activities. These evaluation models sufficiently show that the sediments in the streams of Port Harcourt metropolis are not in ambient quality state as their sediments are polluted through enrichment from chemical substances in the urban land and stream environments from a plethora of generating livelihood activities of the human population. This is a cause for concern with regard to the suitability of the water quality for human consumption, and the health of the aquatic ecosystem. Unchecked degradation of stream quality in the area portends serious environmental consequences in the future unless drastic efforts are made to re-urbanize the area by enforcing regulatory restoration of floral cover of streams areas. This will involve enforcing sanctions against residential and business-type development on the stream limits areas across the floodplains. Governments will have to reclaim from private developers, lands developed for such purposes on the flood plains. The flora regime on the flood

has to be restored which serve as natural buffers to filter and control sediments yields to stream basins.

PARTICIPATIVE LEADERSHIP APPROACH AND PRINCIPAL'S MANAGEMENT EFFECTIVENESS IN SENIOR SECONDARY SCHOOLS IN RIVERS STATE

Chibitam Ichendu CHUKWUMATI
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

Participative leadership approach and principal's management effectiveness in senior secondary schools in Rivers State. The paper examined principal's of senior secondary school as the manager who judiciously utilizes all resource of Senior Secondary schools towards effective delivery of school stated goal which is effective teaching and learning. It also emphasis on principal's management effective skills such as supervision skills, communications skills, organization skills, etc. The paper also examined participative leadership style as a leadership style which encourages and supports employees to participate in decision – making process of an organization. It also states some of the participative leadership approach style by principal's towards effective management of senior secondary schools in Rivers State such as team work, consultative activities, and subordinate reward and challenges. The paper concludes that principal's management effectiveness in Senior Secondary schools in Rivers State enhanced through participative leadership approach. The paper then suggest regular supervision openness and team work for principal's effective management of Senior Secondary schools in Rivers State.

Keywords: Participative Leadership, Principal's Management, Senior, Secondary Schools.

INTRODUCTION

The concept of principal's' management effectiveness in senior secondary schools in Rivers state is often used to express the overall school effectiveness in relation to the attainment of both normative and summative values in students as spelt out in the National Policy on Education (FGN, 2014).

The school principal is the accounting officer of the school who is either praised or blamed depending on the degree of his/her effectiveness in influencing the relevant orders in and outside school to enhance teaching and learning. Management of a school is about providing a vision and establishment of what the future will be like as well as winning the supported vision of those who can make it happen. Ajibade (2005) observes that schools that do not have effective management from their principal's will get stranded in complacency. In such situations,

problems will not be confronted and solved, and opportunities will be misused. Principalship is the key to a good school environment and in achieving teaching and learning quality. A good principal is important to teachers, and it affects their decision about where to work.

Participative variant of leadership cannot be overstressed. The school leader needs to possess the desirable personal skills and leadership approaches or styles in order to effectively manage the resources available in the school. By the complex nature of the school as a formal organization with clearly stated goals, and people drawn from diverse backgrounds, teachers and students alike, principal's need the participation and involvement of everyone in the affairs of the system. From the foregoing, it can be advanced that, participative approach is synonymous with the democratic style of leadership which borders on giving consideration to the opinions of subordinates or followers in decision making processes (Appadorai, 2004). Leadership experts like Ololube (2019) explained that the participative leadership approach to effective management is not different from the democratic leadership style adopted in decision making processes in which principal's as institutional leaders consult teachers and other members of the institution, as well as allow the views of the majority to be heard substantially with specific interest in avoiding financial recklessness. Leadership may mean the process of inspiring, guiding and influencing others to obey rules and regulations within an organization.

With participative leadership qualities, principal's consult, rally round important personalities from the immediate community and become open or transparent and accountable at all times. Kalagbor (2017) termed these personal leadership qualities of principal's as possession of principles of accountability and probity in school leadership that enhanced management effectiveness. The principal is thus, accountable to critical stakeholders such as teachers, parents and school management committees as may be deemed necessary by the government and the community concerned. Amanchukwu (2013) and Koko and Nwiyi (2006) found that, the principal initiates a high degree of school-community relationships and floats programmes such as open-days, inter-house sports among others, through which influential members of the community and agencies intervene and contribute to the growth of the school. The community members and external agencies donate funds, material educational resources; teaching aids and equipment for effective teaching and learning (Amanchukwu , 2013; Koko & Nwiyi , 2006).

THEORETICAL FRAMEWORK:

This article is anchored on participative system theory. The theory was propounded by Rensis Likert in the year 1967. Likert, was a renowned American Social Psychologist and one of the key proponents of participative management theory whose scientific interest was dominated by leadership, motivation, managing conflict, building high teams for performance, change, ethics and culture. In his research conducted in the University of Michigan in 1967, Likert developed new methods of management in six dimensions including leadership, communication, decisions, goals and control put together in a book entitled "The Human Organization: Its Management and Value" in 1967. This was towards meeting the desire for developing a system that could produce employee job satisfaction and high productivity using the appropriate people-oriented leadership style (Likert, 1967). Findings by Prasad et al. (2010) among several other scholars upheld the enormous works of Likert on people-oriented leadership in participative systems, dignifying him as an eminent management Thinker and researcher who laid good foundations empirically for the development of management science in the academic field of study. Pugh and Hickson (2007) promoted the work of Likert among the Human Relations scholars who believed that,

organizations remain systems of interdependent human beings, and maintained that human beings are the organization itself, and not only working for the organization. This reveals that, there cannot be successful organizations without human beings vis-à-vis workers.
According to the proponent, the following are the essential characteristics of leaders who encourage participative system (Likert, 1967):

- The leader is supportive, approachable (easy to reach and talk to) and interested in the well-being of subordinates;
- He builds the subordinates into cohesive, highly effective, cooperative problem-solving teams;
- Subordinates work together and are not deceived to be hostile and compete against each other;
- Assists subordinates in ensuring that their tasks are well done with necessary facilities or resources such as training, budget, space among others are supplied;
- Inform subordinates of overall plans for them to plan their work effectively and according;
- High quality performance is expected of oneself as a leader and other members.

This theory is relevant to this article because its shows how leaders of an organization develop trust and confidence in members of the organization. The confidence and trust reposed enable employees or subordinates to be committed to organizational goals.

CONCEPTUAL CLARIFICATION

The following terms are clarified for the purpose of this article:

Principal Management effectiveness:

The term management is the process of bringing human and material resources together for purposes of coordinating and directing the affairs of the organization towards achieving set goals. This definition reveals that management is more concerned about achieving organizational goals. Generally, management is seen as a concept that is concerned with the operation of organizations, and harnessing the resources towards attaining the intentions of the organization. In education, the management focuses on harnessing both human and material resources within the educational organizations to achieve set educational goals.

Management is a collection of activities directed towards efficient and effective utilization of organizational resources for achieving organizational goals (Bush, 2008). Okeke et al. in Okoroma (2007) dwelled on the fact that management is essential due to the importance of resources that are scarce, and how to avoid wastages in the system. This brings us to the concept of educational management that presupposes the process of coordinating human beings and materials for enhancing the teaching-learning process. Okeke et al. in Okoroma (2007) continued that, educational management is the process of bringing men and materials together for effective and functional teaching and learning in school. The analysis above, is that, educational management is a process because it requires the careful and systematic arrangement or coordination of the available resources, both human and materials for effective teaching and learning, which form the integral aspect of the school management.

While effectiveness presupposes the degree by which an activity is rightly and successfully done to achieve the desired results, management effectiveness is the ability to achieve set goals through carefully following laid down processes and procedures. In the school system, the entire effectiveness of the process of teaching and learning centres on the school manager or principal who is charged with the responsibility of facilitating the actualization of educational goals in the school.

Okorie (2009) found that the effectiveness of the school is measured by individual teacher motivation, ability, individual perception, the enormous resources and organizational systems with harmonious relationships built with the school system. For effective school management, the principal adopts relevant strategies and skills; communicates goals effectively and listens actively for appropriate feedback. The concept of managerial effectiveness is considered in terms of organizational output achieved based on the ability of the leader or principal to utilize the resources available to the organization optimally (Manafa, 2020).

The principal is an individual certified as a teacher and the highest government personnel promoted to the rank of an administrator to head a secondary school. He or she performs supervisory role and other duties as may be assigned by the government. The principal ensures that clearly set goals are achieved through the adoption of approaches based on consultation, teamwork, collaborative decision making processes among others (Lumby et al., 2003). This is because the expectations of the school in the society are high with the positive behaviour and knowledge of the learner to be developed as target. Also, knowing that the school as a complex system requires a school manager who is participatory and people-oriented, to be able to influence others rather than imposing or coercing decisions that sometimes lead to disobedience to instructions and ineffectiveness (Yulk, 2002).

Glatter's in Bush (2008) was very emphatic that, in upholding the grounds of management that emphasizes efficient and effective utilization of organizational resources to actualizing goals. Glatter's stated that management is more concerned with the internal operation of schools as well as their relationships with immediate communities and governing bodies as formal organizations.

It is maintained that, school managers need the engagement and participation of staff internally and external agencies or stakeholders for effective management of the school (Glatter's in Bush, 2008). The idea of involving and engaging others for effective management of the school corroborates the proposition that schools as formal organizations need to be participatory in nature (Ibara, 2010).

Thus, in attaining the goals of secondary education and managerial effectiveness, principals are expected to possess relevant managerial skills. Manafa (2020), Amadi (2008) and Akporehe and Asiyai (2023) identified supervision, communication, organizational, human relations and collaborative, motivational skills among others for management effectiveness.

Principal's' managerial skills for effective management of secondary schools

The following skills are needed of principal's towards enhancing effective management of secondary schools in Rivers state:

Supervision Skills

Supervision skills are concerned with the skills possessed by principal's to carry out instructional supervision to be effective in schools. Amadi (2008) considered supervisory skills of principal's enable them to administer and help teachers to help themselves. The principal as the internal school supervisor needs some desirable skills to handle and improve instructional supervisory programmes. The principal with the skills is able to support the teacher in solving the problems bothering him in the classroom. Amadi (2008) further stressed that, by the role of principal's, they become the vehicle for transferring good instruction from the teachers to the students, advisers and motivators to teachers as professional colleagues.

Communication skills

In effectively managing the school, the acquisition of communication skills principal's is imperative. The rationale behind principal's' communication skills in the management of schools is to ensure effective management of resources available; building and maintaining cordial relationships between the school and its environment (communities); relationship between the principal and teachers with their students (Mba & Maclean, 2022). As effective communication borders on clarity of ideas, active listening, strengthening appropriate communication channels among others, principal's need to be abreast and keep maintaining all these. The importance of principal's' communication skills is further advanced by
Mba and Maclean (2022), Scott and Mitchell (2016) and Manafa (2020) as:

- Creates the opportunity for employees to express their opinions and feelings and also serves as medium of resolution conflicts, reducing tension and refining direction for individuals.
- It becomes a tool for the control of the activities and programmes in the school.
- It is a medium for motivating teachers, students and other members of the school to be committed to the goals of the school.
- The decision making process is facilitated through the provision of information needed.

Organizational skills

This is concerned with division, arrangement and allocation of tasks or work, authority and resources among employees with the ultimate aim of achieving organizational goals. In achieving this, the manager considers it wise to engage two or more people in working relationships. The principal groups people or employees and activities into specific unit and establish relationship among the employees for effective work to occur. Manafa (2020) found that the principal locates the person right to delegate the right job for effective performance.

Human relations and Collaborative skills

For effective management, principal's need the skills of involving and relating with the teachers, students, parents and other subordinates and consulting with them as stakeholders in the school for decision making to be collectively undertaken and problems shared and solve (Agi & Adiele, 2015). Akporehe and Asiyai (2023) found that, it is needed of principal's to possess sufficient

human relations or interpersonal skills to be able to coordinate and bring members together of the school for common involvement and participation in the activities leading to goal attainment. According to Akporehe and Asiyai (2023), with these skills the principal relates with and incorporates teaching and non-teaching staff; students and external agencies such as the government, religious groups and philanthropic organizations in collectively making decisions on the way forward of the school.

Motivational skills

The effective management of secondary schools will lopsided if the skills or factors of motivation are absent. Denga (2015) termed motivation as internal forces igniting, arousing, energizing and propelling behaviour for achievement of organizational goals. According to Denga, motivational factors are not necessarily tangible forces but they are always there to boost morale and determination of workers towards actualizing the intentions of the organization such as the school. This, therefore, means that with desirable skills of motivation, principal's in secondary schools can easily spur school members to be committed to predetermined goals.

Teamwork skills

Teamwork is the way or strategy and principle adopted by a leader in working together among group members with shared ideas and values for achieving the intentions of the group. Lumby et al. (2003) aligned with the above by considering teamwork as a principle which emphasizes working cooperatively as group members with shared values for achieving the goals of the group. The goals of the school are achievable when leaders create the opportunity for school members to work collectively. It is believed that, school members' morale is increased with team-type service which to a great extent affects teaching and learning and effective school management.

In the school, the principal ensures that teachers, non-teaching staff, students, parents and external agencies work together for the purpose of achieving the goals of the school. As the school is a complex system, leaders need to be skillful and flexible in inspiring and committing members of the school to work as a team.

Participative leadership Style:

Participative leadership is the aspect of leadership that presupposes guiding, inspiring and influencing people to collectively make decisions that impact all members of the organization. It is the leadership that emphasizes leadership building strong relationship between the leader and followers or subordinates within an organization.

Participative leadership model is synonymous with a democratic leadership that creates the opportunity for majority of members of an organization to take part in the decision-making process that leads to a leader not imposing personal decisions on the people without consultation. In adopting participative leadership in the school system, it is viewed that, it develops the potential to reduce the burden of principal's in the discharge of assigned duties and also discourage all manner of the leader becoming authoritarian. Abbass (2012) found that participation or involvement in institutional management and affairs for attainment of goals can be analyzed in different perspectives or typified as:

- Transitive participation: This is the type of participation through which school members are sufficiently oriented about the goals of the school to work towards and effectively achieve the goals through their involvement.
- Moral participation: This is concerned with involving in the affairs of the school people without sentiment and bitterness.
- Spontaneous participation: In this type of participation, school members are actively and naturally involved and without constraints in the activities of the school. Example of this is the involvement of parents and other community members in Parents-Teachers Associations.
- Free participation which borders on involvement of individual members without restrictions or being forced to do so.

The above types of leadership as enumerated are in line with the democratic leadership style principals are expected to apply in secondary schools (Abbass, 2012). It is true because without the involvement of other members of the school goal actualization which is not a one-man affair in a formal system will be difficult to attain. In line with the above, Coplan (2001) pointed out that, participative leadership approach enables school leaders as formal leaders to collectively make binding decisions and discourage a situation where leaders automatically grow into super heads or autocratic heads.

Scholars like Lumby et al. (2003), Kochan and Reed (2005) and Ogbonnaya (2009) aligned with the above, by maintaining that, leaders must work collaboratively with other members of the school to succeed in managing schools effectively. Lumby et al. (2003) stated that, school leaders need certain leadership skills and adopt important approaches such as:

- Teamwork;
- Consultative activities;
- Effective communication network;
- Subordinate reward system;
- Subordinate involvement in decision making;
- Openness.

Armstrong (2012) emphasized that, the effective management of an organization is possible if leaders are able to reward, and empower employees financially and non-financially. Ogbonnaya (2009) and Kalagbor (2017) stated that under participative leadership, parents are given the freedom to participate in the school affairs and express their opinions through the instrumentality of Parents-Teachers' Associations, Open-Days and other events. As the relevance of participative leadership as a concept cannot be over-stressed, Ogbonnaya (2009) pointed out that principals who adopt the participative approaches need some qualities to grant teachers freedom to express their opinions; interact among themselves and with the management in dealing with important issues concerning them and the school at large. Such school leaders are open-minded, probed and accountable to the people (Kalagbor, 2017). Teachers, non-teaching staff, students and their parents; other community members are given the opportunity to air their views on the school matters, and teachers in particular are supported in their personal professional development programmes to be updated in skills and knowledge for higher commitment to classroom activities.

In order to achieve the management effectiveness of secondary schools, principal's need to make practicable and strengthen the above approaches. Amanchukwu (2013) added that participative leaders clearly state and define goals. According to Amanchukwu (2013), the success of the school as an organization depends on the ability of the leader to set goals and objectives clearly for members to fully participate and be committed; share the school mission and vision to be actualized. On effective communication as an approach to be adopted by principal's to effectively manage schools, Mba and Maclean (2022) found that information disseminated effectively by school leaders enhances goal actualization. In this regard, effective communication channels need to be strengthened to ensure that information is transmitted from the top management to the low-level staff effectively.

Okoroma (2016) pointed out that at the top of the organizational hierarchy leaders create the opportunity for a free-flow of downward and upward communication for effective transmission through active listening skills. Bush (2008) stressed that, participative school leaders give greater attention to other members of the school and are available to the people including the community, parents, students and external agencies.

In effectively managing secondary schools, teamwork as an important technique is needed of principal's. Lumby et al. (2003) termed teamwork as a means of working together of group members with shared values and vision towards achieving the group goals. In order to achieve the goals of education in the school through teamwork, the principal need to acquire teamwork skills which is also concerned with effectively communicating the goals of the school, and open-mindedness of the principal to secure the support and obedience of other members for his effectiveness. As an instructional leader, the principal work together with teachers to be able to solve classroom problems with teachers. Through this medium, teachers are allowed to express their views about the issues bothering them and that of the school in general. The school leader values individual teachers and their personalities. A leader whose interest is effectively managing the school allows the participation and involvement of all stakeholders; treatment of every member equally and ensuring that there is freedom of expression (Peretomde, 2001).

It is believed that effective school management can be achieved through staff reward and recognition for hard work (Amadi, 2008; Armstrong, 2012). Subhashim and Kumar (2019) suggested that in rewarding staff attention should be based on the skills and knowledge of teachers which enhances the desired student learning outcomes. Armstrong (2012) insisted that for increasing performance of employees, leaders must be able to embark on either financial or non-financial rewards in reckoning with employees' hard work. Armstrong (2012) further urged managers to always recognize and appreciate employees for improved performance to leads to high productivity. In recognizing and appreciating subordinates, Denga (2015) found that school members and other stakeholders are motivated, and urges teachers to always know students by their names as a way of recognition.

The implication is that, as human beings are essential assets in any successful organization, participatory leaders ensure that, people are widely consulted to be part of decision making processes with their fundamental rights as Nigerian citizens guaranteed and protected within the school system towards effective management of the system.

Senior Secondary School:

The secondary education generally receives children from primary education and prepares them for the tertiary education. Specifically, the senior secondary education is the education students

receive after junior secondary education (FRN, 2004). The following are the specific goals of secondary education according to the National Policy on Education (FRN2004):

- Provide all primary school leavers with the opportunity for education of a higher level, irrespective of sex, social status, religious or ethnic background;
- Offer diversified curriculum to cater for the differences in talents, opportunities and future roles;
- Provide trained manpower in the applied science, technology and commerce at sub-professional grades;
- Develop and promote Nigeria an languages, arts and culture in the context of world's cultural heritage;
- Inspire students with a desire for self-improvement and achievement of excellence;
- Foster National unity with an emphasis on the common ties that unite us in our diversity;
- Raise a generation of people who can think for themselves, respect the views and feelings of others, respect the dignity of labour, appreciate those values specified under our broad national and live as good citizens;
- Provide technical knowledge and vocational skills necessary about y for agricultural, industrial, commercial and economic development.

According to the National Policy on Education, the senior secondary education as the focus of this article shall be run for three (3) years duration, to be able to accomplish the set goals (FRN, 2004). Also, in order to actualize the desire for effectively managing secondary schools, principal's need to clearly define the set goals for a collaborative effort of all stakeholders toward ensuring that the goals are accomplished.

Challenges of Participative Leadership Approach to Effective Management of Senior Secondary School in Rivers State

- Most school principal hides under the principle and pretend to be democratic but they run the school with selected few staff who either are their kinsmen or clique members. This attitude toward participative democratic way of piloting the affairs of an organization or school are what Agi and Adiele (2015) termed as pseudo-democratic attitude of leaders. In this style of participative leadership, the decision making is hardly real and finally carried out collectively by a few members of the organization and bound on everyone.

  It has been alleged that principle create and encourage division using a few individual who are favorable to them in doing critical and important activities against the principle of the majority rule that is participatory. This also affects the attitude of delegating authority when leaders fail to satisfactorily transfer functions to teachers and stakeholder or locate the right person in delegating authority (MBA, 2020; OKoroma, 2007). The effect of this is follows' distrust, apathy and indifference to task, student' undisciplined behavior, and general non commitment to set goals in relation to effect school management.
- **Inability to clearly set and define goals:** school leaders have been criticized for being inefficient in clearly stating and defining goals, and failed to incorporate or consult widely in defining the goals that require all part and staff particularly teachers whose duty is implementing educational goals in the classroom and the school at large. The inability of a leader to clearly defining education goals can pose confusion to teachers and other working

toward achieving the intentions of the school. Amanchukwu (2013) pointed out that, the effectiveness of any organization is dependent on the ability of the leader to clearly set goals and objectives for members to be involved and committed to attainment efforts. For effective management of school, Mba and Maclean (2022) stated that communication channels should be well strengthened for information of goals to be transmitted for effective actualization. Therefore, effective communication channels enhance goal attainment.

- **Poor attention to feedback and rewords for hard work:** most school leaders are not well informed about regular feedback and reward system, even recognition as well as the psychological attachment to these techniques. It is understood that, teacher who are rewarded are encourage to increase their performance and work hard. Sidin (2020) opined that in the classroom, there are numerous reward for improved performance of both teacher and student to be happy and perform higher. Rewarding student enhances an improved the relationship between the teacher and the students. Student' learning abilities are enhance but most time this approach has been looked down upon by principal's and teachers. This is challenging as teacher whose counterparts are being rewarded with some packages and recognized in other institutions.
- **Leadership rigidity and limited opportunities for subordinate's freedom of expression:** another challenge facing participative schools is the working attitude of principal toward enforcing and protecting the right to freedom of expression of teachers as Nigerian citizen. It is no gain saying that, principle lead with limited opportunity for teachers, student and other school members to express their views or opinion on issue that affect the school. This is contrary to constitutional provisions that every citizen shall be entitled to freedom of expression, including freedom to hold opinion and to receive and impact ideas and information without interference" (FRN 1999). But it is an aberration that, the right of teachers, students and their parent are not guaranteed and protected particularly on the issues that border on the school. In the classroom and school sometime teachers are forced not to hold meeting and speak for themselves; students are not given the opportunity to ask question in the classroom and on general school's matter because they are reduced to nothing. This a problem that urgent attention in relation to leadership awareness in human right and education law (Peretomode, 2001)
- **Participative Leadership approach is time-consuming:** there have been criticisms in some quarters that, school leaders' excessive reliance on collective interests and wider consultations in making final decision as important attributes of any successful participation leader without staff motivation can be dangerous and lead to delays in solving problems and handling important issues that bothering the school.
- **Limited involvement:** it is alleged that teachers, students, parents and external agencies who are critical stakeholders in any educational institution are not regular allowed by school leaders to be involved in the affairs of the institutions which mostly the relationship between the school leadership and the community. In particular, some principle have found it difficult to allow the stakeholders in the management of the school which negatively affects teaching and learning, with student who are at the receiving end suffer. This is a challenge, and if not checked through research finding and recommendation could result in dangerous effect on public institution established in the communities. According to Abbass (2012), individuals and agencies could transitively or morally. Freely or spontaneously participate in the affairs for its effectiveness.

- **Lukewarm attitude to instructional supervisions:** principal as internal school supervisor are most time found not doing their job leading to ineffective teaching and learning. Principal's are blamed for being regularly engaged in private affairs and other administrative business rather than instructional supervisory functions.
- **Insecurity:** principals are faced with threat of lives of teachers and students within their jurisdiction. The government is insensitive about building security architecture around schools' environment leaving school leaders who regular complained of poor salaries and other incentives to running schools. Problems associated with insecurity have driven teachers from teaching in security threatened and violence ravaged areas in Rivers State and other part of the country with the student at the receiving end. Mba (2020) found that, in Rivers Sate in 2015, teaching staff and corps members were kidnapped at Agba-Ndele in Emoha local government area and some part of Ogba/Egbema/Ndoni local government area. As a result of this, teachers and students were in the fear and abandoned teaching and learning as schools were skeletally run if not totally shut down.
- **Inadequate staff training and development**: it is a challenge when teachers have not been able to update their skills and knowledge due to paucity of found and lack of support for professional and human capital development of teachers by principal's. Principals are expected to support staff in undergoing training and retraining attend seminars, workshops, conferences and higher academic programmers to boost their instructional abilities. The above grounds, thus, lend support to the fact that the concept of participative leadership is relevant and adequate for enhancing effective management of senior secondary schools in Rivers State, and in particular guiding the present paper.

CONCLUSION

The paper concludes that participative leadership approach such as teamwork, Consultative activities, Effective communication network, Subordinate reward system, etc. and principle management effectiveness skills, such as supervision skills, Communication skills, and organization skills, etc, are approaches for principal's effective management of senior secondary school in Rivers state. This Benefit is supported in using participatory theory as a clear help to achieve the goal of senior secondary schools as was spelt out in National policy of education.

Suggestions:

- Regular supervision should be encouraged to enhance principal's management effectiveness of public senior secondary schools in Rivers state.
- Open communication system should be adopted among principal's so as to improve their productivity and co-operation.
- Principal's should always provide a collaborative working system for staff as this will improve their effectiveness in school.
- There should be adequate staff training as this goes a long way to motivate staff in turn improves their effectiveness at work.
- Effective communication should be encouraged to enhance principal's management effectiveness in public Secondary school Rivers State.

THE IMPACT OF PH ON SUSTAINABLE PORTABILITY OF WATER OF THE STREAMS IN PORT HARCOURT METROPOLIS

David E. UWA-SAMUEL
Centre for International Strategy and Leadership, Port Harcourt, Nigeria
ravdafmuel@gmail.com
http://orchid.org0009-0004-6429-6303

ABSTRACT

The goal of this study was to determine the concentration levels of pH is suspended and bed sediments in the six major streams of the Port Harcourt metropolis. The objective was to examine the impact on the sustainability of the streams as sources of quality portal water. One null hypothesis was formulated for the study on the relationship between the concentration levels of pH in suspended and bed sediments. A sample frame of 1000 meters of the lower stretch, with a sample interval of 50 meters, and a sample size of 5 sampling points was respectively adopted for each stream. The sample size for all the streams was sixty. The samples were tested for pH levels using the electrometric method based on APHA4500-H+ B standard methods. The results showed the mean pH in suspended sediments was 5.24 and 5.25in bed sediments. Across the six streams studied, the highest pH value in suspended sediments was 5.75 in Woji stream and in bed sediments the highest pH was 5.86 in Ntawogba stream. The pH ranges were 4.96 – 5.7 in suspended sediments and 4.45 – 5.86 in bed sediments respectively. The findings showed the results tipped towards acidity in the pH spectrum; and when compared with acceptable and permissible limits from regulators were found to be below the required standard levels for portable uses. The T-test results showed no significant variation between pH concentration levels in the suspended and bed sediments implying the null hypothesis was accepted. The study concluded that that pH impacts acidity to the water quality of Port Harcourt streams making them unfit for drinking. There was no case of extreme alkalinity of the stream waters or the pH tipping over 9.0 in the suspended and bed sediments sampled and analyzed for the study. Stream restoration was recommended for the restoring stream water quality and water treatment procedures were recommended for portable uses of the stream waters.

Keywords: Impact, pH, Sustainable Portability, Water, Streams, Port Harcourt, Metropolis.

INTRODUCTION

Stream catchments, stream basins, flood plains and stream banks are protected areas by law in Nigeria. However the administration and enforcement of environmental laws in Nigeria has dire

consequences on the quality of environmental resources and the ecosystem. Rising population and immigrant population numbers to urban centers pose grievous trend to environmental health and sanitation. The estimated population of Port Harcourt metropolis registers about 3,325,000 for the year 2022 and is growing at the rate of 5%. Associated with the population numbers is the attendant releases of releases of chemical and energies as stressors into the environment above geogenic levels.

Such stresses mean the pressure for portable water is on the increase. There is no public water scheme to homes that would ensure clean and treated water for domestic uses. Hence the need to examine some of the physicochemical parameters of water in the streams of the metropolis one of each is the pH of the water of the streams. The concerns on the impact of the pH of streams in Port Harcourt Metropolis center on whether the water is acidic or alkaline for portable uses and by implication the impact on human health if drunk. The role of clean and soft water to the functionality of human, ecological and environmental health needs no overemphasis. The natural, pristine, and terra-ecological source of portable water is primarily streams. The hydro-geomorphic constitution of an undulating geographical landscape includes fluvial network of streams and rivers – rivulets and streamlets in-between. Urbanization as an anthropogenic creation are cast upon such terra-scape is froth with potential and incident environmental problems. Evolutions and development of urban areas and the processes of urbanization perceptively interfere with natural balance and equilibrium of the bio-geomorphic hydrograph of a geo-environment. Upsets in quality of the geogenic attributes of the environment as in an urbanized area are commonplace geo-urban stressors. One of such is the impact of pH a physicochemical variable in determining water quality particularly the portability

What is pH

What constitutes pH of a chemical complex is well documented in the literature. It is regarded as the commonest and primary of water chemistry parameters. Kumar and Puri (2012) uphold that pH is a measure of the concentration of hydrogen ions in their chemical activity in a solution. Thus, pH is taken as the measure of acidity or alkalinity of a solution. Across different countries beside the global standards of permissible limits for various chemical parameters tested for water quality, there are different water quality standards. Even within a given country different agencies push forward their preferred guidelines for permissible limits of parameters. Such objective differences present a measure of bias as to which one should be adopted (Kumar & Puri, 2012). This is obvious in the studies of different researchers focused on assessing water quality for portable uses who resort to comparing different permissible guidelines standards. Kreper (2004) on the one hand offered that under natural conditions streams have pH conditions that are neutral to alkaline; but on another hand he submitted that extreme pH conditions do not necessarily indicate the pollution of stream. Acidity of pH levels of water in streams rather points to heavy metal accumulation in the aquatic environment. Thus, knowledge of pH conditions of water in streams offers geo-environmental information on the nature of contaminants and pollutants delivered into the stream channels as a result of myriad natural and anthropogenic processes within the catchment and watershed.

pH and Water Pollution

The variable of pH in the assessment of water quality is not considered as a contaminant or pollutant (Kreper, 2004). As a factor in chemical processes, pH is however an indispensable driver of solubility of chemical substances in the geo-chemo-environmental complexes. It is noted to regulate the solubility and toxicity of contaminants and pollutants loads delivered into streams. Fresh water quality in ambient conditions has the pH of 7.0. Slow rate in solubility of some inorganic compounds can lead to geoaccumulation of such elements in sediments with impact being rise in bioavailability of heavy metals in aquatic organisms a condition that may be transmitted across the trophic gradient. The release of such chemicals into streams can become a challenge to the suitability and apparently the quality of water from such sources. Apparently, pH of fluvial water that skews towards acidity, or extreme alkalinity can contribute to the build-up in water pollution. The side effects of water pollution can cause a dip in human health (Rakhecha, 2020).

The bio-physicochemical degradation of harmful physical, biological and chemical substances in streams water is driven by the chemical process induced by pH. Slow rate of contaminants and pollutant degradation may lead to concentration levels and accumulations that are hazardous not only to the geospatial environment and its eco-system but also to human health through bioaccumulation (BA) and bioconcentration (BC) (Alexander, 1999). Large scale and long-term concentration of contaminants and pollutants into streams lead to the lowering of the portable quality of water. Consumption of polluted water leads to a number of diseases that plague humans (Kumar et al., 2017). Such water sources are loaded with biological and chemical pollutant that are hazardous to body biochemistry in humans. Such hazards may inhibit the processes of metabolism, anabolism and catabolism in the body systems of humans. Zhu et al., (2022) submit that based WHO database upto 80% of human diseases come from water borne diseases.

Human Tolerance of pH Changes

Whereas all biological species depend on water for biological functioning, different biological species exhibit different tolerance and sensitivity to changes in pH levels of water. This is particular to fresh water sources like streams. Human have a higher tolerance than aquatic species. Indeed, man can survive on water with pH as low as 4, and high as 11. Fink (2005) is of the view that pH as low 2.5 can cause irreversible damages to internal organs in humans; eye and skin irritations in humans are possible at pH below and above 11.

Impact of urbanization of pH conditions of streams

The impact of urbanization on the physicochemistry of streams within urbanized watershed has implications on the pH consitions of the water of such streams. Peters (2009) based on a study of the City of Atlanta, USA is categorical that urbanization affects the water quality of streams in areas under urban landuse. de Jesus Crespo and Ramirez (2011) averred that at worldwide scale stream ecosystems are degraded by urbanization. A model to help in the conceptualization of urban effects on streams' ecosystem degradation such as developed be by Meyer et al (2005), and Walsh (2005) is termed as "urban stream syndrome. According to Wang et al. (2020),

intensive urbanization affected very strongly the water quality, sediment quality and macrobenthos characteristics of urban streams.

O'Driscoll et al. (2010) pointed out that urbanization has affected a number of geo-environmental variables such as watershed hydrology, groundwater recharge, stream geomorphology, climate, biogeochemistry, and stream ecology. They additionally note that urbanization has expanded into areas that were naturally impervious in the watershed. In other words, the overall or minimal changes to water chemistry in streams of urbanized and urbanizing areas can have considerably effects on measurable water quality parameters which includes the pH. De Jesus Crespo and Ramirez (2011) in their study in Puerto Rico concluded that urbanization has a negative effect on the physicochemistry and biological conditioning of their aquatic habitats of urban stream. Thus the impact of urbanization on the water quality of stream water has to link characterization of pH to other physic-chemical parameters. Nevertheless, such parameters including pH can be evaluated as to the effect of their weighted individual impact relative contamination and pollution using such models as the entropy weighted quality index (EQWI).

Study Area

The Port Harcourt metropolis is cast upon a milieu of interacting geo-environmental parameters. Geo-physiographic characteristics of the area as an embodiment of geology and its geomorphology is markedly characterized by contiguous undulating, and rugged topographic outlay. It is subjected to deep weathering and erosional activities. The landform in this low relief area is associated with denudational dissection weathered steep ridges and deep troughs (Youdeowei and Nwankwoala, 2010). Early essays on the physical geography of the eastern Nigeria by Iloeje, (1961), Floyd (1969) and Jungerius (1967) give a geomorphological characterization of the broad area in which the study area falls as lowlands. In Floyd's account, 'the principal characteristics of the land surface of Eastern Nigeria are the limited areas of hills and mountains and the dominance of level to moderately rolling plains. The Niger Delta, the broad Coastal Plain and the Cross River Basin together account for almost seventy per cent of the region. Elevations over the greater part of the lowlands seldom exceed 400 feet above sea level (Floyd, 1969).' As is common with the most of southern Nigeria, the relief is relatively lowland plain. Hence the relief of the Port Harcourt area ranges from -4m to 47m above sea level and has an average elevation of about 11m. The significance of the relief of an area is that it forms a fundamental factor informing on the dynamics process variables of stream flow velocity, discharge and the metrics of stream morphology.

The geologic characteristics of the region of the study area is composed of sedimentary formation. The sedimentary basement is made up of granite. But in the coastal Niger delta region the basement rock is regarded as being of the oceanic crust. As accounted by geologists, there are three sedimentary basins in the country Nigeria all of which are underlain by continental crusts. In Nigeria the thickness of the sedimentary layer ranges from 500 m below the surface in the Sokoto embayment to about 2000 m in the Chad basin. In the coastal region of the Niger delta the range averages 12,000 m. According to Avbovbo (1980), and as affirmed by Pitchard (1979), Barbour et al. (1982), Duze and Ojo (1982) and Oguntoyinbo et al. (1982) this is because 'the area is composed of recent sedimentary rocks of marine origin which have been overlaid on the Precambrian basement complex rocks. The marines sedimentaries which are composed mainly of sands of the cretaceous, tertiary and quaternary epochs have been relatively undisturbed and

from an almost flat lowland surface.' These form the coastal plain sands leading Barbour et al. (1982) to assay that "the tertiary marine deposits consist of coastal plain sands of recent thickness resulting from continued subsidence during their period of deposition and have remained relatively undisturbed since their formations.

On the coastal plain sands, these exist with a super-imposed alluvial deposit of terrigenous origin from distributary's network of the Niger delta basin to form the Niger Delta." The impact of geology on the yield of sediment and suspended sediment to dynamic fluvial systems is highlighted in the literature as reviewed. Specifically, there are three stratigraphic units recognized in geology for the study area. From bottom to top they are the Akata formation, the Agbada formation, and the Benin formation. This geologic warp is believed to have started evolving in the paleocene period up to the present geological age. However, while the Akata Formation is believed to have formed from quaternary desposits in the paleocene, the Agbada Fornarion is traced to the Eocene while the Benin Formation is traced to the miocene or present period (Youdeowei & Nwankwoala, 2012). The contiguous area has a humid tropical climate classified in the grouping Am based on the Koppen-Geiger model (Koppen, 1932). The area experiences long wet seasons of intense rainfalls and short dry season. Rain falls for about 310.7 days of the years and totals up to about 2138mm and above annually. The average temperature range is about 26°C to 21°C. Its biogeography displays a mix of evergreen rainforest, fresh water swamp, wetlands mangrove and salt water swamps

MATERIALS AND METHODS

The electrometric method was used to determine the pH of suspended sediments according to APHA 4500-H+ B standards; 3rd edition, 2017. The reagents were pH buffer 7.0 & 4.0. The procedure was as given below as consistent with the calibration of the pH meter: (i): Take the reading of the pH 7.0 and pH 4.0 standards, before calibration, record the readings. (ii): Calibrate the pH meter using the buffer 7.0 and 4.0 buffers. (iii): Ensure that all buffers are at the same temperature. (iv): Rinse the electrode first with de-ionized water, and then with pH 7 buffer. (v): Place the electrode in the buffer 7, and press calibration knob on the instrument. (vi): Wait for a stable display and accept the reading by pressing enter/yes. (vii): Rinse electrode with de-ionized water and then with buffer 4.0. (viii): Place the electrode in the buffer 4.0 solution. (ix): When the display is stable, accept the reading. (x): Check to see that the slope is okay. (xi):

Take the reading of the pH buffers after calibration and record the results. Sample Measurement: (i): rinse the electrode with de-ionized water, followed by some of the sample, (ii): shake the sample very well and place the electrode in the sample, and (iii): when the reading is stable, record the sample pH. Quality Control/Precautions: (i): check the calibration standard (Buffer 7.0 & 4.0) before carrying out the analysis of sample, (ii): duplicate Sample: Analyze sample in duplicate to ascertain the precision of the analysis, (iii): always use the specified grade of reagent and ensure that it has passed the QC check (confirm that from the QA/QC officer).

Analysis of pH in Bed Sediments: The bed sediments was added to water at a ratio of 1:1. The process is given below: (i): weigh 20g of air-dry soil (passed through 2-mm sieve) into a 50ml beaker, (ii): add 20ml of distilled water and allow standing for 30 minutes and stirring occasionally with a glass rod, (iii): insert the electrode of the pH meter into the partly settled suspension and measure the pH. Do not stir the suspension during measurement, (iv): report the result as "soil pH measured in water."

Quality Control/Precautions: (i): the glassware used must be very clean, (ii): the soil/sediment samples must be accurately weighed, (iii): the pH meter should be calibrated with pH 7 and pH 4 buffer solutions before use daily.

RESULTS AND DISCUSSIONS

Table 1: pH Concentration Levels for Observed Streams

Stream	Egbelu	Rumuolumeni	Ntawogba	Waja	Woji	Elelenwo
Suspended sediments	5.05	5.43	5.09	5.20	5.75	4.96
Bed sediments	4.45	5.42	5.86	5.00	5.45	5.31

As shown in Table 1 the most acidified stream in suspended sediments is Elelenwo with a pH of 4.96; while the least acidified stream in suspended sediments Woji with a pH of 5.75. The most acidified stream in bed sediments is Egbelu with a pH of 4.45, while the least acidified stream is Ntawogba with a pH of 5.86. The order of pH indicating acidification in suspended sediments is as follows Elelenwo 4.96> Egbelu 5.05> Ntawogba 5.09> Waja 5.20> Rumuolumeni 5.43 > Woji.75. In the bed sediments the order of acidification ranks as Egbelu 4.45 > Waja 5.00 > Elelenwo 5.31 > Rumuolumeni 5.42 > Ntawogba 5.86.

The standard permissible level pH limits for portable water as set by different regulatory agencies have little variation between them. The WHO set its standard permissible level pH limit at 7.0-8.5 for portable water. The Nigeria Environmental Standards Regulatory Enforcement Agency (NESREA) set its standard permissible level pH limit at 6.5-8.5 for portable water. The Nigeria Drinking Water Quality Standard Index (NDWQSI) which operates under the Standard Organization of Nigeria set the standard permissible level pH at 6.5-8.5 for portable water. The Department of Petroleum Resources-Environmental Guidelines and Standards for the Petroleum Industry in Nigeria (DPR-EGASPIN), set the permissible limit for pH at the range of 6.5-9.0 for portable water.

The concentration levels of pH in suspended and bed sediments across the streams in Port Harcourt metropolis are given in Table 1. The pH range in suspended sediments in the streams is 4.96 – 5.7; while the pH range in bed sediments is range 4.45 – 5.86. The mean of the concentration level of pH in suspended sediments for the six streams studied is 5.24. The mean of the concentration level of pH in bed sediments for the six streams studied is 5.25. As sediment quality reflects water quality, the impact on portability is profound given that the indication from analyzed results shows acidification across all the streams in the metropolis.

When the pH values in both suspended and bed sediments as given in Table 1 are paired against the regulatory permissible limits of WHO, NESREA, NDWQSI and DPR-EGASPIN the indication highlights that the observed concentration levels as analyzed in the study all fall below the set standards in quality for drinking water in all the streams. As presented in the Table 1 the mean value of pH in suspended sediments and bed sediments is respectively below the range of permissible limits for portable uses of the water and inclines towards acidity. As outlined previously, this study reveals that the range value of the permissible limits is all above the mean laboratory values for suspended and bed sediments for the six streams studied. Granted that safe water has a mean pH of 7.0, with lesser values indicating increasing acidity of water pH makes it unsuitable for drinking without water treatment processes as in this case. Even so were the pH to shoot beyond 9.0 showing tendency towards increasing alkalinity would equally make the water unsuitable for drinking without water treatment processes. The acidity level of pH in the

suspended and bed sediments of the streams of the Port Harcourt metropolis indicate that the water as unfit for human consumption.

Hypothesis Relationship Between pH in Suspended Sediments and Bed Sediments

The null hypothesis for this study stated that there is no significant variation between the concentration levels of pH in suspended sediments and bed sediments. The Table 2 as given is the table summary of T-test verification showed that at 0.05 degrees of freedom, there is no significant variation between the concentration levels in suspended and bed sediments.

Table 2: Summary Table of T-test for pH in Suspended and Bed Sediments

	Mean	Standard Deviation $S^2 = \frac{\varepsilon(X - \bar{X})^2}{N}$	T-Test $t = \frac{\bar{X} - \bar{Y}}{\sqrt{\frac{S^2_X}{N} + \frac{S^2_Y}{N}}}$	DF (N+N-2) Where N = 20	at 0.05 (Two Tail)
Suspended (X)	5.246667	0.072422	0.016	10	2.23
Bed Sediment (Y)	5.25	0.188533			

T-Test of pH in Suspended and Bed Sediments

$\bar{X} = 5.246667$

$\bar{Y} = 5.25$

N= 6

$S^2_x = \frac{\sum(X-\bar{X})^2}{N} = \frac{0.434533}{6} = 0.072422$

$S^2_Y = \frac{\sum(Y-\bar{Y})^2}{N} = \frac{1.1312}{6} = 0.188533$

$$T = \frac{\bar{Y} - \bar{X}}{\sqrt{\frac{S^2_Y}{N} + \frac{S^2_X}{N}}}$$

$t_{Cal} = \frac{0.003333}{0.2085} = 0.016$

Degree of Freedom = N + N – 2 = 10

$t^{16}_{tab} = 2.23$

$Since\ t_{tab} > t_{Cal}$

There is no significant difference variation

FINDINGS

The pH values in both suspended and bed sediments as given in Table 1, when paired against the permissible limits of the regulatory standards of WHO, NESREA, NDWQSI, DPR-EGASPIN indicate that as analyzed, the observed concentration levels for the study parameters all fall

below the set standards across all the streams. Thus, this makes the water from the streams of the Port Harcourt metropolis unfit for human consumption. The indication is clearly that the streams are more acidified in bed sediments than in suspended sediments. Granted that universally portable must have an alkaline pH below the pH 9, for any meaningful domestic uses, water treatment will thus be required before the water from any of the streams could be used for portable purposes. The hypothesis verification indicated that there is no significant variation in the concentration levels of pH in the suspended and bed sediments in the streams of the Port Harcourt metropolis.

CONCLUSION AND RECOMMENDATIONS

The importance of water to livelihood and the place of streams to ecosystem health cannot be overstated with regard to the sustainability of the geo-environment. the role of streams in balancing heat budget in the environment secures them as remarkable pool resource for tracking and maintaining environmental health. This necessitates call for enforcement of environmental laws regarding development on floodplains and stream banks. Regulatory instruments have to be activated to curb unlawful land uses such waste dumping within proximity of flow channels. stream restoration has to be carried out though it requires a lot of political will to fund it. As an input of stream restoration targeted periodic investigation of stream flow channels is required to determine the pH level and activate regulatory deterrence. It was recommended for the water of the streams in Port Harcourt metropolis to be treated before use for drinking. On the basis of sustainable geo-environmental and ecosystem health, stream restoration projects and programs are suggested to be started now and in the earnest to avoid the dire environmental consequences of the streams drying up or disappearing underground.

REWARD MANAGEMENT STRATEGIES FOR ACADEMIC STAFF JOB COMMITMENT IN POLYTECHNICS IN RIVERS STATE, NIGERIA

Bibiana Ambrose UMOREN
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria
bibiumore96@gmail.com

ABSTRACT

This study examined the reward management strategies for academic staff job commitment in Polytechnics in Rivers State Nigeria. The aim of the study was to examine the extent to which the dimensions of the reward management strategies are utilized for academic staff job commitment. The study was guided by 2 objectives with 2 corresponding research questions and hypotheses. Descriptive research design was used for the study. The population of the study comprised all 1470 academic staff of the two Polytechnics, namely: Ken Saro Wiwa Polytechnic and Elechi Amadi Polytechnic in Rivers State. The sample size of the study was 400 academic staff drawn from the entire population through stratified sampling technique. The instrument titled: "Reward Management Strategies for Academic Staff Job Commitment in Polytechnics Questionnaire" (RMSASJCPQ) was used for the study. Furthermore; test - retest method was used to establish the Reliability of the instrument, the coefficient value of 0.867 and 0.821 was obtained using Cronbach Alpha. The Data collected were analyzed using descriptive statistics; Mean and Standard Deviation were used to answer the research question, while independent t-test was used to test the null hypotheses at 0.05 level of significance. The findings revealed among others that, there is significant difference between the mean ratings of male and female staff on the extent of career development opportunities are utilized for academic staff job commitment in Polytechnics in Rivers State. Based on the findings, it was concluded that well-designed reward management strategies such as prompt payment of salary, and career development opportunities have the potential to be utilized for academic staff job commitment. The study therefore, among others, recommend that, relevant government agency and polytechnic administrators should be exposed to and equipped with the relevant reward management strategies through seminars, conferences and workshops in order to ensure academic staff job commitment in polytechnics.

Keywords: Reward, Management Strategies, Academic Staff, Job Commitment, Polytechnics, Rivers State, Nigeria.

INTRODUCTION

Academic staff can play important role in an educational institution. Reward management is about the design, implementation, maintenance, communication and evolution of reward policies which help organizations to improve performance and achieve their objectives. Academic staff are main interface with students, and their job commitment is crucial to determine level of performance of teaching, learning, research and service to community, and thus critically affect students' performance. Rowley (2019) opined that most higher institutions have a major role to offer a high-quality teaching, learning and research experience to their students. However, the effectiveness and efficiency of any institution are to a large extent, dependent on the level of motivation available for the labour force. In today's ever increasing and dynamic institution and work environment, the highly motivated staff's serve as a synergy for accomplishment of the institutional goals, institutional plans, high efficiency, commitment, growth and high performance. Every institution wants to be successful and have constant progress. It is a well-known fact that institution whether private institution concerns, mutual benefit associates or even public entities require competent workforce to survive and to remain competitive.

Reward system implemented by institution will influence staff behavior and attitude towards their job if the rewards satisfy their needs and help them to reach personal goals. The various forms of behaviour and attitude disposition which institution require of its employees in order to achieve set goals depend on the kind of rewards and incentive package the institution is willing to offer. Sometimes, rewards are not simply expressed in the monetary form, but it also includes those difficult to measure in monetary currencies.

Academic staff are the heartbeat of any educational institution, their commitment to duty directly related to the level of motivation they have within the institution, education in this regard. Their major assignment is to develop the students academically and morally through training. Academic staff Job commitment to a large extent gives direction to the attainment of desired objectives in Polytechnic's in Rivers State. The Polytechnic's system for instance, might achieve its goal when staff are highly committed to their duties. The role of a Polytechnic's lecturer is mainly to teach, carry out relevant research and then be involved in community service.

Career development involves exposing the staff to capacity building programmes and other training activities that will help to sharpen the skills and knowledge of the academic staff and this goes a long way to improve on their effectiveness on the job. Academic staff in Polytechnics show interest in career development programmes as it helps to keep them abreast with issues in their profession and getting an opportunity to attend a professional development programme such as conferences and seminars spurs the staff to action as this will enable them to acquire more experience which may even be used to secure employment in a better organization. Some staff therefore look forward to attending career development programmes as it gives them an edge above their colleagues and make them relevant in whatever area they are engaged thereby improving on their job performance. Career development opportunity is considered an essential tool for new and old staff to enhance their present or future performance (Khan, 2011).

Most importantly create an avenue for mastery in the particular skills and aptitude required to be effective at work. Through orientation, a new staff is introduced and integrated into the educational rules and regulations as well as school climate and culture. The aim of this study will be to examine reward management strategies for academic staff job commitment in Polytechnics in Rivers State, Nigeria. Specifically, the study sought to:

- Examine the extent career development opportunities is utilized for academic staff job commitment in Polytechnics in Rivers State.
- Determine the extent prompt payment of salary is utilized for academic staff job commitment in Polytechnics in Rivers State.

Research Questions

The following research questions were formulated to guide the study:

- To what extent is career development opportunities utilized for academic staff job commitment in Polytechnics in Rivers State?
- To what extent is prompt payment of salary utilized for academic staff job commitment in Polytechnics in Rivers State?

Hypotheses

The following null hypotheses guided the study and tested at 0.05 level of significance:

- There is no significant difference between the mean ratings of male and female staff on the extent career development opportunities is utilized for academic staff job commitment in Polytechnics in Rivers State.
- There is no significant difference between the mean ratings of male and female staff on the extent prompt payment of salary is utilized for academic staff job commitment in Polytechnics in Rivers State.

Significance of the Study

This study is significant because it will develop knowledge on the need for managing reward for academic staff job commitment in Polytechnics. This study will be useful for policy makers like members of parliament who will be made to be aware on how rewards affect academic staff job commitment. This study would be of high significance to lecturers, institutional administrators, policy makers. guardians, parents, and the general society: This study will expose to the educational administrators that ensuring rewards management strategies of academic staff' of Polytechnic's is guaranteed, it will increase the commitment of the staff for-effective service delivery to take place. It will also help staff to be encouraged to put in their best for the Polytechnics education to achieve their aims and objectives. The study would be of benefit to all stakeholders in educational industry in understanding the relationship between rewards management of service, staff job commitment, thus, enabling them create judicious and lively conditions of service to promote their performances. Would also help the Government to see the need for adequate non- financial rewards to cover the institutional policy and career development opportunities to motivate staff job commitment in the institution through in-service programme, conferences, symposia, seminars, etc. to improve their skills thereby be of great benefit to students learning and their professional growth. Students are one of the major beneficiaries of this study as they would be oriented on the conditions, they need to satisfy to be able to develop their abilities, attitudes and skills for employment opportunities.

Academic staff are known as the custodian of knowledge. It is the responsibility of the academic staff to educate the student and equip the student with the right skill, knowledge,

attitude and ability needed for the student to compete favorably with others for opportunities available in the Polytechnic's as well as in the labour market. Polytechnics administrators will find this study useful as the outcome will enable them assess the impact of various non-monetary rewards system used for teaching motivation in the institution. The Government will find the outcome of this study useful as it will provide adequate data that will be needed for the planning of Polytechnics programmes. The government will be able to use the result of this study to assess its commitment in the management of Polytechnic's education and to also make future educational plans that will ensure that academic staffs' needs are adequately taken care of for the attainment of institutional goals and objectives. The members of the public such as non-Governmental organizations and private individuals will also identify areas where they can support the activities of the Polytechnics for sustainable development of the institutional through the commitment of the academic staff.

This study was delimited geographically to Rivers State which has 23 Local Government Areas and the focus of the study was on the two Polytechnic's in this State which are Ken Saro-Wiwa Polytechnic, Bori, and Elechi Amadi Polytechnic, Rumuola, in Rivers State. In content, this study covered the various reward management strategies for academic staff job commitment, the extent prompt payment of salaries enhance academic staff job commitment, the extent career development opportunities enhance academic staff job commitment in Polytechnic's in Rivers State.

THEORETICAL FRAMEWORK

Herzberg's two-factor theory (1987)

Herzberg's (1987) two-factor theory is based on the fulfillment needs, on how to satisfy workers and know their plights, in order to bring out the best in them. The main aim of this theory is to know what satisfy and dissatisfy workers in an organization. The study revealed that the factors that led to job satisfaction are not the same that dissatisfied them. This implies that job satisfaction and dissatisfaction are independent. Herzberg sees environmental factor as the major cause of workers' dissatisfaction, which is also known as hygiene factor. However, the presence of these factors has nothing to with the satisfaction of workers but rather help to increase the performance of workers in the white-collar jobs. Examples of hygiene factors include interpersonal interaction with colleagues and supervisors and the working environment; this is otherwise known as the job content. This is perceived as important but not really sufficient to satisfy workers in this category. On the other side is the job context which dwells on or emphasizes motivating factors in order to make them to work harder. This specifies what people actually do in their work, and entails achievement, recognition for work done, responsibility and authority, advancement and career.

Two-Factor Theory is closely related to Maslow's hierarchy of needs but it introduced more factors to measure how individuals are motivated in the workplace. This theory states that meeting the lower-level needs (extrinsic or hygiene factors such as supervision, salary decrease or increase, working conditions and organizational policy) of individuals would not motivate them to exert more effort or committed in the job, but would only prevent them from being dissatisfied.

CONCEPTUAL REVIEW

Reward

The concepts of reward management are inter-changeably used by researchers. Ezigbo and Court (2011) argued that the concepts are quite interrelated, overlapping and complementary in the context of employee motivation. Reward is the compensation doing work well given to an employee in the form of both financial and nonfinancial incentives (Ezigbo and Court, 2011). This definition is in consonance with the position of Kreitner (2004) that reward is the material and psychological payoffs given to an employee as recognition for good contribution and for performing tasks well in the workplace. In the views of Molhotra, Budhwar and Prowse (2007), organizational reward means all the benefits which include financial and non-financial, that an employee receives through the employment relationship with an organization. Cole (2002), as cited in Nwiyi (2016), opined that the growth of the economy and of a country largely depend on the Educational system in that country, hence rewarding staff's become very necessary to achieve quality education that will drive the economy towards the path of development.

Academic staff work to develop institutional environment that promote teaching, learning, critical thinking team work among staff's, School administrators and students. Lecturer's job commitment is an essential tool required to reshape teaching and learning to meet the present demands for staff improvement and excellent performance. They are the main resources for educational' business activities; the issues of Staff rewards critically decide academic success.

Classification of Reward Management

Monetary Rewards and Non- Monetary Rewards

Monetary rewards are those that will enhance the employee's financial well-being directly, example bonus, increase in wages and profit-sharing schemes. On the other hand, non-monetary rewards do not enhance the employees' financial position directly but make the job more attractive. In every career be it lecturing or any other work, employees will be willing to put in their best if what they go home with at the end of the month is enough to help them meet their needs, The way workers are remunerated for their efforts in their work places determine how serious they will be with their work. Remuneration as defined refers to the monetary income obtained by workers for participating in social labour, that is, the material compensation paid by an employer in a statutory way to a worker in exchange for fulfillment of labour obligations after a labour relationship was been established by them". Labour remuneration is the main source of income for workers to meet their material, cultural and living needs of themselves and their family members. In every career be it teaching or any other work, employees will be willing to put in their best if what they go home with at the end of the month is enough to help them meet their needs.

Performance-Based Rewards and Membership-Based Rewards

Employees performance is an indicator of the quantity of work done (i.e. how much unit of a product has been produced or provided), quality of work produced (how well the work has been done) and the timeliness of the work that has been done.

The rewards that a business organization gives to their employees can be based on either their performance or membership criteria. Performance based rewards are exemplified by the use of commissions, piecework pay plans, incentive schemes, group bonuses, merit pay or other forms of pay for performance plans. Membership-based rewards would include cost of living increases, benefits and salary increase, seniority or time in rank, credential or future potential as can be seen in tertiary institution.

Reward Management strategies for staff job commitment

It is notable that different motivation strategies may affect the staff in different ways at points in time because conditions, needs and personal objectives are not static but inconstant state of flux. The staff who accomplish their task or give good commitment, they different not only want to focus on their achievement but they want their achievement to he appreciated. The overall aim of reward system is to support the attainment of the Institutional goals and objectives by helping the organization to ensure that it has the skilled, committed and well-motivated work force it needs. In a school system, it is necessary for the administrators to develop the most suitable incentives and good reward system which could be financial and non-financial, nevertheless, one of the strategies to improve the management of reward packages is to give rewards in line with the needs and context of work environment. It is the motivation and co-ordination of the activities and effort of the staff in school in order to obtain maximum output from them and consequently achieve the goals of education optimally. The functions according to Lynch (2000) include the following:

Staff Maintenance

This concern making the work environment conducive for workers, pertinent practices include; promotion and transfer, motivation, staff safety, security and health services. It is pertinent that educational establishments have sound policies in respect of staff transfer and promotion to ensure that justice and fairness prevail in dealing with staff. As work to be performed in the school is important, the mood of the man to perform the job is equally important. For maximum and productive goal attainment, the administrators must ensure the comfort and happiness of the workers.

Staff Development

This is the process of appraising staff performances and identifying their key skills and competence that need development or training to improve their skills for better performance. It involves providing development programme and training courses that are suitable for the programme. The success of educational organization hinges on the strength and quality of the staff members. There is need to change through training and to improve and grow in competence. This can be done through in-service training, conference, workshop and seminars.

Academic staff Job Commitment

The term commitment has been studied in different forms in the psychological literature. Adeniji (2019) remarked that lecturers often show their dissatisfaction if there is no adequate provision

for job security, promotion and when unfairness is exhibited. Reio and Reio (2018) stated that job commitment is referred to the extent to which teachers/lecturers make out, relates to their places of employment.

Career Development Opportunities are Utilized for Academic Staff Job Commitment

The personal growth of the academic staff is an important factor that is often given due consideration before and after taking a job. Academic staffs' in the Polytechnic's look forward to any job opportunity which can increase their chances of self-actualization. Some lecturers value the lecturing profession because it gives them the opportunity of striking a work life balance where they can interact with the members of their family and this forms the major non-monetary reward which some lecturers look out for if they must give their best work performance to the Polytechnic.

Career development opportunities help staff to improve in knowledge and embrace new innovations in lecturing profession. Staff development opportunities allow employees to develop and enhance their skills which include socialization of different forms just as new staffs need training to begin work, so also more experienced staff need retraining to keep up with the demands and challenges of their job. The success of any organization is dependent on its workforce, and in order to get the best workforce to do the job, it must be continuously trained and developed.

Prompt payment of salary for Academic Staff job commitment

It is extensively conceived that money helps to stimulate job efforts (Miline, 2007). It can be observed in most of the developing countries where physiological needs of most workers are yet to be met. The role of money is very crucial in the realization of the deserved needs of workers and in obtaining higher order needs such as recognition in the society and in purchasing luxury goods and services that bring about comfort in life. The cardinal reason why most people engage in one form of job or another is to earn salary or income. This is needed to meet up with some vital personnel and domestic needs like feeding, clothing, payment of rent, schools fees, utility bills etc. Salary can be described as the money that an employee receives for doing his job. Money is believed to have a great tendency of bringing out a higher commitment in employee when he is adequately paid. It is believed that man is an economic being, whose attitude to work can only be influence by money. Prompt pay salary to staff are important because with money, people can satisfy needs for status, security, recognition and affiliation. For example, in Nigeria, a person's social worth depends largely on the size of his earnings or acquired monetary wealth exhibited in either building raised, types of house he can afford to live in and the type of car he uses.

The salary of an academic staff is paid by his employer can have a great influence on his commitment in the administration. A staff doesn't simply view his salary as a dollar amount, he sees it as the value his employer places on him as a worker. The level of appreciation he feels can have a direct impact on his overall performance. A worker is more likely to perform to his potential if they are happy with the salary he is earning. A person earning a high salary feels motivated to do a good job, because he wants to please his employer retain his position. His salary brings him a feeling of security, allows him to feel accomplished and gives him a high-status ranking that he enjoys. A person is much more willing to put in extra hours at the office if

he feels his financial rewards, are a fair trade-off. It increases the commitment, satisfaction and productivity.

Adelabu (2013) observed that in Nigeria, job satisfaction induces greater commitment to lecturing. He added that lack of job satisfaction as a result of poor salary package and other conditions of service after employees' commitment to work and contributions to the effectiveness of institution is reduced. It has been confirmed that lecturing job is devoid of satisfaction. Hence, many who lend themselves in the field are there by necessity rather than by design; therefore, most of them put on low rate of commitment while on the job. Staff motivation is an important factor for any educational system to achieve its goals and objectives.

CHALLENGES OF ACADEMIC STAFF JOB COMMITMENT

Inadequate Infrastructural Facilities

Inadequate infrastructural facilities are another fundamental challenge facing the academic staff of Polytechnic's. Infrastructural facilities refer to that social capital that aids delivering of teaching, researching and other academic services in the educational institutions. Infrastructural facilities include classrooms, offices, lectures halls, sport ground, light, water, good roads, ICT facilities etc. Many academic and non-academic staff in the Polytechnic's in Rivers State cannot discharge their academic services effectively due to inadequate infrastructural facilities. Many academic staff do not have constant light in their offices and internet services to support their online teaching programme. Fatuzzo, (2017) observed that the Nigerian polytechnics seem to be grappling with the challenges of engaging their workforce especially the academic staff due to frustrating work conditions arising from inadequate or lack of lecturing and research facilities, poor remuneration, unfavorable policies like high imposition of taxes, and poor job security with non-pensionable salary. These challenges may have culminated into poor commitment in the Polytechnic ranking. The Polytechnic's lack of sufficient facilities and equipment to effective deliver teaching and research programme. Nwagwu (2017) opined that our institutions of higher learning are characterized by under-funding, poor working environments, poor conditions of service, inadequate infrastructural facilities and ineffective management of financial resources.

Poor Funding of Research Programme

One of the cardinal programme and core functions of the academic staff is carrying out research. Over the world, lecturers are known for carrying out research frequently, it is unfortunate that academic staff of many Polytechnic's not carrying out research due to poor funding of research programme and lack of conducive environment. Thesis confirmed by Okoli, et al. (2016) who affirmed the poor attitude of Governments towards research and inadequate funding of research programme have not given enough priorities it deserves. One of the functions of the Universities is to engaged in research programs and solve the social, economic, and political challenges affecting the Nation through their findings. Due to the poor research programs and lack of research capital, many young researchers are discouraged to embark on researches.

Empirical Review of Related Studies

Okoli et al. (2020) carried out another study on reward management practices and employee performance of public universities in South-East, Nigeria. Two research questions were formulated to guide the study. The study used a descriptive survey research design. A well-structured questionnaire was used to gather the data. The split half test was used to assess the internal consistency of the items and the reliability of the questionnaire. The validity of the paper's content was assessed using the expert judgment approach. The Pearson Product Moment Correlation Coefficient (PPMCC) was used to examine the data at 0.05 level of significance. The results showed that distributive justice and employee commitment had a substantial positive link (cal. r.893 > crit. r 0.098), and that employee recognition and job satisfaction had a strong positive association (cal. r.942 > crit. r 0.098). Therefore, it was advised, among other things, that the targeted public institutions need to make sure that staff are rewarded justly and fairly and that they need to rely on more than just the base wage that employees receive.

METHODOLOGY

The researcher adopted a descriptive research design. This was used to allow for numerical data to be collect within a short time for systematic analysis in order to test the null hypothesis. Descriptive surveys are normally intended to describe the characteristics of particular individuals or a group and report things as they are and provide numerical data of the population. The descriptive survey design involves explaining the issue, gathering, describing, analyzing and interpreting data on Reward Management Strategies for Academic Staff job Commitment in Polytechnic in Rivers State, Nigeria.

The population for this study consisted all the academic staff in two (2) State Polytechnics in Rivers State; 1470 (1,110 males and 360 females). Namely: Ken Saro-Wiwa Polytechnic, Bori (950), and Captain Elechi Amadi Polytechnic, Rumuola (520), Port Harcourt, Rivers State. The academic staff in the Polytechnics was chosen because the researcher feel that they are qualify to respond accurately in providing suitable information as required by the researcher.

The sample size for this study comprised of 400 academic staff which was 5% of the entire population of the study and this consisted of 246 males and 154 females academic staff in two Polytechnics in Rivers State. The simple random sampling technique was used to select the sample of the study.

The research instrument for collecting data in this study was a self-design questionnaire titled: "Reward Management Strategies for Academic Staff job Commitment in Polytechnics in Rivers State Questionnaire (RMSASCDPRSQ)." It was developed by the researcher with the assistant of the research supervisor. The instrument was divided into section A and B. Section A comprises of demographic data of the respondents while section B comprises of items base on postulate research questions.

Validity is the degree to which a test measures what it purports to measure. Validation involves collecting and analyzing data to assess the accuracy of an instrument (Sharmna, et al, 2021). To validate the research instrument, face and content validity of the instrument was established by researcher’s supervisor and two other experts, one in the department of educational management in Ignatius Ajuru University and another from Department of Statistics

Ken Saro-Wiwa Polytechnic, Bori, Rivers State. Their corrections were implemented in the final draft of the instrument.

The Cronbach alpha method was used to test the reliability of the instrument. Twenty (20) respondents use during the test-retest of the instrument which was on a representative sample in Rivers State different from the study area in order to avoid contamination. Copies of the instrument was administered on the respondent to complete and return them within time frame of two weeks. Finally, their responses were analyzed using Cronbach alpha test of reliability and a reliability index: 0.86 and 0.821 respectively.

The administration of the instrument was done through direct delivery approach with the help of two research assistants. Four hundred (400) copies of the questionnaire was administered personally to the respondents by the researcher in two polytechnics in Rivers State. The instrument was retrieved immediately after completion, 400 copies of the instrument were distributed and administered and 346 copies were properly answered and returned which represented 86.5% returned rate. The researcher intimated the research assistants on the purpose of the research, the content of the Instrument, how to administer and collect the instrument. The researcher and research assistants will go round the Ken Saro-Wiwa Polytechnic, Bori, and Captain Elechi Amadi Polytechnic, Rumuola, Rivers State and distributed the copies of instrument to the academic staff (respondents). More so, the researcher will give an introductory instruction on how to complete the questionnaire by the academic staff. The researcher and research assistants probably guide the staff on how to respond to the questions.

Data for this study was gather through the administration of the questionnaire. The Mean and Standard deviation was used in answering the research questions while the independent t-test analysis was used in testing the hypotheses at 0.05 level of significance.

RESULTS AND DISCUSSION

Research Question One: To what extent is career development opportunities is utilized for academic staff job commitment in Polytechnics in Rivers State?

Table 1: Mean ratings and standard deviation on the extent career development opportunities is utilized for academic staff job commitment in Polytechnics in Rivers, State Nigeria

s/n	Items	Mean	SD	N	Decision
1	Enhance teaching skills by upgrading teaching skills through professional development can lead to greater confidence and enthusiasm in the classroom resulting in increased job commitment.	2.26	1.327	346	Low extent
2	Career development opportunities can lead to better student outcomes which can increase staff motivation and commitment.	2.84	1.654	346	High extent
	Grand mean and SD	**3.689**	**2.154**		**High extent**

The Data on Table 1 shows that, the mean ratings and standard deviation on the extent career development opportunities is utilized for academic staff job commitment in Polytechnics in Rivers State. The table shows that all the items are well above the criterion mean while item 1 is below the criterion mean of 2.50 which indicates that enhanced teaching skills by upgrading teaching skills through professional development can lead to greater confidence and enthusiasm

in the classroom, resulting in increased job commitment. This means that, career development opportunities has a significant impact on enhancing academic staff job commitment in polytechnics in Rivers State, improved job satisfaction opportunities can lead to increased job satisfaction, which in turn can boost job commitment, career development opportunities can lead to better student outcomes, which can increase staff motivation and job commitment, as seen on items 1 and 2 with mean ratings of 2.26 and 2.82 respectively. However, the grand mean of table 1 shows 3.689 which further indicates that the majority of the respondents agreed that career development opportunities is utilized for academic staff job commitment in Polytechnics in Rivers State, Nigeria. To what extent is prompt payment of Salary utilized for academic staff job commitment in Polytechnics in Rivers State, Nigeria?

Table 2: Mean ratings and standard deviation on the extent prompt payment of salary utilized for academic staff job commitment in Polytechnics in Rivers State, Nigeria

s/n	Items	Mean	SD	N	Decision
3	Prompt salary is instrumental in retaining skilled facility member, preventing them from seeking better-paying opportunities elsewhere.	2.92	1.612	346	High extent
4	Prompt payment of staff salary enables them to meet up their financial obligations and motivates their job co	2.89	1.723	346	High extent
	Grand mean and SD	**2.905**	**2.473**		**High extent**

The data on table 2 shows the mean ratings and standard deviation on the extent prompt payment of salary is utilized for academic staff job commitment in Polytechnics in Rivers State. Enhance teaching skills by upgrading teaching skills through professional development can lead to greater confidence and enthusiasm in the classroom resulting in increased job commitment

The table shows that, both male and female academic staff agreed that to high extent prompt payment of salary is utilized for academic staff job commitment, prompt salary ịs instrumental in retaining skilled faculty members, preventing them from seeking better-paying opportunities elsewhere, prompt payment of staff salary enables them meet up their financial obligation and motivates their job commitment as seen on item 3 and 4 with the mean ratings of 2.92, and 2.89 respectively. However, the grand mean of table 2 shows 2.905, which further indicate that the majority of the respondents agreed to high extent that prompt payment of salary is utilized for academic staff job commitment in Polytechnics in Rivers State, Nigeria.

Test of Hypotheses

Null Hypothesis One

HO[1]: There is no significant difference between the mean ratings of male and female staff on the extent career development opportunities is utilized for academic staff job commitment in Polytechnics in Rivers State.

Table 3: Summary of t-test on the difference between the mean rating of male and female staff on the extent career development opportunities enhances the academic staff commitment in Polytechnics in Rivers State

Gender	N	Mean	SD	Df	t-test	Sig.	Decision
Male	226	2.96	0.76	344	1.696	.091	**NS**
Female	120	2.82	0.70				

Table 3 reveals the summary of t-test on the difference between the mean rating of male and female staff on the extent career development opportunities is utilized for academic staff commitment in Polytechnics in Rivers State. The result from the table above reveals the mean responses of the male staff as 2.96 and the standard deviation of 0.76 while the mean responses of female staff is 2.82 and standard deviation is 0.70. The table also reveals t-test calculated value of 1.696 and corresponding significance value of .091. The result shows that $p>0.05$ at 344 degrees of freedom. Hence, it is concluded that there is no significant difference between the mean ratings of male and female staff on the extent career development opportunities enhances academic staff job commitment in Polytechnics in Rivers State. Therefore, the null hypothesis five is retained at 0.05 level of significance.

Null Hypothesis Two

HO_2: There is no significant difference between the mean ratings of male and female staff on the extent of prompt payment of salary is utilized for academic staff job commitment in Polytechnics in Rivers State.

Table 4: Summary of t-test on the difference between the mean rating of male and female staff on the extent of prompt payment of salary is utilized for academic staff commitment in Polytechnics in Rivers State

Gender	N	Mean	SD	Df	t-test	Sig.	Decision
Male	226	2.91	0.96	344	0.129	.898	**NS**
Female	120	2.90	1.13				

Table 4 displays the summary of t-test on the difference between the mean rating of male and female staff on the extent of prompt payment of salary is utilized for academic staff commitment in Polytechnics in Rivers State. The above table shows mean responses of the male teachers to be 2.91 and the standard deviation of 0.96 while the mean responses of female academic staff is 2.96 and standard deviation is 1.13. The table also reveals t-test calculated value of 0.129 and corresponding significance value of .898. The result shows that $p>0.05$ at 344 degrees of freedom. Hence, it is concluded that there is no significant difference between the mean ratings of male and female staff on the extent of prompt payment of salary is utilized for academic staff job commitment in Polytechnics in Rivers State. Therefore, the null hypothesis two is retained at 0.05 level of significance.

DISCUSSION AND FINDINGS

The extent career development opportunities is utilized for academic staff job commitment.

This finding is in agreement with the findings of Armstrong (2001), he opines that career rewards management strategy includes the following reward options; training and development, lateral moves/advancement, career progression, personal growth, stretch assignment and career

incentives etc. Similarly, Tahira et al. (2012) argued that career reward strategy are of four (4) types which are career development, training, opportunities for acquiring required skills and participation environment. The authors added that career reward strategy has been recognized as a powerful tool for attaining employees' motivation and commitment, and is a strong source of employee retentions. The result analysis in Research Questions shows that reward management help to enhance academic staff job commitment in Polytechnics. All the items have grand mean rating above 2.5 indicating that use of rewards management to encourage staff to put in their best actually enhance job Commitment. Employer would enhance staff commitment by attributing consideration on non-financial rewards to staff in giving praise and encouragement to staff, recognition for excellent performance, establishing room for staff autonomy, professional growth and staff promotion, decrease in staff responsibilities and giving high quality and adequate leadership.

This finding is in agreement with the findings of Armstrong (2001), he opines that career rewards management strategy includes the following reward options; training and development, lateral moves/advancement, career progression, personal growth, stretch assignment and career incentives etc. Similarly, Tahira et al. (2012) argued that career reward strategy are of four (4) types which are career development, training, opportunities for acquiring required skills and participation environment. The authors added that career reward strategy has been recognized as a powerful tool for attaining employees' motivation and commitment, and is a strong source of employee retentions. The result analysis in Research Questions shows that reward management help to enhance academic staff job commitment in Polytechnics. All the items have grand mean rating above 2.5 indicating that use of rewards management to encourage staff to put in their best actually enhance job Commitment. Employer would enhance staff commitment by attributing consideration on non-financial rewards to staff in giving praise and encouragement to staff, recognition for excellent performance, establishing room for staff autonomy, professional growth and staff promotion, decrease in staff responsibilities and giving high quality and adequate leadership.

The extent prompt payment of salary is utilized for academic staff job commitment

The findings of the study revealed that to a high extent prompt payment of salary encourages academic staff job commitment. They are motivated to work, staff will adhere to professional code of conduct for effective job performance and to enhance the rate of staff job committed. The findings of the study in this regard showed that the according to Ausubel, (2002), employees who experience stressful working condition are more likely to be performed less in their jobs; hence, they are not likely to be productive. A prompt payment of salary, motivates academic staff to give their best. But wherever motivation is lacking, the result is a reduced level of job commitment. This agrees with Ausubel's position that staff who experience delayed in salary are less likely to be involved in their job. This negative correlation seems to suggest that the staff in the study do not feel motivated with their job, due to apparent delayed payment of salary could affect their level of job commitment.

CONCLUSION AND RECOMMENDATIONS

This study was designed to investigate reward management strategies for academic staff job commitment in Polytechnics in Rivers State, Nigeria. The academic staff job commitment is

largely based on financial or non-financial rewards they received in the process of discharging their responsibilities. All financial and non-financial rewards, psychological payment that an administrator provides for its employees in exchange for work they perform.

Academic staff teaching and mentoring students, conducting research and publishing scholar work, developing and upgrading curricular, assessing students learning and progress, participating in departmental and institutional service, supervising graduate students and research assistants, engaging in career development and continuous learning.

The methods and procedures used in carrying out the study was discussed under the following subheadings: research design, population of the study, sample and sampling technique, instrument for data collection, validity of the instrument, reliability of the instrument, method of data collection and method of data analysis. The study adopted descriptive research designs. The population of the study comprised all the 1470 (i.e. 1110 males and 360 females) academic staff in two State Polytechnics in Rivers State.

A sample of three hundred and forty-six (346) i.e male 226 and 120 female respondents representing 5% of academic staff in Polytechnics in Rivers State drawn from the entire population were used for the study. The instrument used for the data collection was a researcher's develop questionnaire titled Reward Management Strategies for Academic Staff Job Commitment in Polytechnics Questionnaire (RMSASJCPQ). The instrument was divided into two sections: A and B. Section 'A' elicited demographic data of the respondents, while section 'B' addressed the research questions. The instrument for the study was validated by the researcher's supervisor and other two experts in Departmental of Statistics, Ken Sari Wiwa Polytechnic and Educational management, Ignatius Ajuru University, Rivers State.

The experts were requested to vet the instrument in terms of relevance, clarity, usability and appropriateness. Reliability of the instrument was established, twenty (20) copies of the instrument were given to twenty respondents who were not part of the sample size but part of sample population. The scores obtained was collated, coded, were scaled Cronbach Alpha (ă), and computed the Statistical Package for Social Science (SPSS) version 22 software which yielded Reliability index of 0.75 and 0.84 hence the reliability of the instrument was established.

CONCLUSION

Academic Staff are the engine rooms of the Polytechnics and they need to be motivated to work well and improve on their job commitment. The study mirrored on managing reward strategies with the aim to verifying its efficacy on academic staff job commitment, and the enhancement of productivity in Polytechnics. Based on the finding of the study, it can therefore be concluded that various rewards management strategies such as prompt payment of salary, regular promotion,, provision of incentives, career development opportunities and recognition rewards hold remarkable enhancement on academic staff job commitment in Polytechnics in Rivers State, Nigeria. It revealed that when academic staff are adequately rewarded by enhanced salaries/wages, provided with avenue and monetary support for skill update and careers advancement in their various fields of learning, allowances to meet up with the cost incurred in the provision of life necessities and given recognition and encouragement, it releases in them the motivation to put in their best towards achieving a set academic goals and objectives.

Moreover, the paper affirms further that rewards offered by an institution have positive relationship with job commitment and satisfaction. As such, this propels employees' performance, retention and the attainment of academic goals. The study however, observed that

if an administrator reward strategy is perceived to be unfair and unrealistic, it will de-motivate academic staff job commitment. Government needs to increase the funding of Polytechnics education, increase the funding of research programme, motivate the academic staff, provision of effective staff development programme, provision of infrastructural facilities, implementation of union agreement, provision of adequate incentives and capacity development programme on Information Communication Technology (ICT) so that, at the end of the day, academic goals will be highly attained through job commitment of academic staff.

Recommendations

Based on the findings of this study, discussions and conclusion drawn from it the following recommendations are made:

- Administrators of various Polytechnics, policymakers and other stakeholders in the education field should know that financial rewards are not the sole factor that is utilized for staff job commitment.
- Relevant government agency and polytechnic administrators should be exposed to and equipped with the relevant reward management strategies through seminars, conferences and workshops in order to ensure academic staff job commitment in polytechnics.
- Government should provide relevant legislation with respect to staff welfare in the form of minimum wage beyond which no private Polytechnics should pay their workers.

ABSTRACT

The intersection of economics and policy leadership is crucial for sustainable development, financial stability, and institutional resilience. This study critically examines the role of economic literacy in leadership, emphasizing its impact on policy formulation, resource management, and financial decision-making. Drawing on an extensive review of contemporary literature and case studies, including Nigeria's structural adjustment policies and Rwanda's economic resurgence, the study highlights how informed leadership fosters economic prosperity, while poor economic decision-making exacerbates financial crises and inequality. Findings suggest that leaders who integrate economic principles into governance enhance fiscal responsibility, drive inclusive growth, and mitigate economic volatility. However, gaps remain in financial education within leadership training, necessitating structured programs to improve economic competence among decision-makers. Future research should explore innovative economic governance models, digital financial tools for leadership, and global best practices for strengthening economic resilience. Conclusively, bridging the gap between economics and leadership through financial literacy, regulatory oversight, and strategic investment is essential for fostering long-term economic prosperity.

INTRODUCTION

In an era where economic sustainability dictates national and organizational progress, the intersection of economics, leadership, and management has gained increasing scholarly attention. Economics, as a discipline, revolves around resource allocation, financial decision-making, and sustainability, principles that are equally integral to effective leadership and sound management. Leadership, in turn, involves guiding individuals and institutions toward strategic goals, while management ensures the efficient utilization of resources, operational control, and institutional stability within economic constraints. Samuelson and Nordhaus (2009) describe economics as the study of resource allocation and cost-benefit analysis, which are fundamental to both leadership decision-making and managerial efficiency. Similarly, Mintzberg (2017) defines leadership as the strategic coordination of human and material resources to achieve long-term institutional objectives, a process that inherently demands both economic foresight and managerial oversight.

Given the increasing complexity of global economies and competitive business environments, leaders and managers who neglect fundamental economic principles often encounter inefficiencies, stagnation, and crises, reinforcing the imperative of economic literacy in leadership and management. Economic theories such as rational choice theory and public choice theory, as outlined by Stiglitz and Greenwald (2014), provide a structured foundation for managerial decision-making and leadership strategies that maximize institutional and societal benefits while minimizing inefficiencies. Acemoglu and Robinson (2012) assert that economically literate leaders and managers operate within a framework of financial accountability, strategic investment, and cost-benefit analysis, ensuring optimal resource utilization, budgetary discipline, and institutional sustainability.

Agreeably, Ananyi and Ololube (2024) comparative analysis of the differences between leadership and management in decisions made in isolation from economic realities often result in financial mismanagement, unsustainable policies, and institutional instability. Historical accounts demonstrate how economic foresight, coupled with strong managerial leadership, has driven national prosperity, whereas poor financial planning and weak management structures have led to prolonged economic downturns. Therefore, leadership effectiveness should not be measured solely by vision or influence but by its capacity to drive sustainable economic and managerial transformation. Similarly, Todaro and Smith (2020) contend that corporate leaders and managers who integrate economic fundamentals into their strategic vision and operational models enhance business resilience, efficiency, and adaptive decision-making in response to dynamic market conditions. Beyond financial prudence, economic leadership and management foster innovation, institutional productivity, and equitable resource distribution for sustainable development.

Leadership and management within public institutions, businesses, and educational organizations must therefore be approached as integrated economic functions, where strategic investment, financial accountability, and operational efficiency shape long-term institutional sustainability. Ananyi Ololube (2021) highlights that leadership and management failures are often rooted in economic miscalculations, inefficient resource management, and financial corruption. Misallocation of funds, bureaucratic inefficiencies, excessive government spending, and lack of fiscal transparency weaken both economic and management systems, erode public trust, and ultimately contribute to financial crises and institutional decline (Mintzberg, 2017). Institutional governance collapses when leadership and management are detached from

economic sustainability principles, further emphasizing the need for leaders and managers to adopt a forward-looking, data-driven economic perspective in decision-making.

Ananyi and Ololube (2023) present a comparative analysis of leadership and management, emphasizing that institutional success extends beyond administrative efficiency to encompass economic sustainability, financial stability, and long-term development planning. This perspective asserts that effective leadership operates as a strategic force, integrating economic methodologies with managerial strategies, ethical governance, and developmental planning, ensuring institutional adaptability and societal well-being. Leadership is, therefore, not just a governance tool but a transformative economic and managerial mechanism that influences fiscal stability, operational resilience, and holistic institutional progress (Schiefer, 2018).

To deepen this discourse, this article explores leadership as both an economic and managerial mechanism, examining the consequences of economic mismanagement in leadership, the role of data-driven managerial decision-making in fostering sustainable institutional growth, and the necessity of economic literacy in leadership and management training. Ananyi, Cheta-Maclean, and Ololube (2024) emphasize the role of social justice, managerial accountability, and credible leadership in university management, highlighting how ethical leadership and effective management structures influence institutional success. In line with this, the discussion in this article contributes to a unified theoretical framework where leadership and management are understood not just as administrative functions but as economic and strategic imperatives. The qualitative analysis therefore seeks to bridge the gap between leadership, managerial effectiveness, and sustainable economic progress, reinforcing the necessity for leaders and managers to integrate economic foresight, financial accountability, and sustainable governance in their strategic decision-making.

Position Statement

The growing disconnect between leadership practices and economic principles has led to significant inefficiencies, financial mismanagement, and institutional instability across governance, corporate organizations, and educational institutions. Despite the increasing complexity of economic systems, many leaders continue to operate without a structured economic framework, causing long-term setbacks that hinder growth, development, and social progress. This misalignment between leadership and economic principles highlight the urgent need for a reconceptualization of leadership as an economic function rather than a mere administrative or visionary role. Given these realities, this article asserts that leadership, regardless of its context, who fail to incorporate economic principles into their decision-making risk perpetuating inefficiencies, instability, and stagnation. This study, therefore, seeks to bridge the gap between leadership and economic sustainability by proposing a framework through an economic lens that aligns leadership effectiveness with fiscal responsibility, resource optimization, and long-term socio-economic impact using a new theoretical perspective that will guide future discourse on leadership effectiveness and institutional sustainability in governance, business, and education.

Economics and Leadership

Economics, as a field, is primarily concerned with the efficient allocation of limited resources to meet the needs of individuals and institutions. It encompasses decision-making processes related

to production, distribution, and consumption, ensuring that available resources generate maximum utility. Samuelson and Nordhaus (2017) argue that economic principles, including cost-benefit analysis, market equilibrium, and opportunity cost, play a crucial role in shaping financial and policy decisions. Without a fundamental understanding of these principles, leaders may struggle to navigate fiscal challenges, implement sustainable policies, or drive institutional development. This economic perspective is particularly essential in public administration, where leaders are responsible for optimizing government budgets, managing public resources, and ensuring economic stability.

Leadership, in contrast, involves the capacity to inspire, influence, and direct people toward achieving organizational or societal objectives. Northouse (2021) describes leadership as a multidimensional process that requires vision, strategic planning, and adaptability, particularly in complex and resource-constrained environments. Whether in corporate settings, educational institutions, or political offices, leadership effectiveness is closely tied to decision-making processes that consider financial feasibility, risk assessment, and long-term sustainability. A leader who lacks economic foresight may make decisions that compromise financial stability, resulting in stagnation or institutional decline. This underscores the necessity of integrating economic literacy into leadership development to enhance problem-solving and strategic thinking.

The intersection between economics and leadership is evident in various sectors where financial management and policy implementation shape institutional success. In governance, leaders must balance economic growth with social welfare policies, ensuring that fiscal strategies support long-term national development. Todaro and Smith (2020) highlight that political leadership significantly influences economic progress through policies that determine inflation control, public sector investment, and employment rates. Similarly, in the business sector, corporate executives must apply economic principles such as market demand forecasting, capital investment strategies, and operational cost management to sustain profitability and competitive advantage. Educational leadership also requires economic awareness, as school administrators must allocate funds efficiently, ensure sustainable infrastructural development, and implement policies that improve academic performance within financial constraints.

Understanding the economic implications of leadership decisions is vital for fostering institutional growth, mitigating financial risks, and ensuring long-term sustainability. Drucker (2001) asserts that organizations and nations thrive when leaders incorporate economic reasoning into their strategic planning, aligning fiscal discipline with broader developmental objectives. The inability to do so often results in economic instability, inefficient governance, and financial crises that hinder progress. By integrating economic literacy into leadership frameworks, leaders can develop more effective policies, drive innovation, and enhance institutional resilience across all sectors.

Conceptual Framework

To develop the Conceptual Model for this *Economics and Leadership: A Qualitative Perspective* framework visually represent the interactions between leadership, economic policies, financial literacy, and institutional governance while showing their collective impact on sustainable economic growth and decision-making. Below is the structured framework for the conceptual model diagram:

Core Components of Economic Leadership Model

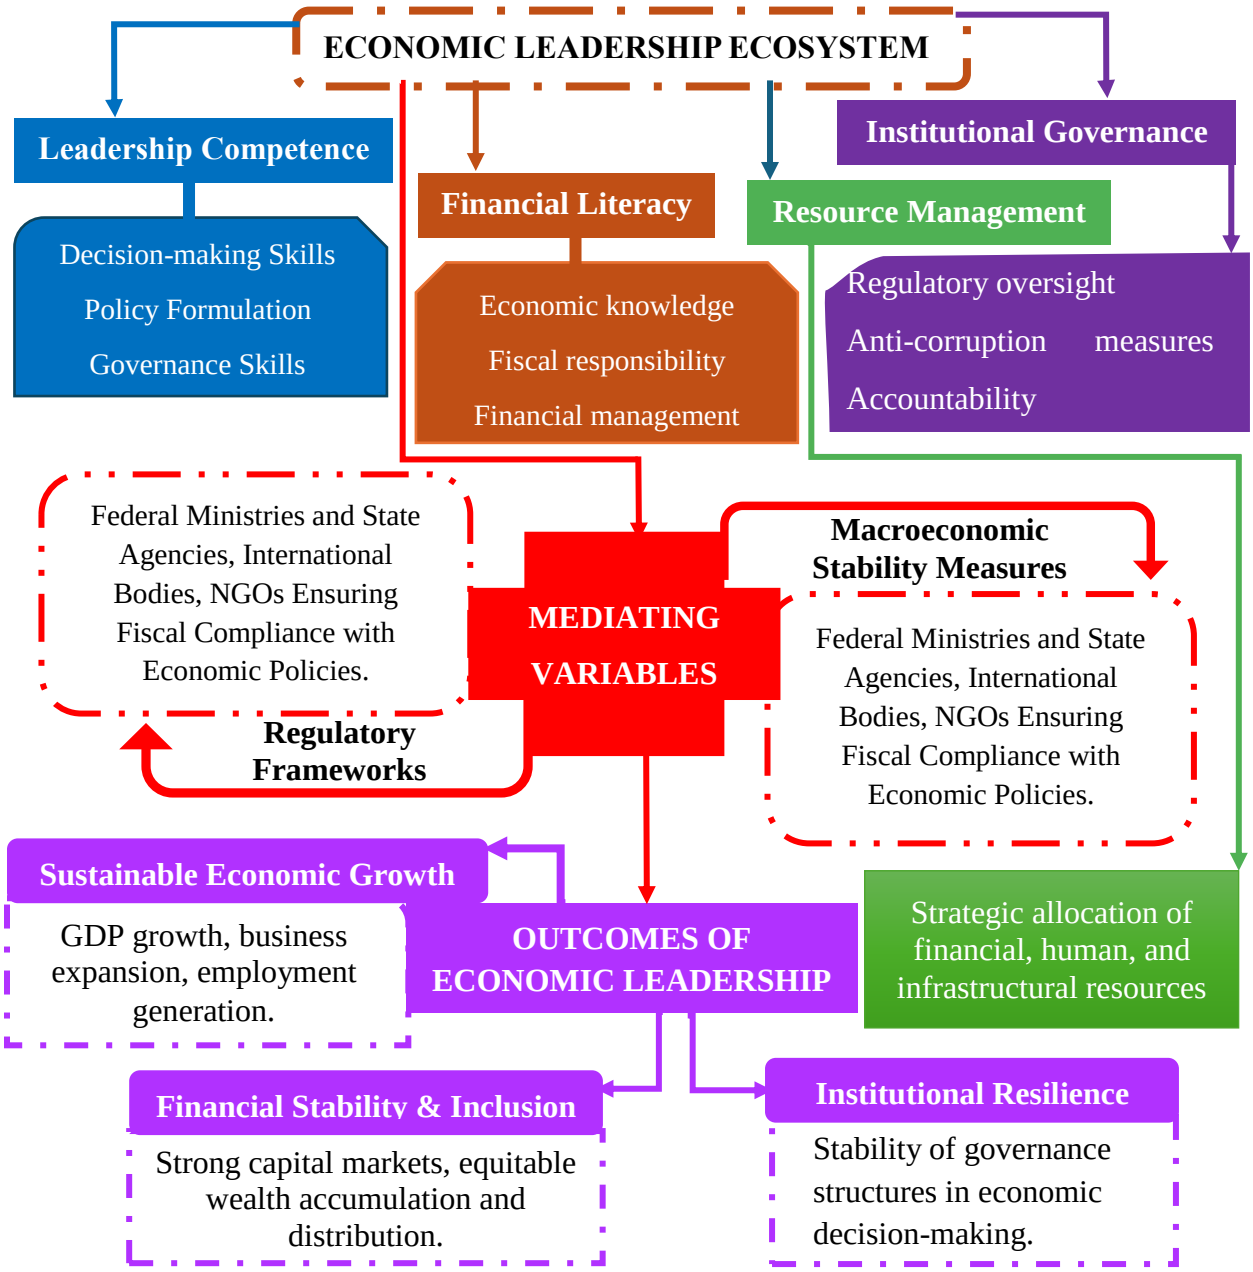

Figure 1: Economic Leadership Ecosystem

The structured framework (Figure 1) presents the conceptual model for *Economics and Leadership: A Qualitative Perspective*. The framework visually represent the interactions between leadership, economic policies, financial literacy, and institutional governance while showing their collective impact on sustainable economic growth and decision-making. The conceptual model diagram showing how leadership and economic variables influence policy implementation and governance, ultimately leading to economic outcomes.

Application of the Model

This framework can be used to:

- Analyze leadership effectiveness in economic governance.
- Assess the impact of policy decisions on national and institutional growth.
- Guide reforms in leadership training programs focused on economic management.
- Strengthen financial literacy initiatives for policymakers.

Economics Leadership

Leadership, at its core, is an economic function that involves making strategic decisions regarding resource distribution, financial planning, and sustainable development. Whether in governance, corporate management, or institutional administration, leaders influence economic policies and determine the allocation of financial and human capital. The ability to balance short-term gains with long-term sustainability defines effective leadership, making financial literacy an indispensable skill. Economic theories such as scarcity, opportunity cost, and cost-effectiveness directly shape leadership strategies, highlighting the need for data-driven and financially responsible decision-making. This section explores the economic responsibilities of leaders, the role of financial management in leadership efficiency, and the impact of economic policies on leadership effectiveness.

Leadership as an Economic Function

Leadership, when viewed through an economic lens, functions as a decision-making process centered on optimizing scarce resources to achieve institutional, organizational, or governmental goals. Leaders act as economic agents who navigate complex environments by making choices that balance efficiency, sustainability, and long-term value creation. The principles of economics particularly scarcity, opportunity cost, and marginal utility provides a structured framework for leaders to assess resource allocation, risk management, and strategic investment. In this regard, leadership is not merely about guiding people but also about ensuring that economic decisions foster growth, stability, and innovation within an institution or society.

Scarcity, a fundamental economic concept, plays a critical role in leadership decision-making. Leaders constantly face limited financial, human, and material resources, necessitating prioritization and trade-offs. A leader who understands the constraints of scarcity can effectively allocate resources to areas of greatest impact. For example, in the public sector, government leaders must decide how to allocate budgets across infrastructure, education, and healthcare, ensuring maximum societal benefit. Similarly, in corporate settings, executives determine which projects to fund based on their potential return on investment and alignment with strategic objectives.

Opportunity cost further underscores the economic nature of leadership. Every decision a leader makes involves forgoing an alternative course of action. A university administrator who invests in faculty training rather than expanding campus facilities, for instance, prioritizes long-term human capital development over immediate infrastructure growth. In governance, policies that allocate resources toward social welfare programs instead of tax cuts reflect leadership

choices aimed at equitable economic development. Leaders who understand opportunity cost make informed decisions that align with long-term sustainability rather than short-term gains.

Marginal utility, which evaluates the added benefit of an incremental decision, is another economic theory that shapes leadership strategies. Leaders must assess whether additional investments whether in hiring new personnel, expanding services, or adopting new technologies yield proportional benefits. In corporate management, leaders must decide how much to invest in employee incentives before diminishing returns set in, ensuring that expenditures lead to increased productivity rather than unnecessary financial strain. This principle is particularly relevant in education, where policymakers must determine the optimal level of funding required to improve learning outcomes without excessive spending.

Cost-effectiveness remains a cornerstone of leadership, emphasizing the ability to achieve organizational goals with minimal waste. Leaders who integrate cost-effectiveness into their decision-making enhance financial sustainability and operational efficiency. For instance, technology-driven workflow automation in businesses and educational institutions reduces administrative costs while increasing productivity. Public administrators who implement data-driven decision-making ensure that government expenditures are aligned with measurable social and economic benefits. Effective leadership, therefore, requires an economic mindset that ensures resource utilization is optimized for long-term institutional success.

The application of these economic principles, leadership transcends traditional notions of authority and guidance, evolving into a dynamic function that harmonizes resource management, fiscal discipline, and strategic planning. Leaders who approach their roles with an economic consciousness not only enhance institutional sustainability but also contribute to broader societal progress, ensuring that leadership remains an engine of economic and social development.

That was an error. I'll rewrite the section properly with in-text citations in APA 7th edition, ensuring narrative citations are prioritized and each paragraph contains no more than one cited author. I'll also ensure scholarly sources from 2017 to 2024 are referenced, aligning with your specified guidelines.

Resource Allocation and Leadership Efficiency

Effective leadership is central to the efficient allocation of financial, human, and material resources, as it ensures that institutions and organizations function optimally. Leaders must strategically distribute these resources to maximize productivity, enhance institutional sustainability, and achieve long-term objectives. According to Okonkwo (2019), effective resource allocation is essential for fostering organizational growth and innovation, as it enables institutions to respond to emerging challenges while maintaining financial stability. However, misallocation of resources, often stemming from poor planning, lack of accountability, and inefficiencies in leadership, can lead to economic stagnation, reduced productivity, and financial crises. When resources are not strategically deployed, organizations may suffer from budget overruns, operational delays, and diminished stakeholder trust, ultimately affecting institutional success.

The consequences of leadership failures in resource management are evident in both corporate and public sectors. Eze and Akpan (2021) examined the impact of mismanagement in public institutions and found that financial misallocation often leads to project abandonment, infrastructural decay, and reduced service delivery. In contrast, strategic resource allocation has been a key factor in the success of high-performing organizations. For instance, Adebayo (2020)

analyzed private-sector firms and noted that companies prioritizing efficiency in financial and human resource allocation experienced higher profitability, improved innovation, and long-term sustainability. These findings underscore the need for leaders to integrate financial prudence with strategic decision-making to avoid resource wastage and ensure optimal performance.

To enhance leadership efficiency in resource allocation, institutions must adopt evidence-based strategies that align with organizational goals. Nwachukwu (2022) emphasized that leaders who employ data-driven decision-making in resource management tend to achieve better outcomes, as they rely on analytics to optimize financial expenditures and workforce distribution. Additionally, continuous monitoring and evaluation mechanisms help identify inefficiencies and improve accountability. By embracing a strategic, data-informed approach, leaders can minimize financial risks, enhance institutional performance, and foster sustainable economic growth.

Economic Policies and Leadership Decisions

Economic policies, including taxation, budgeting, and investment strategies, require informed leadership to drive sustainable growth. Leaders must understand how fiscal policies impact national economies and business sustainability, as financial mismanagement can lead to stagnation and resource inefficiency (Acemoglu & Robinson, 2019). Effective leadership aligns economic policies with developmental goals, ensuring long-term stability and inclusivity. Historical and contemporary cases highlight leadership's role in economic stability. Nigeria's Structural Adjustment Program in the 1980s led to inflation and currency devaluation due to poor policy execution (Ekeruche, 2022).

In contrast, Rwanda's economic growth under Paul Kagame, through infrastructure investment and business-friendly policies, demonstrates the benefits of sound leadership (IMF, 2023). Similarly, taxation policies affect economic equity—progressive tax reforms can drive growth, while excessive taxation, like Ghana's E-levy, can stifle small businesses (Nnanna, 2020). Budgeting and investment strategies further shape economic outcomes. Strategic budgeting in key sectors, such as Malaysia's Vision 2020 initiative, propelled industrialization, while excessive borrowing has led to Argentina's recurring debt crises (IMF, 2023). Business leaders who embrace financial intelligence, like Elon Musk's investments in Tesla and SpaceX, drive innovation, whereas poor financial foresight, as seen in Kodak's decline, results in corporate failure (World Bank, 2021). Positively driving change must integrate economics leaders with knowledge of financial expertise into decision-making to sustain economic competitiveness.

Therefore, leaders must be equipped with financial literacy to implement taxation reforms, design effective budgeting systems, and make informed investment decisions. Sound economic policies not only enhance governance and business performance but also contribute to broader societal development. Ultimately, economic policies and leadership decisions are inseparable, as every policy choice carries financial consequences that shape economic landscapes. Therefore, leadership effectiveness should be assessed by a leader's ability to integrate economic sustainability into decision-making processes, ensuring that fiscal policies align with long-term economic growth.

Leadership Failures in Economic Management

The effectiveness of leadership is often measured by its ability to drive economic growth, ensure financial stability, and optimize resource allocation. However, when leadership fails in economic management, the consequences are far-reaching ranges from financial crises and budget deficits to institutional collapse and loss of public trust. Poor economic decision-making, corruption, and short-term political agendas have repeatedly undermined national and corporate financial health. Leadership failures in economic management manifest in inefficient policies, misallocation of resources, and lack of financial accountability, leading to economic instability. This section critically examines cases of leadership failures caused by economic mismanagement, corruption, and political interference, highlighting the need for responsible financial leadership.

Poor Economic Decision-Making by Leaders

Poor economic decision-making by leaders often results in financial crises, economic stagnation, and institutional collapse, affecting both public and private sectors. Leaders who fail to assess economic risks, misallocate resources, or implement unsustainable fiscal policies expose their organizations and nations to long-term financial instability. For instance, Venezuela's economic downturn, exacerbated by excessive reliance on oil revenues without strategic diversification, led to hyperinflation and mass poverty, illustrating the consequences of poor economic planning (World Bank, 2021). Similarly, corporate mismanagement, such as the collapse of Lehman Brothers in 2008 due to high-risk investments and weak regulatory oversight, underscores how ineffective financial leadership can trigger global economic downturns (IMF, 2023). In contrast, countries and corporations that prioritize data-driven financial decision-making, risk assessment, and economic foresight sustain long-term stability and growth. Therefore, leaders must develop strong financial literacy and strategic planning skills to prevent economic mismanagement that can have far-reaching consequences.

Corruption and Economic Leadership Deficits

Corruption remains a significant barrier to effective economic leadership, undermining public trust, diverting resources from essential services, and crippling economic development. Leaders who engage in embezzlement, bribery, and misappropriation of funds weaken institutional structures and discourage foreign investment, as seen in Nigeria's struggle with corruption scandals that have hindered infrastructure development despite significant oil revenues (Ekeruche, 2022). The impact of corruption is also evident in corporate governance, where unethical financial practices, such as fraudulent accounting in the Enron scandal, led to massive job losses and investor distrust (Acemoglu & Robinson, 2019). Conversely, countries and organizations that implement strict anti-corruption measures, transparency policies, and accountability frameworks experience higher economic growth and institutional efficiency. Leaders must therefore embrace integrity and ethical financial management as fundamental principles to foster sustainable economic progress and public confidence.

Political Leadership and Economic Challenges

Political leadership plays a crucial role in shaping economic outcomes, as government policies, regulatory frameworks, and fiscal management directly influence national development and stability. However, political leaders often face economic challenges such as inflation, unemployment, debt crises, and income inequality, which require sound economic policies to address effectively. Poor governance, policy inconsistencies, and a lack of economic foresight can exacerbate these challenges, as seen in Zimbabwe's hyperinflation crisis, where excessive money printing and weak financial regulations led to economic collapse (Mlambo, 2018). Similarly, political instability in countries like Sudan has deterred foreign investment and disrupted economic progress due to governance failures and conflict-driven uncertainty (World Bank, 2022). In Nigeria, recent political decisions have significantly impacted the economy. The removal of petrol subsidies led to a surge in transportation costs, prompting the government to invest $200 million in a compressed natural gas initiative to mitigate the crisis (Associated Press, 2024). Additionally, the proposed tax reform bill has sparked debates, with northern leaders expressing concerns that it may favor economically productive southern states, potentially deepening regional inequalities (Financial Times, 2025). In contrast, countries with strong political leadership, such as Rwanda, have demonstrated how strategic economic planning, anti-corruption measures, and policy stability can drive sustainable growth and attract foreign direct investment (Ndikumana & Boyce, 2019). Effective political leadership, therefore, requires a balance between economic literacy, governance accountability, and long-term policy planning to navigate complex economic challenges and promote national prosperity.

Rethinking Leadership through an Economic Lens

As global economies evolve, so must leadership strategies to ensure financial stability, sustainable development, and innovation-driven growth. Leaders who incorporate economic principles into their decision-making processes create long-term value, enhance institutional resilience, and drive economic transformation. The integration of financial planning, economic data analysis, and entrepreneurial thinking into leadership models has led to more effective governance and business strategies. This section explores how leaders can adopt strategic economic leadership approaches to ensure sustainability, use data-driven insights to enhance decision-making, and leverage innovation to drive economic transformation.

Strategic Economic Leadership for Sustainable Growth

Long-term economic planning is fundamental to sustainable growth, requiring leaders to adopt strategic frameworks that ensure economic resilience and progressive development. Visionary leadership focuses on setting long-term economic goals and aligning national or corporate policies toward sustainable growth, while transformational leadership emphasizes adaptability, innovation, and inclusive economic planning. A notable example is Singapore under Lee Kuan Yew, whose leadership focused on infrastructure development, human capital investment, and trade liberalization, transforming the nation into a global economic hub (Lee, 2011). Similarly, Nigeria's former President Olusegun Obasanjo implemented critical economic reforms, including debt relief negotiations and privatization of key industries, fostering macroeconomic stability and investor confidence (Moyo, 2018). However, poor long-term planning often results in economic stagnation and crises. Venezuela's overreliance on oil revenues without

diversification led to hyperinflation and economic collapse due to the absence of a strategic growth model (Acemoglu & Robinson, 2019).

Strategic economic leadership demands a balance between immediate policy interventions and sustainable development initiatives. Leaders must integrate sound fiscal policies, infrastructure investments, and human capital development to enhance economic productivity. In Nigeria, inconsistent policies and political interference in economic planning have contributed to inflation, unemployment, and weak industrialization (Ndikumana & Boyce, 2019). However, countries like Rwanda have demonstrated that effective leadership, backed by long-term planning, can drive economic prosperity. President Paul Kagame's economic vision focused on ICT development, entrepreneurship, and governance reforms, attracting foreign direct investment and positioning Rwanda as a competitive economy (World Bank, 2023). Sustainable economic leadership, therefore, requires clear policy frameworks, institutional accountability, and an innovation-driven economy that fosters long-term growth.

Leadership and Economic Decision-Making

Effective economic decision-making in leadership is closely linked to managerial leadership styles, such as transformational, transactional, and strategic leadership, each influencing economic policies in distinct ways. Transformational leaders drive economic innovation by fostering a culture of adaptability and long-term vision, often advocating for progressive fiscal policies and structural reforms that enhance economic resilience. Transactional leaders, on the other hand, focus on regulatory compliance, budgetary discipline, and short-term financial performance, ensuring that economic policies align with existing institutional frameworks. Strategic leaders integrate market analytics, risk assessment, and policy foresight to shape macroeconomic strategies that balance stability with growth.

Economic data plays a crucial role in leadership and managerial decision-making, providing empirical insights that guide policy-making, market regulation, and financial planning. Leaders who rely on key economic indicators such as GDP growth, inflation rates, employment statistics, and foreign exchange reserves are better positioned to enhance financial stability and economic efficiency. For instance, China’s use of big data analytics in economic forecasting has allowed its government to adjust fiscal policies and monetary strategies proactively, ensuring sustained economic expansion (World Bank, 2023). Conversely, the absence of reliable economic data has led to policy inconsistencies in many developing nations. Nigeria’s Central Bank has faced criticism for policy reversals and inflation mismanagement, partly due to outdated economic models and inadequate real-time data analysis (Nigeria National Information Technology Development Agency, 2022). This underscores the need for leaders to integrate digital tools, artificial intelligence, and blockchain technology to enhance economic decision-making and managerial efficiency.

Data-driven leadership and managerial efficiency improve transparency, optimize resource allocation, and minimize economic risks. The adoption of financial forecasting and market analytics helps leaders anticipate economic shifts and implement timely interventions, ensuring institutional resilience. In corporate leadership, firms like Amazon and Tesla have leveraged data analytics to optimize supply chains, pricing models, and consumer behavior predictions, leading to market dominance and financial efficiency (Moyo, 2018). In Nigeria, the digital economy expansion has provided opportunities for economic transformation through

fintech innovations, improving financial inclusion and economic diversification (Nigeria National Information Technology Development Agency, 2022).

To enhance managerial effectiveness in economic decision-making, leaders must prioritize economic intelligence by investing in data infrastructure, strengthening institutional research capabilities, and fostering collaboration between government agencies, private sector stakeholders, and technology firms. Economic decision-making should align with principles of organizational control, financial accountability, and long-term sustainability, ensuring that leadership strategies contribute to institutional stability, economic resilience, and national development.

Leadership Innovation for Economic Transformation

Innovation-driven leadership fosters economic transformation by integrating entrepreneurship, technology, and strategic policy reforms to create sustainable growth. Leaders who embrace innovation create environments that encourage industrial diversification, technological progress, and economic inclusivity. Rwanda's transformation into a tech-driven economy under President Paul Kagame is a testament to how strategic innovation fosters economic expansion. His administration invested in ICT infrastructure, startup incubation, and digital governance, attracting foreign investors and positioning Rwanda as a hub for African innovation (Ndikumana & Boyce, 2019). Similarly, the UAE's leadership in transforming its economy from an oil-dependent state to a knowledge-based economy showcases how strategic investments in research, technology, and entrepreneurship drive national growth (Acemoglu & Robinson, 2019). These examples highlight the importance of leadership in fostering an environment that supports technological advancements and business development.

For economic transformation to be sustainable, leaders must implement policies that promote research funding, technological education, and regulatory frameworks that encourage entrepreneurship. Ananyi and Ololube (2023) posited that leadership considers the big picture and how everything works together. While ethical leadership inspires workers to do the right thing, flexible management practices promote innovation and data-driven economy. Nigeria's ongoing push for digital economy expansion through the National Digital Economy Policy and Strategy demonstrates the government's commitment to innovation-led growth (Nigeria National Information Technology Development Agency, 2022). However, challenges such as bureaucratic bottlenecks, inadequate infrastructure, and regulatory uncertainty hinder progress. Countries that have successfully driven economic transformation through innovation, such as South Korea and Germany, have established strong institutional frameworks that support startups, intellectual property rights, and industrial competitiveness (World Bank, 2023). Nigerian leadership can learn from these models by enhancing policy consistency, investing in research-driven entrepreneurship, and fostering partnerships between government and private-sector innovators to accelerate economic growth.

Strengthening Economic Literacy among Leaders

Economic literacy is crucial for leaders across all sectors, as it provides the foundational knowledge needed to make informed financial decisions, allocate resources efficiently, and formulate policies that drive economic growth. Leaders with limited economic understanding often implement policies that lead to inflation, excessive borrowing, or inefficient public

spending, undermining national and institutional stability. For instance, Nigeria's persistent foreign exchange instability and rising inflation have been linked to inconsistent fiscal policies and weak economic planning, demonstrating the consequences of poor economic literacy among policymakers (World Bank, 2023). Similarly, corporate executives who fail to grasp financial management principles may engage in unsustainable business practices, leading to financial mismanagement and eventual corporate collapse. Given these realities, economic literacy should be an integral part of leadership development across governance, business, and education to ensure that decision-makers can navigate economic challenges effectively. To enhance economic literacy among leaders, structured leadership development programs should incorporate financial management, policy analysis, and economic sustainability training.

Countries with significant economies, such as Germany and Singapore, emphasize financial education in government institutions and corporate training programs, ensuring leaders are equipped with the necessary skills to manage economic complexities (Moyo, 2018). In Nigeria, leadership academies, public sector training programs, and executive education initiatives should integrate financial planning and macroeconomic policy training to improve decision-making at all levels. Additionally, leveraging digital tools such as financial simulations, data-driven forecasting models, and AI-driven economic advisory platforms can provide real-time insights for leaders, enhancing their ability to implement sound economic strategies. Strengthening economic literacy among leaders is essential for fostering sustainable economic growth, improving public financial management, and enhancing institutional resilience in the face of economic uncertainty.

The CHARTER Policy Framework for Economic Leadership Excellence

The CHARTER Policy Framework represents a structured approach to economic leadership, emphasizing corporate governance, human capital development, anti-corruption mechanisms, regulatory oversight, trade and investment policies, economic sustainability, and resource mobilization through public-private partnerships. These policy measures are designed to address financial accountability, policy-driven economic management, and sustainable economic leadership. However, while Nigeria has made strides in implementing elements of these policies, significant gaps remain in enforcement, consistency, and adaptation to global economic trends. Comparative analysis with countries such as Singapore, Germany, and South Africa reveals areas where Nigeria's policy frameworks require strengthening. For instance, while Nigeria has implemented corporate governance codes through the *Financial Reporting Council (FRC)*, challenges such as weak enforcement and regulatory capture hinder their effectiveness. Countries like Singapore have successfully institutionalized economic leadership through robust corporate governance mechanisms, stringent anti-corruption policies, and well-integrated human capital development strategies. Thus, a critical review of each *CHARTER* component is necessary to evaluate its effectiveness, highlight implementation gaps, and propose strategies for improving economic leadership excellence.

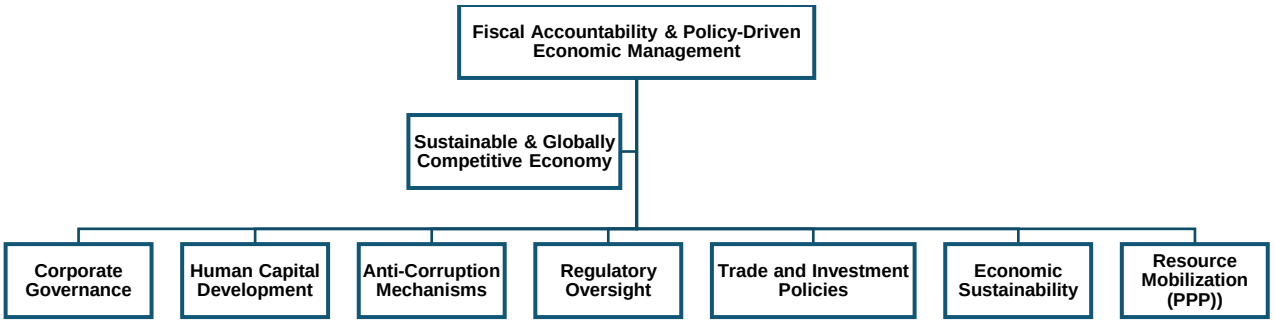

Figure 2: The CHARTER Policy Framework for Economic Leadership Excellence

The CHARTER Policy Framework for Economic Leadership Excellence is a structured model designed to illustrate the interconnectivity between fundamental economic leadership principles and sustainable economic governance. Foundation of this framework posits corporate governance, human capital development, anti-corruption mechanisms, regulatory oversight, trade and investment policies, economic sustainability, and resource mobilization through public-private partnerships (PPP) serve as the key policy components for shaping financial accountability and policy-driven economic management. These elements collectively channel into the central policy focus, where financial prudence, institutional transparency, and data-informed governance decisions converge to foster national and organizational stability. The structured pathway of this framework highlights how strategic policy implementation, coupled with sound leadership, translates into a sustainable and globally competitive economy a pertinent outcome reflecting economic resilience, efficiency, and inclusive growth. Emphasizing on enforcement consistency, regulatory independence, and adaptive economic strategies, this model establishes a pragmatic blueprint for strengthening governance structures and reinforcing economic leadership in line with international best practices. Through a logical progression of interconnected policy measures, the CHARTER framework provides an actionable, results-oriented approach to economic transformation, ensuring both institutional effectiveness and national economic prosperity.

Corporate Governance and Financial Integrity

Corporate governance is fundamental to economic leadership, ensuring financial integrity, transparency, and accountability in both public and private sectors. Nigeria has implemented corporate governance reforms, particularly with the *Financial Reporting Council of Nigeria (FRC)* strengthening regulatory oversight. However, enforcement remains a critical gap, as many firms, particularly state-owned enterprises, do not fully comply with financial disclosure requirements. In contrast, Germany has demonstrated exemplary corporate governance through the *Deutscher Corporate Governance Kodex (DCGK),* which mandates transparent reporting and executive accountability. Nigeria's governance framework still suffers from regulatory arbitrage, weak sanctions for financial mismanagement, and a lack of independence among oversight bodies (World Bank, 2024). Strengthening corporate governance in Nigeria requires stricter enforcement mechanisms, real-time financial auditing technologies, and policies that ensure leadership accountability.

Human Capital Development and Financial Literacy

A well-structured human capital development strategy is a cornerstone of economic leadership. Nigeria has initiated financial literacy campaigns and skill development programs, but gaps remain in their accessibility and implementation. While policies such as the *National Financial Inclusion Strategy (NFIS)* aim to increase financial literacy, they have yet to reach grassroots levels effectively. In contrast, Finland integrates financial education into its national curriculum, ensuring economic literacy from an early age. The gap in Nigeria's approach lies in its limited institutional capacity to scale financial literacy programs beyond urban centers (Reuters, 2024). Effective leadership must prioritize human capital development through structured economic education, leadership training, and targeted financial literacy programs that integrate digital tools and inclusive economic policies.

Anti-Corruption and Transparency Policies

Corruption remains one of the most significant barriers to economic leadership excellence in Nigeria. While initiatives such as the *Public Procurement Act (2007)* and the *Nigerian Financial Intelligence Unit (NFIU)* have been established to combat financial mismanagement, enforcement remains weak. According to World Bank (2024), reported Transparency International's 2023 Corruption Perceptions Index ranked Nigeria 150th out of 180 countries, reflecting the country's struggle to curb corruption. In contrast, Singapore has successfully eradicated systemic corruption through stringent anti-corruption laws, an independent judiciary, and zero-tolerance policies (World Bank, 2024). To bridge Nigeria's gap, leadership must enforce stricter anti-corruption measures, including digitalizing procurement processes, strengthening asset declaration mechanisms, and ensuring political will to prosecute financial misconduct.

Regulatory Oversight and Compliance Mechanisms

Regulatory oversight ensures adherence to economic policies, yet Nigeria's regulatory institutions, such as the *Central Bank of Nigeria (CBN)* and the *Securities and Exchange Commission (SEC),* often face operational inefficiencies and political interference. South Africa's *Financial Sector Conduct Authority (FSCA)* provides a stronger regulatory framework by maintaining independence and employing proactive financial supervision strategies (World Bank, 2024). Nigeria's challenge lies in its fragmented regulatory framework, where overlapping mandates between agencies create inconsistencies in enforcement. To strengthen economic leadership, regulatory bodies must enhance institutional autonomy, integrate digital compliance systems, and adopt a risk-based supervisory model that aligns with international best practices.

Trade, Investment, and Monetary Policy

Nigeria's trade and investment policies are critical to economic leadership, yet inconsistencies in foreign exchange management, high import dependency, and fluctuating monetary policies create economic instability. The Foreign Exchange (Monitoring and Miscellaneous Provisions) Act aims to regulate capital flows, yet Nigeria's forex market remains volatile, deterring *foreign direct investment (FDI).* In contrast, China's monetary policy framework emphasizes exchange

rate stability and investment-friendly fiscal policies, attracting global investors. To strengthen Nigeria's economic leadership, policy consistency, inflation-targeting frameworks, and strategic investment incentives must be prioritized. A well-coordinated trade and investment policy, supported by stable monetary regulations, can position Nigeria as a competitive global economic player.

Economic Sustainability and Leadership Planning

Long-term economic sustainability requires structured leadership planning, yet Nigeria's economic policies often focus on short-term fiscal adjustments rather than long-term development strategies. *The Economic Recovery and Growth Plan (ERGP) (2017–2020)* sought to address economic diversification, yet its implementation was hampered by poor policy continuity and inconsistent government priorities. Countries such as Germany and Canada have successfully embedded sustainability principles into economic governance through multi-decade strategic plans. Nigeria must institutionalize long-term economic planning by ensuring policy continuity across administrations, integrating environmental sustainability into leadership strategies, and prioritizing local value addition in industrialization policies.

Resource Mobilization through Public-Private Partnerships (PPPs)

Public-Private Partnerships (PPPs) offer a sustainable model for economic leadership, yet Nigeria's implementation faces structural and operational bottlenecks. *The Infrastructure Concession Regulatory Commission (ICRC)* oversees PPP projects, but bureaucratic inefficiencies and financial risks deter private-sector participation. *The United Kingdom's Private Finance Initiative (PFI)* has successfully leveraged PPPs for infrastructure development, ensuring transparent contractual agreements and risk-sharing models. Nigeria must refine its PPP frameworks by fostering investment-friendly environments, ensuring contract transparency, and aligning projects with national economic priorities to attract sustainable private-sector engagement.

The CHARTER Policy Framework provides a comprehensive blueprint for economic leadership excellence, yet its implementation in Nigeria remains constrained by weak enforcement, regulatory inefficiencies, and inconsistencies in long-term economic planning. While policies exist in various forms, gaps in governance, transparency, and human capital development must be addressed to ensure sustainable economic growth. Comparative analysis with countries such as Singapore, Germany, China, and South Africa highlights critical areas where Nigeria can strengthen its policy frameworks. Adopting stricter corporate governance measures, enhancing human capital investment, ensuring regulatory independence, and reinforcing anti-corruption mechanisms, Nigeria can position itself as a leader in economic governance. A well-executed CHARTER framework will not only enhance financial accountability but also foster a resilient, sustainable, and globally competitive economy.

Future Directions

Future directions for economic leadership should prioritize adaptive policy frameworks, digital transformation, and sustainable economic planning to address the complexities of a rapidly evolving global economy. Leaders must embrace data-driven decision-making, integrating

economic forecasting, artificial intelligence, and big data analytics to enhance financial governance and strategic planning. In Nigeria, strengthening institutional capacity through continuous leadership training, regulatory reforms, and robust public-private partnerships can foster economic resilience and inclusive growth. Additionally, fostering a culture of transparency and accountability in governance and corporate leadership will be essential in mitigating financial mismanagement and corruption, which have historically impeded economic progress. Internationally, countries such as Singapore and Germany provide valuable models of economic leadership driven by long-term policy consistency, financial discipline, and investment in human capital, underscoring the need for Nigerian policymakers to adopt similar strategies tailored to local economic realities. Emphasizing sustainable development, leaders should integrate climate-conscious economic policies, innovative financing mechanisms, and entrepreneurship-driven economic models to ensure long-term prosperity. Furthermore, leveraging digital finance, blockchain technology, and fintech innovations can enhance economic inclusivity, streamline financial transactions, and promote broader access to capital for businesses and individuals. Moving forward, economic leadership must be anchored in continuous learning, evidence-based policy reforms, and global economic integration to foster national stability, institutional efficiency, and sustained economic development.

CONCLUSION

The intersection of economics and leadership is fundamental to fostering sustainable development, financial stability, and institutional resilience. Effective leadership demands economic literacy, enabling policymakers and corporate executives to implement informed strategies that drive national growth, optimize resource distribution, and mitigate financial risks. Conversely, a lack of economic expertise can result in mismanagement, stagnation, and socioeconomic disparities. Lessons drawn from global case studies, such as Nigeria's structural adjustment challenges and Rwanda's economic resurgence, underscore the pivotal role of leadership in shaping economic outcomes. Future economic leadership must prioritize strategic investments, sound fiscal policies, and governance reforms to navigate evolving financial landscapes. In conclusion, embedding economic education in leadership training, strengthening regulatory oversight, and leveraging innovative economic frameworks will drive inclusive growth and long-term prosperity in an increasingly interconnected global economy.

REQUISITE FUND MANAGEMENT KNOWLEDGE OF PRINCIPALS FOR EFFECTIVE ADMINISTRATION OF SECONDARY SCHOOLS IN NIGERIA

Ann C. SALVATION
Department of Educational Management
Economics of Education and Policy Leadership
Ignatius Ajuru University of Education

ABSTRACT

Effective administration of secondary schools in Nigeria is critically dependent on the prudent management of financial resources. This paper examines the role of administrators' fund management knowledge in enhancing the efficiency and effectiveness of school administration in secondary schools in Nigeria. It explores how principals and other school leaders utilize budgeting, internal revenue generation, financial recordkeeping, and auditing to meet educational goals amidst limited resources. Drawing on both qualitative and quantitative data from both secondary and tertiary institutions across various Nigerian states, the paper highlights significant gaps in financial literacy and accountability among school administrators. The paper concludes that school administrators must be well-equipped with financial management skills to maximize the utility of available funds even as secondary schools in Nigeria grapple with challenges imposed by limited funding, and such financial management skills could be acquired through regular training, policy support, and institutional frameworks. The paper went on to suggest among others that the Ministry of Education through the Schools Board should mandate compulsory pre-service and in-service training on financial and budgetary management for all current and aspiring school administrators, to equip them with the skills needed for efficient planning, utilization, and reporting of school funds.

Keywords: School Administrators, Knowledge, Fund Management, Auditing, Budgeting, Fund Acquisition, Administrative Effectiveness.

INTRODUCTION

Funds or financial resources are the livewire of the educational system, without which other educational resources can either not be acquired or may begin to malfunction to the detriment of school goals and objectives. From literature and by experience, the effectiveness of secondary school administrators is strongly correlated with their fund management competencies. It however plays out that competency or skill is a function of knowledge, and the level of performance of public secondary school administrators in Nigeria in the management of funds does not show that they are really knowledgeable about fund management. This is evidenced by

the worrisome level of fund inadequacy and of misappropriation of available funds in these schools (Ololube, 2016), which have widely led to the underperformance of this level of education in Nigeria as can be visibly attested to by the poor state of educational resources and of abysmal students' performance in both internal and external exams, which come as effects of fund inadequacy and misappropriation in school systems.

When it comes to managing funds in organizations, attention is often paid to fund acquisition, and appropriate utilization. Moreover, the sustenance of both variables in the school system is dependent on the administrator's expert knowledge of and competence in fund management. This paper is of the view that school administrators in public secondary schools need such financial management knowledge as (1) knowledge of internal revenue generation, (2) knowledge of budgeting, (3) knowledge of managing the cash at hand to avoid wastages or inappropriate spending, (4) knowledge of inventory management, (5) knowledge of financial savings/financial reserves, and (6) knowledge of auditing, among such other related knowledge areas that are acknowledged in finance literatures.

Principals' possession of the highlighted knowledge is important to address the two major dimensions of financial resources challenges identified in literature, vis-à-vis the inadequacy of funds for school administration and the mismanagement of funds by school administrators (Nwogu & Moses, 2020). While the problem of inadequacy comes basically from the poor budgetary allocation of the government to the educational sector, which has always been a far cry from the 26% prescription of UNESCO for developing countries of the world (Adio & Chapi, 2020), the problem of financial mismanagement often emanates from diverse directions ranging from poor budgeting practices and lack of planning for how generated funds would be utilized, siphoning of school funds by school staff, frivolous expenditure, poor accountability structure, among others (Famurewa, 2014).

Within the scope of this paper, administrator's knowledge of fund management in the areas of budgeting, fund acquisition, financial records management, and financial auditing is examined in the light of how it could bring about effective administration of secondary schools in Nigeria. In previous studies, Osuji and Nyebuchi (2021) had found that school administrators' revenue generation and auditing skills enhanced effective administration of public secondary schools in Port Harcourt Metropolis of Rivers State. Ikediugwu and Ukeji (2020) in their study had also earlier on found that administrators of private secondary schools employed more fund management strategies in the areas of their financial budgeting strategies, fund allocation strategies, and auditing strategies than administrators of public secondary schools. However, despite the findings of these existing studies, principals of secondary schools still continue to struggle with effectively managing finances in their schools to the detriment of administrative effectiveness. As such this paper explores the identified fund management knowledge areas and more, with the view of finding out how the possession of such knowledge by school administrators may bring about effective administration of secondary schools in Nigeria.

CONCEPTUAL REVIEW

Administrative Effectiveness of Secondary Schools

The success of any organization depends on effective administration. Administration has been defined as the careful and systematic arrangement and use of resources (human and material), situations and opportunities for the achievement of the specific objectives of a given organisation

(Nwagwu cited in Momoh & Obiweluozor, 2015). Administrators are implementers of policies and decisions through coordinated activities and so must have the capability of planning, organizing and controlling available resources to achieve results (Peretomode, 2011). They are responsible for the achievement of results through the specialized efforts of other people whether individually or collectively in an organization.

Effectiveness means to bring about or to accomplish; thus before an action, or an institution or an individual is regarded as effective, there must be an accomplishment. An organization therefore may be termed effective if it accomplishes specific goals. Consequently, administrative effectiveness is the positive response of the school administration to the accomplishment of stated goals of the school system through actions. These include administrative performance in decision making, delegation of duties and setting of examples, provision and effective utilization of resources, vision and goal setting, innovation, support for teachers and students, stakeholder engagement, among other hallmarks of an effective organization. Supporting this definition is McCrimmon (2017)'s findings that effective administration entails efficiency, getting things done with least cost.

Administrative effectiveness in organizations follow some principles; not just about getting results, the "how" is also critical as it entails efficiency which means reaching a destination with minimal cost. An effective administrator is an asset to an organization or institution providing the link between organizations' various parts and ensures the smooth communication and transmission of information from one part to the other. Jenkins (2010) posited that the work of school administrators is complex and demanding; they should know and understand their schools and communities, exert leadership to achieve positive educational outcomes and continue to develop and grow in their professional expertise.

An effective school administrator must have knowledge of how students learn and the leadership and management actions necessary to support students' learning. According to Momoh and Obiweluozor (2015, p.126), the following are the criteria for determining administrative effectiveness:

- Purposeful leadership of the staff by the head
- Involvement of the heads of departments
- Structured lesson
- Intellectually challenging teaching
- Maximum communication between teachers and pupils
- Efficient and accurate record keeping
- Parental and community involvement
- Positive school climate
- Productive division of labour among teachers

The principal has been recognized as the educational leader of his school and the school community, and thus the head of the school management who is responsible for supervision of instruction as well as for the execution of administrative functions (Ijaiya, 2014). It is the responsibility of the principals to implement policies of government on education in accordance with set standards. Accordingly, he possesses leadership skills with clear vision of what must be accomplished. These skills come from the principals' knowledge of the school and what is needed to be done to improve education for all students. As an administrator, the principal has a unique opportunity to lead several groups including communities. Therefore, he must provide

leadership in developing liaisons with community members as school volunteers and in maintaining students' discipline.

Adegun cited in Momoh and Obiweluozor (2015) observed that administrative ineffectiveness of principals is a factor inhibiting attainment of secondary school goals. Supporting this observation is Timilehin (2010) who opined that school administrators must motivate staff to use their creativity and initiative as necessary inputs, towards the accomplishment of school goals. In this light, effective school principals are liked and respected, rather than feared. They communicate, care for students and are willing to impose punishment if necessary. Being effective as an administrator is moreover dependent on the level of knowledge possessed by the principal on several fronts, one of which is fund management knowledge because financial resource is a critical pillar of the school system.

Fund Management

Fund management, otherwise referred to as financial management has been conceptualized from different perspectives by different authors. Espinoza (2018) described it as the process of ensuring that school leaders plan, organize, delegate and control the funds of the school to achieve its goals. Pandit cited in Bua and Adzongo (2014) conceptualized it as that management activity which is concerned with the planning and controlling of an organization's financial resources". This means that financial management is concerned with decisions on how to produce, raise money, expand and give accounts of funds provided for the implementation of programmes of an organization or a school. In the opinion of Ajaegbo cited in Espinosa (2018), fund management in the school system is a key factor in knowing how the school is effectively managed or if it is able to realize its objectives. This highlights why it is critically important for principals to be grounded in knowledge about the management of funds. More so, financial resources or funds are rightly acknowledged to be the livewire of any level of system of education (Usman, 2016). As such, the principal's knowledge of managing this critical resource in the school system can simply not be overemphasized.

Ogbonnaya (2015) asserted that the main purpose of fund management, be it in government, business or school, is the raising of funds and ensuring that the funds realized are utilized in the most effective and efficient manner. He explained further that resources are scarce and that all efforts should be made by educational administrators and planners to ensure optimal utilization of funds.

Financial management is the fundamental element on which the success of any organization depends. Where the management is weak, success is hard to ascertain. No institution or school has ever succeeded in history without proper utilization of its resources. Poor management of finances results in financial misappropriation, embezzlement, diversion of finance for different projects and so on.

Mgbodile cited in Bua and Adzongo (2014) summarized some factors that leads to mismanagement of school funds to include the following: delay in release of funds to schools, mismanagement of funds, diversion of funds to other sectors of the economy, lack of training or inadequate training of heads of educational institutions in issues of finance, financial clerks negligence in school finance matters, outright appointments by politicians of unqualified personnel to head schools; attitudes of form teachers in remitting fees collected to principals and due to delay or non-payment of their salaries.

School finances are used for the day-to-day running of the organization. It is of paramount importance to note that every school manager or head teacher needs to plan the school budget either termly or annually to achieve optimal school objectives and for the effective management of finance. It is solely the responsibility of the school administrator to see to it that the necessary funds regularly solicited for, meet the demands of their schools. The availability of such funds will help handle school projects which will go a long way to enhance better learning and teaching. However, Tims cited in Bua and Adzongo (2014) observed that some head teachers (Principals) or school managers are found to be inefficient in the way and manner they manage the finances in their schools. This may not be mismanagement or embezzlement but because of ignorance of simple techniques of budgeting and management.

Fund Management Practices for Effective School Administration

Barasa (2019) recognized that efficient management of financial resources is an important task for school principals. As leaders, principals are often confronted with the tasks of ensuring that financial resources are made available to run the different departments of the school (Cole and Kelly, 2011). This is made possible by the possession of certain competencies and understanding relating to the management of funds. This paper examines four major fund management practices, which include budgeting, fund generation, financial record management, and financial auditing. Each of these areas is examined in the light of the ongoing discourse.

Budgeting Practice

Budgeting is the process of preparing a budget. Nwaeke (2019, p.250) described a budget as a financial plan for a definite period which is based upon careful estimates both of the expenditure needs and the probable income of an institution. Budgeting is a crucial financial planning tool that guides the allocation of scarce resources to meet organizational goals. In the context of Nigerian school systems, budgeting ensures that educational institutions plan effectively for the delivery of quality education. It outlines projected revenues and expenditures within a specific period, typically an academic or fiscal year.

Budgeting in school systems refers to the process of planning, allocating, and managing financial resources to support educational programs, infrastructure, personnel, and student services. It involves key stages: planning, formulation, approval, execution, and evaluation (Ololube, 2016). In Nigeria, the budgeting process is guided by national policies and state education boards, with school administrators often having limited autonomy.

The education budget is part of the national or state government budget and is typically categorized into recurrent (salaries, utilities, operational costs) and capital expenditures (construction, renovation, procurement of teaching aids). The Universal Basic Education Commission (UBEC) and Tertiary Education Trust Fund (TETFund) are major funding agencies influencing school budgeting across primary, secondary, and tertiary institutions (Ejiogu, 2019).

Effective budgeting is a critical tool for school leadership and management. It provides a financial framework for achieving school goals, supports transparency and accountability, and facilitates stakeholder participation in decision-making (Adepoju & Fabiyi, 2017). Budgeting also promotes equity by ensuring that limited resources are distributed according to needs and priorities.

Moreover, budgeting serves as a strategic tool for performance evaluation. It allows administrators to assess whether resources have been utilized efficiently and effectively. According to Okendu (2012), schools that implement participatory budgeting models often perform better in terms of infrastructure development, teacher motivation, and student outcomes.

Despite its importance, budgeting in Nigerian schools faces significant challenges. One major issue is inadequate funding. The UNESCO benchmark recommends that countries allocate at least 15–20% of public expenditure to education; however, Nigeria consistently falls below this threshold (World Bank, 2021). This results in dilapidated infrastructure, poor remuneration for teachers, and limited access to teaching materials.

Another challenge is poor budget implementation. Budgets are often not fully released or are delayed, affecting the timely execution of school projects. Corruption and mismanagement further exacerbate the situation. According to Uzochukwu (2020), funds intended for school development are sometimes diverted for non-educational purposes, weakening trust in the system.

Lack of capacity among school administrators in financial planning and management is also a concern. Many school heads are trained in pedagogy but lack budgeting skills. This limits their ability to formulate realistic budgets, monitor expenditures, or engage stakeholders effectively (Ololube, 2016).

Political interference also hinders effective budgeting. Education budgets at state and federal levels are often influenced by political considerations rather than actual educational needs. As a result, resources may be disproportionately allocated, leaving some regions or schools underfunded (Ejiogu, 2019).

To improve budgeting practices in Nigerian school systems, literature suggest several reforms, including increasing funding for education, building administrative capacity, promoting participatory budgeting, strengthening oversight and accountability, and leveraging technology (Ejiogu, 2022; Okoro & Uche, 2020).

Fund Generation Practice

Fund generation generally refers to the process of raising and managing financial resources to support the activities, programs, and initiatives of the school. The Nigerian education system has persistently faced challenges related to underfunding, which adversely affects infrastructure, teacher motivation, learning outcomes, and access to quality education. Traditionally, funding for schools, particularly public ones, has been primarily the responsibility of government through budgetary allocations. However, given the dwindling economic resources and increasing demands on public funds, reliance on government alone has proven insufficient. As such, the need for sustainable fund generation strategies within public secondary schools systems has become critical.

The National Policy on Education (NPE) emphasizes that education is an instrument for national development. To achieve this goal, adequate financial resources are essential. Unfortunately, many schools in Nigeria suffer from chronic financial deficits. According to the Universal Basic Education Commission (UBEC, 2020), over 60% of public schools lack adequate infrastructure due to funding constraints. Consequently, internal fund generation serves as a practical response to augment budgetary shortfalls, promote institutional self-reliance, and improve service delivery.

Fund generation within public secondary schools aligns with the global trend of diversifying educational financing. The World Bank (2019) advocates for innovative financing mechanisms to bridge funding gaps in developing countries' education sectors. Therefore, fund generation efforts such as income-generating projects, alumni contributions, public-private partnerships, and community involvement (Adepoju & Fabiyi, 2017; Akomolafe & Aremu, 2016; Ibara, 2016; Onyeche, 2018; Pillah & Gokum, 2024) are increasingly becoming essential in Nigeria.

Financial Record Management Practice

Financial record management refers to the systematic process of recording, storing, retrieving, and analyzing financial transactions to ensure transparency, accountability, and informed decision-making (Okoli & Iwuchukwu, 2020). It encompasses budgeting, expenditure tracking, income documentation, and audit compliance. In school systems, financial records include payment vouchers, receipts, invoices, payrolls, and account books, which must be meticulously maintained and periodically reviewed.

In Nigeria, school administrators ranges from principals at the secondary level to bursars and finance officers at the tertiary level are responsible for maintaining accurate financial records. Unfortunately, many educational institutions, particularly public schools, lack the capacity or systems to uphold proper financial management standards (Ogunode, 2021). The result is often financial misappropriation, misallocation of resources, and erosion of stakeholder trust.

Management of financial records in the school system is crucial for several reasons. One of such reasons is that is promotes accountability and transparency. Financial record management ensures that funds are used for their intended purposes. Transparent financial documentation builds confidence among stakeholders, including parents, government agencies, and donors (Adeniyi & Taiwo, 2022). It allows for the auditing of financial activities and helps prevent embezzlement and corruption, which are common issues in the Nigerian education sector.

Secondly, financial records are used to support decision-making. Accurate financial records provide critical data for planning and budgeting. School heads and administrators rely on these records to assess financial health, determine priority areas, and make evidence-based decisions (Oluremi & Olatunji, 2019). For example, knowing the expenditure pattern helps identify wasteful spending and areas that require cost-saving measures.

Thirdly, managing financial records in schools complies with legal and policy frameworks. Nigerian public schools are subject to financial regulations set by the Federal and State Ministries of Education and the Office of the Auditor General. Proper record keeping ensures compliance with these laws and reduces the risk of penalties or sanctions (Nwachukwu & Adebayo, 2020). Institutions that maintain clean financial records are also more likely to attract funding from donors and development partners.

The fourth reason for managing financial records in schools is for institutional sustainability. Schools that manage their finances effectively are better positioned to plan for the future and expand their services. Financial records provide a historical perspective that can be used for forecasting, applying for grants, and justifying increased government subventions (Ogunode, 2021). This is especially critical in a country where schools often operate under severe financial constraints.

Financial record management is a cornerstone of effective school administration. In the Nigerian context, where education financing is a persistent challenge, maintaining accurate and

transparent financial records can make the difference between institutional progress and stagnation. By investing in training, technology, and oversight, Nigerian schools can improve their financial management practices and build a more accountable and sustainable education system.

Financial Auditing Practice

Financial auditing refers to the independent examination of financial records, statements, and procedures of an organization to ascertain their accuracy, compliance with financial regulations, and transparency (Ogunode, 2021). In school systems, financial audits evaluate how funds are allocated, managed, and accounted for. Auditing goes beyond just checking books; it includes evaluating the adequacy of internal controls and recommending improvements to financial practices (Akinyemi & Odetunde, 2020).

Financial auditing has emerged as a crucial tool for ensuring transparency and institutional integrity especially in the Nigerian context, where schools frequently struggle with inadequate funding, mismanagement, and corruption. Financial auditing, when properly implemented, promotes prudent resource management, strengthens stakeholder trust, and enhances the overall credibility of the school system. This paper argues that institutionalizing robust financial auditing practices in Nigerian school systems is necessary for improving financial governance, minimizing corruption, and achieving sustainable educational development.

In Nigerian schools, especially public institutions, financial audits are typically conducted by internal audit units, external auditors from ministries of education or finance, or independent bodies appointed by oversight agencies. However, the frequency and rigor of these audits vary significantly, and in many instances, audits are either delayed or not conducted at all (Adeyemi & Olaleye, 2019).

Auditing serves several useful purposes in the school system. One of such purposes is enhancing accountability and transparency. Financial auditing fosters a culture of accountability by ensuring that school administrators and bursars provide a clear and accurate account of funds received and spent. Transparent auditing reduces the risk of embezzlement and misuse of funds, which are prevalent issues in many Nigerian public schools (Ejiogu, 2022).

Secondly, financial auditing improves resource allocation. Regular audits provide insights into financial inefficiencies and misallocations. These insights can guide future budgeting and expenditure decisions, ensuring that resources are directed toward high-priority needs like infrastructure, teacher welfare, and learning materials (Okoro & Uche, 2020).

Thirdly, financial auditing builds stakeholder confidence. When audits are conducted transparently and results are shared, stakeholders such as parents, teachers, donors, and government agencies gain confidence in the management of the school. This trust is essential for attracting additional funding and community support (Ogunode, 2021).

Also, carrying financial auditing in public secondary schools ensures legal and policy compliance. Nigerian schools are required to comply with financial regulations as set out in public service rules and financial guidelines issued by the government. Auditing ensures compliance with these rules, preventing legal liabilities and sanctions (Adeyemi & Olaleye, 2019).

Principals' Knowledge of Budgeting for Effective Administration of Public Senior Secondary Schools

Knowledge of budgeting and budgetary control is of paramount importance to school administrators who intend to be effective in their administrative roles in public secondary schools in Rivers State. Lucey cited in Kpedor (2012) defined a budget as a qualitative statement which is prepared to include planned revenue, expenses, assets, liabilities and cash-flows over a specific period of time. According to the study, a budget serves several purposes in the sense that it provides a focus for the organization; helps the coordination of activities and facilitates control of the firm.

Budgeting knowledge is required by principals in the areas of:

- Budget preparation: This entails understanding how to create an annual budget that is aligned with school goals and improvement plans (Titus & Ukaigwe, 2018).
- Forecasting and planning: Knowledge of forecasting and planning entails predicting future financial needs and resources of the school. This could be understood by paying adequate attention to past and present financial data of the school.
- Resource allocation knowledge: This is the knowledge of how to strategically distribute funds to various departments and various projects of the school (Nwaeke, 2019).

Kpedor (2012) identified some common types of budgets, and they include: (1) Cash Budget, which is a detailed estimate of expected cash receipts and payments for a future accounting period; (2) The Master Budget, which is a detailed set of budgets involving all phases of a firm's operations for a given period of time; (3) The Operation budget which details how operations will be carried out in order for the organization to produce goods and services; (4) The financial budget, which shows the various sources from which an organization expects to receive funds during the budget period; and (5) The sales budget, which shows the quantities of each goods and/or services that the organization expects to sale and the projected selling price. The study further documents that, most people do not participate in budget building or review, a situation which is not healthy for a very realistic budget and that, in rare cases do the project managers receive monthly performance report, and most of the deviation in the performance in respect of meal cost and the number of employees for a project are misplaced in the budget.

Financial budgeting strategy in administrators' fund management in the view of Agbe et al. cited in Ikediugwu and Ukeji (2020) implies systematic approach of financial planning for an organization's income to be generated and/or expenditure to be incurred during the period and the capital to be employed to attain a given objective. Financial budgeting is also the formulation of plans using budget, both long and short range for future activity (Ikediugwu & Ukeji, 2020). Budgeting prevents wasteful spending of funds provided for various educational programmes. This is because its implementers are tied to or expected to follow the approved estimates in expending funds.

Budgeting is a necessary tool in the financial management of all organizations, educational institutions inclusive. Ebong cited in Titus and Ukaigwe (2018) underscoring the importance of budgeting in schools posited that a management strategy such as school budget helps to highlight many problems long before they occur to prevent wastage of resources. Furthermore, it facilitates the process of delegation, control, evaluation and accountability by

relating resource application to planned programmes. That is the major concern of administering the budget is to make sure that the result achieved by the school carefully justifies the financial outlay.

Moses (2014) opined that budgeting guarantees effectiveness of school administration by ensuring that only planned programmes are pursued, unnecessary spending is avoided and that all proposed expenditures are matched towards the expected revenue, leaving no room for deficit but rather creating a greater room for budget surplus. A successful school budget must be the product of a process that is based on sound and quality information. Ogbonnaya (2015, p. 14) while stressing the purpose of budget stated that:

- School budget forecasts the activities, services and programmes, which an appropriate governing council (e.g. board of governor) has approved for a given period usually a one year in relation to income and expenditure.
- School budget shows what revenue is to be anticipated and from what source this is to be derived.
- School budget shows details, statement and estimates the expenditure of the various items of the school system as a whole.
- School budget shows what other contributions and pressures on the budget that are anticipated during the financial year e.g. the pressure of inflation and how the school intends to raise more money over and above its original budget or how it intends to adjust itself to the situation.
- School budget must be prepared in such a way that it can be executed by anyone, even from outside the school system. In this way the school budget aids the administration of the school programme in accordance with the accepted financial plan.

Ubong et al. cited in Titus and Ukaigwe (2018) stated that the school budget has three principal elements. These are the educational plan, the revenue plan and the expenditure plan. The three make up a functional school budget. The educational plan presents the objectives of the school as derived from the national community objectives. It also states the target as for instance, the number of students expected to be graduated in the school year. It also documents the resources available in the school such as instructional materials, classrooms and other spaces, school plant generally, special services rendered and personnel (teaching and non-teaching staff) among other things. The revenue plan details the likely sources of funds such as government (Federal, State and Local), education tax fund, funds from philanthropic or charitable organizations, funds from the community associations, Alumni Associations, etc. The revenue plan also details capital receipts (money realized from sale of school equipment or grant from government for construction) and miscellaneous receipts (donations, development funds). The expenditure plan contains details of the different items of projected expenditure with the amount to be expended on each item.

Principals' Knowledge of Fund Generation for Effective Administration of Public Senior Secondary Schools

Ensuring the availability of funds in the school's coffers is one of the primary management functions of the school principal, especially as every other resource that is being managed by him is in one way or the other sustained by finance in the school (Usman, 2016). Where funds are

unavailable, the discourse of financial management may simply lack merit because it is available fund that is being managed. As such, knowledge about fund acquisition/generation is key for every principal who must become an effective administrator.

Literature identifies two major sources of funds acquisition which principals must be knowledgeable about, and these include the external sources of fund acquisition and the internal sources of fund acquisition (Amadi, 2021; Amaechi & Obioha, 2020; Duru-Uremadu, 2020). While the external sources are revenue generation sources from outside the school system (or from the external stakeholders of the school), the internal sources of revenue generation or fund generation are those sources from within the school system or from the activities of the school.

Ogbonnaya cited in Amaechi and Obioha (2020) articulated the fund acquisition sources available to public senior secondary schools, aside from the subventions and grants that come from the government. Principals moreover require knowledge, competence and skills to be able to exploit these fund acquisition sources. These are examined below:

- *School Fees:* School fees constitute one of the major internal sources of fund generation for the Nigerian educational system. School fees include tuition fees, dormitory, or hostel fees, equipment fees, caution depositions, and insurance fees. These fees are paid into the account units or bursary department of various educational institutions. It is important to note that even though
- *Registration fees from external examinations:* Even though there is a supposed free education going on in Rivers State, and the government claims that registrations for WAEC and NECO are free, experience proves that students are still levied by public school administrators to make payments for various deliverables with respect to external examinations. Principals must therefore be knowledgeable of how to do this without flouting government orders and falling out with their employers. This requires revenue generation skill, though.
- *Parents Teachers Association (PTA):* Every secondary school in Rivers State has Parents Teachers Association that helps the state government in one form or the other in managing the affairs of the school. Although experience proves that the PTA is not very functional in most public secondary schools in the state, principals are in the right position to make them functional. Normally, every student pays the PTA levy every term which is managed by the school authority in conjunction with the PTA officials. In many cases, PTA money is used in providing PTA teachers and some school facilities and repairs (Amaechi & Obioha, 2020). Apart from provision of both human and material resources, PTA motivates both students and teachers by giving awards and scholarships to exceptional students and teachers. This goes a long way to encourage hard work and commitment in the school.
- *Commercial activities in the school:* Principals necessarily need entrepreneurial knowledge to be effective administrators. Proceeds from sales of school uniforms, sales of students hand crafts, sales of text books and stationary, the staging of school plays and raffles, sales of farm produce from school farms, and other innovative commercial activities within the school could be veritable sources of acquiring funds internally in the school system. Amaechi and Obioha (2020) acknowledged that some educational institutions organize the sale of handwork and the staging of plays on a regular basis. During the staging of plays, the parents and guardians of pupils are invited who some specified amount to the school for watching such plays.

- *Community efforts:* He noted that communities do provide funds for education. They do this indirectly in the sense that they set up schools for government to administer. They also provide necessary materials for effective running of the school. Their efforts are always appreciated by the heads of school in such locality and the government. School administrators must however be excellent in their human relations with their communities for this to be possible and this also requires knowledge.
- *Donations from individuals and charitable organizations:* Amaechi and Obioha (2020) averred that philanthropic individuals and charitable organizations do donate money for the importation of science equipment, provision of relevant instructional materials and the construction of classroom blocks in schools. At times, the donations are in thousands of Naira. It is important to note that some of the donations are made by individuals and organizations from the information they gather on the progress of the school. It is also on record that products of some institutions make donations based on their first-hand information concerning the situation of things in the institution.
- *Alumni associations:* Alumni associations constitute one of the charitable organizations that make donations to schools. This view was supported by Odoh (2018) when he opined that, the Alumni of most secondary schools usually organize activities to raise funds for their alma mater. This has happened in many cases, especially during prize-house competitions. Donations are made by invited guests, politicians, top government official, companies operating in the locality, and well spirited individual. The funds realized are used to equip school libraries, renovate dilapidated classroom blocks and other projects the school want to undertake (Ahmed & Adepoju, 2013).

Principals' Knowledge of Financial Records Management for Effective Administration of Public Senior Secondary Schools

Buadi and Adams (2022) averred that financial records are the records resulting from the conduct of business and activities relating to money or other forms of capital. Barata et al. cited in Buadi & Adams (2022) posited that financial records result from the conduct of business and activities relating to accounting and auditing. Financial records come in a variety of forms including invoices and receipts, and are recorded on a variety of media such as print media and electronic media. For records to serve their purpose in providing reliable evidence, Buadi and Adams (2022) suggested that records in both paper and electronic form must be managed so that the information they convey can be accurate, complete, and comprehensive. For public senior secondary schools to be effectively managed, principals are expected to possess requisite knowledge in financial records management. This would enable them to be able to manage financial records efficiently from their creation to their disposition. This will ensure that the information carried by such records is valid, authentic and reliable throughout their existence (Buadi & Adams, 2022).

Public Procurement Oversight Authority (PPOA) (2020) opined that sound financial records management is a critical component for effective administration, transparency, accountability, delivery of quality services and meaningful, reporting and auditing. When there is sound financial records management, there is adequacy in the monitoring of financial systems which facilitates assessment of information. Thus, financial management systems help organizations, including public senior secondary schools, to allocate resources efficiently, strengthen accountability and ensure adequate control of budget.

Despite the advantages associated with effective financial records management, financial records are poorly managed in most organizations including public educational institutions. This is because financial records generators and recipients including accountants, auditors and workers in finance departments are not trained to have adept knowledge of records management principles and practices. Principals of secondary schools importantly need to know how to manage financial records to avoid misappropriation of school finances.

A study by Usman and Akor (2013) revealed that even though most educational institutions have records management policies that require all workers to engage in effective records management practices, most workers do not manage records effectively due to inadequate training. The same is applicable especially in public secondary schools where majority of principals do not have professional accounting knowledge and due to the fact that effective management of financial records requires knowledge of accounting. As such, for principals to be effective in managing financial records of their schools, the need for them to undergo trainings in that regard is of paramount importance. Professional development programs of principals ought to necessarily include record keeping packages, which must integrally incorporate the management of schools' financial records.

Principals' Knowledge of Financial Auditing for Effective Administration of Public Senior Secondary Schools

Ikediugwu and Ukeji (2020) opined that auditing strategy in administrators' fund management refers to the examination of financial records to guard against fraud and waste. Auditing in educational planning entails the verification of records kept in an accounting system of an educational institution. Its importance lies in the fact that there is no school fund management that would be complete without appropriate auditing. The primary objective of auditing in a public or private organization is to verify the records kept in their accounts departments in order to determine their gains and losses on the efficiency of fund managers (Oche, 2019).

Internal auditing serves as an important link in the business and financial reporting processes of corporations and not-for-profit organizations. They also play a vital role in monitoring an organization's risks and identifying areas which need to be focused on in an effort to improve risk management (Ejoh & Ejom, 2014). According to the study, internal auditing is charged with the responsibility of improving organizational effectiveness and efficiency through constructive criticism. The study classifies internal auditing has four constituents, namely; verification of written records, analysis of policy, evaluation of the logic and completeness of procedures, internal services and staffing to assure they are efficient and appropriate for the organization's policies; and reporting recommendations for improvements to management. Whittington and Pany cited in Geteri et al. (2017) state that, internal control also includes included a program for preparing, verifying and distributing the current reports and analyses which the management can use to maintain control of the activities and functions undertaken within the organization.

The necessity for the knowledge of auditing as a fund management practice for principals' administrative effectiveness can simply not be overemphasized. Auditing is a fund management measure put in place to mitigate or prevent fraudulent activities and misappropriation of funds in the school. Auditing is a systematic investigation and appraisal of transactions procedures, operations and result in financial statements (Anichebe, 2010). In the view of Ogbonnaya (2015) auditing in education means the verification of records kept in an

accounting system of an educational institution. In carrying out a school audit, the school administrator is able to evaluate the controls in which available funds have currently been put in place and assess them to know how they will be used. Ezeani and Oladele (2012) asserted that school audit assist the school administrator to delegate resources appropriately and pursue a defined objective for the growth of the school. Moses cited in Farrant and Onye (2016) underscoring the importance of auditing in financial management posited that a management strategy such as school audit enlightens the general public on the management of school funds and how it affects the child. It helps school administrators detect fraud and error in financial management of educational institutions.

Farrant and Onye (2016) stated that the school head who handles a lot of money in the course of the year should periodically audit their accounts if he is to give proper account. This is because carrying out accurate auditing and periodic checks are essential for discovery of mistakes, losses and misuse of funds made available for running of the school. Auditing provides the school administrator with reasonable assurance on whether the financial statement of the school presents a fair financial position and is in conformity with the generally accepted accounting principles for effective administration of the school (Ezeani & Oladele, 2012). Its primary objective to school administrators is to verify the records kept in the school accounts department in order to determine their gains and losses on the efficiency of available funds. A successful auditing as a financial management practice by the school administrator is a base for sound and quality financial information which is critical to smooth running of universities. The university administrator is therefore responsible and accountable for financial management of the entire fund made available for the running of the school.

Studies carried out in various parts of the world highlight certain attributes and qualities of auditing in firms, especially in relation to firms' performance. A study on 36 Local Government inspectorates in West Java and Banten carried out by Zeyn (2018) using correlation and regression techniques, highlighted the importance of internal auditing in government. The study claimed that better financial responsibility and reporting are positive outcomes of auditing. Ugwu et al. (2020) in the same manner showed a positive link between bank performance and audit firm size. To boost performance, audit quality for efficient resource allocation should be the target of financial organizations.

There are basically two types or classes of auditing carried out on organizations, as well as in educational institutions, and on which principals of secondary schools need sufficient knowledge. These are the external or statutory auditing and internal auditing (Adewara et al., 2023; Egiyi & Okafor, 2022; Ezeani & Oladele, 2012; Obara, 2012; Olalere & Adegbie, 2023). For Aguolu cited in Ezeani and Oladele (2012), statutory or external audits are those compulsorily required "under the provision of an Act or Degrees or Law of the Land". Anichebe (2010) buttressed that external audit is imposed by statute, and is carried out within the enterprise as a result of being compulsorily required by legislation. Examples of statutory audits include auditing of schools as contained in the provision of CAMA 1990, auditing of banks as required under BOFIA, auditing of insurance companies (Ezeani & Oladele, 2012), etc. Internal audit is however, somehow the opposite of the statutory or external audit as its arrangement is within the institution setup and is not subject to external control or statutory provisions. This study is therefore focused on the internal audit practice as a fund management strategy of university adminstrators.

The aim of financial auditing as a fund management practice in schools is to ensure effectiveness in a goal attainment and efficiency in resource allocation and utilization. Towards

this, Ezeani and Oladele (2012, p.50) highlighted the objectives of auditing the school's financial performance to include:

- To secure the continued maintenance of soundly based system of controls within each area of responsibility which in this case is the schools.
- To evaluate the use of resources in the pursuit of defined objectives of the school.
- To assess adherence to budgetary provisions/operational guidelines.
- To review compliance with statutory and regulatory procedures.
- To ensure continuous examination of accounting books, store and personnel records with a view to detecting frauds, errors and mistakes for corrective actions.
- To vouch the integrity of the key operator through periodic surprise cash surveys, checks on revenue collections, cashbooks, banking documents and asset registers.
- To ensure that every transaction especially of financial nature is duly approved and appropriately authorized before execution.
- To ensure that the due process is adequately and consistently observed in the award of contracts of works, supplies and job orders.
- To ascertain the adequacy of effort to implement previous audit recommendations.
- To ensure the existence and adequacy of vital records.
- To evaluate the adequacy of and security of documents and records.
- To ascertain and ensure that an enterprise conforms with statutory and professional requirements.
- To advice on financial matter for efficient decision making by the school management. All these among others are meant to engender accountability of stewardship by extension of effective performance.

Importance of Fund Management Knowledge in Effective Administration of Secondary Schools

The significant position occupied by finance in school administration makes it unreasonable for a principal to be deficient in fund management knowledge Sufficient knowledge of fund management is required to ensure that funds are not lacking for the operation of the school, and to also guarantee that available funds are appropriately allocated and effectively utilized for the achievement of school goals at any point in time. Literature highlights some necessities for administrators' possession of fund management knowledge in administrating schools, some of which are examined in the proceeding paragraphs:

- Optimum allocation of resources: A principal with solid knowledge of fund management can allocate resources (e.g., teaching materials, technology, infrastructure) in line with school priorities. When resource allocation is optimized in the school system, it guarantees the direction of resources to areas that mostly impact learning and administration, and that school budgeting reflects both short-term needs and long-term goals (Ereh et al., 2019; Usman, 2016).
- Effecting planning and execution of school budgets: Principals who understand financial planning would be able to prepare realistic budgets, monitor spending, and ensure compliance with financial regulations (Okafor, 2023). This includes anticipating costs and setting spending limits and preventing overspending or underutilization of funds.

This reduces financial mismanagement, enhances transparency, and builds stakeholder trust.

- Development and maintenance of school infrastructure: Sound fund management knowledge helps in prioritizing capital projects (e.g., classroom upgrades, sanitation) and in planning for maintenance, avoiding emergency repairs that strain budgets. This is necessary for a safe and conducive learning environment.
- Staff Development and Welfare: Knowledgeable principals allocate funds for continuous professional development for teachers and for staff motivation and welfare initiatives (e.g., health support, bonuses). These initiatives are used to enhance teacher satisfaction and performance, leading to better student outcomes.
- Fundraising and external partnerships: Principals who are skilled the management of finance are able to identify funding gaps and initiate appropriate fundraising activities and prepare financial reports for external donors or stakeholders, increasing credibility (Okafor, 2023). This expands resource base and strengthens the school's financial sustainability.
- Compliance and audit readiness: Understanding financial protocols ensures that all school expenditures are well documented and that the school meets audit requirements and avoids legal issues (Adetoso et al., 2013; Ezeani and Oladele, 2012). This protects the school's reputation and enables uninterrupted operations.
- Informed Decision Making: Principals who track income and expenses can use data to make informed decisions about resource reallocation and to monitor financial trends that inform long-term planning. This promotes administrative decisions that are based on evidence.

How Principals Can Acquire Knowledge of Fund Management for Effective Administration of Secondary Schools in Nigeria

Principals play a critical role in managing school resources effectively, and acquiring solid fund management knowledge is essential for efficient school administration. This section of the paper outlines several ways principals can acquire or improve their fund management skills. These include:

- *Professional Development Programs:* Such programs can include (i) workshops and seminars organized by ministries of education, local education authorities, or NGOs, which often cover budgeting, financial reporting, and audit preparation; (ii) online courses from platforms like Coursera, edX, and FutureLearn, which offer financial management courses tailored to school leaders; and (iii) certification programs, which often have fund management in their course content.
- *Formal Education*: Principals and other school administrators including teachers looking forward to administrative positions can take up postgraduate programs, such as M.Ed. in Educational Leadership or an MBA with a focus on finance to build strong theoretical and practical knowledge, and/or short-term diplomas/certificates offered by many universities, which offer specialized short courses in school business management or educational finance.
- *Mentoring and Peer Learning:* School administrators can enroll in mentorship programs to learn from experienced school administrators who excel in fund management.

- *Membership of Professional Learning Communities (PLCs):* Joining networks or associations of school leaders to share knowledge and experiences related to financial issues can also be a veritable means of acquiring fund management knowledge for school administrators.
- *Government and NGO Support:* School administrators can be trained by the Ministry of Education via the schools board, providing them with manuals, guidelines, and training sessions on school fund management. Also, NGOs can offer training and resources to school leaders in low-resource settings to improve transparency and accountability.
- *Reading and Self-Learning:* School administrators can acquire fund management knowledge by studying guides or handbooks published by educational departments or NGOs. Reading books on school financial management and academic journals focused on educational leadership and finance could also be a veritable means of acquiring requisite knowledge in that regard.
- *Use of Technology Tools:* Administrators can also leverage on technology to learn how to manage funds in their schools. Learning to use school accounting software (e.g., QuickBooks for Education, School Finance) through tutorials or training can streamline budgeting and reporting. Some training programs use budget simulation tools to teach principals about trade-offs and fund allocation. Technology has indeed made learning easy, accessible, and fun, and the more administrators utilize them, the better they likely become on their jobs.

Effective fund management by principals depends on a combination of formal education, continuous professional development, practical experience, and peer support. Equipping school leaders with this knowledge leads to more transparent, efficient, and impactful school administration.

CONCLUSION

Fund management knowledge is a critical competency for school administrators in Nigeria, particularly within the secondary school system. Effective administration hinges not only on pedagogical leadership but also on the ability to plan, allocate, monitor, and evaluate financial resources in a transparent and accountable manner. As the education sector continues to grapple with inadequate funding and resource constraints, school administrators must be well-equipped with financial management skills to maximize the utility of available funds. Enhancing their capacity through regular training, policy support, and institutional frameworks will not only improve the efficiency of school operations but also contribute significantly to the attainment of educational goals. Therefore, strengthening fund management knowledge is essential for promoting transparency, accountability, and overall effectiveness in the administration of secondary schools in Nigeria.

Suggestions

Based on the discussion of the paper, the following suggestions have been made:

- The Ministry of Education through the Schools Board should mandate compulsory pre-service and in-service training on financial and budgetary management for all current and

aspiring school administrators, to equip them with the skills needed for efficient planning, utilization, and reporting of school funds.

- The Ministry of Education should ensure that leadership positions such as principals or vice-principals are based not only on years of service or teaching experience but also on proven competence in school management, particularly in budgeting and fund accountability.
- Tertiary institutions offering degrees or diplomas in Educational Management should include core modules on fund management, public procurement, and financial ethics to prepare future administrators for real world challenges.
- Schools should be encouraged to use simple accounting software or digital templates or financial planning, budget tracking, and expenditure reporting to ensure efficiency and reduce errors in misappropriation.
- The government should promote research on best practices in school fund management and create a national database for sharing success stories and challenges, as this will inform policy-making and support evidence-based improvements.

ABSTRACT

This study critically interrogates the dominant conception of Return on Investment (ROI) in education, framing it as a colonial-capitalist paradigm that often marginalizes indigenous knowledge systems, cultural relevance, and community-based learning outcomes. Conventional interpretations of educational ROI typically emphasize economic productivity, employability, and market-driven competencies—approaches that ignore the historical, ecological, and sociocultural specificities of communities such as those in Ndokwa West Local Government Area of Delta State, Nigeria. The research contends that such frameworks perpetuate structural inequities and undermine the potential of education to serve as a vehicle for local empowerment and restorative justice. In contrast, the paper proposes a redefinition of ROI through a decolonial lens that foregrounds indigenous epistemologies, ecological sustainability, and equity-driven development. By engaging the lived experiences and traditional ecological knowledge of the Ndokwa people, the study introduces an alternative educational model rooted in cultural sovereignty, collective agency, and social cohesion. This reconceptualization envisions education not merely as a means of economic return but as a transformative tool for building resilient communities and preserving intergenerational wisdom. The study advocates for policy frameworks that resist neoliberal standardization and instead align educational investment with community-based values, justice, and long-term sustainability. Ultimately, it calls for a paradigm shift that repositions ROI as a measure of education's capacity to restore, heal, and empower indigenous communities.

Keywords: Reimagining Education, Decolonisation, Return of Investment, Indigenous Knowledge, Equity and Ecological Justice.

INTRODUCTION/BACKGROUND TO THE STUDY

In Ndokwa West Local Government Area (LGA) of Delta State, Nigeria, traditional evaluations of educational return on investment (ROI) have predominantly emphasized economic outcomes,

often sidelining indigenous knowledge systems, cultural values, and ecological considerations. This paper proposes a decolonial framework that reimagines educational ROI by integrating indigenous knowledge, promoting equity, and ensuring ecological justice. By challenging colonial-capitalist paradigms, this study seeks to align educational outcomes with the sociocultural and environmental realities of Ndokwa West, fostering a more holistic and inclusive approach to community development.

The legacy of colonial education in Africa has often marginalized indigenous knowledge systems, leading to a disconnect between formal education and local cultural contexts. Emeagwali (2020) argues that decolonizing education necessitates the integration of African indigenous knowledge into curricula to foster relevance and authenticity in learning experiences. This perspective is echoed by scholars who emphasize the importance of incorporating indigenous languages and cultural practices to enrich educational content and pedagogy (Emeagwali, 2020). In the context of Ndokwa West LGA, recognizing and validating indigenous knowledge can bridge the gap between formal education and community life, enhancing the applicability and acceptance of educational initiatives.

National education policies in Nigeria, such as the Universal Basic Education (UBE) program, aim to provide free and compulsory education to all children. However, the implementation of these policies often encounters challenges, including inadequate infrastructure, insufficient funding, and socio-cultural barriers (UBEC, 2024). The Universal Basic Education Commission (UBEC) has been proactive in addressing some of these issues by partnering with organizations like UNICEF to strengthen foundational learning and education outcomes (UBEC, 2024). Despite these efforts, disparities persist, particularly in marginalized regions like Ndokwa Nation i.e. Ukwani language speaking communities, where educational needs are intertwined with cultural and environmental factors.

The concept of ecological justice emphasizes the interdependence between human societies and their natural environments. In the Niger Delta region, which includes Ndokwa West LGA, environmental degradation due to oil exploration has adversely affected local livelihoods and health (Emeagwali, 2020). Integrating ecological considerations into educational frameworks is essential for fostering environmental stewardship and sustainable development. This approach aligns with the principles of ecopedagogy, which advocates for education that promotes ecological awareness and action (Emeagwali, 2020). By embedding ecological justice into educational ROI assessments, communities can cultivate a sense of responsibility toward their environment, ensuring that development initiatives do not compromise ecological integrity.

Economic equity in education involves ensuring that all individuals, regardless of their socio-economic background, have access to quality educational opportunities. In Ndokwa West LGA, economic disparities have led to unequal access to education, with marginalized groups often being left behind. Addressing these inequities requires targeted interventions that consider the unique socio-economic challenges of the region. The World Bank's approval of a $1.57 billion financing package for Nigeria's health and education sectors underscores the need for substantial investment to bridge these gaps (Reuters, 2024). However, the effectiveness of such investments depends on their alignment with local needs and contexts, highlighting the importance of community involvement in decision-making processes.

A decolonial approach to education challenges the dominance of Western-centric paradigms and advocates for the inclusion of diverse epistemologies. This perspective calls for a critical examination of existing educational structures and content to identify and dismantle colonial legacies that perpetuate inequality and cultural erasure (Emeagwali, 2020). In Ndokwa

West LGA, adopting a decolonial framework involves recognizing and valifying indigenous knowledge systems, promoting linguistic diversity, and ensuring that education contributes to both social and environmental justice. Such an approach not only enriches the educational experience but also empowers communities to define development on their own terms, fostering resilience and self-determination.

Supposedly, reimagining educational ROI in Ndokwa West LGA necessitates a comprehensive approach that integrates indigenous knowledge, promotes equity, and ensures ecological justice. Through constructively structured positioning of this paper challenges colonial-capitalist logics and embraces African-centered epistemologies, simply perceiving education as a catalyst for holistic development that resonates with the cultural and environmental realities of the community. This study aims to contribute to the discourse on decolonial education by providing insights and recommendations that are both contextually relevant and transformative.

The Problem Statement

Educational return on investment (ROI) in Ndokwa West LGA has long been assessed through a colonial-capitalist framework that prioritizes economic outputs such as employment rates and income levels while overlooking the region's sociocultural and ecological realities. This approach marginalizes indigenous knowledge systems (IKS), deepens educational inequities, and neglects the environmental costs of economic development. To redefine education ROI, there is an urgent need to decolonize economic logics in education policy by shifting from financial-based evaluations to holistic, community-centered measures that empower local economies, sustain cultural continuity, and promote ecological consciousness. A reparative approach demands embedding IKS—such as apprenticeship models, oral traditions, and ecological literacies—into curricula and decision-making to restore local agency and ensure educational relevance. Additionally, intergenerational ecological stewardship must be integrated into education policy to address environmental degradation from extractive industries, foster sustainable development, and promote equity-driven governance. This paper recognizes the research gap in prevailing education models and proposes a transformative framework that prioritizes cultural specificity, social equity, and ecological resilience. Instead of solely preparing students for neoliberal labor markets, education should cultivate knowledge systems that empower communities, sustain local economies, and nurture environmental responsibility. By restructuring education policy to integrate indigenous knowledge, redefine economic success, and foreground ecological justice, this study offers a contextually relevant and sustainable model for educational transformation in Ndokwa West LGA and across Delta State.

THEORETICAL FOUNDATIONS

A significant theoretical foundation is essential for reimagining educational return on investment (ROI) in Ndokwa West Local Government Area (LGA) through an integrative lens that foregrounds cultural, economic, and ecological dimensions. This study is anchored on two distinct yet interconnected frameworks that collectively challenge neoliberal education models, reposition indigenous knowledge systems, and promote sustainable governance in education. Together, these frameworks provide a transformative lens for redefining education ROI beyond economic productivity, centering equity, cultural resilience, and ecological justice.

Decolonial Leadership Theory (Mbembe, 2016; Ndlovu-Gatsheni, 2018)

Decolonial Leadership Theory critiques the Eurocentric foundations of contemporary education governance and policy, challenging the neoliberal logics that prioritize economic efficiency over holistic community well-being. Drawing from decolonial scholars such as Mignolo (2016) and Quijano (2007), this framework interrogates how Western economic models have been imposed on African education systems through colonial legacies, fostering an environment where local epistemologies are rendered invisible. In the context of Nigeria's education system, this theory highlights the enduring effects of colonial education policies, which continue to shape curriculum design, institutional governance, and policy priorities in ways that marginalize indigenous perspectives (Ndlovu-Gatsheni, 2018). A key dimension of Decolonial Leadership Theory is its alignment with *Ubuntu Philosophy*, which reframes education not as an individualistic pursuit of wealth accumulation but as a communal endeavor aimed at fostering collective well-being and social harmony (Letseka, 2013).

This perspective challenges the dominant ROI paradigm by advocating for an education system that measures success through social cohesion, intergenerational knowledge transmission, and cultural sustainability rather than solely through economic productivity. Applying this position to Ndokwa West LGA necessitates a shift from rigid, market-driven education models to a governance framework that empowers communities to define educational value on their own terms, ensuring that learning remains relevant to their lived experiences and aspirations (Mbembe, 2016). Given the environmental degradation in the Niger Delta due to extractive oil industries, integrating ecopedagogical principles into the education system would help cultivate environmental stewardship and equip learners with the skills to advocate for ecological justice. Thus, this theoretical construct provides a foundation for a reparative approach to education ROI that challenges neoliberal metrics and fosters economic, social, and environmental sustainability.

Common-Pool Resource (CPR) Theory (Ostrom, 1990; Dietz et al., 2003)

Common-Pool Resource (CPR) Theory, developed by Elinor Ostrom (1990) and later expanded by scholars such as Dietz, Ostrom, and Stern (2003), provides an alternative to market-driven and state-controlled resource management models by emphasizing community-led governance of shared resources. Traditionally applied to environmental and economic resources, CPR Theory argues that communities, when given the autonomy and appropriate institutional arrangements, can sustainably manage common resources without over-exploitation or external intervention. This theory challenges the assumptions of Hardin's (1968) "Tragedy of the Commons", which posited that common resources are inevitably depleted due to individual self-interest. Instead, Ostrom (1990) demonstrated that locally devised governance systems, informed by collective knowledge and community norms, can effectively regulate resource use and ensure long-term sustainability. The principles of CPR governance, such as clearly defined boundaries, participatory decision-making, conflict resolution mechanisms, and self-regulation, are highly relevant for rethinking educational resource management in Ndokwa West LGA.

Furthermore, CPR Theory's emphasis on intergenerational knowledge transmission and ecological responsibility aligns with the study's objective of embedding environmental consciousness within education policies. In Ndokwa West, where environmental degradation from oil exploration threatens both livelihoods and learning environments, adopting a CPR-based

education model ensures that schools become centers of ecological stewardship, where students learn not only academic content but also practical strategies for resource conservation, sustainable livelihoods, and climate resilience. Anchoring this study on The CPR Theory highlight shift in promoting educational equity, cultural sustainability, and environmental justice, reinforcing the study's overarching goal of redefining education ROI through decolonial and ecological lenses.

Together, Decolonial Leadership Theory and Common-Pool Resource (CPR) Theory offer a compelling framework for challenging the economic reductionism and colonial legacies that shape education ROI in Ndokwa West LGA. While DLT critiques the dominance of neoliberal education policies and calls for indigenous knowledge reintegration, CPR Theory advances community-driven models of governance, ensuring that education remains a collectively managed resource rather than a commodified service. These theories collectively provide the intellectual foundation for restructuring education policies to align with cultural, ecological, and economic imperatives, fostering a more inclusive, sustainable, and self-determined educational system.

CONCEPTUAL MODEL

Figure 1: Reparative Framework for Indigenous Knowledge, Equity, and Ecological Justice

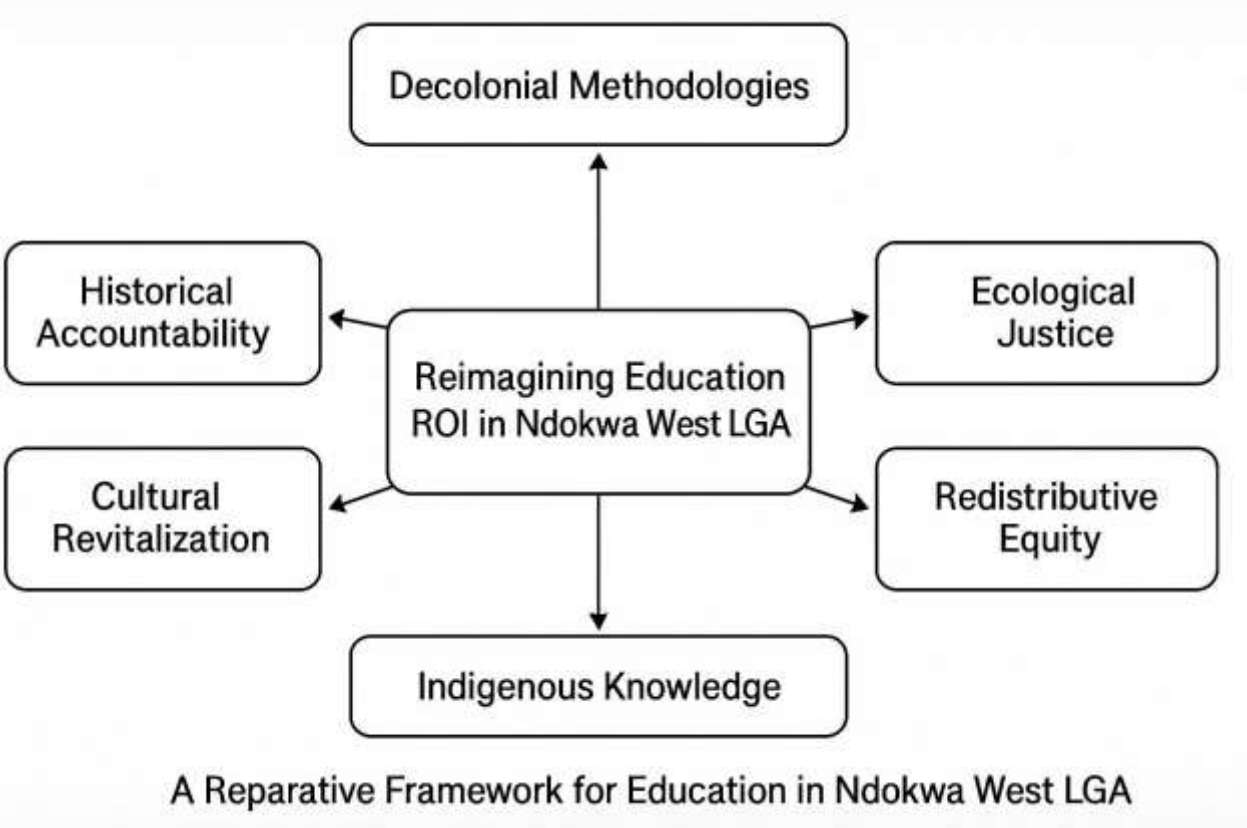

Figure 1: Reparative framework for indigenous knowledge, equity, and ecological justice

The conceptual model for the study titled "Reimagining Education ROI in Ndokwa West LGA: A Reparative Framework Centering Indigenous Knowledge, Equity, and Ecological Justice"

presents a comprehensive and dynamic approach to rethinking the concept of Return on Investment (ROI) in education within the context of Ndokwa West Local Government Area (LGA). This model challenges the traditional colonial-capitalist framework of ROI, which primarily focuses on economic returns and market-driven outcomes, and instead proposes a reparative justice approach that integrates indigenous knowledge, equity, and ecological justice. This model is designed to foster a shift from the narrow economic measurements of ROI to a broader, more holistic understanding of the impacts of education—one that considers the cultural, environmental, and social dimensions of learning. Through framework of rethinking education supply centering indigenous knowledge, equity, and ecological justice, the model proposes a reparative framework that incorporates educational outcomes with the values of sustainability, cultural identity, and community empowerment in Ndokwa Nation and Delta State at large.

Ndokwa Indigenous Communities and Locations

The Ndokwa people of Delta State represent a significant ethnic group within Nigeria's South-South geopolitical zone, possessing a distinct cultural identity intricately linked to their settlements and linguistic heritage. They primarily inhabit communities within the Ndokwa West Local Government Area (LGA), where their indigenous identity is expressed through the Ukwuani language and a network of towns and villages shaped by kinship, migration, and ecological adaptation. The Local Government Area has an estimated population of 205,600 in 2022. The area covers 809.9 square kilometers and has a population density of 253.9 people per square kilometer (National Bureau of Statistics, 2024). Communities such as Utagba-Ogbe, Utagba-Uno, Abbi, Emu, Onicha-Ukwuani, Ogume, and Utagbe-Uno constitute the foundational settlements that define the territorial and cultural geography of the Ndokwa people. These communities are not merely geographical designations; they embody deep ancestral ties and serve as socio-cultural and economic units where governance, land use, and inter-generational knowledge transmission take place.

The Utagbe-Uno district is collectively formed from the following communities such as Umuseti, Umusadege, Isumpe, Etua-Uno, Umusedeli, Umusam, and Ikiribi, each uniquely contributing to the Ukwani indigenous cultural heritage. Emu, for instance, is composed of differentiated quarters—Emu-Uno, Emu-Ebendo, and Emu-Iyasele—each reflecting a genealogical and political structure grounded in customary practices. Ogume, similarly, features composite units such as Ogbe-Ogume, Ogbagu, and Umuchime, whose spatial and symbolic orientations reveal a historical consciousness rooted in clan affiliation and indigenous law. According to Okonta (2023), the continuity of these settlement-based identities sustains cultural coherence among the Ndokwa and reinforces their resistance to homogenizing forces of modern development planning. Ndokwa West LGA’s administrative framework is further organized into districts that map closely onto these indigenous settlement patterns, including key nodes like Abbi, Utagba-Uno, Utagba-Ogbe, Onicha-Ukwuani, Emu, and Ogume. These divisions facilitate governance, local policy implementation, and political representation but also mirror the ways in which identity, place, and power converge in indigenous contexts.

The communities under each district maintain local leadership structures chiefdoms, town unions, and village councils that exercise significant autonomy over customary land governance, dispute resolution, and communal festivals. According to Enebeli (2024), infrastructural disparities across these communities reveal the uneven reach of state development, with areas

like Utagba-Ogbe enjoying comparatively better access to public services due to their central administrative roles. In contrast, peripheral communities face developmental neglect, resulting in limited road infrastructure, poor electricity supply, and constrained healthcare and educational facilities. Delta State Government policy reports (2023) have acknowledged these inequalities and proposed targeted rural development frameworks, though implementation remains inconsistent. For example, the Emu axis has repeatedly reported poor rural electrification coverage and under-resourced primary health centers, raising concerns about the LGA's infrastructural equity and policy responsiveness.

Beyond administration, the Ndokwa people maintain a profound ecological connection to their environment, which in turn shapes their livelihoods, rituals, and social memory. The region is marked by a mix of rainforest and freshwater ecosystems, particularly in communities closer to the Niger floodplains. Agriculture and fishing remain primary economic activities, organized largely through family labor systems and guided by seasonal knowledge passed down across generations. Cultural practices such as the Ikenga masquerade, Ukpalabo, the Iwu traditional rites, and yam festivals often coincide with planting or harvest cycles and are imbued with ecological reverence. According to Ogosi (2024), many Ndokwa rituals are explicitly designed to honor ancestral spirits as custodians of the land, reinforcing ecological stewardship within cultural consciousness. However, the region is increasingly confronted by environmental disruptions such as flooding, oil pollution, and deforestation. Egbule (2024) reported that recurring seasonal floods in parts of Abbi and Ogume have displaced hundreds of families and led to extensive crop loss, threatening not only subsistence but also the cultural calendar tied to agricultural cycles. These environmental pressures demand both infrastructural adaptation and cultural continuity strategies, especially through the integration of traditional ecological knowledge into formal education and land-use policy.

Culturally and politically, Ndokwa communities maintain strong identities rooted in territorial heritage and ecological belonging, forming a collective consciousness that defines who they are in relation to where they live. This place-based identity structure is not static but dynamic, responding to historical events such as colonial boundary demarcations, Christian missionary incursions, and more recently, state-led decentralization. Ukaegbu (2023) emphasized that the naming and location of these communities are acts of historical narration, where spatial claims signify ancestral authority and resistance to dispossession. As such, any scholarly or policy-oriented approach to development in Ndokwa West LGA must recognize these deeply embedded relationships between people and place. The conceptualization of indigenous communities must therefore go beyond administrative cartography to engage with the lived realities, historical knowledge systems, and governance mechanisms that sustain these communities. It is through this lens that Ndokwa can be understood not as a passive recipient of policy interventions, but as an active custodian of cultural sovereignty grounded in named geographies and traditional ecological zones.

Decolonizing ROI in Education

The concept of Return on Investment (ROI) has traditionally been confined to financial metrics, focusing on economic returns derived from educational expenditures. However, the need to decolonize this concept is increasingly urgent, particularly in post-colonial societies like those in Africa, where education systems were historically structured to serve colonial interests, often at the expense of indigenous knowledge systems and cultural preservation. Decolonizing ROI in

education seeks to redefine the value of education beyond economic output and academic achievement, embracing a more holistic, culturally relevant, and socially inclusive framework. According to Okpala (2024), the traditional focus on financial ROI fails to account for the ways in which education can contribute to social justice, cultural reclamation, and community empowerment. Decolonization, in this context, involves an intentional shift in perspective, moving away from metrics that prioritize individual wealth accumulation and aligning ROI with the broader social, economic, and ecological well-being of communities. A decolonized approach to ROI in education places value on indigenous knowledge, community-based learning, and the relational aspects of education, including the development of a sense of belonging, cultural pride, and social responsibility.

This shift requires challenging the Eurocentric paradigms that dominate educational systems and replacing them with models that prioritize the needs and perspectives of marginalized communities. As Nwosu (2024) suggests, the framework for decolonizing ROI in education must integrate indigenous epistemologies and cultural practices into the learning process, ensuring that education contributes to the empowerment of local communities and respects their unique histories and identities. In regions like Ndokwa Ukwani, where local cultures and traditions have often been sidelined by dominant educational narratives, decolonizing ROI could mean investing in programs that promote indigenous languages, community-based education, and locally relevant curricula that address the socio-cultural realities of the population. Embracing this decolonized approach, ROI can be viewed as a tool for social transformation, fostering environments where educational success is measured not just by academic performance but by the development of critical consciousness, collective well-being, and sustainable community futures. This broader interpretation of ROI in education aligns with the growing call for education systems that serve the collective good, prioritize equity, and contribute to the deconstruction of colonial legacies still embedded in contemporary educational practices (Thompson, 2024).

Return of Investments as Radical Love for Education

In the current discourse on education, radical love represents a transformative and deeply humanistic approach that goes beyond traditional financial returns. Radical love in the context of education entails an investment not only in infrastructure but in people, communities, and a nurturing environment that transcends the transactional nature of education. According to Hlabangane (2024), radical love challenges the conventional notions of return on investment (ROI), shifting focus from economic outcomes to social, emotional, and intellectual growth that contribute to community resilience. By emphasizing care and empathy in the learning process, radical love fosters environments where marginalized groups can thrive and be empowered, aligning with the growing body of literature that seeks to redefine the purpose of education in contemporary societies (Pearson & Hernández-Saca, 2024).

In educational systems, ROI is often narrowly defined as academic achievement or economic productivity, with little regard for the transformative impact education can have on social structures and individual identities. However, a more expansive understanding of ROI includes the nurturing of critical thinking, self-awareness, and the collective well-being of communities. As Imad (2024) posits, radical love in education is about creating spaces where individuals are valued beyond their academic performance, allowing them to engage with their education in a meaningful way. This shift requires a reframing of educational goals, emphasizing

values of justice, equity, and mutual respect. For communities like Ndokwa Ukwani, where historical injustices have shaped access to resources and opportunities, ROI as radical love signifies a commitment to addressing these disparities by investing in human potential and cultural renewal, ensuring that education serves as a tool for social transformation.

Pre-Colonial Indigenous Education

In pre-colonial Ndokwa communities, education was not institutionalized in the modern Western sense but deeply embedded in the cultural, spiritual, and economic life of the people. Learning was a lifelong, community-driven process characterized by practical instruction, oral transmission, and deeply rooted communal values. Among the Ndokwa people, particularly in agrarian and riverine communities, apprenticeship served as a foundational educational model. Boys and girls were socialized into roles through close mentorship by elders, learning crafts such as farming, fishing, pottery, weaving, blacksmithing, and hunting. These vocational trainings were holistic in nature, integrating skills with the values of patience, discipline, communal responsibility, and ecological awareness. Knowledge acquisition was not only about productivity but about maintaining harmony with the environment and fulfilling one's societal roles, reinforcing the ethical codes that sustained the community's collective wellbeing.

Secret societies such as Okpella played a significant role in the transmission of advanced and often sacred knowledge that guided social cohesion, leadership training, and conflict resolution. These societies were custodians of cosmological wisdom, traditional medicine, and customary laws, functioning as informal yet highly structured institutions of higher learning within Ndokwa society. Participation in these societies was often restricted to certain age groups or families and required rigorous initiation processes that symbolized the deep commitment to learning and guardianship of indigenous knowledge. Such structures embodied a form of epistemic sovereignty that preserved the cultural identity of the people and ensured intergenerational continuity of wisdom systems. As Obaro (2017) observed, these indigenous frameworks provided a moral compass and a highly contextualized education system that responded effectively to the socio-economic realities of the community.

The curriculum of this indigenous system was flexible, pragmatic, and responsive to environmental changes. Children were taught to observe, question, and adapt, which made their learning process highly interactive and adaptive. It was this fluid, experiential, and eco-socially grounded model of education that produced generations of self-reliant, culturally grounded, and ecologically conscious individuals. Such indigenous pedagogy sharply contrasts with the standardization and rigidity introduced by colonial models of education. Furthermore, the spiritual and symbolic elements embedded in pre-colonial education fostered a sense of identity and sacred duty, elements largely absent from Western-style schooling. Hence, pre-colonial indigenous education in Ndokwa was far more than a means to personal economic advancement; it was a foundational institution for social reproduction, cultural sustainability, and ecological guardianship.

Colonial Disruption

The imposition of colonial rule in Nigeria brought with it a Western system of education that fundamentally disrupted the indigenous epistemologies that had underpinned Ndokwa society for centuries. Missionary education, in particular, sought to replace indigenous belief systems and

pedagogies with Euro-Christian ideals. The establishment of mission schools served dual purposes: to convert indigenous peoples to Christianity and to prepare them for subordinate roles within the colonial administrative system. By privileging literacy in English and Christian religious instruction over local knowledge, the colonial education system marginalized indigenous languages, histories, and ecological philosophies. As Uwaifo (2016) posited, colonial education was an ideological project aimed at reshaping the African mind to suit the exploitative needs of the empire.

This imposed system created an epistemic rupture, where traditional institutions like the Okpella were delegitimized and their roles in knowledge production eroded. The practical and ethical grounding that indigenous education provided was replaced by rote learning, Eurocentric curricula, and examinations that had little relevance to local economic or ecological contexts. Clerical training became the apex of colonial education, designed to produce low-level functionaries and interpreters who would assist in the colonial project rather than challenge it. Thus, instead of cultivating community leaders grounded in local realities, the colonial education system produced a class of individuals alienated from their cultural roots and dependent on colonial validation for social mobility. In this way, colonial education served as a mechanism of cultural dislocation and social stratification.

Furthermore, the colonial emphasis on formal schooling spaces excluded many from accessing education, especially women and rural dwellers, deepening gender and geographic disparities. While indigenous education was inclusive and communal, colonial schooling required conformity, attendance at mission stations, and abandonment of traditional beliefs. As a result, the cultural distance between the content of education and the lived realities of Ndokwa people widened. Education became a path to individual advancement rather than communal upliftment, reshaping its meaning and purpose in profound ways. Hence, colonial disruption of indigenous education not only displaced local knowledge systems but also redefined education as a tool of assimilation rather than liberation.

Postcolonial Betrayal

Although independence in 1960 promised a reorientation of Nigeria's education system toward national development, postcolonial governance largely failed to reverse the colonial legacies embedded in educational structures. In the oil-rich Niger Delta, of which Ndokwa West is part, the discovery and commercialization of petroleum in 1956 marked a significant turning point. Education became increasingly instrumentalized to serve the extractive interests of the state and multinational oil corporations. Programs like Shell's Corporate Social Responsibility (CSR) initiatives introduced scholarships, school buildings, and training schemes; yet these often functioned as compensatory gestures rather than transformative investments. According to Okonta (2018), such initiatives rarely addressed the structural neglect and ecological devastation caused by oil exploration. Instead, they commodified education, framing it as a transactional good offered in exchange for resource exploitation and community compliance.

This commodification redefined the purpose of education as a pathway to employment in oil corporations rather than as a means for community empowerment and ecological stewardship. Local curricula were not updated to reflect the environmental challenges faced by the region, nor did they incorporate indigenous perspectives on sustainability. The emphasis remained on producing technocrats and professionals who could support the oil economy, perpetuating a form of petro-education that was fundamentally extractivist in orientation. The result has been a

widening gap between educational outcomes and community wellbeing, as the needs of the oil economy continue to override the developmental aspirations of local people.

Moreover, the militarization of the Niger Delta in response to youth restiveness, environmental activism, and demands for resource control has further disrupted educational access. Communities in Ndokwa West have experienced school closures, student displacements, and a general atmosphere of fear and instability. The presence of military checkpoints, oil surveillance operations, and the criminalization of protest have turned educational spaces into contested zones. As Owugah (2019) noted, the securitization of the region has resulted in a decline in school attendance, teacher retention, and parental engagement, thereby undermining the fundamental goals of universal basic education. Consequently, rather than fulfilling its promise as a liberatory tool, education in the postcolonial petro-state has often served to reinforce exclusion, alienation, and ecological injustice.

Figure 2: Features of Ndokwa Indigenous Communities and Locati*ons*

The infographic titled *"Features of Ndokwa Indigenous Communities and Locations"* visually summarizes key aspects of Ndokwa West Local Government Area, highlighting a projected population of 205,600 people spread across a landmass of 816 square kilometers as of 2022. It presents a central mind map showing major indigenous communities such as Utagba-Uno, Utagba-Ogbe, Abbi, Emu (with subdivisions Emu-Uno, Emu-Ebendo, and Emu-Iyasele), Onicha-Ukwuani, Ogume (including Ogbe-Ogume, Ogbagu, and Umuchime), and Utagbe-Uno, reflecting historical lineage and cultural ties. A bar chart illustrates the presence of traditional institutions like town unions, village councils, and chiefdoms, while another visual compares infrastructural disparities across communities, showing better access in Utagba-Ogbe than in Emu and Ogume. Eco-symbols represent strong connections to natural ecosystems, with

livelihoods centered on agriculture and fishing, shaped by ancestral knowledge and seasonal rhythms. The infographic also portrays place-based identity through spatial illustrations, emphasizing how each community's name and structure serve as records of ancestral authority, ecological stewardship, and resistance to displacement, offering a comprehensive and organized visual interpretation of Ndokwa West's demographic, cultural, and environmental landscape.

Sociocultural and Political Economy Analysis

The Ukwuani-speaking communities located within Ndokwa West, Ndokwa East, and Ukwuani Local Government Areas in Delta State grapple with entrenched socioeconomic and educational challenges rooted in the historical marginalization of Niger Delta minorities. These communities, despite their strategic geographical positioning and rich natural endowments, continue to experience multidimensional poverty, weakened institutions, and educational underdevelopment—conditions shaped by a legacy of extractive colonialism, postcolonial neglect, and contemporary neoliberal statecraft. The layering of structural violence through oil-induced ecological devastation, infrastructural decay, and governance failure has deepened regional inequalities and fostered exclusionary political economies that undermine not just material wellbeing but also cultural integrity, employability, and generational educational advancement (Aghalino, 2020; Okonta, 2018).

SOCIOLOGICAL CHALLENGES

These challenges are exacerbated by land tenure conflicts, highlighting the deep-rooted socio-economic struggles that hinder community development:

Oil Wealth vs. Poverty (Resource Curse)

One of the most paradoxical features of the Ukwuani landscape is the coexistence of immense natural resource wealth with entrenched poverty, a classic manifestation of the "resource curse." Despite their proximity to crude oil reserves and decades of extractive activities by multinationals like Shell and Agip, Ukwuani communities remain economically disempowered and socially marginalized. The vast earnings from oil are rarely reinvested into these host communities, a result of skewed federal allocation systems and exploitative arrangements that favour the state and oil conglomerates while dispossessing the local populace (Obi, 2016). The resultant environmental degradation has stripped communities of their agrarian base, with extensive oil spills contaminating farmland, groundwater, and aquatic systems, thereby undermining food security and the traditional economy centered on farming and fishing (Ebiem, 2019). The destruction of biodiversity and farmlands has not only intensified hunger but also eroded the capacity of families to send children to school or afford healthcare, resulting in an intergenerational reproduction of poverty (Onyima, 2021).

Furthermore, oil-induced environmental pollution contributes to long-term ecological and public health crises that disproportionately affect marginalized rural households. The loss of arable land and water bodies previously vital for subsistence agriculture and artisanal fishing has left local youth with few viable employment opportunities, deepening economic disenfranchisement and fueling restiveness (Iwilade, 2016). This scenario has shifted the utility of education in the eyes of many parents, as the absence of a clear connection between schooling

and job security discourages long-term investment in formal education, especially for girls. Ultimately, the resource curse in Ukwuani lands is not merely an economic anomaly but a systemic contradiction perpetuated by exclusionary policies and exploitative extractive practices.

Infrastructure Deficit

The absence of critical infrastructure in Ukwuani communities serves as both a symptom and a driver of underdevelopment. The dilapidated state of rural roads, frequent power outages, and poor health facilities create structural bottlenecks that suppress enterprise, compromise wellbeing, and limit educational access (Enujeko & Aluko, 2015). For instance, children in several riverine and upland areas trek long distances to reach poorly equipped schools, a burden worsened during the rainy season when flooded roads become impassable. Many schools lack basic instructional materials, proper roofing, sanitation facilities, and consistent electricity to support modern pedagogy. Similarly, the health centers in these regions are under-resourced, with a chronic shortage of medical staff, drugs, and emergency transport services, resulting in preventable deaths and heightened morbidity rates among women and children (Izeogu, 2017). Water scarcity, exacerbated by pollution of traditional water sources due to oil spills, compels reliance on unsafe sources like streams and shallow boreholes, contributing to waterborne diseases that disrupt school attendance and productivity. The infrastructure deficit thus reflects more than just developmental neglect; it represents a structural exclusion that sustains poverty traps and obstructs any meaningful realization of inclusive education or employability empowerment. As the physical environment deteriorates, so too does the educational climate, where both pupils and teachers operate under demotivating conditions that undermine cognitive development and instructional effectiveness (Okoh, 2019).

Rural-Urban Migration

Rural-urban migration has emerged as a coping strategy for many young people in Ukwuani areas, driven largely by the absence of local employment opportunities, degraded ecosystems, and an overstretched informal sector. This migratory trend, while temporarily relieving the pressures of unemployment, generates new challenges for the communities left behind, such as the depletion of the labor force, the fragmentation of traditional family structures, and the erosion of indigenous cultural practices (Onyeonoru, 2016). The departure of the youth also weakens communal initiatives and reduces participation in local development projects, ultimately diminishing the region's human capital base. In the urban centers, migrants often face precarious employment, poor housing, and limited access to social services, leading to a cyclical movement between marginality in the city and despair in the village. Additionally, the educational implications of this migration are profound. Families fragmented by economic migration experience difficulties in sustaining consistent educational support for their children. Moreover, remittances are often insufficient to cover the rising costs of formal education in both rural and urban areas. The constant mobility further disrupts children’s schooling, especially when families move seasonally between work sites. Over time, this migration contributes to a shift in value systems, where traditional learning models and community-oriented educational values are displaced by survivalist mentalities centered on material acquisition and urban assimilation (Okumagba, 2015).

Land Tenure Conflicts

Land remains one of the most contentious resources in Ukwuani communities, not only due to its economic value but also because of its cultural, spiritual, and genealogical significance. The intrusion of external actors—particularly oil companies and government agencies—into local land tenure arrangements has generated intense conflict and dispossession. Traditionally, land was held communally under the custodianship of elders and family heads, who mediated access and use based on lineage ties and collective needs (Otite, 2017). However, the imposition of statutory land laws and the commodification of land under capitalist imperatives have disrupted these indigenous governance structures, facilitating land grabbing for exploration, road construction, and private agribusiness projects without due consultation or compensation. The result is a deepening of distrust between communities, corporations, and state actors, often leading to protests, legal disputes, and in some cases, violent confrontations. For farmers whose farmlands are arbitrarily seized or rendered infertile due to oil spills, the impact is immediate and generational, as livelihoods are destroyed, food systems collapse, and economic displacement becomes inevitable (Obi, 2016). The educational consequences of these conflicts are significant: as household incomes dwindle, children are withdrawn from school to support family subsistence or because fees become unaffordable. Moreover, displaced families often find themselves resettled in underserved areas with no schools or basic services, perpetuating cycles of illiteracy and socioeconomic stagnation.

EMPLOYABILITY CHALLENGES

Ukwuani communities face limited formal employment opportunities, with the oil sector offering few jobs for locals. A lack of vocational skills and a disconnect between education and market demands leave many youths underemployed. Additionally, gender inequality further restricts women's access to employment, compounding the region's employability challenges.

Limited Formal Employment Opportunities

Despite being situated within Nigeria's oil-rich region, Ukwuani communities face limited access to formal employment opportunities. The dominance of the petroleum industry in Ndokwa West and surrounding LGAs has not translated into meaningful employment for local youth. Oil companies such as Shell and Agip, operating within these territories, often import skilled labor from outside the communities, leaving indigenes in marginal positions (Okoh, 2020). Government employment initiatives designed to mitigate this imbalance frequently fall short due to favoritism, politicization of job quotas, and lack of transparency (Ekpu, 2019). This exclusionary pattern has perpetuated widespread disillusionment among educated youth, many of whom, despite possessing higher education credentials, remain unemployed or underemployed. The perceived disconnection between the presence of oil wealth and job scarcity further fuels community resentment and a sense of structural injustice.

Skills Mismatch

The disconnect between the educational system and labor market needs continues to deepen the employability crisis in the Ukwuani region. Many educational institutions, especially at the

secondary and tertiary levels, remain overly theoretical and poorly aligned with the technical and vocational skills required in emerging industries such as green energy, ICT, and agro-processing (Obasi, 2017). As a result, graduates often possess qualifications that do not meet the practical demands of employers, contributing to high levels of underemployment. Vocational training centers are either absent or ill-equipped, and efforts at curriculum reform are sporadic and uncoordinated (Akpan & Iyede, 2021). Consequently, the youth population finds itself ill-prepared for meaningful participation in both formal and entrepreneurial labor sectors, thus widening the economic dependency on oil companies for tokenistic or exploitative labor.

Informal Economy Dominance

In the absence of robust formal employment systems, a significant portion of the Ukwuani populace operates within the informal economy. Activities such as subsistence farming, petty trading, and motorcycle transport (popularly known as "okada") have become survival strategies for thousands of households (Efe, 2018). While these economic activities serve as buffers against complete unemployment, they provide minimal economic security and lack the structural support to facilitate upward mobility. Most workers in the informal economy have no access to pensions, healthcare benefits, or credit services, reinforcing cycles of poverty. Moreover, informal jobs are highly vulnerable to economic shocks and government crackdowns, particularly in urban centers where informal transport services are often outlawed or heavily taxed without alternatives provided.

Gender Inequality in Employment

Gender-based barriers to employment present another formidable challenge within Ukwuani communities. Women, particularly in rural areas, have significantly fewer opportunities for participation in the formal economy due to enduring cultural norms that restrict their mobility and autonomy (Anele, 2016). Patriarchal expectations often limit women to domestic roles, excluding them from technical, managerial, and industrial occupations. Female entrepreneurs, while active in the informal economy, frequently encounter obstacles such as lack of collateral for loans, limited access to training programs, and discrimination in market access (Ofuani, 2020). These gendered disparities in employment not only hinder community-wide economic development but also compromise broader efforts at social inclusion and equity.

EDUCATION CHALLENGES

In Ukwuani communities, inadequate school facilities, teacher shortages, and high dropout rates hamper educational progress. Economic difficulties, early marriages, and a colonial education system that neglects indigenous knowledge contribute to the challenges. These issues are compounded by a digital divide, preventing students from accessing modern educational resources:

Inadequate School Infrastructure

The education system in Ukwuani communities is undermined by severe infrastructural deficiencies. Many public primary and secondary schools operate in dilapidated buildings with

broken roofs, overcrowded classrooms, and limited teaching materials (Igbokwe, 2019). Some schools lack basic amenities such as furniture, water supply, or toilet facilities, which hampers both learning and hygiene. The absence of well-equipped laboratories, libraries, and ICT centers makes it nearly impossible to deliver quality education, especially in science and technology subjects. In several remote villages, students must travel long distances often on foot or by unsafe transport routes to attend the nearest secondary school, discouraging school attendance and completion.

Poor Teacher Quality and Shortage

Teacher-related issues constitute another critical bottleneck in the delivery of quality education in the region. Rural schools frequently suffer from chronic teacher shortages, exacerbated by poor remuneration, lack of housing, and unsafe working conditions (Enueme & Egwunyenga, 2015). These constraints deter qualified teachers from accepting or maintaining postings in rural schools, resulting in a reliance on untrained or underqualified personnel. Even where teachers are present, absenteeism remains high due to a lack of monitoring, poor transportation infrastructure, and disillusionment with the education system. These challenges directly compromise learning outcomes and widen the performance gap between rural and urban schools.

High Dropout Rates

High dropout rates, particularly among adolescents, pose a grave threat to the region's human capital development. Many students, especially boys, are forced to abandon schooling to engage in farming, fishing, or informal work in order to support their families, while girls often drop out due to early pregnancies, child marriages, or domestic responsibilities (Okoloko, 2021). These socioeconomic pressures are compounded by the hidden costs of education—such as uniforms, books, and transportation—which remain unaffordable for many low-income families despite nominally free education policies. The long-term consequence is a growing generation of youths who are excluded from the formal economy and civic engagement due to low educational attainment.

Colonial Legacy in Education System

The enduring legacy of colonial education remains a significant structural impediment to educational transformation in Ukwuani areas. The British colonial model introduced an education system designed to produce clerks and missionaries rather than critical thinkers or innovators capable of community-led development (Fafunwa, 1991). This legacy persists in current curricula, which often prioritize Western knowledge and norms over local histories, languages, and epistemologies. Indigenous knowledge systems—once transmitted through oral tradition, apprenticeship, and communal rituals—have been largely displaced by a Eurocentric syllabus that devalues traditional intelligence (Onwueme, 2022). This cultural disconnect alienates students from their heritage and undermines the relevance of education to their lived realities.

Digital Divide

The digital divide further exacerbates educational inequality across Ukwuani communities. Most schools lack computers, internet access, or trained ICT personnel, leaving students ill-prepared for participation in the global digital economy (Obah-Akpowoghaha, 2020). The COVID-19 pandemic exposed these vulnerabilities, as many students were unable to access online learning platforms due to technological and infrastructural barriers. The absence of digital literacy not only constrains academic achievement but also limits employability, innovation, and entrepreneurial potential. Without targeted investments in digital infrastructure and teacher training, the region risks being further marginalized in Nigeria's knowledge-driven economy.
Ukwuani communities face deep-seated socioeconomic, employment, and education challenges rooted in historical injustices and contemporary governance failures. Addressing these issues requires targeted interventions such as equitable resource distribution, skills development, infrastructure investment, and culturally relevant education reforms.

SOCIOCULTURAL DIMENSIONS OF ROI

The Return on Investment (ROI) in education within Ndokwa West, located in Delta State, Nigeria, is significantly influenced by sociocultural factors, including gender roles, religious institutions, and informal economic activities. These elements shape local perspectives on the value of education, often resulting in paradoxical outcomes for the community. The following exploration examines the gendered aspects of ROI, the role of religious institutions, and the informal economy's counter-narrative to the neoliberal education models prevalent in the region.

Gendered ROI in Ndokwa West

In Ndokwa West, traditional matrilineal structures were once central to community life and economic transactions, ensuring women played pivotal roles in family and community governance. However, the rise of patriarchal capitalism, particularly in the wake of oil exploration, has eroded these systems, limiting women's autonomy and reinforcing gendered economic inequality. The economic hardship caused by oil wealth concentration has led to increased child marriage rates as families grapple with poverty and insecurity. Ogunyemi, 2020) noted that the rise of patriarchal capitalism form economic pressures force many boys and especially girls out of school, contributing to high dropout rates. This economic situation reflects a deeper challenge to gendered ROI in education, as the community's shift towards market-driven models undermines indigenous practices that once empowered women, thus reinforcing existing gender disparities in education and employment.

Religious Institutions as Double-Edged Swords

Religious institutions, particularly Pentecostal and Islamic schools, play a significant role in shaping educational frameworks within Ndokwa West. These schools, while promoting religious values, often align with market-driven ROI models, emphasizing the need for vocational skills and financial independence. On one hand, Oluwaseun (2018) study revealed that religious education provides moral guidance and discipline, while on the other, it reinforces neoliberal education frameworks that prioritize economic productivity over holistic community

development. By blending faith-based teachings with market-driven education, these institutions contribute to the neoliberal project of human capital development, yet also present a counterpoint to secular, formal education systems by offering an alternative approach to the pursuit of ROI that balances spiritual and economic needs. This dual nature creates a complex dynamic where religious institutions may either challenge or reinforce the inequities fostered by the larger education system.

The Informal Economy as Counter-ROI

In Ndokwa West, the informal economy offers a viable alternative to formal education, often challenging the neoliberal ROI metrics that prioritize formal schooling as the sole path to economic success. A comparison between the economic and social status of Keke NAPEP drivers, who often earn a living through informal transport services, and university graduates, who struggle with underemployment, reveals the limitations of traditional educational paths in providing sustainable livelihoods (Alabi, 2020). Indigenous craft economies, such as pottery and weaving, also offer an alternative model of economic development, demonstrating that ROI in Ndokwa West is not solely derived from formal education or salaried employment. These alternative forms of labor, deeply rooted in local knowledge and practices, offer a more sustainable and culturally relevant route to economic and social mobility, underscoring the potential of the informal economy to provide counter-ROI to the formal educational and economic systems that dominate the region. Ananyi, Cheta-Maclean, and Ololube (2024) study provides foresights on the impact of social justice and credible leadership in the 21st century university leadership and management. Therefore, measuring the returns on educational growth and development within the Ukwani/Ndokwa communities metrics and call for a more inclusive and culturally sensitive approach.

FAILURES OF CURRENT INTERVENTIONS

The scholarship programs administered by agencies such as the Niger Delta Development Commission (NDDC) have been criticized for urban biases and elite capture, limiting their effectiveness in promoting equitable development across the Niger Delta region. These programs often favor students from urban centers, neglecting rural and marginalized communities where educational opportunities are scarce. Such urban-centric allocations are frequently influenced by political patronage, with beneficiaries selected based on connections rather than merit, perpetuating systemic inequality. According to Ayuba (2023), these issues specifically elite capture and the politicization of development efforts have weakened the impact of NDDC's initiatives, particularly in regions such as Bayelsa. This urban bias within scholarship distribution fails to address the educational needs of the broader population, hindering human capital development and reinforcing existing power imbalances that impede social mobility and regional progress.

Similarly, the Delta State 2025 empowerment programs, notably the M.O.R.E ICT-YEP program, have been criticized for favoritism and political bias in their approval and distribution processes, marginalizing rural areas (UNFGADA, 2025). Despite the program's potential to enhance digital literacy and equip youths with skills for the digital economy, its uneven distribution often serves elite interests rather than the broader community. Governor Oborevwori's proposed widows' empowerment program also faces challenges, as its success

depends on fair and equitable distribution, which has yet to be achieved. Corruption, mismanagement, and unclear responsibilities between agencies have contributed to the ineffectiveness of these interventions. To address these challenges, Akinyoade (2023) suggests the implementation of transparent selection processes, equitable distribution of resources, and genuine community involvement in decision-making. Ensuring that development initiatives are free from political manipulation and serve the interests of all communities, especially the marginalized, is crucial for achieving sustainable development and social justice in the Niger Delta.

Beyond Tokenism to Transformative Justice

The Ndokwa and Ukwuani communities in Delta State have long endured systemic neglect, with development efforts often manifesting as superficial or tokenistic interventions that fail to address the underlying structural issues. Despite being resource-rich areas, these communities grapple with inadequate infrastructure, poor educational facilities, and environmental degradation resulting from oil exploration activities. The Ndokwa Neku Union NNU (2024) has highlighted the dearth of infrastructure in Ndokwa East, Ndokwa West, and Ukwuani councils, noting that these areas have remained neglected since 1905, despite producing significant quantities of oil (Guardian News, 2021). Such token gestures not only fail to address the root causes of underdevelopment but also perpetuate a cycle of dependency and disenfranchisement.
To move beyond tokenism, it is imperative to adopt a transformative justice approach that seeks to rectify historical injustices through comprehensive, inclusive, and sustainable development strategies. This entails not only addressing immediate infrastructural deficits but also empowering local communities to actively participate in decision-making processes that affect their lives. For instance, UNFGDA (2025) solicits initiatives that prioritize the construction of schools, healthcare facilities, and roads should be complemented by programs that build the capacity of community members to manage and sustain these infrastructures. Furthermore, environmental remediation efforts must go beyond mere cleanup exercises to include measures that prevent future degradation and promote sustainable livelihoods. By fostering genuine partnerships between government agencies, oil companies, and local communities, and by ensuring that development initiatives are transparent, accountable, and responsive to the needs of the people, it is possible to break the cycle of neglect and build a foundation for lasting peace and prosperity in the Ndokwa and Ukwuani communities.

Grassroots Alternatives to Socioeconomic Development

Ndokwa West, a region in Delta State, Nigeria, has experienced significant socioeconomic growth driven by private sector investments and individual efforts. These contributions have primarily impacted education, cultural preservation, infrastructure, and community development. While these developments reflect the resilience and initiative of local people, they also highlight the limited support from government entities, which have historically overlooked the region in favor of other parts of Delta State. Through community-driven projects, the private sector, and local actors, Ndokwa West has seen progress in areas traditionally neglected by the state, providing essential services and fostering local economic development.

Learning Ukwuani Language and Cultural Preservation

The Ukwuani Learning Hub (ULH) stands at the forefront of preserving and promoting the Ukwuani language and culture, which are integral components of the identity of the Ndokwa people. ULH is a non-profit initiative, based in both Nigeria and the United Kingdom, that is committed to ensuring the survival of the Ukwuani language through active language training and linguistic research. The Hub is also involved in translating and documenting indigenous folklore, alongside partnerships with volunteers and local policymakers (Ukwuani Language Hub, 2024). Language is a powerful symbol of identity and culture, and the ULH's mission aligns with broader efforts to preserve the region's heritage. Through its advocacy, ULH has been engaging with communities and stakeholders to secure the future of the Ukwuani language while positioning it as a vital aspect of the region's social fabric.

Private Sector Initiatives

Private sector investments have also significantly contributed to the growth of Ndokwa West. One of the most prominent examples is the development of the Kwale Gas Gathering Hub, a major energy project in the region. This facility, valued at 300 million standard cubic feet per day (MMscf/d), aims to harness natural gas resources to power local industries, improve energy supply, and generate job opportunities for the people of Ndokwa West (The Electricity Hub, 2024). The gas hub is positioned as a key player in transforming the local economy by promoting energy security, industrial growth, and technological innovation. It underscores the potential of the private sector to address some of the energy challenges faced by the region, creating a ripple effect on other aspects of local economic activity. As the private sector and local communities continue to lead development initiatives, it is imperative that the government recognizes the value of these efforts and works in tandem with these stakeholders to address the persistent challenges facing Ndokwa West.

Community Development Projects

Indigenous community development initiatives have also been crucial in improving the livelihoods of people in Ndokwa West. Women's participation in community-led projects, particularly in the Ndokwa agricultural zone, has been instrumental in fostering sustainable development. These initiatives focus on improving agricultural practices, enhancing resource management, and promoting entrepreneurial skills among the community members (JSTOR, 2024). Furthermore, local development projects, such as the construction of infrastructure and the promotion of small-scale enterprises, have provided alternative economic opportunities for the people, demonstrating the capacity of grassroots movements to effect positive change. These projects reflect a strong sense of community cohesion and a commitment to addressing local needs through collective action, often bypassing bureaucratic inefficiencies. Ololube, Cheta-Maclean and Ananyi (2024) study offered strategies and impact of infrastructure development for empowerment and inclusion in Nigerian public universities. Notwithstanding the significant efforts of the private sector and local individuals, Ndokwa West continues to face neglect from the Delta State government.

The Ndokwa Neku Union (NNU) has presented comprehensive development plans that include initiatives such as establishing a modular refinery and advocating for the creation of a

federal polytechnic in Kwale (ThisDay Live, 2024). However, these proposals often face political and bureaucratic challenges, which hinder their successful implementation. The lack of governmental support underscores the need for a more responsive and inclusive approach to development in Ndokwa West. Although private and individual efforts have made a meaningful impact, they cannot replace the role of the government in ensuring sustainable growth and addressing the region's systemic challenges.

A Call for Actionable Pathways

The reparative education framework focuses on addressing historical injustices, particularly in postcolonial contexts like the Niger Delta, where resource extraction and marginalization have long impacted indigenous communities. This framework advocates for integrating indigenous knowledge systems (IKS), participatory governance, and ecological reparations in educational policies and practices to foster social equity, economic justice, and environmental restoration. In regions like Ndokwa West LGA, these strategies offer transformative potential for healing, empowerment, and sustainable development by recognizing local knowledge and engaging communities in the decision-making processes that shape their future. So, to say, the integration of indigenous knowledge, participatory governance, and ecological reparations provides a holistic approach to addressing historical injustices in the Niger Delta. By reforming curricula, fostering community-driven governance, and promoting ecological sustainability, these strategies empower local communities and contribute to the region's socio-economic and environmental healing. While the study has highlighted critical issues related to education and ecological reparations in the Niger Delta, several key areas remain underexplored and warrant further investigation to deepen understanding and inform effective strategies. These areas present opportunities for research to shape practical recommendations and influence policy and practice. They offer actionable insights for policymakers and educators, ensuring that future generations can build a more just and sustainable society.

CONCLUSION

In conclusion, the true return on investment in education transcends economic metrics, focusing instead on healing historical trauma and restoring cultural dignity. For the Ndokwa Nation and Delta State at large, the real value lies in an education system that acknowledges past injustices, empowers communities through indigenous knowledge, and promotes sustainable practices that directly address the challenges of resource extraction. The integration of decolonial education frameworks, participatory governance, and ecological reparations offers an actionable path to eradicate the hardships that have long plagued these communities. By embracing these transformative strategies, Ndokwa West has the potential to serve as a global model for decolonial education praxis, demonstrating how education can be a tool for societal healing, cultural revitalization, and environmental restoration. This model would not only benefit the Niger Delta region but could also inspire similar movements across postcolonial societies worldwide, showing that education, when rooted in local knowledge and community-driven solutions, can truly reshape the future for generations to come.

IMPACT OF MERIT-BASED PAY ON TEACHER MOTIVATION AND EFFECTIVENESS

Chioma Vivian MADUAGUM
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

Merit-based pay (MBP) has emerged as a controversial yet widely debated strategy to enhance teacher motivation and effectiveness. This study examines the impact of MBP systems on educators, analyzing whether performance-linked compensation improves classroom outcomes. Proponents argue that MBP incentivizes excellence, rewards high-performing teachers, and fosters a results-driven culture. Critics, however, contend that it may create competition over collaboration, reduce intrinsic motivation, and rely on flawed evaluation metrics. Empirical evidence suggests mixed outcomes. Some studies indicate that MBP can boost teacher effort and student achievement, particularly in high-stakes testing environments. Conversely, other research highlights unintended consequences, such as stress, inequity in resource distribution, and teaching-to-the-test behaviors. Teacher motivation appears influenced by both financial rewards and professional recognition, though long-term effectiveness depends on fair, transparent evaluation systems. The study concludes that while MBP has potential to enhance teacher performance, its success hinges on balanced implementation. Policymakers must address measurement biases, ensure equitable access to growth opportunities, and integrate non-monetary incentives like professional development. Further research is needed to assess MBP's sustainability and its broader impact on educational equity.

Keywords: Merit-based Pay, Teacher Motivation, Effectiveness, Performance Incentives, Education Policy.

INTRODUCTION

Teachers play a crucial role in shaping the future, yet education systems worldwide struggle to keep them motivated and effective. One strategy that has gained attention is merit-based pay (MBP), a system where teacher salaries or bonuses are tied to performance metrics. The idea is simple: reward good teaching to encourage better outcomes. But does it really work? The debate over MBP is intense, with supporters claiming it boosts effort and student achievement, while critics argue it creates stress, unfair competition, and narrow teaching focused only on test scores. Understanding how MBP affects teacher motivation and effectiveness is essential for designing policies that improve education without unintended harm.

Proponents of MBP argue that linking pay to performance incentivizes teachers to work harder and innovate in the classroom. Studies have shown that financial rewards can increase teacher effort, particularly in subjects like math and science where measurable outcomes are easier to track (Dee & Wyckoff, 2015; Springer et al., 2010). When teachers know their performance directly impacts their earnings, they may invest more time in lesson planning, student feedback, and professional development. Some evidence suggests that well-designed MBP systems can lead to modest gains in student test scores, especially in low-performing schools (Fryer, 2013; Muralidharan & Sundararaman, 2011).

However, critics warn that MBP can backfire if not carefully implemented. Teaching is a complex profession, and reducing performance to a few measurable outcomes - like standardized test results may ignore other important aspects of education, such as critical thinking, creativity, and social-emotional learning (Baker et al., 2010; Marsh et al., 2021). Teachers in disadvantaged schools often face challenges beyond their control, such as student poverty and limited resources, making it unfair to judge them by the same metrics as those in well-funded schools (Harris, 2020). Additionally, excessive focus on test scores may lead to "teaching to the test," where educators prioritize exam preparation over deeper learning (Koretz, 2017).

Teacher motivation is another critical factor. While financial incentives might drive short-term effort, they may not sustain long-term passion for teaching. Intrinsic motivation - the desire to teach because it is meaningful can diminish if rewards feel manipulative or unattainable (Ryan & Deci, 2017). Some studies suggest that collaboration and supportive school environments have a stronger impact on teacher satisfaction and effectiveness than pay-for-performance schemes (Kraft et al., 2020). If MBP creates a competitive atmosphere where teachers hoard strategies rather than sharing them, overall school improvement could suffer (Johnson et al., 2012).

Given these complexities, policymakers must carefully design MBP systems to maximize benefits while minimizing drawbacks. Transparent evaluation methods, fair benchmarks, and support for professional growth are essential to ensure that merit pay motivates rather than discourages teachers (Podgursky & Springer, 2020). The goal should be fostering an environment where teachers feel valued, empowered, and fairly compensated - not just financially rewarded for narrow achievements. This discussion examines the impact of merit-based pay on teacher motivation and effectiveness, drawing on recent research to assess its potential benefits and risks. The evidence suggests that while MBP can be a useful tool in education reform, its success depends on thoughtful implementation that considers the diverse needs of teachers and students.

THEORETICAL FOUNDATION

This paper is anchored on Expectancy Theory (Vroom, 1964)

Expectancy Theory, developed by Vroom (1964), explains motivation as a process shaped by three key factors: expectancy, instrumentality, and valence. Expectancy refers to the belief that effort will lead to desired performance, instrumentality is the perception that performance will result in a reward, and valence is the value an individual places on that reward. When applied to merit-based pay for teachers, the theory suggests that financial incentives will only motivate if educators believe their extra effort improves student outcomes (expectancy), trust that strong

performance will be fairly rewarded (instrumentality), and value the monetary bonus or recognition (valence) (Parijat & Bagga, 2014).

Recent studies show that merit pay systems often fail because one or more of these components are weak. For instance, if teachers doubt the accuracy of performance evaluations - such as those based heavily on standardized test scores their expectancy diminishes, reducing motivation (Dee & Wyckoff, 2015). Similarly, if rewards are inconsistently distributed or perceived as insignificant, instrumentality and valence suffer (Marsh et al., 2021). Research also suggests that extrinsic rewards like merit pay may crowd out intrinsic motivation when teachers feel controlled rather than empowered (Ryan & Deci, 2017). For merit-based pay to succeed, policymakers must ensure transparent performance metrics, credible reward systems, and meaningful incentives. Without these elements, expectancy gaps undermine the policy's effectiveness (Podgursky & Springer, 2020).

Relevance of Expectancy Theory to Merit-Based Pay in Education

Expectancy Theory provides a valuable framework for examining merit-based pay's impact on teacher motivation and effectiveness. The theory's three components - expectancy (effort-performance belief), instrumentality (performance-reward connection), and valence (reward value) directly apply to performance-based compensation systems in education. Teachers must believe their increased effort will lead to measurable improvements in student outcomes, trust that evaluations will accurately reflect their performance, and value the financial incentives offered. When these conditions are met, merit pay can potentially enhance motivation and teaching quality (Dee & Wyckoff, 2015).

However, challenges emerge when any component weakens. If teachers question the fairness of evaluation metrics or doubt reward distributions, motivation may decrease rather than improve (Marsh et al., 2021). The theory helps explain why some merit pay initiatives succeed while others fail, emphasizing the need for transparent, credible systems that align teacher expectations with performance incentives (Podgursky & Springer, 2020).

CONCEPTUAL UNDERPINNING

Merit-based pay

Merit-based pay, also known as pay-for-performance, is a compensation system where employees receive financial rewards based on their individual performance and contributions to an organization. This approach contrasts with fixed salary structures or seniority-based raises, as it directly ties earnings to measurable achievements, such as meeting sales targets, completing projects, or exceeding performance evaluations. Employers often adopt merit pay to motivate employees, align individual efforts with organizational goals, and retain top talent.

The concept of merit pay has evolved significantly since its early implementation in the U.S. in 1908, when it was first introduced for teachers in Newton, Massachusetts. Modern applications vary across industries, including salary increases, annual bonuses, spot rewards, and profit-sharing programs. For instance, sales roles frequently use commission-based structures, while corporate environments may link annual raises to performance reviews. Mercer's 2023 Compensation Planning Survey noted that average merit increases in 2024 are projected at 3.5%, reflecting a cautious approach amid economic uncertainties.

Proponents argue merit pay enhances productivity by incentivizing employees to excel. A transparent system fosters trust, as workers understand how their performance impacts earnings. Organizations with merit-based structures often report higher engagement, as employees perceive a direct correlation between effort and reward. Additionally, such systems help identify high performers, enabling targeted retention strategies and reducing turnover among top talent.

Critics, however, raise concerns about fairness and subjectivity in performance evaluations. Biases, whether conscious or unconscious, may influence assessments, leading to disparities in rewards. Some employees may prioritize short-term goals over long-term collaboration, potentially harming teamwork. Furthermore, merit pay can create stress, particularly when budgets constrain raises, leaving employees feeling undervalued despite strong performance.

To mitigate these challenges, experts recommend clear performance metrics, regular feedback, and calibration sessions to ensure consistency. Incorporating equity-focused adjustments, such as market-based salary reviews, can address pay compression and internal disparities. While merit pay is not universally applicable, its effectiveness depends on organizational culture, transparency, and alignment with broader business objectives.

CHARACTERISTICS OF MERIT-BASED PAY

Merit-based pay is characterized by the following:

Performance-Linked Compensation

Merit-based pay systems are structured around the principle that employee compensation should reflect individual performance. Rather than relying solely on tenure, educational qualifications, or fixed salary scales, these systems provide financial incentives based on measurable achievements. In education, for example, merit pay may be tied to student test score improvements, classroom observation ratings, or contributions to school development (Podgursky & Springer, 2011). This structure aims to motivate employees to improve their productivity and align their actions with institutional goals. The performance criteria used in such systems must be clearly defined, transparent, and relevant to the specific job functions.

Use of Evaluation Metrics

A defining feature of merit-based pay is its reliance on systematic performance evaluation metrics. These metrics can include quantitative indicators such as output levels, customer satisfaction scores, student learning gains, or efficiency ratings, as well as qualitative assessments such as peer reviews, supervisor evaluations, and self-assessments (Darling-Hammond et al., 2012). The effectiveness of merit-based pay depends heavily on the reliability and fairness of these evaluation tools. Inaccurate or biased metrics may lead to disputes, decreased morale, and reduced trust in the system. For this reason, multiple measures are often recommended to capture a more complete picture of employee contributions and mitigate the risks associated with a single data point.

Differentiated Rewards

Merit-based pay structures allow for differentiation in compensation based on varying levels of performance. High performers receive higher financial rewards, recognition, or career advancement opportunities, while average or low performers may receive less or no additional compensation. This creates a tiered reward system that can stimulate competition and productivity among employees (Peters, Godfrey & King, 2022). In practice, such differentiation must be handled carefully to avoid resentment or perceptions of favoritism. Clear communication and consistent application of standards are essential to maintain fairness and organizational cohesion. Where implemented successfully, differentiated rewards can serve as powerful motivators and reinforce a performance-oriented work culture.

Incentive for Continuous Improvement

Merit-based pay systems are intended to encourage ongoing improvement rather than reward one-time achievements. Employees are motivated to set goals, seek professional development, and innovate in their roles to remain competitive and earn rewards. In education, this might involve teachers engaging in continuous training, adopting new instructional methods, or contributing to school leadership activities (Deci, Olafsen & Ryan, 2017). The system thus acts as both a reward and a developmental tool. To sustain this function, institutions must provide opportunities for growth, mentorship, and feedback. Without support structures in place, the long-term benefits of merit-based pay may be limited, and staff motivation may decline.

TEACHER MOTIVATION

Teacher motivation plays a crucial role in shaping educational outcomes, influencing both instructional quality and student engagement. Intrinsic motivation, where teachers find personal satisfaction in teaching, often leads to greater persistence and deeper information processing compared to extrinsic motivators like rewards or external pressures. Teachers' who adopt mastery goals, focusing on skill development rather than performance comparisons, tend to create more supportive learning environments that encourage students to view mistakes as opportunities for growth. The expectations teachers hold for their students can also create self-fulfilling prophecies, where high expectations foster better learning opportunities while low expectations may hinder progress.

Professional development programs significantly impact teacher motivation, particularly when they emphasize autonomy, practical relevance, and collaboration. High-quality online professional development (OPD) enhances engagement by providing structured, cognitively stimulating, and applicable learning experiences. Teachers with lower initial motivation may still engage effectively if the OPD offers meaningful collaboration opportunities, suggesting that well-designed programs can compensate for motivational gaps. Additionally, teachers' willingness to participate in continuous learning is influenced by personal factors such as self-efficacy and prior learning experiences, as well as school-level factors like administrative support and workload pressures.

Cultural and contextual differences further shape teacher motivation. For instance, Spanish physical education teachers exhibit higher intrinsic motivation compared to their Lithuanian counterparts, who rely more on extrinsic motivators. Teaching styles also correlate

with motivation; intrinsically motivated educators often adopt student-centered approaches, while extrinsically motivated teachers may prefer rigid, instructor-led methods. In agricultural education, intrinsic factors such as personal fulfillment and altruistic motivations drive teachers more than extrinsic rewards, though both play a role in retention and job satisfaction.

Effective goal-setting strategies can enhance teacher motivation by emphasizing short-term, specific, and moderately challenging objectives rather than distant or overly ambitious ones. Regular feedback and opportunities for self-assessment help maintain motivation by allowing teachers to track progress and adjust strategies. The interplay between teacher motivation and professional growth underscores the need for supportive policies and tailored development programs that address both individual and systemic influences.

TEACHER EFFECTIVENESS

Teacher effectiveness plays a pivotal role in shaping student learning outcomes and overall educational quality. Effective teachers employ structured instructional strategies, such as clear lesson organization, modeling problem-solving techniques, and fostering interactive classroom environments. These practices align with dimensions of the Dynamic Model of Educational Effectiveness (DMEE), which emphasizes the importance of questioning techniques and managing student behavior to maintain productive learning atmospheres. Student evaluations often reveal that teachers who excel in these areas create more engaging and supportive classrooms, though such assessments may be limited by sample size and cultural context.

The measurement of teacher effectiveness frequently incorporates multiple evaluation methods, including classroom observations, student performance data, and peer assessments. Value-added models (VAMs) have gained prominence for quantifying teachers' contributions to student achievement growth, though debates persist about their reliability in isolating teacher impact from external factors. Combining VAMs with qualitative measures, such as structured classroom observations, provides a more holistic understanding of teaching quality. For instance, teachers who consistently demonstrate clarity in explanations and adaptability in addressing diverse learning needs tend to yield higher student achievement gains.

Professional development programs significantly enhance teacher effectiveness by addressing both pedagogical skills and subject-matter expertise. High-quality training that incorporates practical classroom applications and collaborative learning opportunities helps teachers refine their instructional techniques. Programs emphasizing mastery of content and evidence-based teaching strategies are particularly impactful, as they enable educators to tailor instruction to students' varying abilities. Mentorship and feedback mechanisms further strengthen teaching practices, with experienced peers providing actionable insights for improvement.

Cultural and institutional contexts also influence teacher effectiveness. In special education settings, for example, teachers adapt general pedagogical principles to meet individualized student needs, often employing differentiated instruction and behavioral support strategies. Cross-cultural studies reveal variations in teaching styles, with some educators prioritizing student-centered approaches while others rely on direct instruction. Systemic support, including adequate resources and manageable workloads, is essential for sustaining effective teaching practices across diverse educational environments

PERFORMANCE INCENTIVES

Performance incentives serve as strategic tools designed to improve productivity, motivation, and goal alignment across different sectors, particularly in education, corporate organizations, and public service. These incentives may be financial, such as bonuses and merit pay, or non-financial, such as recognition awards, career advancement opportunities, or flexible work conditions. Performance incentives are predicated on the principle that individuals tend to exert more effort when rewards are contingent upon their achievements or efficiency levels (Deci, Olafsen & Ryan, 2017). In the education sector, for instance, performance incentives have been used to reward teachers for improvements in student outcomes, classroom effectiveness, and compliance with professional development plans.

In organizational contexts, performance incentives are essential in driving employee engagement, improving retention rates, and fostering a results-driven culture. A well-designed incentive scheme connects employee goals with organizational objectives and encourages the pursuit of excellence. According to Lee and Raschke (2016), employees who perceive the incentive system as fair and transparent show increased levels of job satisfaction and commitment. However, there is a risk of promoting unhealthy competition or gaming of performance metrics if the incentives are poorly structured or not aligned with long-term goals (Peters et al., 2022).

Non-monetary incentives also play a critical role in fostering intrinsic motivation. Rewards such as public recognition, personal growth opportunities, and constructive feedback often encourage sustained performance, particularly in roles where intrinsic values and purpose-driven work dominate (Frey & Osterloh, 2012). In teaching, non-financial incentives such as mentoring programs and leadership responsibilities have shown to improve morale and reduce attrition (Podgursky & Springer, 2011).

Successful implementation of performance incentives requires a robust evaluation system that captures both qualitative and quantitative metrics. Transparency, equity, and stakeholder involvement in the design and implementation of such systems can enhance trust and drive desired behaviours (Jiang et al., 2012). Furthermore, context-specific factors such as cultural attitudes, institutional structure, and resource availability must be considered in tailoring incentive schemes. When appropriately aligned, performance incentives can transform work environments and significantly impact institutional outcomes.

FROM STANDARD SALARIES TO PERFORMANCE METRICS: A PARADIGM SHIFT

The transition from traditional standard salary systems to performance-based metrics reflects a significant transformation in organizational management, particularly in education, public service, and the corporate world. Standard salaries, typically based on years of experience, academic qualifications, and rank, have long been the norm, especially in public sector employment. This model, while consistent and predictable, has often been criticized for ignoring the actual productivity or impact of employees (Podgursky & Springer, 2011). As global institutions face increased demands for accountability, efficiency, and measurable outcomes, a shift toward performance-based compensation has emerged as a strategic response to improving employee output and institutional results.

Performance-based metrics introduce a system where remuneration and advancement are tied to quantifiable results, such as student academic progress, project completion rates, customer satisfaction, or financial performance. This shift aligns employee behavior with organizational goals, encouraging a culture of responsibility and measurable contribution. In education, for instance, teacher effectiveness is increasingly linked to student achievement, professional development, and classroom evaluations rather than solely on tenure or qualifications (Hanushek & Rivkin, 2012). This change has generated discussions around fairness, motivation, and the ability of performance metrics to accurately capture the complexities of professional roles.

Supporters of this shift argue that performance-based models foster innovation, accountability, and higher work standards. Employees who understand the expectations and metrics tied to rewards are more likely to take ownership of their roles. Financial incentives and recognition also serve as motivators, particularly in competitive and goal-oriented environments (Deci, Olafsen & Ryan, 2017). However, the design and implementation of such systems require caution. Metrics that focus narrowly on quantifiable results may encourage superficial compliance, neglect holistic job performance, or create unhealthy competition (Peters et al., 2022).

In public service settings, such as healthcare or education, overreliance on metrics may also ignore contextual factors like resource limitations, socio-economic challenges, or student demographics. These concerns necessitate a balanced approach that incorporates both quantitative performance indicators and qualitative evaluations. According to Frey and Osterloh (2012), intrinsic motivation can be undermined when external rewards become dominant, especially in roles traditionally driven by purpose, such as teaching or social work.

Transitioning to performance metrics demands strong leadership, stakeholder engagement, and transparency. Employees need to understand how their performance is assessed and how it links to rewards. Trust in the system is critical. Where employees view the system as biased or opaque, morale and cooperation can suffer (Lee & Raschke, 2016). Institutions must also invest in training evaluators, developing valid performance tools, and ensuring that performance assessments are fair, comprehensive, and context-sensitive.

In sum, the paradigm shift from standard salaries to performance metrics represents a broader movement toward outcome-driven management. While it offers opportunities for improvement and innovation, it also brings challenges that require thoughtful policy design and ethical considerations. As more organizations adopt this model, ongoing evaluation, refinement, and stakeholder feedback will be essential in ensuring its effectiveness and sustainability.

GLOBAL MODELS OF PERFORMANCE-BASED COMPENSATION

United States: Accountability-Driven Pay Structures

In the United States, performance-based compensation has become central to educational and corporate reforms. One widely adopted model is the merit-pay system for teachers, where financial rewards are linked to student test scores, classroom evaluations, and other performance metrics (Springer et al., 2010). Programs such as the Teacher Incentive Fund and Race to the Top have incentivized states to implement value-added models (VAM) to assess teacher effectiveness. However, critics argue that VAM may oversimplify complex educational dynamics and pressure teachers to "teach to the test" (Darling-Hammond et al., 2012). In corporate settings, performance-based bonuses are typically tied to individual, team, or

organizational targets. Stock options, commissions, and productivity-linked pay structures are common, especially in sales and technology sectors (Gerhart & Fang, 2015). The U.S. model emphasizes measurable outcomes and accountability, although it often raises debates about fairness, reliability, and long-term impact on motivation.

Finland: Emphasis on Professional Autonomy and Collective Growth

Finland takes a markedly different approach by focusing on professional development and collective responsibility rather than individual financial rewards. Teachers, for instance, are salaried based on national agreements, with little variation for performance-based bonuses. The Finnish system is rooted in trust, autonomy, and intrinsic motivation (Sahlberg, 2011). Rather than performance pay, schools invest in continuous training, peer collaboration, and high entry standards into the teaching profession. This model aims to foster intrinsic motivation and professional accountability without the pressure of external rewards. Finnish corporations also tend to favor team-based performance evaluations and bonuses over individualistic assessments (Vartiainen, 2012). The collective orientation supports social cohesion and work-life balance, which are seen as essential to sustained performance.

China: Competitive Incentives within Centralized Structures

In China, performance-based compensation is embedded within a broader culture of central planning and strong state oversight. In public education, teachers' bonuses are tied to student academic results, teaching evaluations, and attendance. The structure is competitive, with high-performing teachers often receiving public recognition and monetary incentives (Li & Ni, 2016). This approach aligns with China's educational emphasis on examination performance. However, it can contribute to excessive student pressure and narrowed curricular focus. In the corporate world, especially in tech and manufacturing sectors, performance-based bonuses, quarterly targets, and efficiency benchmarks are aggressively pursued. Firms offer structured incentives and promotions based on output, profit contribution, and innovation (Zhu & Warner, 2019). The Chinese model rewards measurable outcomes and competition but often at the expense of worker wellbeing.

Nigeria: Emerging Practices and Structural Challenges

Nigeria has adopted elements of performance-based compensation, especially in donor-supported education and public service reforms. Programs funded by international partners, such as the World Bank and DFID, have introduced incentive schemes aimed at improving teaching effectiveness and public sector accountability (Ogunyemi & Okebukola, 2021). However, implementation is often hampered by infrastructural gaps, political interference, and lack of reliable performance data. In many public institutions, salary structures remain standardized, and reward systems lack transparency. The private sector, particularly in telecommunications and banking, increasingly uses performance-based bonuses, sales targets, and promotion-linked KPIs to drive productivity (Adewale & Anthonia, 2013). Nonetheless, inconsistencies in evaluation methods and employee distrust in the fairness of assessments hinder optimal results. The Nigerian model reflects a hybrid system still in transition, where performance pay gains traction but faces systemic limitations.

MERIT-BASED PAY AND TEACHER MOTIVATION: A DOUBLE-EDGED SWORD

Merit-based pay systems have been introduced in various educational contexts as a strategy to improve teaching effectiveness and student achievement. These systems reward teachers based on their performance, typically measured through student test scores, classroom observations, or contributions to school improvement initiatives. While proponents argue that such systems incentivize excellence and align teacher efforts with educational goals, critics warn that they may have unintended consequences that undermine teacher morale, collaboration, and long-term commitment to the profession.

Teachers often enter the profession motivated by a sense of purpose and commitment to student development rather than financial incentives. When merit-based pay becomes the primary measure of success, it can shift focus from holistic teaching practices to narrow metrics, particularly standardized test outcomes. This shift may result in teaching to the test, neglect of non-tested subjects, and reduced attention to individual student needs (Springer et al., 2010). In high-stakes environments, teachers may feel pressured to prioritize short-term gains over long-term educational growth, leading to burnout and decreased job satisfaction (Li & Ni, 2016).

The perception of fairness in merit-based pay systems significantly influences their impact on teacher motivation. Teachers who believe that evaluations are biased or fail to capture the full scope of their work may feel undervalued, resulting in decreased motivation and resistance to institutional goals. Evaluation tools that overemphasize test scores can marginalize teachers working with students from disadvantaged backgrounds, where academic progress may be slower due to external challenges (Darling-Hammond et al., 2012). In such contexts, merit-based systems risk reinforcing inequalities rather than addressing them.

On the other hand, when thoughtfully designed, merit-based pay can reinforce professional growth and reward dedication. Programs that combine multiple measures; such as student learning gains, peer reviews, classroom practices, and professional development are more likely to be perceived as legitimate and motivational (Podgursky & Springer, 2011). Transparent processes, clear expectations, and opportunities for teacher input can also enhance the credibility of these systems and foster greater acceptance. In some settings, performance incentives have contributed to reduced absenteeism and increased engagement, particularly when coupled with supportive leadership and collaborative school cultures (Peters, Godfrey & King, 2022).

However, sustaining motivation requires more than financial incentives. Teachers value autonomy, respect, recognition, and opportunities for career advancement. When merit-based systems ignore these factors, they may fail to cultivate lasting motivation or improve teaching quality. Intrinsic motivators often hold more weight in professional commitment than extrinsic rewards, especially in emotionally demanding professions such as teaching (Deci, Olafsen & Ryan, 2017). Thus, a balanced approach that integrates fair performance metrics with supportive working conditions is essential for maximizing the benefits of merit-based pay while minimizing its risks.

INFLUENCE OF MERIT PAY ON TEACHING EFFECTIVENESS AND CLASSROOM PRACTICE

Merit pay has emerged as a performance-based incentive aimed at improving teaching effectiveness and student outcomes through monetary rewards tied to teacher performance. This system links compensation to classroom achievements, student academic progress, teacher

evaluations, or other quantifiable outputs. In theory, it motivates teachers to improve instructional quality, adopt innovative pedagogical strategies, and invest more effort in their professional development. However, the influence of merit pay on teaching effectiveness and classroom practice is complex, revealing both opportunities and limitations.

When financial rewards are tied to performance, teachers may feel incentivized to improve their instructional methods, manage classrooms more effectively, and align their practices with institutional goals. Performance pay systems have the potential to foster increased effort and accountability, particularly in settings where other forms of recognition are lacking. Some studies suggest that well-structured merit pay programs can lead to modest improvements in student achievement, particularly when they include multiple measures of performance such as classroom observations, peer reviews, and student growth metrics (Springer et al., 2010). Teachers receiving additional pay based on results may also be more likely to participate in training programs and seek professional growth, which contributes to better teaching outcomes over time (Podgursky & Springer, 2011).

In practice, however, merit pay may distort teaching objectives, especially when tied narrowly to standardized test scores. Teachers may shift their focus toward subjects and content areas that are tested, reducing time spent on creative, moral, or collaborative learning. The narrowing of curriculum to meet performance targets may limit student engagement and holistic development. Additionally, teachers working in challenging environments may find it harder to demonstrate measurable student gains, which can affect their compensation unfairly. This creates a risk of disincentivizing teachers from working with underperforming or disadvantaged students (Darling-Hammond et al., 2012).

Merit pay can also affect collaboration among educators. When competition for financial rewards is introduced, peer support and collective planning may decrease. Teachers may become less inclined to share resources or instructional strategies, fearing that others may outperform them in evaluation metrics. This can weaken the collegial environment necessary for effective teaching and school improvement. Moreover, when merit pay lacks transparency or is perceived as inconsistent, trust in the system deteriorates. Teachers may view evaluation tools as subjective or politically influenced, reducing motivation and increasing job dissatisfaction (Peters et al., 2022).

On the other hand, when merit pay is embedded in a system that values holistic teaching practices and offers support for professional development, it can promote positive changes in classroom behavior. Teachers may adopt more reflective teaching practices, experiment with student-centered approaches, and engage more actively in assessment strategies that drive learning outcomes. Programs that balance financial incentives with mentorship, feedback, and instructional support are more likely to improve both teaching quality and classroom experience (Deci, Olafsen & Ryan, 2017). The effectiveness of merit pay in transforming classroom practice depends on how well the system is designed, perceived, and integrated with broader educational goals. A narrow focus on test-based outcomes may compromise teaching integrity, while a comprehensive approach that values multiple dimensions of teaching is more likely to foster meaningful change.

EQUITY, FAIRNESS, AND CONTROVERSIES SURROUNDING MERIT-BASED COMPENSATION

Merit-based compensation has been adopted in various sectors, including education and public service, as a mechanism to enhance performance, reward productivity, and drive accountability. This model links employee remuneration to quantifiable outcomes such as student achievement, project delivery, or organizational growth. Although the system is intended to incentivize excellence, concerns related to equity, fairness, and its broader implications continue to generate debate. Merit pay systems are often built on the assumption that performance can be objectively measured and fairly rewarded. In practice, however, subjective biases, systemic inequalities, and contextual challenges frequently distort outcomes.

One significant concern relates to the equity of applying uniform performance standards to diverse environments. Teachers working in under-resourced schools, for example, often serve students facing socio-economic barriers that hinder academic achievement. These educators may put in extraordinary effort, yet their students' test scores - commonly used in merit-based evaluations may not reflect the teachers' true impact. As a result, merit pay structures can penalize those who work in challenging conditions, widening inequalities across schools and discouraging service in marginalized communities (Darling-Hammond et al., 2012). This undermines the principle of equity, as it fails to account for the broader structural factors that influence performance outcomes.

The fairness of evaluation tools used in merit-based systems is also contested. Metrics such as standardized test scores, student attendance, or administrative assessments are often narrow in scope and may not capture the full range of professional responsibilities. For instance, the value-added models frequently used in education have been criticized for statistical instability and limited ability to distinguish between effective and ineffective teaching (Springer et al., 2010). Teachers and other professionals often argue that their contributions to student well-being, mentorship, extracurricular engagement, or community service are overlooked in performance calculations, leading to frustration and loss of morale.

Controversies also arise when performance data is perceived as manipulated or influenced by politics, favoritism, or inadequate oversight. In some cases, employees report that rewards are distributed based on personal relationships with supervisors or institutional biases rather than genuine merit. This perception erodes trust and can foster workplace resentment. Moreover, when employees feel that they are competing against one another for a limited pool of rewards, collaboration may diminish, and unhealthy work cultures can develop (Peters et al., 2022). These dynamics conflict with organizational values that rely on teamwork, mutual support, and shared success.

Critics further argue that tying compensation too closely to performance may diminish intrinsic motivation, particularly in professions driven by altruism, such as teaching and caregiving. Financial incentives may shift attention from long-term professional growth and student development to short-term outcomes aimed at satisfying evaluation criteria (Deci et al., 2017). Instead of encouraging authentic engagement, merit pay may contribute to strategic behavior such as focusing only on measurable tasks while neglecting broader educational or organizational goals. As institutions adopt merit-based compensation systems, addressing these issues of equity and fairness is essential. Transparent evaluation methods, multiple sources of performance data, and inclusive policy design can help ensure that merit pay motivates rather than marginalizes.

CHALLENGES OF IMPLEMENTING MERIT-BASED PAY IN SCHOOLS

Implementing merit-based pay in schools is faced with these challenges:

Inadequate Evaluation Systems

One of the major obstacles in implementing merit-based pay in schools is the challenge of developing fair, accurate, and comprehensive evaluation systems. Most schools rely heavily on standardized test scores to assess teacher effectiveness, which provides a narrow measure of student learning and ignores other essential educational outcomes. Teachers who work with students from disadvantaged backgrounds may face structural barriers that affect test performance, yet those factors are often not adequately accounted for in evaluations. As a result, reliance on test scores may penalize effective teachers working under difficult conditions (Darling-Hammond et al., 2012). Additionally, inconsistent classroom observation practices and subjective administrative assessments may create skepticism among teachers regarding the fairness of the process.

Undermining Collaboration and Collegiality

Merit-based pay systems often reward individual performance, which can undermine the collaborative culture necessary for effective teaching and school-wide improvement. When teachers compete for financial rewards, they may become less inclined to share instructional resources, co-teach, or participate in joint problem-solving activities. A culture of competition may replace one of collegiality, reducing the willingness of staff to support peers or mentor less experienced colleagues (Peters, Godfrey & King, 2022). This shift can weaken collective learning, which is essential in schools where teamwork contributes significantly to student success and institutional growth.

Union Resistance and Policy Disputes

Teacher unions frequently resist the implementation of merit-based pay systems due to concerns about fairness, transparency, and long-term impact on job security. Many educators view the approach as a means of privatizing public education or undermining negotiated salary structures based on experience and qualifications. Without proper dialogue and consensus-building, policy adoption may face legal obstacles or labor unrest. In some cases, merit pay programs have been abandoned due to sustained opposition from stakeholders who perceive them as unjust or misaligned with educational values (Podgursky & Springer, 2011). Successful implementation often depends on building trust through inclusive policy processes and providing opportunities for teacher input.

Sustainability and Funding Constraints

The sustainability of merit-based pay programs is often threatened by inconsistent funding and budgetary limitations. Performance bonuses require dedicated financial resources that may not be consistently available, particularly in low-income or underfunded school districts. In times of economic downturn or policy shifts, governments and school authorities may withdraw financial

support, causing disruptions and demoralization among staff. Short-term funding cycles can prevent schools from maintaining long-term incentive structures, reducing the credibility and motivational effect of the program (Springer et al., 2010). Without stable financial planning, merit-based pay risks becoming an unsustainable reform initiative with limited impact on instructional quality.

POLICY PERSPECTIVES AND IMPLEMENTATION REALITIES

Merit-based pay has gained significant attention in policy discussions as governments and educational authorities seek mechanisms to improve performance and accountability in public service, especially in education. From a policy standpoint, merit-based pay is often presented as a rational solution to enhance effectiveness, reward high performers, and attract talented professionals into teaching and other public roles. Policymakers view it as a tool to shift from uniform salary structures to results-oriented compensation models that align with institutional goals. In theory, it incentivizes excellence, motivates continuous improvement, and discourages complacency within the workforce.

In implementation, however, the effectiveness of merit-based pay is frequently constrained by institutional, technical, and socio-cultural challenges. Translating policy into practice requires reliable performance metrics, data infrastructure, and evaluative frameworks that are often lacking in many education systems. In many developing countries, limited capacity to measure teacher performance accurately undermines the credibility of performance-based pay schemes. Administrators may rely heavily on student test scores, which are affected by numerous factors beyond the teacher's control, such as socio-economic background and school resources (Darling-Hammond et al., 2012). The overemphasis on quantitative indicators may distort teaching practices and discourage educators from working in disadvantaged settings where gains are harder to measure.

Stakeholder resistance is another implementation challenge. Teachers and unions often oppose merit pay policies, arguing that they erode professional autonomy and create unhealthy competition. In several contexts, merit-based reforms have failed to gain traction due to a lack of consultation with teachers during the policy design phase. Without teacher buy-in, implementation becomes fragmented, inconsistent, or symbolic. According to Podgursky and Springer (2011), programs that succeed tend to involve educators in shaping the evaluation criteria and ensure that assessments reflect multiple dimensions of teaching, including classroom practice, professional development, and student engagement.

Political considerations further influence the trajectory of merit pay policies. Shifts in political leadership can lead to abrupt changes in direction, defunding of pilot programs, or inconsistent policy enforcement. In the United States, for example, several states initiated merit-based teacher compensation programs with federal incentives, only for them to be discontinued or scaled back under new administrations (Springer et al., 2010). This lack of continuity reduces trust and dampens the motivational impact of the system. In some countries, performance pay policies have been affected by corruption, favoritism, or weak monitoring mechanisms, raising concerns about fairness and transparency (Peters et al., 2022).

Sustainability is another concern. Merit-based pay often requires sustained funding, regular evaluation, and administrative capacity to manage the system. Governments facing fiscal constraints may struggle to maintain incentive programs, especially when economic priorities shift. Moreover, inconsistent or delayed payments can demotivate staff and undermine the entire

policy objective. Policies that are not accompanied by investments in teacher training, curriculum reform, and supportive work environments are unlikely to yield long-term results. For merit pay to succeed, it must be embedded within broader educational reforms and supported by transparent, inclusive, and context-sensitive implementation frameworks.

RECOMMENDATIONS FOR SUSTAINABLE AND INCLUSIVE MERIT-BASED PAY STRUCTURES

For sustainable and inclusive merit-based pay structures to be achieved, these recommendations are made:

Develop Comprehensive and Context-Sensitive Evaluation Metrics

Merit-based pay systems must be grounded in evaluation frameworks that reflect the complexity of job roles and the diverse contexts in which employees work. Over-reliance on a narrow set of indicators, such as standardized test scores or raw output, can disadvantage professionals operating in high-need or under-resourced environments. A more inclusive approach combines quantitative data - like student learning gains or project completion rates with qualitative evidence, such as peer assessments, self-evaluations, classroom observations, and stakeholder feedback (Darling-Hammond et al., 2012). In education, for example, including measures like student engagement, teacher collaboration, and participation in professional development offers a more balanced view of performance. Evaluation tools should be adapted to specific institutional contexts to ensure fairness and relevance. Systems that acknowledge the challenges faced by employees working with marginalized populations tend to foster greater equity in merit pay distribution (Li & Ni, 2016).

Ensure Transparency and Stakeholder Engagement

The sustainability of any performance-based pay structure depends significantly on transparency and participatory design. Employees must understand the criteria used for evaluation, the processes of data collection and analysis, and the mechanisms through which decisions on compensation are made. Clear guidelines and open communication channels reduce distrust and perceptions of favoritism or political interference (Peters, Godfrey & King, 2022). Stakeholder involvement during the policy formulation and review process also strengthens legitimacy and trust in the system. Involving teachers, union representatives, administrators, and community members in decision-making processes ensures that the merit pay scheme reflects shared values and institutional goals (Podgursky & Springer, 2011). Regular feedback loops and opportunities to appeal decisions further promote accountability and adaptability in policy implementation.

Align Merit Pay with Professional Development and Support

Merit-based pay should not operate in isolation but must be integrated into broader systems of professional growth and institutional support. Rather than simply rewarding past performance, the system should motivate future development. Linking merit pay to participation in mentoring programs, curriculum development, leadership roles, and instructional training encourages continuous learning and collaboration (Deci, Olafsen & Ryan, 2017). In sectors like education,

this approach fosters a culture of shared improvement rather than competition. Providing coaching, feedback, and career advancement opportunities alongside financial incentives helps to maintain intrinsic motivation and long-term commitment to the profession. Sustainable merit pay systems invest in capacity-building as much as they reward achievement.

Implement Pilot Programs and Continuous Evaluation

Before full-scale implementation, merit pay systems should be piloted within a limited context to identify challenges, assess impacts, and make necessary adjustments. Pilot programs offer valuable insights into stakeholder perceptions, administrative burdens, and unintended consequences. Lessons learned from small-scale implementations can inform better system design and improve readiness for broader application (Springer et al., 2010). Once operational, merit-based pay structures must be subject to continuous evaluation. Independent assessments should monitor whether the system achieves intended goals - such as improved performance, equity, and motivation while identifying any emerging inequities or inefficiencies. Adjustments should be data-driven and inclusive, with periodic reviews engaging all stakeholders to recalibrate objectives and strategies.

CONCLUSION

Merit-based pay (MBP) presents a dual-edged sword in education, offering potential benefits while posing significant challenges. On one hand, it can motivate teachers by rewarding performance, fostering accountability, and improving student outcomes in measurable areas. Financial incentives may drive educators to adopt innovative teaching strategies and invest more effort into high-need classrooms. However, the effectiveness of MBP depends heavily on fair, transparent evaluation systems that account for diverse teaching contexts beyond standardized test scores. Critically, MBP risks undermining collaboration, increasing stress, and reducing intrinsic motivation if poorly implemented. Teachers in under-resourced schools may face disproportionate disadvantages, exacerbating inequities. For MBP to succeed, policymakers must integrate it with professional development, peer support, and non-monetary recognition. A balanced approach - combining performance incentives with holistic growth opportunities may sustain long-term teacher motivation and effectiveness. Finally, while MBP can be a useful tool in education reform, it should not replace systemic investments in teacher training, fair wages, and supportive work environments. Future research should explore hybrid models that align merit rewards with broader educational goals, ensuring both teacher satisfaction and student success.

Suggestions

The following suggestions are made based on the foregoing discussions:

- To effectively apply merit-based pay (MBP) in enhancing teacher motivation and effectiveness, governments, educational managers, and stakeholders should adopt a well-structured and equitable approach. First, they must establish clear, objective, and multi-dimensional evaluation criteria that go beyond student test scores. Factors such as classroom innovation, student engagement, professional development, and contributions

to school improvement should be considered to ensure a fair assessment of teacher performance.

- Transparency in the MBP system is essential to build trust among educators. Teachers should fully understand how their performance is measured, what rewards are attainable, and the process for appealing evaluations. Open communication and regular feedback will help prevent perceptions of bias or unfair treatment.
- Professional development opportunities should be integrated with MBP to support continuous growth. Rather than focusing solely on financial rewards, schools should provide training, mentorship, and resources to help teachers meet performance standards. This approach ensures that MBP encourages improvement rather than competition at the expense of collaboration.
- Policymakers must ensure equitable implementation by addressing disparities in resource allocation. Schools in disadvantaged areas often face greater challenges, so MBP systems should include adjustments for varying student needs and school conditions. Providing additional support to under-resourced schools will create a more balanced and motivating environment for all teachers. When these measures are in place, merit-based pay can effectively enhance teacher motivation and effectiveness without compromising fairness or educational quality.

ABSTRACT

This study investigates managing class struggles for effective student academic performance in mathematics education in Ignatius Ajuru University of Education, Rivers State. The study was guided by two research questions and corresponding hypotheses. The study adopted a descriptive survey research design. The population for this study comprises 15 Mathematics Education lecturers at Ignatius Ajuru University of Education, Rivers State. Given the manageable size of the population, the census sampling technique was adopted, meaning that all 15 Mathematics Education lecturers at Ignatius Ajuru University of Education, Rivers State, were included in the study. Data were collected using a self-developed questionnaire, "Managing Class Struggles for Effective Student Academic Performance in Mathematics Education Questionnaire" (MCSEASAPMEQ). The questionnaire was validated and tested for reliability using the test-retest method and the Cronbach Alpha technique, yielding a reliability coefficient of 0.77. Data analysis was performed using descriptive statistics (mean and standard deviation) to answer research questions and inferential statistics (independent t-tests) to test hypotheses, facilitated by SPSS version 27.0. Findings revealed that class struggles negatively influence students' ability to perform well in mathematics. However, the use of structured management strategies such as scaffolded learning, self-efficacy development, peer collaboration, and differentiated instruction significantly contributes to improved academic performance. Notably, male lecturers reported higher usage of these strategies compared to their female counterparts, highlighting a gender-based difference in instructional practices. Conclusively, class struggles in mathematics education pose a significant barrier to student success, but can be managed with student-centred approaches effectively. Based on the findings, it recommended, among others, that lecturers should be trained to identify and address class struggles through targeted support programs and early intervention strategies effectively.

Keywords: Class Struggles, Effective, Student, Academic Performance, Mathematics Education.

INTRODUCTION

Mathematics education serves as a cornerstone of academic development, providing students with essential analytical, problem-solving, and logical reasoning skills that extend far beyond the classroom. The significance of mathematics in educational curricula cannot be overstated, as it forms the foundation for scientific advancement, technological innovation, and critical thinking processes that are increasingly vital in our modern world. At Ignatius Ajuru University of Education in Rivers State, where future educators are being prepared, the quality of mathematics education directly impacts not only individual student outcomes but also the broader educational landscape, as these students will eventually teach in schools across the region.

However, despite its fundamental importance, mathematics education faces persistent challenges that significantly impact student academic performance. Research consistently demonstrates that students encounter substantial difficulties in mathematics learning, with many experiencing what Stoehr (2017) asserted, that mathematics anxiety is a psychological phenomenon that manifests differently across individual learners. This anxiety often stems from negative past experiences, inadequate foundational knowledge, or inappropriate teaching methodologies that fail to accommodate diverse learning styles and capabilities. Students frequently struggle with abstract mathematical concepts, procedural fluency, and the ability to connect mathematical principles to real-world applications, creating barriers that can persist throughout their academic journey.

The challenges in mathematics learning are particularly pronounced in the Nigerian educational context, where Adeneye et al. (2023) noted the nature of poor mathematics performance among students. These difficulties are compounded by various systemic issues, including inadequate resources, large class sizes, and limited access to modern teaching technologies. Furthermore, Obut et al. (2024) reveal that students' struggles in mathematics learning are deeply rooted in both cognitive and affective factors that require comprehensive intervention strategies.

Central to these educational challenges is the phenomenon of class struggles, which encompasses the various conflicts and tensions that arise within the mathematics classroom environment. These struggles manifest in multiple dimensions, including students' resistance to challenging mathematical tasks, fear of making mistakes, and reluctance to engage in mathematical discourse. Queen (2014) defined class struggle as an inherent aspect of the educational process, where students and teachers navigate competing interests, expectations, and approaches to learning. In mathematics education specifically, these struggles often emerge when students encounter cognitive dissonance between their existing knowledge and new mathematical concepts being introduced.

The complexity of class struggles in mathematics education is further illuminated by research on productive struggle. Russo and colleagues (2020) emphasised that elementary teachers hold varying beliefs about the role of struggle in mathematics learning, with some viewing it as necessary for deep understanding while others perceive it as potentially harmful to student confidence. This dichotomy reflects broader tensions within mathematics pedagogy regarding how to balance challenge with support, rigour with accessibility, and individual needs with curriculum demands.

Buckley and Sullivan (2023) added that anxiety and uncertainty are not obstacles to be eliminated but as natural components of the learning process that can be productively managed. Their research suggests that effective mathematics education requires careful attention to both

cognitive and emotional aspects of learning, creating classroom environments where students feel safe to struggle, make mistakes, and gradually build mathematical understanding. At Ignatius Ajuru University of Education, addressing these class struggles becomes particularly crucial as future mathematics educators must be equipped with both the theoretical understanding and practical strategies necessary to manage these complex dynamics effectively, ultimately ensuring improved student academic performance in mathematics across Rivers State's educational system.

Statement of the Problem

Class struggles have become a significant concern in mathematics education, impacting students' academic performance in universities. Students face numerous challenges in mathematics classrooms, leading to decreased motivation, poor academic achievement, and increased anxiety. Mathematics teachers often struggle to engage students, address individual learning needs, and promote a supportive learning environment. Students' difficulties in understanding mathematical concepts, coupled with inadequate teacher support, create a barrier to academic success. This situation leads to frustration, decreased confidence, and a negative attitude towards mathematics. Consequently, students' academic performance suffers, and their overall mathematical ability is hindered.

The persistence of class struggles in mathematics education necessitates immediate attention. Effective management strategies are essential to mitigate the negative impact on students' academic performance. Teachers must adopt innovative approaches to create a conducive learning environment, foster positive relationships, and cater to diverse learning needs. This study aims to investigate managing class struggles for effective student academic performance in mathematics education in Ignatius Ajuru University of Education, Rivers State. The specific objectives are to investigate the impact of class struggles on students' academic performance and also identify class struggle management strategies that can improve students' academic performance in mathematics education at Ignatius Ajuru University of Education, Rivers State.

Research Questions

The following questions were raised to guide the study:

- How do class struggles impact students' academic performance in mathematics education at Ignatius Ajuru University of Education, Rivers State
- What class struggle management strategies can be employed to improve students' academic performance in mathematics education at Ignatius Ajuru University of Education, Rivers State

Hypotheses

The following hypotheses were formulated and statistically tested at a 0.05 level of significance:

- Class struggles have a significant impact on students' academic performance in mathematics education at Ignatius Ajuru University of Education, Rivers State.

- Effective class struggle management strategies can significantly improve students' academic performance in mathematics education at Ignatius Ajuru University of Education, Rivers State.

Theoretical framework

Albert Bandura's Self-Efficacy Theory, introduced in 1977 through his seminal work "Self-Efficacy: Toward a Unifying Theory of Behavioural Change," provides a powerful theoretical framework for understanding and addressing class struggles in mathematics education (Formella & Ugwuanyi, 2024). Emerging from social cognitive psychology, this theory emphasises that individuals' beliefs about their capabilities to perform specific tasks serve as crucial determinants of behavioural change and goal attainment, making it particularly relevant to educational contexts where student confidence and persistence are essential for academic success.

The theory posits that self-efficacy, an individual's belief in their ability to succeed in particular situations, fundamentally shapes behaviour, motivation, and overall well-being. In mathematics classrooms, this translates to students' perceptions of their mathematical capabilities directly influencing whether they will attempt challenging problems, the level of effort they invest in learning activities, and their persistence when confronted with difficulties (Abiodun, 2020). When students possess strong mathematical self-efficacy, they are more likely to engage actively with complex concepts, persist through challenging tasks, and maintain motivation despite temporary setbacks.

The relevance of Self-Efficacy Theory to managing class struggles becomes particularly evident in the Nigerian educational context. Class struggles often emerge when students experience repeated failures or encounter concepts that exceed their perceived capabilities, creating negative feedback loops where decreased self-efficacy leads to reduced effort and poorer performance. Self-Efficacy Theory principles could also help educators interrupt these cycles through strategic interventions that build students' confidence by providing scaffolded opportunities for success, offering constructive feedback that emphasises growth and improvement, and fostering environments where challenges are reframed as opportunities for development rather than threats to self-worth. This approach transforms class struggles into catalysts for enhanced mathematical self-efficacy and improved academic performance.

CONCEPTUAL CLARIFICATION

Class Struggle

Class struggles in the educational context represent the multifaceted conflicts and tensions that emerge within classroom environments, encompassing both academic and social dimensions of the learning process. Queen (2014) defined class struggle as an inherent aspect of education where students and teachers navigate competing interests, expectations, and approaches to learning, creating dynamic interactions that can either facilitate or hinder educational progress. These struggles manifest in various forms, including student resistance to challenging academic tasks, conflicts between individual learning needs and standardised curriculum demands, and tensions arising from diverse socioeconomic backgrounds and educational preparedness levels.

In mathematics education specifically, class struggles often emerge when students encounter cognitive dissonance between their existing knowledge structures and new

mathematical concepts being introduced. Russo and colleagues (2020) emphasise that these struggles are not merely obstacles to be eliminated but represent complex pedagogical phenomena that require careful management, as teachers hold varying beliefs about whether struggle enhances deep mathematical understanding or potentially damages student confidence and motivation. Class struggles extend beyond simple academic difficulties to encompass the broader power dynamics, resource allocation issues, and institutional barriers that influence classroom interactions. These struggles can manifest as student disengagement, academic anxiety, behavioural disruptions, or withdrawal from mathematical discourse, ultimately impacting both individual learning outcomes and overall classroom climate, making their effective management crucial for successful mathematics education.

Class Struggles and Students' Academic Performance in Mathematics Education

Class struggles significantly impact students' academic performance in mathematics education through complex psychological and pedagogical mechanisms that influence both learning processes and educational outcomes. When students encounter difficulties in mathematics classrooms, these struggles can create barriers that extend beyond immediate comprehension issues to affect long-term academic achievement and mathematical confidence. Obut et al. (2024) revealed that students' struggles in learning mathematics are deeply rooted in both cognitive and affective factors, demonstrating how classroom tensions directly correlate with decreased performance levels, reduced engagement, and increased mathematical anxiety among learners.

The relationship between class struggles and academic performance becomes particularly pronounced when students experience repeated failures or encounter learning environments that inadequately support their diverse needs. These struggles often manifest as decreased motivation, avoidance behaviours, and reduced participation in mathematical activities, creating negative feedback loops that perpetuate poor performance. Buckley and Sullivan (2023) emphasise that while anxiety and uncertainty are natural components of mathematical learning, their mismanagement in classroom settings can transform productive cognitive challenges into detrimental academic barriers that significantly impair student achievement.

The impact of class struggles on academic performance is further complicated by institutional factors, teaching methodologies, and individual student characteristics, making it essential for educators to develop comprehensive strategies that address both the immediate symptoms of struggle and the underlying systemic issues that contribute to diminished mathematical performance and academic success**.**

Class Struggle Management Strategies to Improve Students' Academic Performance in Mathematics Education

Strategies that can be employed to improve students' academic performance:

Scaffolded Productive Struggle Implementation: Educators should design mathematics tasks that promote productive struggle by maintaining high cognitive demand while providing appropriate scaffolding support. Luby (2022) asserted that teachers must balance challenge with support, allowing students to experience manageable difficulties that build resilience and mathematical

understanding. This approach transforms struggles from barriers into learning opportunities that enhance problem-solving capabilities and mathematical confidence.

Building Mathematical Self-Efficacy through Success Experiences: Teachers should create structured opportunities for students to experience incremental successes in mathematics, thereby building their confidence and belief in their mathematical abilities. Russo et al (2020) pointed out that when students develop positive beliefs about their mathematical capabilities, they demonstrate increased persistence, engagement, and willingness to tackle challenging problems, ultimately leading to improved academic performance and reduced classroom tensions.

Collaborative Peer Learning and Support Systems: Implementing peer tutoring and collaborative learning structures allows students to learn from each other in supportive environments that reduce individual performance anxiety. Buckley and Sullivan (2023) opined that reframing classroom dynamics to emphasise collective problem-solving and peer support helps students view struggles as shared experiences rather than personal failures, fostering a more positive mathematical learning community.

Differentiated Instruction and Individualised Support: Teachers should employ differentiated instructional strategies that address diverse learning needs, backgrounds, and mathematical readiness levels within the classroom. Stoehr (2017) noted that mathematics anxiety manifests differently across individual learners, requiring tailored approaches that consider students' unique challenges, learning styles, and emotional responses to mathematical content, ensuring that all students receive appropriate support to overcome their specific struggles.

REVIEW OF RELATED EMPIRICAL STUDIES

Obut et al. (2024) conducted a study aimed at exploring the various struggles students encounter in learning mathematics and how these struggles affect academic performance. Their research, based in the Philippines, revealed that cognitive difficulties, such as misunderstanding abstract concepts, as well as emotional challenges like anxiety and low self-confidence, were major barriers to effective mathematics learning. The study also highlighted instructional gaps, including a lack of teacher support and ineffective pedagogical approaches, which further exacerbate these struggles. Their findings suggest that without timely intervention, students' mathematical achievement continues to decline. The authors recommended the development of tailored instructional enhancements and learner support systems to address these challenges. The study aligns closely with findings from the present research, confirming that class struggles significantly impact students' academic outcomes in mathematics. It reinforces the importance of understanding the multifaceted nature of learning struggles and providing responsive, student-centred strategies to mitigate their effects.

Luby (2022) conducted a doctoral study focused on identifying strategies teachers can use to reduce anxiety and promote productive struggle among secondary school students in mathematics classrooms. Through interviews and classroom observations, Luby found that when teachers adopt practices such as clear goal-setting, formative feedback, collaborative learning, and scaffolding, students are more likely to remain engaged and persistent during difficult mathematical tasks. Her research emphasised that anxiety does not necessarily need to be eliminated; rather, it should be managed and reframed to encourage growth and learning. She

proposed that creating psychologically safe classrooms allows students to take risks and learn from their mistakes, key aspects of productive struggle. These findings support the present study's conclusion that effective management of class struggles through intentional instructional strategies significantly enhances students' academic performance. The work revealed the value of equipping teachers with practical tools to transform struggles into meaningful, confidence-building learning experiences in mathematics education.

METHODOLOGY

This study adopted a descriptive survey research design to investigate the management of class struggles for effective student academic performance in mathematics education at Ignatius Ajuru University of Education, Rivers State. The population for this study comprises 15 Mathematics Education lecturers at Ignatius Ajuru University of Education, Rivers State. Given the manageable size of the population, the census sampling technique was adopted, meaning that all 15 Mathematics Education lecturers at Ignatius Ajuru University of Education, Rivers State, were included in the study. Data were collected using a self-developed questionnaire, "Managing Class Struggles for Effective Student Academic Performance in Mathematics Education Questionnaire" (MCSEASAPMEQ), measured on a five-point Likert scale ranging from Never, 2 = Rarely, 3 = Sometimes, 4 = Often, 5 = Always). The questionnaire was validated and tested for reliability using the test-retest method and the Cronbach Alpha technique, yielding a reliability coefficient of 0.77. Data analysis was performed using descriptive statistics (mean and standard deviation) to answer research questions and inferential statistics (independent t-tests) to test hypotheses, facilitated by SPSS version 27.0. Meanwhile, a total of 15 questionnaires were distributed; 12(80%) were retrieved, valid and used for the analysis.

RESULTS

Research Questions One: How do class struggles impact students' academic performance in mathematics education at Ignatius Ajuru University of Education, Rivers State?

Descriptive Statistics Table: Class struggles impact students' academic performance in mathematics education

S/N	Item	Mean	SD.	Decision
1	My student finds it difficult to understand mathematical concepts in class	3.65	0.52	Often
2	Class struggles (e.g., difficulty understanding concepts, lack of engagement) affect my students' academic performance	3.80	0.48	Often
3	I feel frustrated or discouraged when my students are faced with challenging mathematics problems in class	3.42	0.60	Often
4	I help my students alleviate class struggles and improve their academic performance	4.00	0.50	Often
	Grand Mean	**3.72**		Often

Table one presents the descriptive statistics on lecturers' perceptions of how class struggles impact students' academic performance in mathematics education at Ignatius Ajuru University of Education, Rivers State. All four items recorded mean scores above the criterion mean of 3.0, indicating general agreement among the respondents. Item 1, which states that students find it difficult to understand mathematical concepts in class, had a mean of 3.65, suggesting that lecturers recognise a consistent struggle with comprehension. Item 2 had the highest relevance to

the research question, with a mean of 3.80, strongly indicating that class struggles, such as difficulty understanding concepts and lack of engagement, significantly affect academic performance. Lecturers also expressed emotional involvement, as seen in item 3 (mean-3.42), where they reported feeling frustrated or discouraged when students face mathematical challenges. Importantly, item 4 showed that lecturers actively assist students in overcoming these struggles (mean=4.00). The grand mean of 3.72 confirms a collective agreement that class struggles significantly impact students' academic performance, thus answering the research question affirmatively.

Research Question Two: What class struggle management strategies can be employed to improve students' academic performance in mathematics education at Ignatius Ajuru University of Education, Rivers State?

Descriptive Statistics Table: Class struggle management strategies to improve students' academic performance in mathematics education

S/N	Class Struggle Management Strategy	Mean	SD.	Decision
5	I employ scaffolded productive struggle implementation strategies to improve students' academic performance in mathematics education	4.10	0.60	Often
6	I adopted building mathematical self-efficacy through successful experiences as a strategy to improve students' academic performance in mathematics education	4.25	0.55	Often
7	I employ collaborative peer learning and support systems as a strategy to improve students' academic performance in mathematics education	4.05	0.70	Often
8	I employ differentiated instruction and individualised support as a strategy to improve students' academic performance in mathematics education	4.40	0.50	Often
	Grand Mean	**4.20**		**Often**

Table two presents the descriptive statistics on class struggle management strategies used by mathematics education lecturers at Ignatius Ajuru University of Education to improve students' academic performance. The data revealed that all four strategies recorded mean scores above the criterion mean of 3.0, indicating they are used more than occasionally, with all scoring in the "Often" range (mean $\geq$ 4.0). Lecturers reported frequently employing scaffolded productive struggle strategies (Mean = 4.10), which guide students through complex problems in a structured way. The use of self-efficacy-building strategies (Mean = 4.25) shows that fostering students' belief in their mathematical abilities is a common and intentional approach. Likewise, collaborative peer learning systems (Mean = 4.05) and differentiated instruction (Mean = 4.40) are widely adopted to tailor support to individual student needs. With a grand mean of 4.20, the findings suggest that these class struggle management strategies are consistently and actively employed, demonstrating their perceived effectiveness in enhancing mathematics academic performance.

TEST OF HYPOTHESES

Hypothesis One: There is no significant difference between male and female lecturers in the class struggles that have a significant impact on students' academic performance in mathematics education at Ignatius Ajuru University of Education, Rivers State

Hypothesis Testing Table on Class Struggles: Has a significant impact on students' academic performance in mathematics education

Lecturers	N	$\bar{x}$	SD.	Df	t	t-tab	Sig.	Decision
Male	9	3.78	0.44	11	2.49	2.228	.033	Significant (Reject H_0)
Female	3	3.10	0.40					

The independent samples t-test was conducted to examine whether there is a significant difference between male and female lecturers' perceptions of the impact of class struggles on students' academic performance in mathematics education. The result shows that t = 2.49 is greater than t-tab = 2.228, and the p-value (0.033) < 0.05, indicating a statistically significant difference. Therefore, the null hypothesis is rejected, and it implies that gender influences lecturers' perceptions. Male lecturers reported a higher mean perception (3.78) compared to female lecturers (3.10), suggesting that they view class struggles as having a greater impact on students' academic performance in mathematics education at Ignatius Ajuru University of Education, Rivers State.

Hypothesis Two: There is no significant difference between male and female lecturers in the use of effective class struggle management strategies to improve students' academic performance in mathematics education at Ignatius Ajuru University of Education, Rivers State.

Independent t-test Table on the effective class struggle management strategies to improve students' academic performance in mathematics education

Lecturers	N	$\bar{x}$	S.D	Df	t	t-tab	Sig.	Decision
Male	9	4.30	0.40	11	2.58	2.228	.027	Significant (Reject H_0)
Female	3	3.80	0.35					

An independent samples t-test was conducted to determine whether there is a significant difference between male and female lecturers in the use of class struggle management strategies to improve students' academic performance in mathematics education. The results show a t-value of 2.58, which is greater than the critical value of 2.228, with a p-value of .027, less than 0.05. Therefore, the null hypothesis is rejected, indicating a statistically significant difference. Male lecturers (Mean = 4.30) reported a higher use of these strategies than female lecturers (Mean = 3.80), suggesting that male lecturers are more proactive or consistent in applying management strategies to support students facing classroom struggles in mathematics education at Ignatius Ajuru University of Education, Rivers State.

DISCUSSION OF FINDINGS

Class struggles have a significant impact on students' academic performance in mathematics education at Ignatius Ajuru University of Education, Rivers State

The results of the independent samples t-test indicated a statistically significant difference between male and female lecturers' perceptions regarding the impact of class struggles on students' academic performance. Male lecturers, on average, perceived a higher level of negative impact from struggles such as difficulty in understanding mathematical concepts and lack of

classroom engagement. This finding aligns with Obut et al. (2024), who explored students' struggles in learning mathematics and identified key barriers such as poor foundational knowledge, anxiety, and lack of motivation. Their study emphasised that class struggles significantly hinder students' mathematical achievement, especially when support mechanisms are lacking. Similarly, Queen (2014) argued that class-based disparities and socio-academic pressures influence how students engage with classroom content, particularly in subjects perceived as difficult, such as mathematics. These findings underscore the critical need for context-aware teaching strategies and support systems that recognise and address the roots of class struggles, particularly in Nigerian tertiary institutions where economic, social, and psychological barriers often converge to affect academic outcomes.

Effective class struggle management strategies can significantly improve students' academic performance in mathematics education at Ignatius Ajuru University of Education, Rivers State.

Findings from the independent samples t-test revealed a significant difference in strategy use between male and female lecturers, with male lecturers reporting more frequent use of management strategies. Overall, the result showed that class struggle management strategies, such as scaffolded instruction, peer support, self-efficacy building, and differentiated instruction, are perceived to significantly improve student outcomes. This result is strongly supported by Luby (2022), who emphasised the effectiveness of specific teaching strategies in reducing mathematics-related anxiety and promoting productive struggle. Her study outlined interventions such as collaborative learning, supportive feedback, and goal-setting as methods that reduce cognitive overload and help students persist through mathematical challenges. Additionally, Buckley and Sullivan (2023) argued that reframing anxiety and uncertainty in the classroom by normalising struggle as part of learning empowers students and enhances resilience. The current findings confirm that effective strategy implementation plays a critical role in addressing class struggles and improving academic performance. This has significant implications for mathematics educators in Nigerian universities, who must prioritise not only content delivery but also adaptive teaching practices that support students emotionally and cognitively.

CONCLUSION

Class struggles in mathematics education encompass a range of challenges such as difficulty understanding abstract concepts, low engagement, anxiety, and lack of individualised academic support. At Ignatius Ajuru University of Education, these struggles significantly affect students' academic performance, especially in mathematics, a subject often perceived as complex and demanding. Therefore, class struggles pose a substantial barrier to student success in mathematics education. However, when effectively managed through student-centred instructional approaches, these challenges can be transformed into opportunities for growth and deeper understanding. It is therefore essential for the university to support lecturers in adopting evidence-based teaching strategies that promote resilience, engagement, and academic achievement among mathematics students.

Recommendations

Based on the findings, the following recommendations were made:

- Lecturers should be trained to identify and address class struggles through targeted support programs and early intervention strategies effectively.
- Mathematics educators should integrate proven management strategies like scaffolded instruction and collaborative peer learning into teaching practices daily.

ABSTRACT

This paper explored advancing plastic waste management through pyrolysis and promoting a circular economy. Traditional plastic waste management methods, such as landfilling and incineration, have notable drawbacks, including environmental pollution and inefficient resource recovery. In response, pyrolysis offers a promising alternative by converting plastic waste into valuable by-products like oil, gas, and char. This process supports closed-loop recycling, reduces reliance on virgin resources, and decreases landfill use, aligning with the principles of a circular economy. Despite its potential, the adoption of pyrolysis technology is hindered by several challenges. Technical issues, such as the need for precise control over process conditions and scalability, must be addressed to improve efficiency and reliability. Economic considerations, including high initial investments and operational costs, affect financial feasibility. Additionally, regulatory and policy barriers may not fully accommodate the nuances of pyrolysis, and public perception issues can impact acceptance. In conclusion, pyrolysis represents a significant advancement in plastic waste management and promoting a circular economy where achieving its full potential requires overcoming technical, economic, regulatory, is social challenges. The paper suggested that continuous investment in research and development, supportive policies, and public engagement are essential for integrating pyrolysis into broader waste management strategies and realising its benefits for sustainability and resource efficiency.

Keywords: Pyrolysis Technology, Circular Economy, Plastic Waste Management.

INTRODUCTION

In several regions, particularly developing countries, waste management poses critical challenges. The sheer volume of waste generated and inefficient disposal methods have far-reaching environmental and health consequences. Waste is often disposed of through littering, open burning, and dumping into waterways and landfills, leading to land degradation, water contamination, and significant harm to biodiversity. The traditional "take-make-dispose" model exacerbates these issues, especially regarding plastic waste. Single-use plastics contribute significantly to environmental degradation, with millions of tons ending up in oceans and

landfills annually, causing marine life entanglement, microplastic contamination, and food chain disruptions (Elisha & Felix, 2020).

Plastic pollution's environmental impacts are complex and profound. Plastics pervade daily life through consumer convenience and industrial practices, but their disposal creates severe ecological consequences. Plastic pollution in oceans threatens marine life and introduces toxins into the food chain, affecting human health (Elisha, 2020). Additionally, plastic production relies heavily on fossil fuels, contributing to greenhouse gas emissions and climate change. Raw material extraction and processing lead to resource depletion and habitat destruction.

Amidst this crisis lies an opportunity to transform waste into valuable resources. The circular economy contrasts sharply with the linear "take-make-dispose" model by promoting a "take-make-use" approach, emphasising continuous use, recycling, and resource recovery. This model closes product life cycle loops through improved resource efficiency, recycling, and waste reduction (Elisha, 2020). Circular economy principles advocate for redesigning products and systems to be restorative, regenerative, and waste-free, helping reduce plastic waste, conserve resources, and mitigate climate change impacts.

One promising technology aligning with circular economy principles is pyrolysis. Pyrolysis is a thermal decomposition process that converts organic materials like plastics into valuable products, including oil, gas, and char (Adeoye et al., 2024). Unlike traditional recycling methods struggling with mixed or contaminated plastics, pyrolysis handles wide-ranging plastic waste, including otherwise difficult-to-recycle materials. Operating at high temperatures without oxygen, pyrolysis breaks down plastic polymers into simpler hydrocarbons usable as raw materials in fuel production, chemical manufacturing, and material recovery.

Pyrolysis offers significant advantages over traditional waste management. It reduces plastic waste volume, lessening environmental burdens from landfills and incineration. Unlike landfilling, which merely stores waste, pyrolysis transforms waste into usable resources, closing material life cycle loops (Adeoye et al., 2024). Pyrolysis addresses environmental concerns from plastic waste incineration by operating under controlled conditions that minimise emissions and capture valuable gases for energy production (Kataki et al., 2018).

Despite potential benefits, widespread pyrolysis adoption faces challenges. The lack of supportive policy frameworks and regulatory structures remains a significant barrier. Effective government policies and incentives are crucial for promoting pyrolysis technology development and deployment (Elisha & Felix, 2020). Investment in research and development is essential for advancing technology, improving efficiency, and reducing operational costs. Collaborations between government agencies, private companies, and research institutions can accelerate the development and commercialisation of advanced pyrolysis technologies (Kataki et al., 2018). The plastic waste crisis necessitates innovative, sustainable solutions. Embracing circular economy principles through technologies like pyrolysis offers promising pathways forward, contributing to more sustainable economic models while reducing environmental impact.

CONCEPTUAL CLARIFICATION

Plastic Waste

Plastic waste has become one of the most pressing environmental challenges of the 21st century. The proliferation of plastics in consumer products, packaging, and industrial applications has led

to unprecedented levels of waste generation, significantly impacting ecosystems, wildlife, and human health. The widespread use of plastics, driven by their convenience, durability, and low cost, has resulted in vast quantities of plastic materials entering the waste stream, often ending up in landfills, oceans, and other natural environments (Geyer et al, 2017).

One of the critical issues with plastic waste is its persistence in the environment. Unlike organic materials, plastics do not biodegrade but instead break down into smaller particles known as microplastics. These microplastics can persist in the environment for centuries, posing risks to wildlife and human health. Marine environments are particularly affected, with large quantities of plastic waste accumulating in the oceans, leading to entanglement and ingestion by marine organisms, which can result in severe physical harm and death (Andrady, 2011).

The environmental impact of plastic waste extends beyond the immediate harm to wildlife. Plastics can also release harmful chemicals into the environment as they degrade, contributing to pollution and potentially affecting human health through the food chain. Studies have shown that plastics can leach toxic substances, such as bisphenol A (BPA) and phthalates, which can have detrimental effects on both ecological systems and human health (Rochman et al., 2013). Furthermore, the production and disposal of plastics are associated with significant environmental costs, including greenhouse gas emissions and resource depletion.

Efforts to address plastic waste have included a combination of policy measures, technological innovations, and public awareness campaigns. Policies aimed at reducing plastic consumption, such as bans on single-use plastics and incentives for recycling, have been implemented in various regions. Technological advancements, such as improved recycling methods and waste-to-energy technologies, offer potential solutions for managing plastic waste. However, despite these efforts, the scale of the plastic waste problem remains substantial, highlighting the need for continued innovation and comprehensive strategies to mitigate its impact (Geyer et al., 2017; Andrady, 2011).

Elisha (2020) argued that the linear economy model, characterised by a "take-make-dispose" approach, has significantly worsened the plastic waste crisis. This model's focus on production, consumption, and disposal leads to environmental harm, as plastics accumulate in landfills and oceans, fragmenting into long-lasting microplastics that damage ecosystems and pose health risks. Therefore, Elisha advocated for a shift to a circular economy model, which emphasises reducing waste and maximising resource efficiency through practices like recycling, reuse, and sustainable material development. This approach aims to minimise the environmental impact of plastics by closing the loop of product life cycles and promoting more sustainable resource management.

Plastic Waste Management

Plastic waste management has evolved significantly over the decades, reflecting changes in technology, policy, and societal attitudes towards environmental sustainability. The journey from the early days of plastic production to the current focus on circular economy models provides insight into the challenges and innovations that have shaped the field. The story of plastic waste management begins with the advent of synthetic plastics in the early 20th century. Plastics, such as Bakelite, were among the first synthetic polymers to be developed, marking a revolutionary shift in material science. These early plastics were celebrated for their versatility and durability, quickly making them popular in a wide range of applications. However, as plastic production surged, the environmental implications of these materials began to surface.

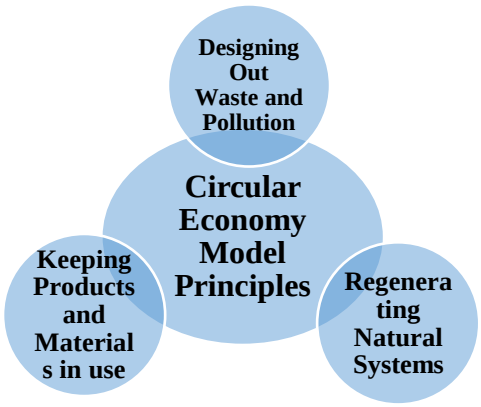
Between the 1950s and 1960s, the convenience of single-use plastics began to dominate consumer culture. Products like plastic bags, bottles, and packaging became ubiquitous, driven by their low cost and ease of use. This period marked the beginning of a significant environmental challenge. The linear economy model characterised by a "take-make-dispose" approach resulted in vast amounts of plastic waste, much of which was not effectively managed or recycled. Initially, plastic waste management strategies focused primarily on landfilling and incineration. Landfills were the predominant method for disposing of plastic waste, but they quickly became overwhelmed by the sheer volume of waste. The non-biodegradable nature of plastics led to concerns about long-term environmental contamination. Incineration, while reducing the volume of waste, raised issues related to air pollution and the release of toxic compounds.

In the 1970s and 1980s, recycling technologies began to gain traction as an alternative to landfilling and incineration. Early recycling efforts focused on separating and reprocessing certain types of plastics, primarily polyethene terephthalate (PET) and high-density polyethene (HDPE). Traditional waste management methods primarily include landfilling, incineration, and open dumping. Landfilling has long been the dominant approach, where waste is buried in designated areas. While this method is straightforward, it presents significant drawbacks, such as leachate production and methane emissions, which can lead to groundwater contamination and contribute to greenhouse gas effects (Adeoye et al., 2024).

Incineration, on the other hand, involves burning waste at high temperatures to reduce its volume and generate energy. While it helps reduce the amount of waste that ends up in landfills, incineration can release harmful emissions, including dioxins and furans, which are detrimental to human health and the environment (Adeoye et al., 2024). Open dumping, the least controlled method, involves the disposal of waste in open sites, often resulting in unsightly and hazardous conditions. These traditional methods are increasingly being recognised as inadequate in addressing the complexities of modern waste streams, particularly in managing persistent materials like plastics.

However, plastic waste management presents several significant challenges. The persistent nature of plastics means they do not decompose easily, leading to accumulation in landfills and oceans. This persistence results in severe environmental impacts, including marine life entanglement, ingestion of microplastics by aquatic organisms, and soil contamination (Elisha, 2020). Additionally, the vast variety of plastic types and compositions complicates recycling efforts, as many plastics are not compatible with existing recycling systems. Contamination of plastic waste with food residues and other materials further impairs recycling processes. The economic viability of recycling is also challenged by the low value of recycled plastics compared to virgin materials, discouraging investment in recycling infrastructure and technologies (Elisha, 2020). These challenges underscore the need for innovative solutions to improve plastic waste management and reduce environmental impact.

In recent years, technological advances have provided new avenues for managing plastic waste. Innovations in chemical recycling, including pyrolysis, have emerged as promising solutions. Pyrolysis, as discussed by Adeoye et al. (2024), involves the thermal decomposition of plastic waste into valuable products like oil, gas, and char. This technology offers several advantages over traditional recycling methods, including the ability to process mixed and contaminated plastics and the potential for converting waste into high-value resources. The transition to a circular economy model represents a significant shift in plastic waste management. Unlike the linear economy model, the circular economy emphasises the continuous use and



recycling of resources, aiming to close the loop of product life cycles. The focus is on reducing waste generation, enhancing resource efficiency, and promoting the reuse of materials. The integration of pyrolysis technology aligns with this model by converting plastic waste into usable products, thereby contributing to a more sustainable and circular economic system.

More so, people now go into the streets to pick plastic waste. We now have pickers, those who buy from them and they in turn distribute or supply to those who recycle them into finished produce for reuse again.

Circular Economy Model Principles

The circular economy operates on three fundamental principles that create a sustainable, regenerative economic system, shifting from the traditional linear "take-make-dispose" model to a circular approach that mimics natural ecosystems (Ellen MacArthur Foundation, 2024).

Figure: Circular Economy Model Principles

Source: Researchers' Conceptualisation

Designing out Waste and Pollution: This principle focuses on preventing waste and pollution at the source through intelligent design and planning. Rather than treating waste as inevitable, the circular economy integrates waste prevention into the initial design phase of products, services, and systems. Companies eliminate problematic materials, reduce resource intensity, and create products that generate minimal negative impacts throughout their lifecycle (Ellen MacArthur Foundation, 2019). Example: Interface Inc. redesigned its carpet tiles to eliminate harmful chemicals and reduce material waste. Their modular design allows easy replacement of individual tiles rather than entire carpets, significantly reducing installation waste.

Keeping Products and Materials in Use: This principle emphasises maximising the utility and lifespan of products through reuse, repair, refurbishment, remanufacturing, and sharing. The goal is to maintain the highest value of materials for as long as possible, creating multiple use cycles before recycling. This challenges traditional ownership models and promotes innovative strategies like product-as-a-service and take-back programs (World Economic Forum, 2020).

Example: Patagonia's Worn Wear program encourages customers to repair rather than replace garments, offering repair services, tutorials, and selling refurbished items. This keeps thousands of garments in use while building customer loyalty.

Regenerating Natural Systems: This principle goes beyond minimising harm to actively restore natural ecosystems and biodiversity. It recognises that economic activity should work in harmony with natural systems, contributing to their health rather than depleting them. This involves renewable energy transitions, biodiversity support, and regenerative practices in agriculture and land management (World Economic Forum, 2020). Example: Unilever's regenerative agriculture initiatives work with farmers to restore soil health, enhance biodiversity, and sequester carbon through practices like cover cropping and integrated pest management.

APPROACHES TO PLASTIC WASTE MANAGEMENT IN AFRICA

In many parts of the world, waste is dealt with more informally, by burning it or dumping it. But waste has value, and networks of waste pickers retrieve materials for resale, from metal to plastic to scraps of fabric. The challenge for many developing world cities is to formalise waste processes and scale them up to keep up with rising consumption, a growing population, and increasing urbanisation. This quest for innovative and appropriate technologies gave birth to the advancement of plastic waste management through pyrolysis to promote a circular economy

The process here involves:

Recyplast: plastic collection boxes in several areas and homes. People are encouraged to find the nearest box and drop off their plastic, and users are rewarded with points that can be cashed out later. The company then sorts and processes the plastic for resale.

Trash2Cash: In Nigeria, refers to initiatives and platforms that incentivise the collection and recycling of waste by offering cash rewards or other forms of compensation to individuals and communities. These programs aim to address waste management challenges, promote environmental sustainability, and create economic opportunities for Nigerians.

Teco2 is a small company in Burkina Faso that is finding a use for waste plastic and turning it into building materials. There are many such companies, making bricks, fencing, or paving slabs.

Teco2 specialises in roof tiles and school benches, and depends on a team of women plastic pickers to bring in the materials for their recycled products.

Megagas in Kenya leverages waste plastic to solve another environmental problem – indoor air pollution. They use a cracking process to turn unsorted plastic waste into gas, which is then sold in bottles. This affordable cooking fuel often replaces wood burning, so as well as reducing pollution, it saves wood and reduces emissions from deforestation.

ScarabTech is also in the fuel business, but takes a different approach. Rather than paying people to bring the waste to their processing plant, they bring their machines to the waste. Based in South Africa, they make small off-grid pyrolysis units that they call beetles. They can be delivered off the back of a lorry, and process plastics into a liquid fuel. The big benefit of their units is that they can be temporarily sited and used to clean up waste hot spots, with the value created paying for the clean-up.

PLASTIC WASTE MANAGEMENT STRATEGIES

Plastic waste management is a critical issue given the environmental challenges posed by plastic pollution. Effective strategies for managing plastic waste include reduction, reuse, recycling, and upcycling. Each strategy offers unique methods for addressing plastic waste and contributes to a more sustainable approach.

Reduction (**Design for Recyclability and Minimal Packaging):** "Reduction" in the context of "Design for Recyclability and Minimal Packaging" refers to minimising the amount of materials used in packaging, both in terms of quantity and complexity, and designing packaging that is easily recyclable or compostable. This approach aims to reduce the environmental impact of packaging by minimising waste and maximising resource efficiency. The reduction of plastic waste begins with design strategies aimed at minimising plastic use and enhancing recyclability. Designing products for recyclability involves selecting materials that can be easily sorted and processed in recycling systems (European Commission. (2020). For example, simplifying product designs to use fewer types of plastic or avoiding multilayered materials can facilitate recycling. The European Commission's circular economy action plan emphasises the importance of designing products for durability and recyclability. It highlights that reducing the complexity of plastic products and packaging can significantly improve recycling rates and decrease plastic waste (European Commission, 2020).

Reuse (**Product Design and Sharing Economies):** Reuse involves extending the life of plastic products through thoughtful design and leveraging sharing economies. Designing products that are durable and repairable can reduce the need for new plastic items. Additionally, sharing economies, where products are shared or leased rather than owned, help minimise overall plastic consumption. Murray et al. (2017) explored the concept of the circular economy, including reuse strategies such as product design improvements and sharing economies. They note that extending product lifecycles through reuse can significantly mitigate plastic waste and reduce demand for new plastic products.

Recycling (**Mechanical and Chemical Recycling (Including Pyrolysis)):** Recycling transforms plastic waste into new products or raw materials. Mechanical recycling involves physically processing plastic waste to create new plastic items. Chemical recycling, including processes like pyrolysis, breaks down plastic waste into its chemical components to produce new raw materials or fuels. Andrady (2015) provided a comprehensive overview of plastic recycling methods. He describes mechanical recycling, which involves shredding and reprocessing plastic waste, and chemical recycling techniques, including pyrolysis, which decomposes plastics into basic chemicals that can be repurposed.

Upcycling (Creative Reuse and Value Addition): Upcycling refers to the creative reuse of plastic waste to create higher-value products. This can involve transforming plastic waste into art, furniture, or other functional items that have increased value compared to the original material. Gregson et al. (2015) explore the concept of upcycling within the circular economy. They discuss how creative reuse of plastic waste not only contributes to reducing plastic waste but also adds value through innovative applications, thereby promoting sustainability and resource efficiency.

PYROLYSIS: A KEY STRATEGY FOR PLASTIC WASTE MANAGEMENT

Pyrolysis is a process that involves the thermal decomposition of organic materials at elevated temperatures in the absence of oxygen. This method is particularly relevant for managing plastic waste, as it effectively breaks down complex polymers into simpler, more manageable molecules. The pyrolysis process produces a range of by-products, including gases, liquids, and solids, each with potential uses in various industries. Specifically, for plastic waste, pyrolysis can transform complex polymers into valuable products such as fuels, chemicals, and char (Adeoye et al., 2024). During pyrolysis, plastic waste is subjected to high temperatures, typically ranging from 300°C to 900°C. Under these conditions, the absence of oxygen prevents combustion, which is crucial for breaking down plastics without burning them. Instead, the heat causes the plastic polymers to decompose into different forms of hydrocarbons. The resulting by-products include gaseous hydrocarbons (such as methane and ethylene), liquid hydrocarbons (which can be further refined into various fuels and chemicals), and solid residues known as char or coke (Adeoye et al., 2024).

Pyrolysis Process

The efficiency and effectiveness of the pyrolysis process depend on several factors, including temperature, heating rate, and the type of plastic feedstock used. Fast pyrolysis, for instance, involves rapidly heating the plastic waste to high temperatures to maximise the yield of liquid products, known as bio-oil. This bio-oil can be further processed into fuels or chemicals (Singh-Morgan, Puente-Urbina, & van Bokhoven, 2022). In contrast, slow pyrolysis involves a more gradual heating process, resulting in higher yields of solid char, which can be used as a carbon source or soil amendment (Uddin et al., 2018). Another variation, catalytic pyrolysis, incorporates catalysts to enhance the process. Catalysts can improve the quality and quantity of the desired products, particularly liquid fuels and chemicals, by facilitating specific chemical reactions during pyrolysis. This method aims to produce higher-value outputs and improve overall process efficiency (Kataki et al., 2018).

Pyrolysis is a thermochemical process that decomposes organic materials at elevated temperatures in the absence of oxygen. This process involves heating the material to high

temperatures, causing it to break down into simpler compounds. Unlike combustion, which requires oxygen and produces heat through burning, pyrolysis operates in a controlled environment where the absence of oxygen prevents burning and instead facilitates thermal decomposition. The products of pyrolysis include gases, liquids, and solid residues, each of which can be used for various applications (Adeoye et al., 2024; Kataki et al., 2018).

STAGES OF THE PYROLYSIS PROCESS

Heating Phase: The pyrolysis process begins with the heating of organic material, such as plastic waste, to temperatures typically between 300°C and 900°C. This heating is done in a reactor where the absence of oxygen prevents combustion. The temperature and heating rate are crucial as they influence the type and quantity of by-products generated (Singh-Morgan et al., 2022).

Decomposition Phase: As the material reaches the desired temperature, it undergoes thermal decomposition. The high heat breaks down the complex polymeric chains in plastics into smaller molecular fragments. This stage produces a variety of by-products, including gases (such as methane, ethylene, and hydrogen), liquids (known as bio-oil), and solid residues (char or coke). The composition and yield of these by-products depend on the type of plastic feedstock and the specific conditions of the pyrolysis process (Uddin et al., 2018).

Cooling and Collection Phase: After decomposition, the gaseous products are cooled and condensed into liquid form, while the solid residues are collected. The gases are often passed through a series of condensers and separators to extract valuable liquid fractions, while the remaining non-condensable gases can be used as fuel to sustain the pyrolysis process or be flared off. The solid char can be used as a carbon-rich material for various applications, such as soil amendment or as a component in industrial processes (Kataki et al., 2018).

TYPES OF PYROLYSIS

Fast Pyrolysis: This method involves rapid heating of the feedstock, usually at temperatures around 500°C, to maximise the yield of liquid products. Fast pyrolysis is designed to produce a high quantity of bio-oil, which can be further upgraded into fuels or chemicals. The process is characterised by a high heating rate and short residence time (Singh-Morgan et al., 2022).

Slow Pyrolysis: In slow pyrolysis, the feedstock is heated more gradually at lower temperatures. This method results in a higher yield of solid char and is often used for producing biochar, which can be applied as a soil amendment or used in industrial applications (Uddin et al., 2018).

Catalytic Pyrolysis: This variation incorporates catalysts to enhance the breakdown of feedstock and improve the quality of the products, particularly for liquid fuels and chemicals. Catalysts can increase the selectivity and yield of desirable products while minimising unwanted by-products (Kataki et al., 2018).

PYROLYSIS APPLICATIONS AND BENEFITS

The pyrolysis process is valuable for converting plastic waste into useful by-products, such as fuels, chemicals, and char, thus providing a sustainable solution to waste management. The technology not only reduces the volume of plastic waste but also recovers resources and generates energy. As such, it plays a significant role in advancing circular economy principles by contributing to resource recovery and reducing environmental impact (Adeoye et al., 2024; Singh-Morgan et al., 2022; Uddin et al., 2018).

Pyrolysis Oil (Bio-Oil): Pyrolysis oil, often referred to as bio-oil, is one of the primary liquid by-products obtained from the pyrolysis process. This liquid is formed when the vapours released during pyrolysis are rapidly cooled and condensed. Pyrolysis oil is a complex mixture containing water, phenolic compounds, aldehydes, ketones, and various hydrocarbons (Adeoye et al., 2024). The composition of pyrolysis oil can vary significantly depending on the feedstock and the specific conditions of the pyrolysis process. For instance, different types of plastics and organic materials can lead to variations in the chemical profile of the resulting bio-oil.

The applications of pyrolysis oil are diverse. It can be used directly as a fuel in some industrial processes or further refined to produce high-value chemicals and fuels. In particular, bio-oil has potential applications in the production of renewable energy and as a feedstock for the chemical industry, thus contributing to sustainable resource management (Kataki et al., 2018). Despite its potential, bio-oil requires further processing to enhance its stability and improve its properties for specific applications.

Pyrolysis Gas: Pyrolysis gas, also known as syngas (synthetic gas), is another significant by-product of the pyrolysis process. This gas is a mixture of various hydrocarbons, including methane (CH_4), carbon monoxide (CO), carbon dioxide (CO_2), and hydrogen (H_2). The composition of pyrolysis gas is influenced by the type of feedstock and the operational parameters of the pyrolysis process (Uddin et al., 2018). The applications of pyrolysis gas are broad and versatile. It can be used as a fuel to generate heat and power within the pyrolysis facility itself or be utilised in other industrial processes. Additionally, after cleaning and conditioning, pyrolysis gas can be used for the production of synthetic fuels and chemicals. This utilisation of pyrolysis gas supports the energy recovery aspect of the technology, reducing reliance on traditional fossil fuels and contributing to overall energy sustainability (Singh-Morgan, Puente-Urbina, & van Bokhoven, 2022).

Pyrolysis Char: Pyrolysis char is the solid by-product that remains after the thermal decomposition of organic materials. This char is a carbon-rich material with a porous structure, resulting from the partial decomposition of the feedstock during pyrolysis. The composition of char includes a high concentration of carbon, along with residual organic and inorganic materials (Kataki et al., 2018). Char has several valuable applications. It can be used as a soil amendment, enhancing soil fertility and promoting carbon sequestration. Additionally, char can be employed in industrial applications, such as water purification, where its porous nature is advantageous. It can also serve as a precursor for producing activated carbon, which is used in various filtration and purification processes (Adeoye et al., 2024). The versatility of pyrolysis char highlights its potential for contributing to both environmental and industrial applications.

Environmental Benefits: Pyrolysis offers significant environmental benefits by providing an alternative to traditional waste management methods such as landfilling and incineration. One of

the primary advantages of pyrolysis is its ability to reduce the volume of plastic and organic waste. Pyrolysis addresses the pressing issue of waste disposal and mitigates the environmental impact associated with landfill use (Adeoye et al., 2024). Additionally, pyrolysis contributes to resource recovery. The by-products of pyrolysis, such as bio-oil, syngas, and char, can replace conventional fossil fuels and raw materials. This not only supports the principles of a circular economy by recycling materials but also reduces the demand for virgin resources. The process also generates fewer greenhouse gases compared to incineration, thus contributing to a reduction in the overall carbon footprint (Kataki et al., 2018). The controlled environment of pyrolysis minimises harmful emissions and enhances the sustainability of waste management practices (Uddin et al., 2018).

Reduced Landfilling: One of the most significant environmental benefits of pyrolysis is its potential to reduce the volume of waste sent to landfills. Plastic waste, which constitutes a major component of landfill material, can be effectively managed through pyrolysis, reducing the need for landfill space (Adeoye et al., 2024). Pyrolysis mitigates the environmental impact associated with landfilling, such as land use, soil contamination, and methane emissions from decomposing organic materials. The reduction in landfilling not only addresses the issue of waste accumulation but also minimises the environmental footprint associated with traditional waste disposal methods. This contributes to more sustainable waste management practices and supports broader environmental goals (Kataki et al., 2018).

Economic Benefits: The economic benefits of pyrolysis are substantial, particularly in terms of cost savings and revenue generation. Pyrolysis can significantly reduce waste management costs by converting waste into useful by-products, thereby decreasing the need for landfill space and associated disposal fees. The ability to produce valuable products like bio-oil, syngas, and char creates economic value and offers potential revenue streams for operators of pyrolysis facilities (Singh-Morgan et al., 2022). Moreover, the by-products of pyrolysis can be used to generate energy, contributing to energy recovery and reducing reliance on traditional energy sources. This not only supports economic sustainability but also aligns with broader goals of reducing dependency on fossil fuels. The overall economic impact of pyrolysis technology includes potential cost savings, revenue from by-products, and contributions to energy sustainability (Uddin et al., 2018).

Closed-Loop Recycling: Pyrolysis supports closed-loop recycling by converting plastic waste into valuable products that can be reintroduced into the production cycle. The process effectively breaks down complex polymers into simpler, usable substances like bio-oil and gases, which can then be used as raw materials or energy sources in various industrial applications. This aligns with the principles of a circular economy, where waste materials are continuously cycled back into the production system rather than being discarded (Adeoye et al., 2024). Pyrolysis helps close the loop of material use and reduces the demand for new raw materials. For instance, the bio-oil produced through pyrolysis can be refined into chemicals or fuels that are used in manufacturing processes, thereby creating a closed loop where the waste material is continually repurposed (Kataki et al., 2018). This process reduces the need for virgin resources and supports sustainable material management.

Energy Generation: Pyrolysis is an effective technology for energy generation. The process produces various by-products, including syngas (pyrolysis gas) and bio-oil, which can be utilised as energy sources. The syngas produced during pyrolysis is rich in methane, hydrogen, and carbon monoxide, which can be burned to generate heat and electricity. This makes pyrolysis a valuable technology for producing renewable energy from waste materials (Uddin et al., 2018). Moreover, bio-oil can be used as a substitute for conventional fossil fuels in certain industrial applications or further refined to produce transportation fuels. The ability to generate energy from waste materials helps reduce reliance on fossil fuels and contributes to energy sustainability (Singh-Morgan, Puente-Urbina, & van Bokhoven, 2022).

CASE STUDIES AND REAL-WORLD APPLICATIONS OF PYROLYSIS

Case Study: The Plastic Energy Project

The Plastic Energy Project, an initiative by the company Plastic Energy, provides a notable example of how pyrolysis technology is applied to manage plastic waste. Based in Spain, this project utilises a patented pyrolysis process known as “TACOIL” to convert plastic waste into high-quality oils that can be refined into fuels and chemicals (Plastic Energy, 2020).

Process Overview: Plastic Energy's pyrolysis technology operates at temperatures between 350°C and 500°C, breaking down plastic waste in the absence of oxygen. The resultant products include a liquid known as "TACOIL," which contains a range of hydrocarbons that can be further refined into diesel and other chemicals. Additionally, the process produces a small amount of solid char and syngas, which can be used for energy generation within the facility (Plastic Energy, 2020).

Impact and Benefits: The Plastic Energy Project demonstrates the efficacy of pyrolysis in managing plastic waste. The facility is designed to handle various types of plastics, including those that are difficult to recycle through conventional methods. The project contributes to the reduction of plastic waste in landfills and supports a circular economy model. The process also reduces greenhouse gas emissions compared to traditional incineration methods (Plastic Energy, 2020).

CASE STUDY: AGILYX CORPORATION

Agilyx Corporation, headquartered in Tigard, Oregon, is another prominent example of a real-world pyrolysis application. Agilyx operates one of the world's first commercial-scale facilities dedicated to the pyrolysis of plastic waste (Agilyx, 2023).

Process Overview: Agilyx's technology involves a two-step pyrolysis process. First, the plastic waste is heated to break it down into synthetic crude oil. This oil is then upgraded in a second step to produce high-quality fuels and chemicals. The company’s technology is designed to process mixed plastics, including polyethene, polypropylene, and polystyrene (Agilyx, 2023).

Impact and Benefits: Agilyx's facility has been operational since 2012 and has processed thousands of tons of plastic waste. The outputs from their pyrolysis process include synthetic

crude oil, which can be further refined into diesel and other products. The technology provides an effective solution for dealing with plastic waste that is otherwise challenging to recycle. Additionally, Agilyx's approach reduces the volume of waste sent to landfills and decreases reliance on fossil fuels by converting waste into valuable energy products (Agilyx, 2023).

CASE STUDY: BAPEDI PYROLYSIS PLANT

In South Africa, the Bapedi Pyrolysis Plant represents a successful implementation of pyrolysis technology to manage agricultural and plastic waste. This facility, located in Limpopo Province, uses pyrolysis to convert agricultural residues and plastic waste into valuable products such as bio-oil and biochar (Bapedi Pyrolysis, 2022).

Process Overview: The Bapedi plant employs a continuous pyrolysis system that processes both agricultural residues (like corn stalks and sugarcane leaves) and plastic waste. The plant operates at temperatures around 500°C to ensure efficient breakdown of the feedstock. The main products include bio-oil, which is used as a fuel, biochar, which is utilised as a soil amendment, and syngas, which can be used for energy (Bapedi Pyrolysis, 2022).

Impact and Benefits: The Bapedi Pyrolysis Plant showcases the versatility of pyrolysis technology in handling multiple types of waste. The facility supports local waste management efforts and provides economic benefits through the production of usable fuels and soil amendments. The use of biochar as a soil enhancer also contributes to carbon sequestration and improves soil health, further demonstrating the environmental benefits of pyrolysis technology (Bapedi Pyrolysis, 2022).

CASE STUDY: PYROLYSIS-BASED WASTE MANAGEMENT

In Switzerland, the **Swiss Federal Laboratories for Materials Science and Technology (SFLMST)** has implemented pyrolysis technology to manage waste and produce valuable by-products. This project is part of a broader research initiative to develop and optimise pyrolysis processes for various types of waste.

Process Overview: SFLMST's pyrolysis research focuses on converting waste plastics and biomass into high-value products, including bio-oil, syngas, and char. The facility operates advanced pyrolysis reactors that allow precise control over temperature and process conditions. This research aims to improve the efficiency and effectiveness of pyrolysis technology for both waste management and resource recovery (EMPA, 2023).

Impact and Benefits: The Swiss Federal Laboratories for Materials Science and Technology (EMPA) highlights several significant benefits of its pyrolysis research. **Closed-loop recycling** is a key advantage, as the technology transforms waste materials into valuable products, thereby supporting a circular economy by recycling waste into usable resources. Energy generation is another critical benefit, with pyrolysis producing bio-oil and syngas that can be used as alternative energy sources, reducing dependence on fossil fuels. Additionally, the technology contributes to reducing landfilling by converting waste into by-products, thus decreasing the volume of waste sent to landfills and mitigating environmental impact (EMPA, 2023).

PYROLYSIS TECHNOLOGY (CHALLENGES AND BARRIERS TO ADOPTION)

Pyrolysis Technology has emerged as a groundbreaking solution for sustainable waste management and energy generation. Biochar and heat offer a promising alternative to traditional disposal methods. Nevertheless, the adoption of Pyrolysis Technology is hindered by several challenges, such as:

Technical and Operational Challenges: Pyrolysis technology, while promising, faces several technical and operational challenges. One major issue is the need for precise control over temperature and reaction conditions to ensure efficient and consistent breakdown of feedstock. Variations in feedstock composition can affect the quality and yield of the by-products, necessitating advanced and often costly technology to manage these variables effectively (Uddin et al., 2018). Additionally, the scale-up from laboratory or pilot-scale operations to commercial-scale facilities can encounter difficulties related to maintaining operational stability and efficiency (Kataki et al., 2018).

Economic Considerations and Cost Factors: Economic factors significantly influence the adoption of pyrolysis technology. The initial capital investment for setting up a pyrolysis plant is substantial, including costs for reactors, feedstock preparation, and by-product handling (Adeoye et al., 2024). Operational costs, such as energy consumption and maintenance, also contribute to the overall expense. Despite the potential for generating valuable by-products, the financial viability of pyrolysis often depends on the market value of these products and subsidies or incentives provided by governments (Singh-Morgan et al., 2022).

Regulatory and Policy Barriers: Regulatory and policy barriers can hinder the widespread adoption of pyrolysis technology. In many regions, existing regulations may not yet fully accommodate or support the nuances of pyrolysis processes, leading to uncertainties and delays in obtaining necessary permits (Uddin et al., 2018). Additionally, there may be a lack of clear guidelines or standards for the quality and safety of the by-products, which can create challenges for market entry and acceptance (Kataki et al., 2018).

Public Perception and Acceptance Issues: Public perception and acceptance are crucial for the successful implementation of pyrolysis technology. There may be scepticism regarding the environmental impact and safety of the technology, particularly if it is not well-understood or if past experiences with similar technologies have been negative (Singh-Morgan et al., 2022). Effective communication and outreach are necessary to address public concerns and build trust in the technology's benefits.

Comparisons with Other Waste Management Technologies: Pyrolysis must be compared with other waste management technologies such as incineration, landfilling, and recycling to understand its relative advantages and limitations. For instance, while pyrolysis can offer a solution for managing plastic waste and generating energy, other technologies like mechanical recycling may be more cost-effective for certain materials (Adeoye et al., 2024). Moreover, incineration may be preferred in regions where waste-to-energy plants are already established, despite concerns about emissions and ash disposal (Kataki et al., 2018). Each technology has its

trade-offs in terms of cost, environmental impact, and efficiency, which influence the decision-making process for waste management strategies.

CONCLUSION

Conclusively, pyrolysis technology stands as a beacon of innovation in the quest to manage plastic waste and foster a circular economy. This technology has the potential to significantly reduce plastic waste, decrease greenhouse gas emissions, and generate clean energy. However, to unlock its full potential, it is crucial to tackle the multifaceted challenges that hinder its adoption. Technical challenges, such as optimising pyrolysis processes and ensuring consistent product quality, must be addressed through research and development. Economic barriers, including high initial investment costs and uncertain market demand, need to be overcome through incentives and market development. Regulatory frameworks must be adapted to support the growth of pyrolysis technology, and social acceptance must be fostered through education and community engagement. Addressing these challenges will require a collaborative effort from governments, industries, and civil society. As we move forward, it is essential to prioritise innovation, investment, and policy support to ensure that pyrolysis technology reaches its full potential and contributes meaningfully to a circular economy.

Strategies to Overcome Challenges

To overcome these challenges, the approach involving various stakeholders is necessary:

- Continued research and development to enhance process control, scalability, and cost-effectiveness are essential. Collaboration between research institutions, technology developers, and engineering firms can drive innovation and improve efficiency.
- Developing cost-effective technologies and exploring financial support mechanisms such as grants and subsidies can make pyrolysis more economically viable. Public-private partnerships can also help distribute financial risks and support large-scale implementations.
- Policymakers and regulatory bodies need to create clear, comprehensive regulations and standards for pyrolysis technology. Industry associations and advocacy groups should work with governments to streamline the regulatory process and establish guidelines for safety and quality.
- Effective communication strategies and public outreach are critical to build trust and acceptance. Engaging with community stakeholders and addressing concerns transparently can help foster positive perceptions of pyrolysis technology.
- Conducting detailed comparisons of pyrolysis with other waste management technologies can inform strategic decisions and ensure that it is used effectively in a broader waste management framework.

ABSTRACT

Teachers play a vital role in shaping the minds of future generation, but their own physical and mental health can significantly impact their ability to deliver effective instruction. This position paper examines the physical and mental health challenges faced by teachers and their effect on service delivery. A comprehensive review of existing literature reveals that, teachers experience high level of stress, burnout, depression, anxiety, confusion, frustration, and generally poor physical and mental health, which can lead to decreased motivation, reduced job satisfaction and poor mental health. Furthermore, these challenges can negatively impact teacher student relationships, instructional quality and student learning outcomes. The paper highlights the need for schools and educational administrators to prioritise teacher well-being and provide supportive environment that promote physical and mental health. By doing so, teachers can deliver high quality instructions, and students can achieve high academic outcomes. Ultimately, this paper aims to inform policy and practice that supports the physical and mental health of teachers, ultimately benefitting students and the broader educational system

Keywords: Teachers, Physical, Mental, Health, Effect, Service, Delivery.

INTRODUCTION

Education is a fundamental human right that everybody should have, regardless of their colour, gender, marital status, social or economic background, this is because education is seen as the pathway to life, and the biggest human resource in education is the teacher, therefore, the teacher is seen as the pillar of education and the educational system.

Teachers are nation builders and the bedrock of any educational system in Nigeria and across the world. They play a vital role in shaping the minds of present and future generation. However, the teaching profession is often characterised by high levels of stress, burnout, frustration and poor physical and mental health. This position paper is determined to look into the physical and mental health of teachers and examine the significant effect this plays in their service delivery, and ultimately students learning outcome.

While this paper presentation highlights both the physical and mental well-being of teachers, more emphasis is placed on the mental health of teachers and this is simply because it is

easier to identify when a teacher has a physical health challenge such as fever, headache, stomach ache, malaria, etc. as some of the signs are easily noticeable even without medical diagnosis, and the school authority can easily grant the teacher permission to go and treat himself/herself. However, it is a little more difficult to identify when a teacher is suffering from a mental health challenge because some of the signs could easily be explained away as anger, being in a bad mood, some other times we make excuses such as the students behaviour got on the teachers nerves, etc, since mental health illness are mostly behavioural illness, these signs are easily explained away as bad behaviour, whereas, that thing we call bad behaviours could be a disaster about to happen which could be averted with early diagnosis. It is only when this negative outburst becomes consistent that people begin to pay attention to the mental health of the teacher, and before this is identified as a mental health challenge, the teacher may have done more harm to herself, the students, her colleagues at work, and even to the learning community.

Mental health challenge is fast becoming a common disease in our society today, and teachers are not immune to it, teachers are also exposed to those elements that cause mental health illness, and they too suffer from this menace that is gradually and subtly eating up a good part of our human lives. It has been observed that while the health sector is stepping up and doing all they can to combat this demon (mental health) the educational sector is paying little or insignificant attention to it, even with its damaging effect on the personal and professional life of the teachers, It is against this backdrop that this paper decided to investigate teachers physical and mental health and its effect on their service delivery

THEORETICAL REVIEW

This work is anchored on two theories, which are:

Stress Appraisal Coping (SAC) Model by Lazarus and Folkman (1984) cited by Tremolada (2020) These theories provide a framework for understanding the complex factors that contribute to both physical and mental health challenges:
Stress Appraisal Coping (SAC) Model. The SAC model developed by Lazarus and Folkman (1984) and cited by Tremolada (2020) explains how individuals experience stress and cope with it. According to this model, stress occur when an individual perceives a threat or challenge that exceeds their coping resources

The second theory is the Job Demand-Resources (JD-R) Model by Arnold Bakker and Evangelia Demerouti (2006) – the model states that when job demands are high and job resources/positive are low, stress and burnout occur. This is a theory that can be used to understand and improve teachers physical and mental well-being by focusing on both the stressors (job demands) and the supportive factor (job resources) in their work environment.

Job Demand – these are aspects of the job that require effort and can lead to stress, such as heavy workload, role ambiguity and lack of control

Job Resources – These are the aspects of the job that can help teachers cope with demands and promote well-being such as autonomy, social support, opportunities for professional development and positive relationships with colleagues and students

The JD-R Model suggest that high job demand without sufficient job resources can lead to burnout, stress and poor mental health. Conversely, the model highlights resources that can buffer the negative effects of job demands, and promote wellbeing, including supportive

colleagues, opportunities for professional development, a positive school climate, and a sense of control over one's work

The relationship between these two theories and this position paper, is that the theories believe that high teacher job demands and low resource both human and infrastructural will lead to stress, burnout and ultimately anxiety and frustration which are both physical and mental health issues. Similarly, this position paper examined the effect of service delivery by teachers in the face of both physical and mental health issues. Hence the theories and the position paper are looking at the same thing – The physical and mental health of teachers and the corresponding effect on their service delivery

CONCEPTUAL CLARIFICATIONS

Teachers Physical Health

Physical health encompasses the effective and efficient functioning of the body, encompassing overall wellness, the absence of disease, and the ability to perform daily activities with little or no limitations, achieved through a combination of exercise, nutrition, rest, and selfcare. This represents one dimension of total well-being, it deals with how your body grows, moves, what you put into it and how you care for it. Physical health is closely linked to mental health, and an integral part of leading a healthy lifestyle

Teachers physical health is a critical aspect of their overall well-being, influencing their ability to deliver effective instruction, manage classrooms, and maintain positive relationship with students. Physical health refers to the absence of physical diseases or disabilities as well as the presence of physical functioning and well-being. (World Health Organization, 2019). Teachers physical health can be influenced by various factors including lifestyle habits, work environment, and access to health care.

Teachers physical health can be impacted through: Work environment – the physical work environment including classroom layout, lighting, temperature and air quality can impact teacher's physical health (Harris, 2017) Workload and work life balance – excessive work load, long working hours, and poor work life balance can contribute to teacher's physical health problems (Kessler, et al., 2015)

Life style habits – teachers life style habits including physical activity, diet and sleep patterns, can influence their physical health (World Health Organization, 2019)

Teachers Mental Health

This is a state of mental (cognitive) well-being that enables teachers to cope with the stresses of the teaching professions, realize their intellectual abilities, set academic goals, pursue and realise their goals, learn to manage and cope with their student, work, and their colleagues, work well and contribute to the learning community. It has intrinsic and instrumental value and its integral to. Teachers mental health includes the teachers emotional, psychological, and social well-being, it affects how the teacher thinks, feels, and acts, and helps determine how he/she handles stress, relates to others and make choices. Good mental health positively affects the teacher, and enables him to meet life's responsibilities and find happiness and meaning both in his career path as a teacher and in the general affairs of life. Poor mental health can have negative impact on the physical health of the teacher, how he feels about himself and how he interacts, with his students,

with the world, and those around him. A mental health breakdown is an impairment which may adversely affect a teachers cognitive or social functioning

Mental health encompasses emotional, psychological and social well-being, influencing how we think, feel, and behave, and its essential for overall health and quality of life. This is a state where he mind enables people to cope with the stresses of life, realise their abilities, , learn well, and work well, and contribute to their community

Physical health is the state of your body while mental health is the state of your mind, feelings and emotions

Mental health conditions can cause difficulty in all aspects of life, including relationships with family, and community, they can result from or lead to problems at school and in the classroom/workplace

Teaching is one of the most difficult jobs to do on earth, because it requires a lot of dynamism in instructional delivery. Different topic may require different instructional delivery technique, depending also on the age and level of the learners/students; which is why we have different teaching methods, such as the lecture method, play way method, field trip method, discussion method etc; and having to master of all these teaching methods alone is very draining for the teacher

The State of Teacher Health

Research has consistently shown that teachers experience a high level of stress, anxiety and burnout. A study by the American federation of teachers found that 51% of teachers reported feeling stressed and overwhelmed while 58% reported feeling anxious or nervous. Furthermore, teachers are at high risk of developing mental health conditions such as depression, and anxiety disorders. American Psychiatric Association (2013)

In terms of physical health, teachers are also at risk. A study by the National Education Association found that 55% of teachers reported experiencing back pain, while 46% reported experiencing headache. Additionally, teachers are at high risk of developing chronic disease such as hypertension, diabetes, and cardiovascular disease. National Institute of Mental Health (2020)

The physical and mental health of teachers has a significant impact on their service delivery. When teachers are unhealthy, they are less able to provide high quality instructions, manage classroom behaviours, and support student learning

Research has shown that teachers stress and burnout are associated with lower levels of teacher's self-efficacy. Job satisfaction, and student engagement. Furthermore, unhealthy teachers are more likely to experience what is called presenteeism, absenteeism (being present at work but not fully productive) and turnout. World Health Organization - WHO (2020). The physical and mental health of teachers also has a significant impact on student learning outcomes. When teachers are unhealthy, they are less able to provide high quality instruction which can lead to lower levels of students' achievement. unhealthy teachers are more likely to experience difficulty managing classroom behaviour which can lead to decreased student engagement and motivation. It is on the note of this identified problems that this study decided to examine teachers physical and mental well-being and its corresponding effect on service delivery and eventually its outcomes on the student's academic performance.

While some may argue that mental health illness is primarily linked to genetics factors, it is still arguable that been exposed to constant professional stress and burnout like teachers face every day in the course of delivering on their responsibilities in the classroom can increase the

risk factors and hence bring the teacher face to face with mental health break down faster than he/she can imagine

Teachers have several sources of stress in the workplace; some of them include; increased class sizes, students' performance objectives, lack of control over work hours and methods, lack of student motivation, difficulty working with parents, lack of professional recognition, and inadequate salary

As a teacher I suffered from post partem depression after the birth of my first child, while I was battling with PPD, I had to be in school every day to teach other people's children while struggling to come to terms with accepting my own child, I went through all kinds of crazy and negative emotions, ranging from rage against the students, to crying in class, then seeing them as the cause of my problem, it was quite enormous, I needed the financial strength that came from the job, so I couldn't quit the job, instead I struggled to live in pretence that all was well. It took the intervention of A therapist from The University of Port Harcourt Teaching Hospital to stop me from beating a particular child to stupor and then probably send myself to prison because of my uncontrolled anger/anxiety which would have had devasting effects on me.

The World Health Organization describes the teacher's mental health as the state of well-being in which the teacher realises his or her abilities, can cope with the normal stresses of life, can work productively and fruitfully, and is able to make a contribution to his community especially the learning community. The teacher's mental health is best understood as a resource, one that allows the teacher to understand his skills and potential that he may use to pursue his passion and dream within the education sector. Mental health allows the teacher to work in constructive ways, either by himself, or collectively as a group or community. Social health is an integral of mental health, where teachers can integrate into society, feel accepted and trusted, contribute to collective effort and work towards strengthening the education sector both for the resent and the future. Mental health in teachers also enables them to recognise, understand and address challenges as they arise. Teachers are able to look at issues objectively and make objective decisions in matters that concern their families, friendship, scholastic pursuit, hobbies, leisure activities.

When teachers experience mental health disorders, they may experience distress, and wide range of clinically significant conditions where areas of functioning are affected. Mental health disorders are characterised by changes that affect the teacher's emotional regulations. (cognitive processes) and behaviour. Broadly, mental health disorders are diagnosed by mental health professionals who have evidenced that mental health symptoms meet diagnostic criterial for duration, frequency and severity; for teachers, this may mean that they are no longer able to function or perform optimally in the classroom, and may need to interrupt their career pursuit while they seek treatment

Certain factors may contribute to a teacher's mental health issues and they include workload and work life balance – excessive workload, long working hours, and poor work life balance can contribute to teacher's mental health issues (Kessler, et al, 2015)

Classroom management – managing challenging students' behaviour and discipline can be a significant source of stress and anxiety for teachers (Marzano, 2017)

Lack of support – teachers may feel unsupported by administration, colleagues, or even parents leading to increased stress and burnout. (Lngersoil, 2023)

Student's Needs – teacher may fel overwhelmed by the diverse needs of their students, including students with disabilities, English Language learners and students from low income background. (Tomlinson, 2021). Overall mental health is an essential part of a teacher's life.

Teachers Service Delivery

Teachers' service delivery refers to the quality of instruction, support and guidance provided by teachers to students in the classroom. Effective service delivery is critical to students learning outcomes, academic achievement, and social-emotional development. service delivery in education the process b which teacher design, deliver and evaluate instructions to meet the diverse needs of students (Danielson, 2017). Effective service delivery involves creating a supportive learning environment, developing, engaging lesson plans, and using assessment data to inform instruction. Several factors influence teachers service delivery. They include:

Teacher characteristics – teachers knowledge skills, and attitude can impact their ability to deliver high quality instructions (Darling-Hammond, 2020)

School environment – the school environment including administrative support, resources and school culture can influence teacher's ability to deliver effective instruction (Hoy & Misket, 2023):

Student's needs – students diverse needs including learning styles, abilities and cultural background can impact teachers service delivery (Tomlinson, 2021)

Several models of service delivery have been developed to guide teachers' instructional practices. They include:

The Danielson Framework – this frame work provides a comprehensive approach to teaching including planning, instruction and assessment (Danielson, 2017)

The Marzano Teacher Evaluation Model – the model provides a frame work for evaluating teacher's instructional practice, including classroom management, instruction and assessment. (Marzano, 2022)

The Universal Design for Learning – this framework provides an approach to instructional design that takes into account the diverse needs of students (Meyer & Rose, 2020). Effective service deliver has a significant impact on students learning outcomes

Academic achievement – high quality instructions can lead to increased academic achievement including improved tests scores and grades (Hattie, 2019)

Social emotional development – effective service delivery can also promote social emotional development including increased self-esteem, motivation, and engagement (Durlak et al., 2021)

College and Career Readiness – high quality instructions can prepare students for college and careers, including developing critical thinking, problem solving, and communication skill (Conley, 2014).

Students service delivery is a critical factor in students learning outcomes, academic achievement, and socioemotional development. By understanding the complex factors that influence service delivery, including teacher characteristics, school environment, and student's needs, educator can develop effective instructional practices that promote student's success

Depression

Depression is a complex and multifaceted mental health disorder, characterised by persistent feeling of sadness, hopelessness, and a loss of interest in activities. It is a leading cause of disability worldwide, affecting millions of people across s different cultures, ages and

socioeconomic background. This is more challenging for teachers as most f their work are based on mental articulation before the physical execution of instructional procedure. Depression is not just sadness that comes and goes, or anger that comes and goes, it is almost living in a constant and persistent mood of anger and sadness at the same time. Depression is characterised by most or some of these symptoms:

- Depressed mood most of the day
- Diminished interest or pleasure in activities
- Significant weight loss or gain
- Insomnia or hypersomnia
- Psychomotor agitation or retardation
- Fatigue or loss of energy
- Feeling of worthlessness or quilt
- Diminished ability to think or concentrate
- Recurrent thoughts of death or suicidal ideation

There are several types of depression as listed below:

Major Depressive Disorder (MDD) also known as unipolar depression. MDD is characterised by one or more major depressive episodes in a person's lifetime. When teachers manifest this type of depression, it could easily be explained away as mood swing, hence this is not easily noticeable in teachers, even when the signs are there. Kessler, et al, (2015).

Persistent Depressive Disorder (PDD) also known as dysthymia, PDD is a type of depression characterised by a low dark or sad mood that last for at least two years
Bipolar Disorder also known as maniac depressive illness. Bipolar disorder is a type of depression characterised by periods of abnormally elevated mod known as mania, or hypomania. This is commonly found in teachers

Postpartum Depression (PPD) PPD is a type of depression that occurs in women after child birth typically within the first year, and a good number of female teachers experience this type of depression, but they do not know what it is
since they do not understand the feelings going on in their bodies as at that time. Murray, (2016).

Psychotic Depression this is the type of depression that is characterised by the presence of psychotic symptoms such as hallucinations or delusions. Teachers who suffer from this kind of depression become a big threat to their students as they sometimes see the students as a threat to them since they are bound by the emotions or feelings of hallucinations and delusions

Depression can have significant consequences and impact, on teacher's life including; impaired functioning – depression can impair a teacher's ability to function in daily life, including work relationship, and self-care. Depression can increase the risk of suicidal ideation in teacher's behaviour; thus exposing the students to trauma. Depression can co-occur with their mental health disorders in teachers, disorder such as anxiety, or substance use disorder. This type of behaviour in teachers can make them to bully and beat up their students without any consideration. Depression can impose a significant economic burden on teachers because when a

teacher begin to manifest strong depressive behaviour, the employer of such teacher is mostly likely to disengage them form the organization/school, and when that happens, it puts more economic pressure on the teacher who now become jobless as a result of depression

Stress

Stress is a pervasive and debilitating variable that affects teachers and mental health, ultimately impacting their service delivery, this conceptual review examines the relationship between stress, teacher well-being, and service delivery

Stress is a dynamic and multifaceted construct that arises from the interaction between and individual and their environment. According to Lazarus and Folkman (1984) stress occurs when an individual perceives a threat or challenge that exceeds their coping resources. In the context of teaching, stress can arise from various sources, including workload, classroom management, student behaviour and administrative tasks. Stress can significantly impact teachers service delivery including:

Instructional Quality – stress can impact teachers' ability to deliver high quality instruction, leading to decreased student engagement and motivation (Harrison, 2023).

Classroom Management – stress can lead to decreased classroom management skills, resulting in increased student misbehaviour, and decreased academic achievement (Marzano, 2017).

Teacher-Student Relationship – stress can negatively impact teacher-student relationships, leading to decreased student motivation, engagement and academic achievement (Hattie, 2019).

Stress is a particular relationship between the person and environment, that is appraised by the person as taxing or exceeding his or her resources or endangering his or her own well-being (Lazarus & Folkman, 1984).

Stress is a critical variable that affects teachers physical and mental health, ultimately impacting their service delivery. It is essential for schools and educational administrators to prioritise teacher well-being and provide supportive environment that mitigate stress and promote teacher resilience

Burnout

Burnout may adversely affect teacher's health, and is a risk factor for poor physical and material well-being of teachers, this may include both emotional and physical exhaustion. Evidence of this may be frustration and irritability, mood swings, impaired concentration, chronic fatigue and insomnia as well as physical symptom such as increased illness, palpitation, gastrointestinal pain, headache, and dizziness. From long hours to heavy workload to low pay, and constantly changing curriculums and standards. It can all pile up, and without the right support, lead to damaging burnout amongst teachers, professional attrition, negative self-concept, despair, hopelessness, frustration, and lack of productivity at work. In addition to teaching, many educators spend long hours grading, preparing lesson plans, attending meetings, and managing extracurricular activities. They often work beyond school hours and on weekends, leading to exhaustion. Burnout can negatively affect teachers in the following way

Anxiety and Depression – burnout can contribute to the development of anxiety and depression, in teachers. Kyriancou, (2021)

Trauma and Compassion Fatigue – teacher may experience trauma and compassion fatigue due to exposure to student's trauma, violence or abuse (Figey, 2015)

Reduced Job Satisfaction – burnout can lead to decreased job satisfaction, reduced motivation, and increased turnover intentions (Maslach & Jackson, 2018)

The impact of burnout on teacher's physical health is such that is can induce:

Cardiovascular Disease – Burnout can increase blood pressure, heart rate and cardiovascular disease risk (Kabat-Zinn, 2023)

Musculoskeletal Disorders – burnout can lead to muscle tension, back pain and musculoskeletal disorders (Harris, 2017)

Sleep Disturbances – Burnout can disrupt sleep pattern, leading to fatigue, decreased productivity, and impaired cognitive function (Harvard- Health, (2019)

Anxiety

Anxiety s a feeling of worry, nervousness, or unease about something, with an uncertain outcome. Anxiety is a pervasive and debilitating factor that affects teachers service delivery. It is a psychological state characterised by feeling of worry, nervousness, and fears that are persistent and overwhelming. (American Psychological Association, 2020), anxiety can arise from various sources including, workload, classroom management, student's behaviour, and administrative tasks.

Social anxiety is an unfounded fear of being judged, a teacher with social anxiety will feel hyper self-conscious and worry about harassment and embarrassment, and might try to avoid situations that trigger these feelings even if it means skipping certain topics of a planned academic program that will be of benefit to the students' academic growth

Anxiety is one of the worst negative challenges that a person can experience. It is a condition in which a person is concerned about the likelihood of a negative occurrence even when there is no reason for such expectations. Teacher anxiety can create a stressful classroom environment, potentially increasing students' anxiety, and affecting their learning and well-being, anxiety can make it difficult for teachers to effectively manage challenging behaviours and maintain a positive learning environment, anxiety can hinder teachers ability to build positive relationships with students and create a supportive classroom culture. Anxiety can lead to:

- Emotional Exhaustion – anxiety can lead to emotional exhaustion, decreased motivation, and reduced job satisfaction (Malach & Jackson, 2018)
- Physical Symptoms – anxiety can manifest physically, including symptoms such as; headaches, stomach aches, and sleep disturbances (Kessler e al, 2012)
- Decreased self-efficacy – anxiety can erode teachers self-efficacy leading to decreased confidence and competence in the classroom ((Bandura, 2017)

Frustration

Frustration is a common emotional response to perceived obstacles in achieving personal, professional, or academic goals. In the context of education, teachers often face a myriad of challenges that can lead to frustration ultimately impacting their mental and physical health, and consequently, their effectiveness in service delivery, this review explores the multifaceted nature of frustration, its implication for teacher well-being, and the resultant effect in educational outcomes

Frustration is an emotional response characterised by feeling of helplessness, aggravation, and dissatisfaction arising from the inability to achieve a desired outcome. It can stem from various factors, including but not limited to:

- External Factors – this include inadequate resources, lack of administrative support, disruptive student behaviour, and high stakes testing pressure
- Internal Factors – Teachers personal expectation, perfectionism, and high levels of responsibility can lead to self-induced frustration when those expectations are not met
- Environmental Factors – class size, school culture, and community support also contribute to a teacher perceived ability to manage their responsibilities effectively
- Frustration and Mental Health – Frustration can severely impact mental health leading to psychological issues such as:
- Anxiety and stress – persistent frustration can result in chronic stress, which is detrimental to mental health. Teachers may experience anxiety that affects their decision-making abilities and classroom management
- Burnout – the continuous circle of frustration can lead to burnout – a state of emotional, physical, and mental exhaustion, signs include feeling of inefficacy, depersonalisation, and a decreased sense of personal accomplishment
- Depression – in severe cases, on-going frustration, and the resultant burnout can lead to depression; diminishing a teacher's enthusiasm, and engagement with their students
- Frustration and Physical Health – the ties between mental and physical health are well documented. Chronic frustration can lead to:
- Physical symptoms – stress manifestation such as headaches, gastrointestinal issues, and fatigue can arise from prolonged frustration
- Reduced Immune Function – chronic stress has been shown to compromise the immune system, making teachers more susceptible to illness, and leading, and leading to increased absenteeism
- Lifestyle choices – Frustration may, lead to unhealth coping mechanisms, including poor diet, lack of exercise, and substance misuse, further exacerbating physical health issues
- The intersection of frustration, mental health physical health has tangible effect on teacher service delivery
- Classroom management – frustrated teachers may struggle to maintain classroom order, effectively diminishing the learning environment and impacting student engagement and behaviour
- Quality of instruction – a teacher's enthusiasm and energy are crucial in delivering quality education. High levels of frustration can lead to disengagement, lack of innovation in teaching practices, and lower overall teaching effectiveness

- Student-Teacher Relationship – teacher frustration can negatively affect relationship with the students leading to a less supportive and nurturing environment which is essential for students learning and development
- Professional Development – Frustrated teachers may be less inclined to participate in professional development opportunities, impeding their growth and adaptation to new teaching strategies or curricular change

CONFUSION

Confusion is a cognitive state characterised by ambiguity, uncertainty, and a lack of clarity can significantly affect various dimensions of a teacher's life, including their physical and mental health as well as service delivery within educational settings. The teaching profession demands high level of cognitive functioning, emotional stability and interpersonal skills, making confusion a particularly detrimental experience for educators. This review aims to explore the concept of confusion, its causes and manifestation, and its implications for teacher's health, and the quality of education they deliver

Understanding Confusion

Confusion can arise from various factors; including information overload, emotional distress, cognitive dissonance, and external environmental pressures. In the context of teaching, confusion may stem from:
Inconsistent Policies and Expectation – teachers are often faced with changing curricula, contradictory guidelines, and unclear expectations from school administrations
High Levels of Stress – The teaching profession is inherently stressful with heavy workloads, lack of resources and pressure to produce students' outcomes that can lead to confusion about priorities and goals
Emotional Strain – Interpersonal relationships with
students' parents and colleagues, an be complex and emotionally tasking, leading to cognitive overload and confusion
Information Overload – The rapid advancement of educational technologies, and pedagogical theories can overwhelm teachers, making it difficult to determine the best approaches to implement

Impact on Mental Health

Cognitive Effect – confusion can lead to impaired decision making and problem-solving abilities. Consequently, teachers may struggle to design effective lesson plans, manage classroom dynamics or respond to students' individual needs.
Emotional Well-Being – Teachers experiencing confusion may feel frustration, anxiety and a sense of inadequacy. This emotional turmoil can develop into more severe mental health issues such as burnout, depression, or anxiety disorders
Stress and Coping Mechanism – Chronic confusion can lead to heightened stress levels, which if not managed effectively can result in maladaptive coping mechanisms such as substance abuse, withdrawal from social interaction or burnout

Job Satisfaction and Professional Identity – Confusion can undermine teachers' confidence in their professional competences leading to diminished job satisfaction, disillusionment and a weakened sense of professional identity

Impact on Physical Health

The nexus between confusion and physical health is notably intertwined. The mental and physical health of teachers can be adversely affected through;
Stress Related Illness – psychological stress resulting from confusion can manifest as physical ailments, such as headaches, gastrointestinal issues and cardiovascular problems due to prolonged activation of the body's stress response
Sleep Disturbances – Confusion can contribute to sleep related issues, such as insomnia or disrupted sleep patterns, leading to further cognitive impairment and a lack of energy to engage effectively in teaching
Increased Absenteeism – Poor physical health resulting from prolonged confusion can lead to increased absenteeism which compounds confusion in schools, as continuity of instruction is disrupted
Lifestyle Changes – Teachers experiencing confusion may neglect self-care practices, leading to poor eating habits, lack of exercise and insufficient health maintenance, thus exacerbating physical health issues
Confusion not only affects teachers as individuals, but also extend its implication to the broader educational environment and service delivery
Quality of instruction – confused teachers may struggle to deliver effective lessons

What is the relationship between a teachers physical and mental health and its effect in his/her service delivery?

The relationship between the physical and mental health of teachers and their service delivery is a significant and multidimensional; The interplay between the physical and mental health of teachers is seen through the

Reciprocal Relationship – physical and mental health are intertwined with each influencing the other (World Health Organization, 2014)

Teacher Well-Being – teacher well-being encompassing both physical and mental health, is essential for effective service delivery Kitchning et al, (2019). Here is some key aspect of that relationship

IMPACT ON TEACHING PERFORMANCE

Teachers in good physical and mental health, tend to perform better in their roles, they are more energetic, focused and effective in delivering lessons. Conversely, poor health can lead to absenteeism, burnout and reduced effectiveness which can affect students learning experiences:

Student Engagement – teachers who are healthy both physically and mentally are often more engaged and enthusiastic. This positivity can transfer to students, fostering an inclusive and motivating classroom environment that enhances student's participation and learning outcomes

Classroom Management – teachers with good mental health are typically in managing classroom behaviour and dynamics. They can handle stress and challenges more effectively, leading to a more productive learning environment. On the other hand, stress and fatigue can impair a teachers' ability to maintain order and discipline. Negatively affecting learning

Emotional Well-Being – mental health influences a teacher's emotional stability and ability to connect with students. Teachers who can empathise and communicate effectively create stronger relationships with their students, promoting a supportive and nurturing classroom atmosphere

Health Risk and Workload – the demands of the teaching profession can contribute to both physical and mental health issues such as stress, anxiety and fatigue. Balancing workload and ensuring adequate support for teachers can mitigate these risks and lead to improved service delivery

Professional Development – teachers who prioritise their health are more likely to engage in professional development opportunities improving their skills and effectiveness. Those experiencing health issues may feel less inclined or able to seek out improvement opportunities

Modelling Behaviour – teachers with good health can serve as role models for students, promoting healthy lifestyle and practices. This modelling has the potential to instil positive behaviours and attitudes in students

Job Satisfaction and Retention – healthy teachers experience higher job satisfaction, and are more likely to stay in the profession. High turnover can disrupt students learning and negatively impact the school's culture

Collaboration and Support – the mental health of teachers affects their willingness and ability t0 collaborate with colleagues. A supportive work environment that focuses on teacher's health can lead to better team work, resources sharing and collective problem solving The physical and mental health of teachers is crucial for effective service delivery in educational settings. Teachers are tasked with shaping the minds and future of their students, a role that demands not just expertise in their subject matter, but also emotional resilience, energy and stamina. The interplay between a teacher's health, both mental and physical and their performance in the classrooms can significantly impact their students learning experience and outcomes.

Physical Health

Influence in Energy Level

Good physical health enhances a teacher's energy and stamina, enabling them to engage actively with their students throughout the school day. Conversely, chronic illness, fatigue and physical injuries can lead to decreased participation, lower enthusiasm and reduced effectiveness in conveying lessons. Teachers with good physical health tend to have higher energy levels, enabling them to engage with students, prepare lessons and grade assignments more efficiently Harris, (2017)

Attendance and Consistency – Post physical health can lead to increased absenteeism. When teachers are frequently absent, it interrupts the learning process, affects student's performance and places additional stress on colleagues who must cover their classes.

Consistence. Consistent attendance is essential for building trusting relationships with students for effective teaching. Teachers with good physical health are more likely to have good attendance and punctuality records, reducing disruptions to the learning environment (Ingersoll, 2013)

Classroom Management

Teachers often face physically demanding task such as managing large groups of students, moving around the classroom, or even engaging in physical activities during lesson (e.g physical education). Good physical health enables teachers to manage these responsibilities effectively. Teacher with good physical health are better equipped to manage classroom behaviour, creating a more conducive learning environment. Emmer & Stough, (2021)

Mental Health

Stress and Burnout

The teaching profession is inherently stressful, and metal health challenge can lead to burnout, characterised by emotional exhaustion, cynicism, and feeling of inefficacy. Burn-out teachers are less likely to connect with their students, deliver dynamic lessons, or create a positive classroom environment. Teachers experiencing high level of stress and burnout may struggle to deliver effective instruction, leading to decreased student engagement and achievement (Maslach & Jackson, 2018)

Mood and Attitude: Teachers mental health affects their mood and attitude influencing their interaction with students, colleagues, and parents (Hargreaves, 2020) Emotional Availability: Teachers mental health affects their emotional well-being and their ability to connect with students empathetically. A teacher struggling with mental health issues may find it challenging to foster a supportive learning environment or to respond effectively to students' emotional needs.

Decision Making and Creativity: Good mental health aids teachers in making sound decisions and being innovative in their teaching approaches. Teachers with poor mental health may rely on traditional teaching methods out of fatigue or despair, which can hinder student's engagement and interest in learning. Teachers with good mental health are more likely to be creative and innovative in their teaching practices, enhancing students learning experiences Craft, (2016)

Impact on Students Outcomes

Academic Performance

The overall performance of students can significantly be influenced by their teacher's health. Engaged and healthy teachers are more likely to be motivating and inspiring which can lead to improved student engagement and higher academic achievement

Social Emotional Development

Teachers play a vital role in a teachers' emotional development, Healthy teachers are better equipped to model positive behaviours, create a nurturing classroom atmosphere, and teach students how to manage their own emotions and relationships

Creating a Positive School Culture

When teachers are in good health, they contribute positively to the school culture. This includes fostering collaboration amongst staff, engaging with families, and participating in professional development. A positive school culture has long term benefits for students and the community. The interplay between the physical and mental health of teachers is crucial to their effectiveness in delivering educational services. Promoting the well-being of teachers is a essential for creating a positive learning environment, and achieving better educational outcomes, for students. Schools, and educational institutions should prioritise well-being programs and support systems for teachers to enhance their health an consequently, their service delivery

CONCLUSION

The physical and mental health of teachers is a critical determinant of their ability to deliver effective education, and maintain a positive learning environment; as front-line educators. Teacher play an essential role in shaping the intellectual and emotional landscape of their students. However, the multifaceted demands of the teaching profession often accompanied by high levels of stress, work load challenges, and emotional labour can significantly impact their well-being

It is evident that teachers physical and mental health directly influence their performance in the classroom, the quality of their interactions with the students, and ultimately student's outcome. Teachers who maintain good physical health are more likely to exhibit greater energy levels, enhanced resilience and reduced absenteeism, contributing positively to the educational ecosystem. Conversely, poor physical health can lead to chronic absenteeism, decreased engagement and burnout which hampers the educator's ability to deliver curriculum effectively, and connect with their students emotionally

Similarly, the mental health of teachers is paramount. Educators who experience stress, anxiety, depression, and burnout may struggle to create an optimal learning environment characterised by patience, empathy and enthusiasm; such mental health challenges can diminish their cognitive capacity, hinder creativity in lesson planning, and negatively affect classroom management. this not only impact the teachers themselves but also has a ripple effect on their students who may experience diminished motivation and engagement, reduced academic performance, and increased behavioural issues

Moreover, a supportive workplace environment that prioritises teacher's well-being can mitigate these challenges, professional development programs, mental health resources, and a culture of open communication can empower teachers to seek help and adopt effective coping strategies. Encouraging work life balance and fostering a school culture that values collaboration and mutual support can further enhance teacher's resilience

In conclusion, I take a position that addressing the physical and mental health of teachers should be a priority for educational institutions and policy makers alike. By investing in teacher well-being, schools can cultivate a healthier workforce that is better equipped to provide quality educational and foster students success. The link between teacher well-being and service

delivery is clear, prioritising teacher's health is not merely a matter of employee welfare, but an essential component of enriching the educational experience for all stakeholders involved. Thus, efforts to improve teachers physical and mental health can lead to thriving e educational environment enhancing both teacher satisfaction and student achievement, ultimately shaping aa brighter future for generations to come

Prioritising the physical and mental health of teachers, is not just beneficial for the educators themselves, but it is also crucial for the success and well-being of their students. Educational institutions need to implement strategies that promote health and well-being amongst teachers such as wellness programs, mental health resources, collaborative work environment, and adequate time for professional development and self-care. By supporting teacher's health, schools can enhance service delivery, and create thriving learning environment for both educators and students

Suggestions

To address the physical and mental health needs of teachers and improve service delivery, the following suggestions should be given attention to:

- Supporting Teacher Health – educational institution should prioritize supporting teacher physical and mental health through wellness programs, professional development opportunities, and access to mental health resources Jennings & Greenberg, (2019)
- Creating a healthy Work Environment – institutions should strive to create a healthy work environment, promoting a positive school culture, manageable workload, and opportunities for teacher autonomy and professional growth. Hargreaves, (2020)
- Teachers should have access to good healthcare via health insurance and any other medium that could facilitate access to good health care for them
- Provide access to hospitals and mental health Resources - Government and school administrators should provide teachers with access to mental health resources, including counselling servicing, stress management training, and m
- Reduce teacher workload and stress - Schools should reduce teacher work load and stress by providing additional support staff, streamlining administrative tasks, and promoting work life balance
- Provide professional development opportunities - Schools should provide teachers with professional development opportunities that focus on teacher wellbeing, including stress management, self-care, and mindfulness training
- Encourage teacher self-care - Schools should encourage teachers to prioritize self-care including taking breaks, practicing mindfulness, and seeking support from colleagues and administrators
- As a teacher, keep things in perspective, have a regular check of both your physical and mental health, consult with the right experts and ensure you get the needed support to enable you cope with the huge responsibilities daily assigned to you. Find small moment for your self
- Government and educational administrators should create a system for early identification of anxiety in teachers, and create a support system that can help them cope and eventually overcome the challenges of anxiety

- Teachers should engage in daily exercise as an anti-stress activity and adopt a healthy eating habit, and ensure to have an adequate sleeping time of six to eight hours everyday
- Visualise the tasks or event with successful outcomes offer counselling services, stress management training, and mental health resources to support teacher's physical and emotional well-being to foster a supportive school culture

Encourage collaboration, open communication, and growth mindset to reduce teacher stress and anxiety

TEACHER TENURE: PROTECTING JOB SECURITY OR HINDERING EDUCATIONAL QUALITY

Hope WAMI
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

The debate on teacher tenure remains a pivotal issue in the discourse on educational reform, raising critical questions about the balance between job security and academic excellence. This paper explores the dual nature of teacher tenure - its role in safeguarding educators from arbitrary dismissal and political influence, while also examining concerns about its potential to shield underperforming teachers and reduce accountability. Through an analytical review of literature, policies, and empirical evidence from various educational systems, the paper investigates how tenure policies impact student achievement, instructional quality, teacher motivation, and institutional efficiency. The paper also highlights contrasting perspectives from stakeholders including policymakers, educators, unions, and parents, revealing how tenure can be both a protector of academic freedom and a possible impediment to performance-driven reform. In the face of growing demands for measurable outcomes and educational accountability, the study emphasizes the need for reforms that balance stability with evaluation. It proposes innovative tenure models that incorporate rigorous and continuous performance assessments without compromising teachers' rights. Finally, the paper argues that teacher tenure, if restructured effectively, can support both job security and educational quality. The findings aim to inform ongoing policy debates and guide administrators, educators, and reform advocates in shaping tenure practices that foster excellence, equity, and responsiveness in the education sector.

Keywords: Teacher Tenure, Job Security, Educational Quality, Accountability, Performance Evaluation.

INTRODUCTION

Teacher tenure has long been a defining feature of educational systems across the world, especially in developed and developing countries that seek to ensure stability and professionalism within the teaching workforce. Introduced as a mechanism to protect teachers from arbitrary dismissal and political interference, tenure provides educators with job security after a period of satisfactory service, usually accompanied by formal evaluations and professional reviews (Goldhaber, 2016). This status grants teachers the freedom to innovate in their instructional methods, challenge policies, and advocate for students without fear of losing

their positions. However, the contemporary education landscape - marked by increasing demands for accountability, measurable student outcomes, and dynamic classroom engagement has raised critical questions about whether tenure is still compatible with the pursuit of educational quality (Hanushek et al., 2018).

Concerns have intensified regarding how tenure policies may shield underperforming teachers from accountability, restrict school leaders' ability to make personnel decisions, and limit the responsiveness of schools to student needs (Boyd et al., 2011). Once granted, tenure can create institutional rigidity, where poorly performing educators remain in the system with limited incentives to improve. This situation is especially problematic in under-resourced schools, where students are most in need of high-quality instruction. Critics argue that traditional tenure systems often overlook instructional effectiveness in favor of longevity, leading to an imbalance between teacher rights and student learning needs (Chingos & West, 2012).

Educational reformers have called for a redefinition of tenure that balances job protection with ongoing performance evaluation. There is growing advocacy for models that integrate tenure with professional development, peer review, and student achievement metrics (Papay & Kraft, 2015). These models aim to ensure that tenure serves not as a shield for mediocrity but as a reward for consistent, effective teaching. Teacher unions, while defending tenure, have also acknowledged the need to support reforms that enhance professionalism and educational outcomes (Weisberg, Sexton, Mulhern, & Keeling, 2009). As the global education community increasingly prioritizes learning standards and performance benchmarks, tenure must evolve to remain relevant.

In developing countries like Nigeria, where educational quality is inconsistent and teacher motivation often affected by poor working conditions, tenure can be both a stabilizing force and a source of inefficiency. Government agencies and school administrators face the challenge of retaining qualified teachers in rural and underserved areas while ensuring accountability across the system (Owoeye & Yara, 2011). If not carefully managed, tenure in such contexts may institutionalize mediocrity, especially in the absence of rigorous teacher evaluations and professional growth structures. Therefore, the conversation around tenure is not just about protection, but about transformation and renewal of the teaching profession.

This paper critically examines the dual nature of teacher tenure; as a mechanism for job security and as a possible hindrance to educational improvement. The discussion draws on existing research, case studies, and comparative policy reviews to assess how tenure can either support or undermine teaching quality. It considers the perspectives of government agencies, school administrators, unions, and parents, presenting practical suggestions on how tenure policies can be restructured to better serve both educators and learners. The goal is to contribute to ongoing educational debates and offer policy-relevant insights that promote both fairness in employment and excellence in classroom practice.

METHODOLOGY

The methodology employed in writing this paper involved a structured, evidence-based approach aimed at presenting a balanced and persuasive argument. A qualitative method guided the development of the paper, focusing on critical analysis, logical reasoning, and interpretation of scholarly literature. The first step entailed defining the scope of the topic to ensure clarity in the argument. The paper aimed to assess whether teacher tenure policies serve as safeguards for

employment stability or act as impediments to academic performance and accountability in schools.

A thorough literature review was conducted using Google Scholar to identify relevant peer-reviewed journal articles, policy briefs, and expert opinions. Emphasis was placed on works from educational scholars, policymakers, and practitioners to capture diverse viewpoints. The paper integrated contrasting perspectives to build a comprehensive argument, allowing the writer to present both the benefits and drawbacks of teacher tenure policies. Special attention was given to how tenure influences teaching quality, administrative authority, and student outcomes.

Arguments were structured using logical progression, beginning with an introduction of the concept of tenure, followed by historical context, benefits for teachers, concerns from administrators, and its effect on student learning. Citations were incorporated following APA 7th edition referencing style to ensure academic credibility and to support claims made throughout the paper.

The writing process also involved critical content evaluation to assess the validity, reliability, and relevance of sources. Emphasis was placed on synthesizing information rather than summarizing, to create original interpretations and compelling reasoning. Counterarguments were addressed to strengthen the position and demonstrate objectivity. The conclusion was developed based on the cumulative weight of the evidence, offering informed suggestions rather than subjective opinions. This methodology ensured that the paper met academic standards while fostering informed debate on the issue of teacher tenure in contemporary education.

CONCEPTUAL UNDERPINNING

Teacher Tenure

Teacher tenure refers to a policy that grants educators permanent employment status after a probationary period, offering protection against arbitrary dismissal. The primary aim of tenure is to ensure job security for teachers, allowing them to exercise academic freedom and focus on long-term educational goals without fear of losing their positions due to non-performance-related reasons. Tenure systems vary across regions, but most require an evaluation process that assesses teacher effectiveness before permanent status is awarded (Springer, 2010). Tenure originated in higher education and gradually extended to the K–12 education system to safeguard teachers from political interference and discriminatory practices. Supporters of tenure argue that it provides stability in the teaching profession and helps attract and retain qualified educators (Goldhaber, 2015). It is also believed to protect teachers who address controversial topics or challenge administrative decisions. However, critics contend that tenure can make it difficult to remove underperforming teachers, potentially affecting student achievement (Kahlenberg, 2016).

Concerns about tenure's impact on educational quality have led to reforms and debates about modifying or abolishing tenure laws in some school districts. Some studies have shown mixed outcomes. For instance, Ladd and Sorensen (2017) noted that while tenure may enhance teacher morale and commitment, it does not automatically translate to improved student outcomes. Others suggest that the process for granting tenure often lacks rigorous evaluation and may be based on seniority rather than teaching effectiveness (Jacob, 2011). Recent policy discussions focus on linking tenure decisions to performance-based metrics rather than years of service alone. Advocates for reform argue that such changes would create a more accountable and effective teaching workforce (Koedel, Li, & Springer, 2022). On the other hand, opponents

caution that removing tenure protections could subject teachers to unfair dismissals and politicization. In essence, teacher tenure remains a controversial yet significant element in educational policy. It serves as a mechanism to balance professional autonomy with the need for accountability in schools.

Job Security

Job security refers to the assurance that an individual will retain employment without the risk of arbitrary dismissal, particularly when performance standards are met. It represents a fundamental condition of stable work life and contributes significantly to employee well-being, organizational commitment, and productivity. Workers who perceive high job security often display greater motivation, engagement, and loyalty to their organizations (De Witte et al., 2015). The concept of job security has evolved with labor market dynamics, technological advancement, and shifts in organizational policies. In traditional employment models, job security was often associated with long-term contracts, seniority, and strong labor unions. In recent years, economic uncertainty, restructuring, and the rise of gig and contract work have contributed to growing concerns about job insecurity, even in professional and skilled sectors (Cheng & Chan, 2020).

Employees experiencing low job security frequently report stress, lower job satisfaction, and mental health issues. Prolonged uncertainty can lead to a decline in work performance, increase in turnover intentions, and strained workplace relationships (Shoss, 2017). In education, healthcare, and public service, job security is particularly valued as it helps retain experienced professionals and reduces recruitment costs (Van der Heijden et al., 2018). Governments and organizations implement various mechanisms to support job security, including collective bargaining agreements, employment protection legislation, and tenure systems in public sectors. These mechanisms aim to protect workers from unjustified termination while maintaining standards of accountability and performance.

In the context of modern workplaces, job security is no longer solely determined by permanence of employment. Employability, continuous skill development, and adaptability to change are becoming vital for maintaining a secure career (De Cuyper et al., 2020). Workers are encouraged to develop transferable skills and participate in lifelong learning initiatives to stay relevant in a shifting economy. Job security remains an essential feature of decent work. Its preservation and adaptation in the face of changing employment trends are necessary for building resilient, fair, and productive work environments.

Educational Quality

Educational quality refers to the effectiveness of an education system in delivering knowledge, skills, values, and competencies that prepare learners for productive and meaningful lives. It encompasses multiple dimensions, including curriculum relevance, teacher competence, learner performance, school infrastructure, and equitable access to learning opportunities (Barrett et al., 2015). The concept is not limited to academic outcomes but also includes the development of critical thinking, creativity, emotional intelligence, and civic responsibility. The quality of education is strongly influenced by the availability and deployment of qualified teachers. Effective teaching practices, continuous professional development, and adequate teacher support systems contribute to better learning outcomes (Guerriero, 2017). Inadequate teacher

preparation, overcrowded classrooms, and insufficient instructional materials often reduce the chances of students acquiring meaningful learning experiences.

Learner-centered environments, where students are actively engaged and supported, contribute significantly to educational quality. Schools that foster participation, inclusion, and supportive teacher–student relationships tend to record higher levels of student achievement and well-being (Hattie, 2012). Assessment systems also shape educational quality. Standardized testing can provide benchmarks, but excessive reliance on exams may narrow the curriculum and undervalue creativity and problem-solving abilities. Policy frameworks and governance systems that prioritize accountability, equity, and investment in education are essential for sustaining quality. Countries with consistent educational reform, transparent leadership, and effective monitoring mechanisms tend to achieve more significant gains in quality learning (Sayed & Ahmed, 2015). Socioeconomic factors such as poverty, parental involvement, and community support also influence how education is delivered and received.

Technological integration in classrooms has expanded the possibilities for enhancing educational quality. When effectively implemented, digital tools can support personalized learning, access to resources, and teacher efficiency (Zawacki-Richter et al., 2020). However, access must be equitable to prevent deepening existing disparities. Educational quality remains central to achieving sustainable development and social advancement. A strong commitment to inclusive, relevant, and student-focused education systems is vital for national development and individual empowerment.

Performance Evaluation

Performance evaluation is a systematic process used to assess an employee's job performance and productivity in relation to organizational objectives. It serves as a critical tool for human resource management, enabling organizations to measure individual contributions, identify areas for improvement, and make informed decisions regarding promotions, training, and compensation (Aguinis, 2019). Effective performance evaluations align employee goals with organizational strategy, fostering a culture of continuous improvement and accountability (Pulakos, 2009). Modern performance evaluation systems emphasize a balance between quantitative metrics and qualitative feedback. Key methods include 360-degree feedback, management by objectives (MBO), and behaviorally anchored rating scales (BARS) (DeNisi & Smith, 2014). The 360-degree feedback approach gathers input from supervisors, peers, and subordinates, offering a holistic view of an employee's performance. In contrast, MBO focuses on goal-setting and achievement, while BARS evaluates specific job-related behaviors (Smither & London, 2016). These methods help mitigate biases often associated with traditional appraisal systems.

Performance evaluations also play a vital role in employee development. Constructive feedback enables employees to recognize strengths and address weaknesses, enhancing job satisfaction and motivation (Kluger & DeNisi, 2019). Regular evaluations facilitate career growth by identifying skill gaps and providing opportunities for targeted training (Armstrong & Baron, 2020). Moreover, transparent evaluation processes improve trust between employees and management, reducing turnover rates (Kuvaas et al., 2017). Challenges in performance evaluation include subjectivity, rater biases, and inconsistent application of criteria. To address these issues, organizations are increasingly adopting data-driven tools such as artificial intelligence (AI) and analytics (Goler et al., 2018). These technologies enhance objectivity by

analyzing performance data and identifying patterns that may not be evident through traditional methods.

Setting the Stage: The Controversy around Teacher Tenure

Teacher tenure, a policy designed to provide job security for educators after a probationary period, has long been a contentious issue in education reform debates. Supporters argue that tenure protects teachers from arbitrary dismissals, fosters academic freedom, and promotes long-term investment in schools (Johnson & Kardos, 2017). Critics, however, contend that tenure makes it difficult to remove underperforming educators, stifles accountability, and hinders efforts to improve educational quality (Hess & West, 2013). This ongoing debate reflects broader tensions between job security and workforce flexibility in public education. The origins of teacher tenure in the United States date back to the early 20th century, when it was introduced to shield educators from political interference and unfair terminations (Moe, 2011). Over time, tenure became a standard benefit in public schools, requiring districts to demonstrate just cause before dismissing a tenured teacher. Proponents assert that this protection encourages experienced educators to remain in the profession, reducing turnover and maintaining stability in schools (Ingersoll & Merrill, 2017). Without tenure, they argue, teachers might face pressure to conform to administrative demands or avoid controversial but necessary classroom discussions.

Opponents of tenure claim that the policy creates inefficiencies in school systems. Removing ineffective tenured teachers often involves lengthy legal processes, which can discourage administrators from pursuing dismissals even when warranted (Springer et al., 2016). Studies suggest that tenure policies may contribute to the retention of low-performing educators, negatively impacting student achievement (Hanushek & Rivkin, 2012). Reform advocates propose alternative systems, such as performance-based contracts, to ensure that teacher retention aligns with measurable outcomes.

The debate has intensified in recent years due to high-profile legal challenges. Cases like *Vergara v. California* (2014) argued that tenure laws disproportionately harm students in low-income schools by protecting ineffective teachers (Koski & Horng, 2014). While the initial ruling struck down California's tenure statutes, subsequent appeals reinstated them, illustrating the legal and political complexities surrounding the issue. Similar lawsuits in other states have kept tenure at the forefront of education policy discussions. Teacher unions play a significant role in defending tenure, framing it as essential for professional autonomy and fair labor practices (Alter, 2018). However, policymakers and education reformers continue to push for changes, advocating for streamlined dismissal procedures and stronger performance evaluations (Dee & Wyckoff, 2015). The challenge lies in balancing teacher protections with mechanisms to ensure accountability and quality instruction.

As education systems evolve, the future of teacher tenure remains uncertain. Some states have modified tenure policies by extending probationary periods or linking job security to performance metrics (Goldhaber et al., 2016). These adjustments aim to address criticisms while preserving the benefits of tenure. The controversy underscores the need for evidence-based reforms that consider both teacher rights and student outcomes.

DEMYSTIFYING TEACHER TENURE

The Road to Teacher Tenure: Qualification, Duration, and Procedures

Teacher tenure provides educators with job security after meeting specific professional benchmarks, but the path to earning it varies significantly across states and school districts. Generally, tenure policies require teachers to complete a probationary period, demonstrate instructional competence, and undergo formal evaluations before receiving permanent employment status (Goldhaber & Hansen, 2019). This process aims to ensure that only effective educators gain long-term protections while allowing schools to dismiss those who fail to meet performance standards. The probationary period before tenure typically ranges from two to five years, with three years being the most common requirement (Strunk et al., 2016). During this time, early-career teachers undergo frequent evaluations, often including classroom observations, student performance metrics, and peer reviews. States like New York and California mandate a minimum number of observation cycles before granting tenure, while others, such as Texas, allow districts greater flexibility in setting probationary terms (Kraft & Gilmour, 2017). These variations reflect differing policy priorities, with some states emphasizing rigorous screening and others prioritizing local control.

Performance evaluations play a central role in tenure decisions. Many districts use standardized frameworks, such as Charlotte Danielson's *Framework for Teaching* or Marzano's *Teacher Evaluation Model*, to assess instructional quality (Steinberg & Sartain, 2015). Evaluations often incorporate multiple measures, including student test scores, principal assessments, and professional development participation. Research suggests that comprehensive evaluation systems improve tenure decisions by reducing reliance on subjective judgments (Harris et al., 2014). However, critics argue that standardized metrics may overlook contextual factors, such as school resources or student demographics that influence teacher effectiveness (Darling-Hammond, 2013). Tenure procedures also involve legal and administrative steps. In most states, school boards must formally approve tenure recommendations after reviewing evaluation data (Koedel et al., 2015). Some districts require additional documentation, such as portfolios of lesson plans or evidence of student growth. Once granted, tenure provides due process rights, meaning teachers can only be dismissed for just cause, such as misconduct or persistent underperformance (Jacob, 2013). These protections aim to prevent arbitrary firings but have also fueled debates about whether they make it too difficult to remove ineffective educators.

Recent reforms have sought to modify tenure processes. States like Florida and North Carolina have extended probationary periods, while others, including Colorado, now require tenure candidates to demonstrate consistent effectiveness over multiple years (Grissom et al., 2021). These changes reflect efforts to balance job security with accountability, ensuring that tenure serves as a reward for proven competence rather than automatic career advancement. The road to tenure remains a critical phase in a teacher's career, shaping both professional trajectories and educational quality. Policymakers continue to refine qualification standards and procedures, striving to create systems that support effective educators while maintaining flexibility for schools.

Tenure Across the World: A Comparative Overview of Global Practices

Teacher tenure systems vary significantly across nations, reflecting diverse educational philosophies, labor policies, and cultural values. While some countries offer strong employment protections to educators, others prioritize flexibility and performance-based contracts. These differences shape teaching quality, job satisfaction, and educational outcomes in distinct ways.

In the United States, tenure policies differ by state but generally provide job security after a probationary period of three to five years (Goldhaber & Hansen, 2019). Tenured teachers gain due process rights, requiring schools to demonstrate just cause for dismissal. However, critics argue that these protections can make it difficult to remove underperforming educators (Strunk et al., 2016). Recent reforms in states like Colorado and Florida have extended probationary periods or linked tenure decisions to student achievement data (Grissom et al., 2021). These changes reflect efforts to balance teacher security with accountability.

European nations often approach tenure differently. In Finland, a country renowned for its high-performing education system, teachers typically receive permanent contracts after a one-year probationary period (Sahlberg, 2015). Finnish teachers enjoy considerable autonomy and societal respect, contributing to low turnover rates. Conversely, England has moved toward more flexible employment structures, with many teachers working on fixed-term contracts (Worth, 2020). Performance-based assessments determine career progression, aligning with broader trends of market-driven reforms in education.

Asian systems present another contrast. In Japan, teachers undergo rigorous evaluations during a probationary period before gaining tenure, which provides strong job security (Bjork, 2016). The Japanese model emphasizes mentorship and continuous professional development, fostering long-term career commitment. Singapore combines tenure-like stability with stringent performance reviews, tying promotions and bonuses to measurable outcomes (Darling-Hammond et al., 2017). These policies reinforce high teaching standards while maintaining incentives for excellence.

Latin American countries exhibit wide variability in tenure policies. In Mexico, teachers historically gained lifetime employment through union-controlled hiring processes, but recent reforms have introduced competency tests and performance evaluations (Santibañez, 2016). Brazil grants tenure after a probationary period but faces challenges in ensuring equitable access to permanent positions across regions (Barbosa & Fernandes, 2021). These examples illustrate how political and institutional factors influence tenure structures.

African nations often struggle with teacher shortages and weak institutional capacity, affecting tenure implementation. South Africa provides permanent posts after probation but grapples with uneven enforcement and bureaucratic delays (Spaull, 2015). In contrast, Kenya employs many teachers on temporary contracts due to budget constraints, limiting job security and professional growth (Oketch et al., 2020). Such conditions highlight the tension between workforce stability and fiscal realities in developing contexts.

Australia and Canada offer decentralized approaches, with tenure-like protections varying by province or territory. Australian teachers in public schools typically secure ongoing employment after probation, while Canadian provinces use a mix of permanent and term contracts (Osmond-Johnson & Campbell, 2018). Both countries emphasize professional development as a pathway to career advancement, blending security with performance expectations.

Globally, tenure policies increasingly incorporate performance metrics, reflecting a shift toward accountability-driven models (OECD, 2019). However, nations with strong tenure protections, such as Finland and Japan, often achieve high educational outcomes, suggesting that job security alone does not impede quality. Effective systems balance stability with mechanisms for identifying and supporting underperforming teachers. The future of tenure may lie in hybrid models that combine reasonable protections with regular, meaningful evaluations. As education systems evolve, policymakers can learn from cross-national comparisons to design tenure policies that attract and retain talented educators while maintaining high standards.

The Promise of Tenure: Arguments in Favor

Teacher tenure remains one of the most debated policies in education, yet its supporters present compelling evidence that it serves crucial functions in maintaining educational quality and professional stability. The system offers protections that benefit teachers, students, and school systems through academic freedom, reduced turnover, and the promotion of long-term educational investments. These advantages demonstrate why tenure continues to play a vital role in many high-performing education systems worldwide.

Academic freedom stands as one of the strongest arguments for tenure. Without job security, teachers may avoid controversial but pedagogically valuable topics, fearing repercussions from administrators or community members (Johnson & Kardos, 2017). Tenure safeguards educators' ability to address complex subjects, encourage critical thinking, and adapt curricula to student needs without undue interference. Studies show that teachers in systems with strong protections report greater willingness to innovate in their classrooms (Lovenheim & Willén, 2019). This freedom proves particularly important in politically charged environments where external pressures might otherwise dictate classroom content.

Teacher retention represents another significant benefit of tenure systems. Schools with higher rates of teacher turnover consistently demonstrate lower student achievement, as instability disrupts learning continuity (Ronfeldt et al., 2013). Tenure provides experienced educators with incentives to remain in the profession, preserving institutional knowledge and maintaining stable learning environments. Data from districts with robust tenure policies reveal significantly lower attrition rates compared to those relying on short-term contracts (Ingersoll & Merrill, 2017). This stability proves especially valuable in high-need schools where turnover tends to be most severe.

The due process protections inherent in tenure systems prevent arbitrary dismissals that could undermine educational quality. Principals and school boards occasionally face political pressures to remove teachers for non-pedagogical reasons, including personal disputes or unpopular teaching methods (Moe, 2011). Tenure ensures that dismissals require documented evidence of professional shortcomings, protecting effective teachers from capricious termination. Legal analyses of dismissal cases demonstrate that tenure laws successfully prevent inappropriate firings while still allowing for the removal of genuinely ineffective educators (Koski & Horng, 2014).

Long-term educational investments flourish under tenure systems. Teachers granted job security demonstrate greater willingness to participate in school improvement initiatives, mentor new colleagues, and engage in ongoing professional development (Darling-Hammond, 2017). These contributions strengthen school cultures and improve outcomes beyond individual classrooms. Research comparing tenure and non-tenure systems finds that schools with greater

job security show higher levels of teacher collaboration and curricular coherence (Bryk et al., 2015).

Critics frequently mischaracterize tenure as an unconditional job guarantee, yet modern systems incorporate multiple accountability measures. Most tenure-granting jurisdictions require rigorous performance reviews during probationary periods and maintain evaluation systems for veteran teachers (Steinberg & Sartain, 2015). Effective districts combine tenure protections with robust professional support systems, creating environments where teachers both receive job security and face expectations for continued growth (Kraft & Gilmour, 2017).

International evidence further supports tenure's educational value. High-performing systems like Finland and Singapore combine strong job protections with careful teacher selection and development processes (Sahlberg, 2015; Darling-Hammond et al., 2017). These nations demonstrate that tenure need not conflict with educational excellence when implemented as part of a comprehensive professionalization strategy.

Reasonable tenure systems strike a crucial balance between protecting educators and maintaining high standards. They recognize teaching as a complex profession requiring both security and accountability. When properly structured, tenure policies promote educational stability, protect pedagogical integrity, and foster environments where teachers can focus on long-term student success rather than short-term job insecurity.

The Pitfalls of Tenure: Critical Perspectives

Teacher tenure systems, while designed to protect educators, have drawn significant criticism for creating structural barriers to educational improvement. Critics argue these policies shield ineffective teachers, reduce accountability, and perpetuate inequities in school systems. Examining these concerns reveals fundamental challenges in how tenure operates in practice. The difficulty of removing underperforming tenured teachers represents one of the most persistent criticisms. School administrators frequently describe tenure dismissal processes as prohibitively expensive and time-consuming, requiring extensive documentation and legal proceedings (Hess & West, 2013). Data from several states show that dismissal rates for tenured teachers remain exceptionally low, even in cases of poor performance or misconduct (Grissom et al., 2021). This creates situations where schools retain ineffective educators simply because removing them proves too burdensome.

Tenure systems may inadvertently protect teachers who contribute to achievement gaps. Studies demonstrate that low-performing students are disproportionately assigned to weaker teachers, with tenure protections making it difficult to reassign or replace these educators (Hanushek & Rivkin, 2012). The inability to swiftly address quality disparities means disadvantaged students often bear the consequences of rigid tenure structures. Urban districts with high poverty rates particularly struggle with this dynamic, as they frequently inherit tenured teachers who transferred from more affluent schools (Koski & Horng, 2014). The automatic nature of tenure in many jurisdictions raises additional concerns. Traditional systems grant permanent status after a set period regardless of performance, creating a binary distinction between probationary and tenured teachers (Strunk et al., 2016). This structure provides little incentive for continued professional growth after securing tenure. Evaluation systems in many districts show a pronounced "widget effect," where nearly all tenured teachers receive satisfactory ratings regardless of actual classroom effectiveness (Kraft & Gilmour, 2017).

Financial implications of tenure systems warrant scrutiny. The costs associated with dismissal procedures often lead districts to buy out underperforming teachers rather than pursue formal termination (Moe, 2011). These payouts divert resources from classrooms while failing to address underlying quality issues. Pension systems tied to tenure status create additional fiscal burdens, as districts must maintain long-term obligations to employees regardless of their current contributions (Costrell & Podgursky, 2010). Tenure policies may discourage innovation in teaching methods. Protected status can reduce competitive pressure to adopt evidence-based practices or respond to evolving student needs (Dee & Wyckoff, 2015). Some research suggests tenured teachers show less engagement with professional development opportunities compared to their non-tenured colleagues (Taylor & Tyler, 2012). This complacency effect potentially slows the implementation of pedagogical improvements across school systems.

The original rationale for tenure - protecting teachers from political interference has diminished relevance in many contemporary contexts. Modern education systems feature more robust legal protections against wrongful termination than existed when tenure systems first emerged (McGuinn, 2012). Alternative frameworks, such as multi-year contracts with performance benchmarks, could provide reasonable job security without creating the rigid structures associated with traditional tenure. International comparisons offer instructive contrasts. Education systems in England and Australia achieve strong results without American-style tenure protections, instead using performance-based contracts and regular reviews (Worth, 2020; Osmond-Johnson & Campbell, 2018). These models demonstrate that job security can coexist with meaningful accountability measures.

Reform proposals suggest several alternatives to traditional tenure. Extended probationary periods would allow more thorough evaluation before granting permanent status (Goldhaber & Hansen, 2019). Performance-based tenure systems could link job security to demonstrated effectiveness rather than time served (Steinberg & Sartain, 2015). These approaches aim to preserve tenure's benefits while addressing its most significant drawbacks. The debate over tenure reflects broader tensions in education policy between professional autonomy and quality control. While tenure's supporters emphasize its role in attracting talented educators, critics maintain that current implementations impose unacceptable costs on school systems and students. Meaningful reform may require rethinking how schools balance teacher protections with the need for continuous improvement.

Voices from the Field on Teacher Tenure: Stakeholder Perspectives

The debate surrounding teacher tenure involves multiple stakeholders, each offering distinct viewpoints shaped by their roles and experiences in education. Teachers, administrators, policymakers, and parents hold divergent opinions about tenure's value and consequences, revealing the complex interplay between job security, educational quality, and systemic accountability.

Classroom teachers frequently defend tenure as essential for professional autonomy and fair treatment. Many educators describe tenure as protection against arbitrary dismissals, particularly when addressing controversial curriculum topics or advocating for student needs (Johnson & Kardos, 2017). Veteran teachers in urban districts report that tenure allows them to challenge administrative decisions that might compromise educational quality without fear of retaliation (Ingersoll & Merrill, 2017). However, newer teachers sometimes express frustration with tenure systems, noting that the extended probationary periods create stressful working

conditions and delayed job security (Kraft & Gilmour, 2017). Some early-career educators argue that performance-based systems might better recognize emerging talent.

School administrators present more mixed perspectives on tenure. Principals in high-performing schools often describe tenure as part of a broader professional culture that values educator expertise (Bryk et al., 2015). These leaders view tenure as enabling long-term instructional improvement through stable faculty relationships. Conversely, administrators in struggling schools frequently characterize tenure as an obstacle to necessary personnel changes (Grissom et al., 2021). District leaders cite the extensive documentation and legal processes required to dismiss tenured teachers as diverting resources from other improvement efforts (Strunk et al., 2016). Many express support for modified tenure systems that maintain due process while streamlining dismissal procedures for ineffective educators.

Policymakers remain deeply divided along ideological lines. Education reformers often frame tenure as an outdated practice that protects mediocrity and resists innovation (Hess & West, 2013). Legislators in reform-minded states have pushed to extend probationary periods or tie tenure decisions to student achievement metrics (Dee & Wyckoff, 2015). In contrast, teacher union allies argue that tenure remains necessary to attract talented professionals to challenging school environments (Koski & Horng, 2014). Political debates frequently center on finding the appropriate balance between teacher protections and accountability measures.

Parents and community members display varied attitudes shaped by personal experiences. Families with children assigned to exceptional tenured teachers typically support the system as a means of retaining high-quality educators (Goldhaber & Hansen, 2019). Those whose children have had ineffective tenured teachers often express frustration with the inability to remove poor performers (Hanushek & Rivkin, 2012). Community surveys reveal particular concern about tenure's impact on equity, as disadvantaged students appear more likely to encounter protected but underperforming teachers (Darling-Hammond, 2017).

Education researchers contribute empirical perspectives to the discussion. Studies of high-performing nations reveal that systems combining tenure-like protections with rigorous selection and evaluation processes achieve strong results (Sahlberg, 2015). Analyses of teacher mobility patterns show that tenure reduces mid-career attrition but may also decrease early-career motivation (Ronfeldt et al., 2013). Research on evaluation systems suggests that comprehensive approaches incorporating multiple measures could make tenure decisions more meaningful (Steinberg & Sartain, 2015).

Teacher unions remain steadfast advocates for tenure protections, framing them as fundamental workplace rights. Union leaders argue that due process provisions prevent discrimination and protect academic freedom (Moe, 2011). They emphasize that tenure does not guarantee lifetime employment but rather ensures fair dismissal procedures. However, some union members privately acknowledge that current systems could benefit from reforms that better distinguish between effective and ineffective educators (Johnson & Kardos, 2017).

Students offer rarely heard but valuable perspectives on tenure. High school students in focus groups describe appreciating teachers who feel secure enough to tackle difficult topics (Koski & Horng, 2014). Yet some students express resentment when encountering tenured teachers who appear disengaged but remain employed. These youth perspectives suggest that tenure's classroom impacts vary considerably based on individual teacher professionalism.

Alternative voices from charter schools and private institutions provide contrasting models. Many charter networks operate without traditional tenure, instead using performance-based contracts (Angrist et al., 2013). Teachers in these settings report both higher accountability

pressures and greater instructional flexibility. Private school educators often describe informal tenure-like arrangements based on institutional loyalty rather than formal policies (Baker, 2014). These variations demonstrate that tenure represents just one approach to workforce stability.

The multiplicity of stakeholder views defies simple policy solutions. Effective tenure reform would need to address teacher concerns about professional security while responding to administrator and parent demands for quality control. Systems that combine reasonable protections with meaningful evaluation and support mechanisms might satisfy diverse constituencies while serving student needs.

Research Insights and Data-Driven Realities

Empirical research on teacher tenure reveals complex relationships between job security, teacher quality, and student outcomes. Contemporary studies using longitudinal data and value-added measures provide nuanced understandings of how tenure policies function in practice. These findings challenge simplistic narratives while offering evidence-based guidance for policy improvement.

Tenure decisions frequently fail to identify the most effective teachers. Analysis of tenure-granting processes in several states shows only moderate correlations between tenure status and measured teacher effectiveness (Goldhaber & Hansen, 2019). Districts often base tenure decisions on limited classroom observations rather than comprehensive performance data, resulting in type I and type II errors in personnel decisions (Steinberg & Sartain, 2015). This suggests current systems may not reliably distinguish between high- and low-performing educators during critical evaluation periods.

The impact of tenure on student achievement yields mixed findings. Some studies report minimal effects, with tenured and non-tenured teachers producing similar value-added gains on average (Strunk et al., 2016). However, other analyses reveal concerning patterns where tenure protections enable the persistence of ineffective teachers in high-poverty schools (Grissom et al., 2021). These disparities suggest tenure implementation varies significantly across contexts, with equity implications requiring attention.

Teacher mobility patterns following tenure receipt present important policy considerations. Research documents a small but consistent increase in absenteeism among teachers after securing tenure, estimated at 1-2 additional days missed annually (Clotfelter et al., 2011). However, tenure also reduces mid-career attrition rates by approximately 30%, preserving experienced educators in the profession (Ronfeldt et al., 2013). These competing effects demonstrate tenure's dual nature as both stabilizing force and potential complacency inducer.

Evaluation system design significantly mediates tenure outcomes. Districts implementing multiple-measure assessment systems show stronger correlations between tenure decisions and teacher effectiveness (Dee & Wyckoff, 2015). Incorporating student surveys, peer reviews, and value-added models creates more robust tenure processes than traditional observation-only approaches (Kraft & Gilmour, 2017). The specific measures included and their relative weights substantially influence tenure's educational impacts.

Economic analyses reveal tenure's fiscal implications. The costs associated with dismissing tenured teachers average 30-50% higher than non-tenured dismissals due to extended due process requirements (Hess & West, 2013). These procedural costs lead many districts to retain underperforming tenured teachers rather than pursue dismissal, creating hidden expenses in terms of lost student learning (Hanushek & Rivkin, 2012).

International comparisons provide instructive contrasts. Nations combining tenure-like protections with rigorous selection processes, such as Finland and Singapore, achieve strong educational outcomes (Darling-Hammond et al., 2017). These systems demonstrate that tenure can function effectively when embedded within comprehensive professional development and accountability frameworks.

Emerging research suggests promising reform directions. Extended probationary periods of 5-7 years allow for more reliable effectiveness measurements (Koedel et al., 2015). Hybrid models incorporating periodic tenure review checkpoints may better maintain professional standards than binary tenure systems (Johnson & Donaldson, 2018). These innovations attempt to preserve tenure's benefits while addressing its documented limitations.

Bridging the Divide: Reforming Tenure for the Future

The polarized debate around teacher tenure calls for balanced reforms that preserve its benefits while addressing legitimate concerns. Evidence-based proposals are emerging to modernize tenure systems, seeking to maintain teacher protections while strengthening accountability and educational quality. These middle-ground approaches attempt to reconcile competing priorities through structural innovations.

Multi-stage tenure systems represent one promising reform direction. Rather than granting permanent status after a single probationary period, some districts now implement tiered systems with periodic performance reviews (Donaldson & Johnson, 2015). These models maintain due process protections while creating ongoing checkpoints for professional growth. Research shows such systems improve teacher retention of high performers while allowing for earlier identification of struggling educators (Goldring et al., 2015).

Performance-based tenure modifications are gaining traction in several states. Reforms in Colorado and Louisiana now require teachers to demonstrate consistent effectiveness across multiple years before receiving tenure protections (Grissom et al., 2021). These systems typically incorporate multiple measures, including classroom observations, student growth metrics, and professional contributions. Early results suggest they improve the correlation between tenure status and teaching quality while reducing the retention of ineffective educators (Dee & Wyckoff, 2015).

Enhanced support systems during probationary periods could strengthen tenure decisions. Many districts are extending mentoring programs for early-career teachers, providing more comprehensive data for tenure evaluations (Kraft & Gilmour, 2017). Chicago's model of intensive induction support coupled with rigorous tenure reviews has shown particular success in developing and retaining effective teachers (Sporte et al., 2013). These approaches recognize that tenure decisions depend heavily on the quality of pre-tenure evaluation and development systems.

Alternative due process models aim to streamline dismissal procedures while maintaining fairness. Some proposals replace lengthy hearings with independent review panels or arbitration systems (Hess & West, 2013). These modified approaches seek to reduce the time and cost of removing ineffective tenured teachers while preserving essential protections against arbitrary dismissals. Pilot programs suggest they can cut dismissal timelines by 40-60% without increasing wrongful termination rates (Strunk et al., 2016).

Compensation reforms could complement tenure modifications. Career ladder systems that tie salary growth to demonstrated effectiveness may provide motivation that traditional

tenure systems lack (Johnson & Donaldson, 2018). When combined with tiered tenure, these models create multiple pathways for professional advancement while maintaining quality standards. Districts implementing such reforms report higher job satisfaction among both early-career and veteran teachers (Kini & Podolsky, 2016).

International models offer valuable lessons for balanced reform. High-performing systems in Singapore and Ontario combine strong professional protections with rigorous evaluation and support structures (Darling-Hammond et al., 2017). These systems demonstrate that job security and accountability can coexist when embedded in comprehensive professional learning cultures. Their success suggests tenure reforms should be part of broader efforts to elevate teaching quality rather than isolated policy changes.

The path forward requires moving beyond binary tenure debates. Effective reforms will likely combine extended probationary periods, multi-measure evaluation systems, enhanced professional support, and streamlined due process. Such balanced approaches could preserve tenure's role in attracting talented educators while addressing legitimate concerns about educational quality and equity.

CONCLUSION

Teacher tenure remains a complex and controversial issue in the educational landscape, embodying the delicate balance between protecting educators' rights and promoting student success. While tenure offers essential job security that fosters academic freedom, attracts talent, and shields teachers from unjust dismissal, it also raises valid concerns about diminished accountability and potential complacency in the classroom. This tension between safeguarding employment and ensuring instructional effectiveness has prompted ongoing debate among policymakers, educators, unions, and the public.

The evidence suggests that tenure, in its current form, often fails to adequately link teacher retention to performance, thereby risking stagnation in instructional quality. However, abolishing tenure outright may expose teachers to political manipulation and instability, ultimately harming the integrity of the profession. The path forward lies not in dismantling tenure, but in reforming it - redefining it as a system that upholds teacher security while mandating regular, fair, and constructive evaluations.

Innovative tenure models that align job protection with student-centered outcomes can transform the narrative, ensuring that only competent and committed educators benefit from its protections. Therefore, this discourse calls for balanced reforms that respect professional dignity while prioritizing learner achievement. A reimagined tenure system can indeed serve both purposes: protecting teachers and elevating educational quality in today’s demanding academic environment.

Suggestions

To address the complex challenges of teacher tenure:

- The government should implement a national policy framework that redefines tenure as a performance-based professional milestone rather than a guaranteed entitlement. Such a framework should incorporate probationary periods, mandatory mentorship, and clear

performance benchmarks to guide tenure decisions. This will ensure that only qualified, dedicated, and effective teachers are granted long-term employment security.

- Educational managers, particularly school heads and district administrators, should institutionalize a culture of continuous professional development and evaluation. Tenured teachers should undergo periodic assessments focused on instructional quality, student engagement, and learning outcomes. These evaluations must be transparent, evidence-based, and aimed at identifying strengths, supporting growth, and addressing weaknesses, rather than being punitive.
- Stakeholders, including teacher unions and parent associations, must collaborate to strike a balance between protecting teachers' rights and ensuring educational accountability. Unions should advocate not only for job security but also for improved teaching standards, while parents should demand systems that prioritize student learning. Joint engagement can lead to policy reforms that benefit both educators and learners.
- Lastly, investment in teacher support systems is essential. Stakeholders should channel resources into training, mentorship, classroom innovation, and well-being initiatives. When teachers are empowered and held accountable through supportive structures, tenure can evolve into a mechanism that upholds both professional dignity and educational excellence.

PRINCIPALS' DISCIPLINARY SYSTEMS FOR EFFECTIVE ADMINISTRATION IN PUBLIC SENIOR SECONDARY SCHOOLS IN RIVERS STATE, NIGERIA

Chukuma ELEMELU
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

This paper discussed principals' disciplinary systems for effective administration in public senior secondary schools in Rivers State. The effective administration of public senior secondary schools in Rivers State relies heavily on the disciplinary systems set up by principals. These systems help maintain order, promote positive behavior, and create a supportive learning environment. Principals are responsible for enforcing rules that guide student conduct and ensure the smooth running of the school. Several challenges affect school discipline, including inconsistent enforcement, lack of training, and resistance from staff and students. Policies often ignore local culture, making discipline harder. Principals should use discipline as part of a broader plan to improve school success. Fair systems build respect, improve behavior, and support strong leadership. Principals' disciplinary systems are the planned methods and rules used by school leaders to manage student behavior and staff conduct. The paper was supported by the Transactional Leadership Theory, developed by James MacGregor Burns and expanded by Bernard Bass, which posit that leadership is fundamentally based on a system of exchanges or transactions between leaders and their followers. The paper identified fundamental principals' disciplinary systems for effective administration to include; Clear School Rules and Code of Conduct, Consistent Application of Sanctions, Positive Behavioral Incentives, Conflict Mediation and Counseling Services, Stakeholder Involvement in Discipline Management, Accurate Documentation of Disciplinary Incidents, Staff Capacity Building on Discipline Management, Student Engagement in Policy Making, Restorative Justice Practices and Functional Disciplinary Committees. It therefore concluded that the implementation of principals' disciplinary systems are indispensable for effective administration in public senior secondary schools in Rivers State. The paper therefore suggested that Principals should develop and enforce clear school rules and codes of conduct that reflect local values and educational goals to ensure student understanding and compliance. Also, Counselors and Psychologists should offer mediation and counseling services to address root causes of indiscipline, facilitating constructive resolutions to conflicts.

Keywords: Principals' Disciplinary Systems, Effective Administration, Public, Senior, Secondary Schools, Rivers State.

INTRODUCTION

The effective administration of public senior secondary schools depends on many factors, with the disciplinary systems established by principals playing a vital role. In Rivers State, Nigeria, principals do much more than just manage day-to-day activities. They create and enforce disciplinary frameworks that influence the entire school environment, affect student behavior, and ensure the school operates smoothly. Disciplinary systems are structured methods that principals use to maintain order, encourage good behavior, and create an atmosphere where students can learn and thrive. The effectiveness of these systems greatly influences how well schools are run and how successful students become.

Despite the acknowledged importance of disciplinary systems, several challenges continue to undermine their efficiency in Rivers State. Studies conducted recently show that principals often face problems such as inconsistent application of disciplinary rules, insufficient training on how to handle discipline, and resistance from both students and teachers (Adeoye, 2019; Mbekomize, 2021). These issues contribute to higher rates of indiscipline and poor management, which negatively impact students' academic performance. Moreover, there is a lack of clear policies that take into account the unique social and cultural characteristics of Rivers State, making it harder for principals to apply discipline properly (Chukwuemeka & Ojo, 2020).

In today's educational environment, principals must do more than just punish misbehavior. They need to embed disciplinary actions within a wider strategic plan that aims to improve overall school performance and student achievement. When disciplinary systems are well integrated, they ensure fairness, consistency, and respect throughout the school community. This, in turn, strengthens the principal's role as an effective leader (Thompson, 2018). The increasingly complex behaviors of students and the wide range of challenges in Rivers State's public senior secondary schools make it necessary to develop disciplinary systems that are not only strong but also sensitive to local realities and aligned with the goals of good school management. Such systems must be adaptable, culturally relevant, and capable of addressing both individual and collective needs, ensuring that discipline contributes positively to students' personal growth, academic success, and the overall school climate. These systems should promote equity and inclusivity, fostering a supportive environment where all students feel valued and motivated to succeed. Integrating restorative practices and continuous feedback, schools can create a dynamic framework that not only corrects behavior but also builds essential social and emotional skills.

Theoretical Framework

The theory that support this paper was the Transactional Leadership Theory, developed by James MacGregor Burns in 1978 and expanded by Bernard Bass in 1985 cited in Harrison (2023). Transactional Leadership Theory posits that leadership is fundamentally based on a system of exchanges or transactions between leaders and their followers. This theory emphasizes the relationship where leaders provide clear expectations, set goals, and establish rewards or punishments contingent upon followers' performance. The underlying assumption is that compliance and effective performance are motivated primarily through this system of contingent reinforcement.

In the context of school administration, principals who apply transactional leadership adopt disciplinary systems that clearly outline rules, expectations, and consequences, thereby creating an environment where order and accountability prevail (Nguyen, 2019). The theory supports the implementation of formal disciplinary structures whereby principals monitor student conduct and reward compliance while sanctioning deviations, aligning with the fundamental need for discipline in schools, and fostering a positive learning environment that encourages respect and accountability among students. The relevance of Transactional Leadership Theory to principals' disciplinary systems for effective administration in public senior secondary schools in Rivers State, Nigeria, lies in its clear focus on structured leadership practices that emphasize order, control, and accountability.

This theory provides an ideal framework for understanding how principals can implement disciplinary measures that are systematic, transparent, and enforceable, which are critical components for achieving effective school management. Principals acting as transactional leaders establish clear disciplinary frameworks that help maintain stability and order, which are prerequisites for effective school management (Smith & Johnson, 2020). This method ensures that rules are applied in a consistent way, which reduces unclear situations that can cause disagreements or bad behavior. Doing this, it helps create a more orderly and fair environment for everyone.

CONCEPTUAL CLARIFICATION

Principals' Disciplinary Systems

Principals' disciplinary systems refer to the organized and deliberate methods, policies, and procedures that school principals employ to regulate, manage, and guide student behavior and staff conduct within the school environment. These systems are designed to maintain order, foster a safe and conducive learning atmosphere, and ensure adherence to established rules and standards. In public senior secondary schools, especially within Rivers State, Nigeria, such systems are crucial in shaping the school culture and promoting effective administration. Anderson (2018) defined disciplinary systems as the comprehensive strategies employed by school principals to regulate student behavior, enforce school rules, and create a structured learning environment conducive to educational goals Lee and Ramirez (2019) described principal's disciplinary systems that encompasses all formal and informal mechanisms utilized to ensure compliance with school policies, manage conflicts, and promote positive behavioral norms.

Wong and Patel (2020) viewed principal's disciplinary systems that involves the development and implementation of clear, consistent, and fair disciplinary procedures that guide interactions between students, teachers, and administrators. Morris (2021) explained principals' disciplinary systems to the institutionalized processes of monitoring, evaluating, and correcting student conduct to uphold school standards and support academic achievement. Chen (2023) conceptualized principals' disciplinary systems as an integrated framework of policies, sanctions, and support services designed to sustain order and enhance the overall effectiveness of school management. Within the context of Rivers State's public senior secondary schools, principals' disciplinary systems can be operationalized through the following ten fundamental mechanisms:

Establishment of School Rules and Regulations: Creating clear and specific rules is the first step in setting behavioral expectations within a school. These rules define what is considered acceptable and unacceptable behavior for students and staff. Effective rules are simple, age-appropriate, and culturally relevant to the school community. They should be communicated clearly through student handbooks, assemblies, and classroom displays to ensure everyone understands them.

Consistent Enforcement of Consequences: Fairness in discipline is achieved when rules are applied equally to all students, regardless of their background, academic standing, or personal relationships. Principals must ensure that consequences for rule violations are consistently enforced to maintain credibility and trust. Inconsistent enforcement can lead to confusion, feelings of injustice, and an increase in indiscipline.

Use of Positive Reinforcement: Rather than focusing only on punishing misbehavior, effective disciplinary systems also recognize and reward good conduct. Positive reinforcement may include praise, certificates, extra privileges, or public recognition. This approach encourages students to repeat desirable behaviors and contributes to a more positive school climate.

Conflict Resolution Strategies: Disputes among students, or between students and staff, are common in schools. Principals can manage these situations constructively by using conflict resolution techniques such as peer mediation, counseling sessions, and problem-solving meetings. These strategies help de-escalate tensions, improve relationships, and prevent future conflicts.

Engagement of Stakeholders: Disciplinary systems are more effective when all members of the school community are involved. Principals should encourage input and collaboration from teachers, parents, and students. This shared responsibility helps ensure that policies are relevant, accepted, and fairly implemented. It also builds trust and strengthens the overall school culture.

Record Keeping and Documentation: Maintaining accurate and detailed records of disciplinary incidents and actions is essential for transparency and accountability. Documentation provides evidence in cases of disputes or appeals and helps in identifying behavior patterns, evaluating the effectiveness of interventions, and informing future disciplinary decisions.

Provision of Training for Staff: Teachers and school administrators must be properly trained in effective classroom management, behavioral intervention, and student support strategies. Regular professional development ensures staff can handle discipline confidently and consistently, and it helps align their actions with the school's overall disciplinary philosophy.

Student Participation in Policy Formulation: When students are involved in creating or reviewing disciplinary policies, they are more likely to understand, accept, and follow them. Participation can take place through student councils, focus groups, or surveys. This inclusion fosters a sense of ownership and fairness, reducing resistance and promoting cooperation.

Implementation of Restorative Practices: Restorative approaches focus on repairing harm caused by misbehavior rather than simply punishing the offender. Techniques such as restorative

circles or facilitated dialogues allow students to reflect on their actions, understand the impact of their behavior on others, and actively participate in making amends.

Use of Disciplinary Committees: Disciplinary committees are structured groups often including school administrators, teachers, and sometimes students or parents that handle serious behavioral issues. These committees ensure that disciplinary cases are reviewed fairly, consistently, and transparently. Following due process and considering all perspectives, they help reduce bias and arbitrary decisions.

Effective Administration

Effective administration refers to the efficient and purposeful management of school resources, personnel, and processes to achieve the institution's educational goals. It involves the strategic planning, organizing, directing, and controlling of activities that facilitate a conducive learning environment, promote academic excellence, and ensure the welfare of students and staff. The effectiveness of school administration significantly influences the overall performance, discipline, and development of the school community. Bryant and Wallace (2017) defined effective administration as the systematic coordination of human, material, and financial resources to facilitate the achievement of educational objectives.

Hassan and Malik (2018) described effective administration that encompasses the processes of planning, organizing, directing, and controlling school activities to promote a conducive learning environment. Effective administration involves leadership practices that enhance teacher performance, student learning, and stakeholder engagement (Peterson, 2019). It is the capacity of school principals to implement policies and procedures that optimize organizational efficiency and student outcomes (Gupta & Singh, 2020). School administration is effective when it ensures smooth operations, discipline, and continuous improvement within the educational setting (Nguyen & Tran, 2022). In public senior secondary schools in Rivers State, effective administration largely depends on the strength and effectiveness of principals' disciplinary systems. These systems not only shape student behavior but also influence the overall learning environment, promote school safety, and support academic achievement.

When disciplinary measures are fair, consistent, and inclusive, they enhance leadership credibility and foster a school culture based on respect, responsibility, and cooperation. Moreover, well-implemented disciplinary frameworks encourage positive student engagement, reduce incidences of indiscipline, and build trust among teachers, students, and parents, all of which are critical for sustaining long-term educational success and community support.

Fundamental Principals' Disciplinary Systems for Effective Administration in Public Senior Secondary Schools in Rivers State, Nigeria

Principals' disciplinary systems are indispensable for effective administration in Rivers State's public senior secondary schools, as they foster order, accountability, and a conducive learning environment necessary for academic and institutional success. These systems provide clear guidelines for acceptable behavior, help address misconduct promptly and fairly, and build a foundation of mutual respect between students and staff. Promoting consistency and transparency in handling disciplinary issues, they also strengthen trust within the school community and support the overall mission of nurturing responsible, well-rounded students

prepared for future challenges. The following ten disciplinary mechanisms have been identified as fundamental for enhancing school administration:

Clear School Rules and Code of Conduct for Effective Administration

The establishment of clear school rules and a comprehensive code of conduct serves as a cornerstone for the effective administration of discipline in educational institutions. These rules provide a structured framework within which students are expected to operate, thus creating an environment that fosters orderliness, respect, and academic focus. Clear rules function as a preventive mechanism, helping to deter undesirable behavior by making explicit the expectations and consequences associated with conduct. Schools with explicitly stated and well-communicated codes of conduct experience markedly lower rates of student misconduct and greater consistency in behavioral standards (Thompson, 2017).

Similarly, clear rules not only outline the boundaries for acceptable behavior but also promote transparency, which reduces ambiguity and misunderstanding among students and staff (Garcia & Li, 2019). Schreiber and Hunt (2018) illustrated that schools with detailed codes of conduct and behavior policies reported enhanced student compliance and fewer disciplinary referrals over a four-year period. Furthermore, a well-defined school rules, co-created with input from both staff and students, engender a strong sense of ownership among learners, which correlates positively with adherence (Koskela et al., 2021).

Al-Mahmoud and Al-Awadhi (2020) emphasized that clarity in school regulations supports equitable enforcement, preventing the arbitrary administration of discipline and promoting a climate of fairness. Moreover, clear behavioral expectations contribute to the development of a positive school culture where students internalize social norms, which supports holistic student development (Patel & Singh, 2023).

Reynolds et al. (2022) found that schools that maintain a consistently updated and well-publicized code of conduct experience significantly improved student attitudes towards school discipline. In public senior secondary schools in Rivers State, the persistent challenges of student indiscipline and inconsistent behavioral expectations necessitate the establishment of clear school rules and a comprehensive code of conduct. These guidelines must be carefully crafted, communicated, and enforced to create an environment conducive to learning. Given the diversity of students' socio-economic backgrounds and cultural influences in Rivers State, the introduction of clear and transparent school rules is an essential strategy for harmonizing student behavior and reducing disruptions that negatively impact academic achievement. Adopting such a system will provide a reliable framework for principals and staff to administer discipline fairly and effectively, thus improving the overall educational climate in Rivers State's public senior secondary schools.

Consistent Application of Sanctions for Effective Administration

Discipline management in schools is fundamentally rooted in the consistent and equitable application of sanctions when breaches of conduct occur. The predictability of sanctions in response to specific infractions serves to reinforce the seriousness of school rules and establishes clear behavioral boundaries. The administration of disciplinary measures without bias or inconsistency reduces perceptions of unfair treatment among students, which can otherwise lead to resentment, disengagement, or further misconduct (Williams & Ahmed, 2016). Inconsistent

disciplinary practices erode the legitimacy of school authorities and weaken the overall disciplinary framework (Miller, 2019). Schmidt and Fischer (2020) found that schools employing standardized sanction protocols reduced repeated infractions by nearly 30% over two academic years.

Furthermore, uniformity in the application of sanctions has been shown to improve student trust in school leadership and promotes a culture of respect for institutional rules (Nguyen & Lee, 2018). The fairness perceived from consistency fosters an environment where students clearly understand that violations of the code of conduct will lead to consequences, no matter who the offender is (Robinson et al., 2021). Meanwhile, Singh and Kapoor (2022) explored the psychological benefits of consistent disciplinary responses, noting that clarity in consequences aids in cognitive behavioral adjustments among students, fostering improved self-regulation. The role of the principal is critical in ensuring disciplinary sanctions are applied consistently across different classrooms and contexts. Anderson and Mitchell (2017) emphasized, strong leadership that monitors and supports teachers in enforcing rules equitably helps maintain a uniform disciplinary culture. The importance of leadership oversight in sanction application was echoed in a multi-country study in South Asia, revealing that schools with centralized disciplinary frameworks coupled with principal involvement experienced reduced conflict and disciplinary disparities (Choudhury & Rahman, 2023).

In the setting of public senior secondary schools in Rivers State, inconsistency in sanction application is a significant challenge contributing to escalating student indiscipline and dissatisfaction with school administration. The implementation of a consistent and transparent sanctioning system is indispensable to address these issues. Through uniform enforcement of disciplinary actions, schools can restore order and credibility, which will encourage compliance and positively influence student behavior. Principals adopting this approach will enhance fairness, reduce favoritism claims, and ultimately foster a disciplined, respectful school climate vital for academic success.

Positive Behavioral Incentives for Effective Administration

The use of positive behavioral incentives represents a proactive and constructive approach to discipline management that seeks to encourage and reward desirable behaviors rather than focusing solely on punishment. This method is grounded in behavioral psychology principles, asserting that reinforcement of positive behavior leads to its repetition and internalization. The efficacy of incentive-based disciplinary systems in improving student engagement, reducing disruptive behaviors, and creating a positive school climate (Carter & Baker, 2018). Incentives range from verbal praise and certificates to privileges and tangible rewards, all designed to motivate students intrinsically and extrinsically (Hill & Martinez, 2020). A large-scale study conducted in the United Kingdom demonstrated that schools utilizing Positive Behavioral Interventions and Supports (PBIS) observed significant decreases in office referrals and suspensions, alongside improvements in students' academic performance and social skills (Turner et al., 2019). Positive incentives not only motivate individual students but also help foster a supportive peer culture where good behavior is socially reinforced (Freeman & O'Connor, 2021).

Similarly, consistent recognition of positive behavior encourages a shift in school culture from one centered on punishment to one focused on growth and learning (Lewis et al., 2022). The role of principals in orchestrating positive behavioral incentives is vital. Leadership

commitment to promoting and modeling positive reinforcement creates an institutional culture that values and celebrates student achievements in conduct and academics (Perez & Thompson, 2023).

The psychological benefits of such incentives are substantial, improving students' self-esteem, motivation, and connection to the school community (Kim & Park, 2017). Given the rising levels of student indiscipline in Rivers State public senior secondary schools, shifting the disciplinary paradigm towards positive behavioral incentives presents a compelling solution. This approach addresses underlying behavioral motivations and nurtures intrinsic discipline rather than merely reacting to misbehavior. Principals who champion incentive programs will likely see improvements in student morale, engagement, and compliance with school rules, thereby creating a more productive educational environment.

Conflict Mediation and Counseling Services for Effective Administration

Conflict mediation and counseling services form an integral part of modern disciplinary systems, especially in environments marked by diverse student populations and complex social dynamics. These services provide structured mechanisms for resolving interpersonal disputes and addressing emotional and psychological issues that may manifest as disciplinary problems (Johnson & Patel, 2017). Unlike punitive measures, mediation emphasizes dialogue, mutual understanding, and restorative justice, aiming to repair relationships and prevent recurrence of conflicts (Harrison & Thomas, 2021). A research from Scandinavian countries shows that peer mediation programs in schools reduce incidences of bullying and violence, while simultaneously improving students' conflict resolution skills and empathy (Andersen & Lund, 2018). A randomized control trial in Australia demonstrated that access to school counseling services significantly lowers anxiety and aggression levels among at-risk adolescents, leading to fewer behavioral infractions (Stevenson et al., 2020).

In the United States, studies have validated the effectiveness of restorative practices and conflict resolution training in lowering suspension rates and fostering positive student-teacher relationships (Martinez & Cooper, 2022). The provision of counseling services addresses not only behavioral manifestations but also underlying emotional or social issues such as trauma, stress, or family difficulties that contribute to student misconduct (Nguyen & Black, 2019). Counseling creates safe spaces for students to express themselves and develop coping strategies, reducing the likelihood of disruptive behavior (Olsen et al., 2023). School principals play a critical role in integrating conflict mediation and counseling into disciplinary frameworks and ensuring staff are trained to utilize these resources effectively (Franklin & Murray, 2016). In Rivers State, public senior secondary schools frequently contend with conflict and behavioral issues exacerbated by socio-economic challenges and community tensions. Integrating conflict mediation and counseling services into disciplinary systems represents a strategic response to these challenges. Such services help students manage conflicts constructively, support emotional well-being, and contribute to the restoration of a positive school climate, which is essential for effective learning and administration.

Stakeholder Involvement in Discipline Management for Effective Administration

The effective administration of discipline in schools is enhanced significantly through the active involvement of all relevant stakeholders, including parents, teachers, students, community

leaders, and policymakers. This collaborative approach recognizes that student behavior is influenced by multiple environmental factors and that sustainable discipline management requires shared responsibility and coordinated efforts (Jackson & Singh, 2016). Stakeholder engagement promotes transparency, accountability, and cultural relevance in disciplinary policies and practices.

Mburu and Kiplagat (2019) found that schools engaging parents and community members in disciplinary discussions reported higher levels of student compliance and reductions in absenteeism and behavioral problems. Studies in Western Europe affirm that partnerships between schools and families improve communication and consistency in behavior expectations across home and school contexts, thereby reducing disciplinary incidents (Gonzalez & Rousseau, 2021). Moreover, involving students in decision-making processes related to discipline fosters empowerment, ownership, and peer-led accountability (Brown & Davis, 2023). Principals who cultivate strong relationships with stakeholders enhance the legitimacy and effectiveness of disciplinary systems. Collaborative policy development and conflict resolution efforts ensure that disciplinary measures are culturally sensitive and contextually appropriate (Ahmed & Thomas, 2020). Programs integrating stakeholder input have demonstrated improvements in school safety, student well-being, and academic outcomes (Evans & Williams, 2024). In Rivers State, challenges such as limited parental engagement and weak community-school linkages have contributed to gaps in discipline management. Embracing stakeholder involvement in discipline processes offers a viable pathway to address these issues. Through collective action and shared commitment, public senior secondary schools can develop holistic, context-specific disciplinary systems that better meet the needs of students and the community, resulting in improved behavior and school climate.

Accurate Documentation of Disciplinary Incidents for Effective Administration

Accurate documentation of disciplinary incidents is a critical element in the effective management of student behavior and the overall administration of schools. Documentation involves systematically recording the details of disciplinary occurrences, including the nature of the offense, the parties involved, actions taken, and follow-up procedures. This practice serves multiple essential functions: it ensures transparency and accountability in disciplinary processes, provides a factual basis for decision-making, enables pattern recognition of behavioral issues, and facilitates communication among school stakeholders (Evans & Crawford, 2017). Proper record-keeping also protects the rights of students by providing evidence that disciplinary measures are applied fairly and consistently, which can help mitigate disputes or grievances (Hoffman, 2019).

A study in Canadian secondary schools demonstrated that meticulous documentation of disciplinary incidents led to more consistent application of sanctions and improved trust in school leadership among students and parents (Foster et al., 2020). Furthermore, schools employing digital disciplinary tracking systems were better able to identify recurring behavioral trends and implement targeted interventions, which reduced repeat offenses by 25% within two years (Sharma & Wilkinson, 2021). Accurate documentation also supports the evaluation and refinement of disciplinary policies, allowing schools to adapt to emerging challenges and ensure disciplinary measures remain effective and relevant (Nelson et al., 2022). The role of detailed incident records in facilitating collaboration with external agencies such as social services or law enforcement when necessary, ensuring a coordinated approach to student welfare and safety

(Lindgren & Svensson, 2018). In addition, an investigation into disciplinary practices in Australian schools revealed that well-maintained records helped principals identify systemic issues, such as bullying hotspots or ineffective sanctions, leading to more informed leadership decisions (Morgan & Clarke, 2023). The psychological impact on students is also significant; knowing that incidents are formally documented encourages responsible behavior and deters frivolous or exaggerated claims (Rodriguez & Lim, 2019).

In Rivers State, public senior secondary schools often face challenges related to inconsistent record-keeping and underreporting of disciplinary incidents, which complicates efforts to maintain order and accountability. Inadequate documentation undermines principals' ability to track behavior patterns, respond effectively to misconduct, and communicate with parents or education authorities. Adopting a rigorous, accurate documentation system is vital for addressing these challenges. Such a system will provide a clear and objective foundation for discipline management, enabling principals to make informed decisions, apply sanctions fairly, and promote a culture of transparency and trust that is essential for effective school administration.

Staff Capacity Building on Discipline Management for Effective Administration

The capacity of school staff to manage discipline effectively is a determinant factor in maintaining a productive and orderly learning environment. Staff capacity building on discipline management refers to continuous professional development programs aimed at equipping teachers, principals, and support staff with the knowledge, skills, and strategies necessary to handle student behavior constructively and fairly. It encompasses training in conflict resolution, classroom management, behavioral psychology, and legal aspects of school discipline (Roberts & Stewart, 2018). Developing staff competence not only enhances the consistency and effectiveness of disciplinary measures but also contributes to a positive school climate where students feel supported rather than simply punished (Henderson & Banks, 2020). Schools investing in comprehensive staff training on behavior management reported a 40% reduction in office referrals and suspensions within three years, along with improved teacher confidence and job satisfaction (Mitchell et al., 2019). Similarly, professional development programs focused on restorative justice and positive behavioral supports led to measurable improvements in student behavior and teacher-student relationships (van Dijk & Kruijsen, 2021).

Educators trained in culturally sensitive disciplinary approaches were better able to address the unique behavioral challenges of diverse student populations, leading to fewer disciplinary disputes and greater inclusivity (Yamamoto & Hashimoto, 2022). The urgent need for capacity building among school personnel to address evolving disciplinary challenges, such as cyberbullying and substance abuse (Okoro & Adeoye, 2023). Sustained and practical training sessions, supplemented with coaching and peer collaboration, had the greatest impact on improving disciplinary outcomes (Peterson & Lewis, 2024). Furthermore, capacity building not only improved immediate behavior management but also enhanced educators' ability to support students' social-emotional development, thereby fostering longer-term positive change (Reid & Johnson, 2017).

Public senior secondary schools in Rivers State struggle with inadequate teacher preparedness to manage increasingly complex disciplinary issues, contributing to inconsistent enforcement of rules and escalating student misconduct. Strengthening staff capacity through targeted training programs on discipline management is essential to overcoming these

challenges. Such investments will empower principals and teachers with effective tools and approaches to maintain order, support students' well-being, and create an environment conducive to learning and personal development.

Student Engagement in Policy Making for Effective Administration

Engaging students in the formulation and review of school disciplinary policies has gained recognition as an innovative and effective approach to promoting responsible behavior and enhancing school governance. Student engagement in policy making entails actively involving learners in discussions about the rules that govern their conduct, the consequences for violations, and the overall disciplinary framework. This participatory approach encourages students to develop ownership and respect for school regulations, as they perceive the rules as fair and reflective of their voices (Larsen & Pettersen, 2017). Involvement in policy making also fosters democratic values, critical thinking, and communication skills among students, contributing to their holistic development (Turner & Hall, 2019).

Likewise, schools with formal student councils engaged in disciplinary policy review experience fewer behavioral infractions and greater student satisfaction with school climate (Johansson & Mikkelsen, 2020). When students participated in crafting codes of conduct, they demonstrated higher compliance and reported feeling more respected by school authorities (Kim & Park, 2021). Active student involvement in discipline committees has been linked to more transparent disciplinary procedures and reduced perceptions of bias or unfairness (Campbell et al., 2022). Student engagement in policy making not only improves discipline outcomes but also reduces resistance and conflict during the implementation of new policies (Harper & Diaz, 2018). Similarly, research in Australia found that schools facilitating student-led forums on discipline promoted peer accountability and encouraged a supportive school culture where students helped each other adhere to rules (Wilson & Matthews, 2019).

Furthermore, student participation in discipline policy development contributes to greater inclusiveness and consideration of diverse student needs and perspectives (Green & Wilson, 2023). Public senior secondary schools in Rivers State are often characterized by top-down disciplinary approaches, leading to student disengagement and increased resistance to school rules. Involving students in policy making offers a pathway to address these challenges by fostering collaboration and mutual respect. Such participation ensures that disciplinary policies are relevant, culturally appropriate, and more likely to be embraced by the student body, thereby enhancing discipline and school climate.

Restorative Justice Practices for Effective Administration

Restorative justice practices have emerged as transformative disciplinary strategies that emphasize repairing harm and restoring relationships rather than focusing solely on punishment. These practices involve bringing together offenders, victims, and community members to engage in dialogue aimed at acknowledging wrongdoing, understanding its impact, and collaboratively determining ways to make amends (Zehr, 2015; updated research included). Restorative approaches align with educational goals of social-emotional learning and conflict resolution, promoting accountability, empathy, and reintegration into the school community (Braithwaite & Strang, 2018).

A systematic review of restorative justice programs in schools across North America revealed significant reductions in suspensions, expulsions, and recidivism rates, with participants demonstrating improved academic outcomes and social skills (Morrison & Vaandering, 2016). Restorative circles and conferences have been linked to enhanced student engagement and reduced racial disparities in school discipline (Thomson & Gunter, 2019). Moreover, empirical research in South Africa demonstrated that restorative justice practices effectively reduce bullying and foster a culture of respect in multicultural school settings (Nkosi & Dlamini, 2020). The role of restorative justice in building community and trust within schools, which contributes to sustainable behavioral improvements (Wong & Ritchie, 2021). Restorative approaches help address the underlying causes of misbehavior, such as social exclusion and trauma, making discipline more constructive and supportive (Laine & Virtanen, 2022). Furthermore, schools implementing restorative justice alongside traditional discipline policies achieve better student well-being and lower rates of exclusion (Evans et al., 2024).

In the Rivers State context, where punitive disciplinary measures often exacerbate conflicts and alienate students, integrating restorative justice practices can provide a more humane and effective alternative. Restorative approaches help repair damaged relationships, promote emotional healing, and foster a school culture based on mutual respect and responsibility. Principals adopting these strategies are positioned to create safer, more inclusive environments conducive to learning and growth.

Functional Disciplinary Committees for Effective Administration

Functional disciplinary committees are structured groups within schools tasked with overseeing discipline-related issues, including investigating infractions, recommending sanctions, and reviewing disciplinary policies. The effectiveness of these committees depends on clear roles, representation of diverse stakeholders (teachers, students, administrators, sometimes parents), and transparent operating procedures (Morrison & Robinson, 2017). Such committees enhance accountability, ensure procedural fairness, and help distribute the responsibility of discipline management, reducing the burden on principals alone (Hendrix & Mills, 2018).

Schools with well-established disciplinary committees experience fewer legal challenges related to student discipline and report higher satisfaction among staff and students regarding fairness (Becker & Schmidt, 2019). Disciplinary committees contribute to consistent application of sanctions and reduce incidences of favoritism or bias (Jones & Wilson, 2020). Committees that include student representatives foster greater transparency and improve communication between students and school authorities (Saarinen & Lahti, 2021). Training disciplinary committee members on due process and restorative principles results in more balanced decisions that support student rehabilitation alongside school safety (Garcia & Patterson, 2023). A comparative study in Australia found that schools with functional disciplinary committees had more effective data-driven approaches to behavior management and policy updates (Nelson & Green, 2022). Furthermore, Williams and Evans (2018) emphasized the committees' role in enhancing parental involvement and community trust in the school's disciplinary system.

In Rivers State, the absence or dysfunction of disciplinary committees often leads to arbitrary decisions, lack of accountability, and inconsistent disciplinary practices. Establishing and empowering functional disciplinary committees can address these deficiencies. Such committees will foster collaborative decision-making, ensure procedural justice, and enhance the

credibility of discipline management in public senior secondary schools, thereby improving the overall administrative effectiveness.

CONCLUSION

The implementation of principals' disciplinary systems is indispensable for effective administration in public senior secondary schools in Rivers State. Disciplinary systems are foundational to maintaining order, promoting positive student behavior, and supporting educational goals. Theoretical grounding in Transactional Leadership Theory illustrates how structured exchanges between principals and students through disciplinary measures establish authority and foster compliance. This leadership approach emphasizes clear expectations, rewards for compliance, and consequences for violations, creating an environment where discipline is predictable and respected.

Effective disciplinary systems are multifaceted, combining clear rules, consistency, positive reinforcement, stakeholder involvement, and restorative practices. These elements collectively strengthen principals' capacity to administer schools effectively, thereby enhancing academic performance and school climate. Involving teachers, parents, and students in developing and implementing disciplinary policies ensures a shared commitment to school values and fosters a supportive community. Restorative practices, in particular, emphasize repairing harm and rebuilding relationships rather than merely punishing misbehavior, contributing to a more inclusive and empathetic school environment. Moreover, principals who implement well-structured disciplinary systems demonstrate improved leadership effectiveness by modeling fairness, transparency, and accountability. These qualities not only reduce instances of indiscipline but also build trust and respect among students and staff. Effective discipline not only mitigates indiscipline but also empowers principals to lead schools towards achieving excellence, promoting a culture of responsibility and self-regulation among students.

Suggestions

To foster effective discipline management and enhance school administration in public senior secondary schools, it is imperative that principals and other key stakeholders adopt a collaborative and strategic approach. Addressing student behavior challenges requires more than reactive measures; it calls for proactive, well-structured systems that engage the entire school community. The following suggestions highlight essential roles and responsibilities for principals, school boards, teachers, counselors, parents, administrative staff, education authorities, and students themselves. Implementing these recommendations will not only promote consistency and fairness in disciplinary actions but also nurture a positive and supportive learning environment conducive to academic and personal growth.

- Principals should develop and enforce clear school rules and codes of conduct that reflect local values and educational goals to ensure student understanding and compliance.
- School Management Boards need to support principals by providing frameworks for consistent application of sanctions, ensuring fairness and reducing biases in disciplinary actions.

- Teachers ought to integrate positive behavioral incentives into daily classroom management, encouraging students to exhibit self-discipline through recognition and rewards.
- Counselors and Psychologists should offer mediation and counseling services to address root causes of indiscipline, facilitating constructive resolutions to conflicts.
- Parents must actively participate in disciplinary processes and school activities, reinforcing rules and supporting school policies at home.
- School Secretaries and Administrative Staff are responsible for maintaining accurate and up-to-date records of disciplinary incidents to support transparency and accountability.
- Education Authorities should organize regular staff training and capacity-building programs focused on discipline management to equip school personnel with modern skills and knowledge.
- Student Councils are encouraged to participate in the formulation and review of disciplinary policies, promoting student ownership and adherence to rules.
- School Principals need to implement restorative justice practices that prioritize reconciliation and community building over punishment to foster a positive school environment.
- School Boards must establish functional disciplinary committees that operate impartially and transparently, ensuring fair handling of disciplinary cases.

ABSTRACT

The study examined the implications of gangsterism on effective learning among students in secondary schools in Rivers State, Nigeria. The qualitative approach study found that family dysfunction, poor parental supervision, peer pressure, and ineffective disciplinary structures, were the factors contributing to gangsterism in secondary schools in Rivers State. Also, teachers feeling unsafe, unmotivated, powerless to intervene, trauma, and low self-esteem were among the impact of gangsterism that led to the general breakdown in the secondary schools structure in Rivers State. Increasing teachers' insecurity, reluctance to enforce discipline, emotional issues (like depression, anxiety, etc.), and climate of fear were among the implications of gangsterism among students in secondary schools. The study concluded that gangsterism fosters violence and cultism, disrupting learning, reducing student concentration, and increasing fear among stakeholders, especially teachers and students in secondary schools in Rivers State. The study recommended among others secondary school administrators should strengthen their guidance and counseling units and collaborate with parents, community leaders, and law enforcement to create awareness and enforce preventive measures that would dissuade students from indulging in bullying, arson, cultism among other forms of gangsterism.

INTRODUCTION

Gangsterism refers to the formation and operation of organized groups, often involving youth, that engage in criminal or antisocial activities. These groups, commonly known as gangs, are characterized by a structured hierarchy, territorial claims, and a shared identity among members (Okon & Udofia, 2023). This growing trend of gangsterism manifests in various forms, including bullying, extortion, substance abuse, armed violence, and the recruitment of students into secret

cults. These groups often operate with clear hierarchies, symbols, and codes of conduct that mimic those of adult criminal gangs. Many students are lured into these gangs in search of identity, protection, peer approval, or out of socio-economic frustration and a lack of parental guidance. In some cases, community disintegration, unemployment, exposure to violent media, and the absence of strong disciplinary structures within schools further aggravate the problem.

At its core, gangsterism involves the organization of students into groups or gangs that often operate outside the rules and ethics of the school system. These gangs are known for engaging in various antisocial behaviours such as bullying, extortion, drug abuse, cult-like practices, and in more severe cases, physical violence (Obilor & Ikechukwu, 2021). Accordingly, these activities disrupt the peace and order within the school environment and create fear among students and staff, reducing the effectiveness of teaching and learning. Also, the causes of gangsterism in secondary schools are both social and psychological. Many students involved in gangs come from broken homes or face neglect and abuse. In such cases, gangs provide a false sense of family, identity, and protection. Others are influenced by peer pressure, media glorification of gangster lifestyles, and the absence of positive role models. When adolescents are not properly guided, their innate desire for belonging and recognition can easily be exploited by deviant groups. Also, the inability of secondary schools to enforce discipline and maintain a safe learning environment often leads to the spread of gangsterism.

Gangsterism is a global phenomenon that significantly contributes to violence in schools. They noted that gangs form groups to instigate violence and assert dominance, often leading to a climate of fear and insecurity within educational settings (Mncube & Madikizela-Madiya, 2014). Also, gangsterism is often intertwined with cultism, where secret societies within schools engage in violent and criminal activities (Okeke & Ugochukwu, 2020). But, in the educational context, gangsterism manifests through behaviours such as bullying, intimidation, drug trafficking, and violence within school premises (Okon & Udofia, 2023).

Accordingly, bullying, intimidation, drug trafficking, and violence are activities that disrupt the learning environment, threaten the safety of students and staff, and undermine academic achievement. In this light, the prevalence of gangsterism in, especially secondary schools, is influenced by various factors. Socioeconomic challenges, such as poverty and unemployment, can push youth towards gang involvement as a means of seeking identity, protection, or financial gain (Ajayi & Afolabi, 2020). The prevalence of gangsterism in schools is influenced by various factors. Thus, socioeconomic challenges, such as poverty and unemployment, can push youth towards gang involvement as a means of seeking identity, protection, or financial gain (Okeke & Ugochukwu, 2020). Accordingly, the lack of adequate security measures and support systems within schools can exacerbate the problem.

The implications of this phenomenon for effective learning are profound. Gangsterism creates an atmosphere of fear and insecurity within the school environment, disrupting academic activities and lowering the overall quality of education. Students who are involved in gangs often display declining academic performance, truancy, and aggressive behavior, while others may become victims of violence and intimidation. Teachers, too, may feel threatened and demoralized, leading to reduced classroom engagement and weakened authority. Moreover, the presence of gangs undermines the social values that schools are meant to instill: discipline, respect, cooperation, and hard work. It distorts peer relationships and shifts students' focus away from learning to survival and conformity to gang expectations. Left unaddressed, this trend not only jeopardizes the educational development of individuals but also poses a long-term threat to societal stability and national development.

Over time, and in recent years, gangsterism among secondary school students in Rivers State, Nigeria, has become a disturbing trend, and deeper societal issues that secondary schools need to reclaim to retain their role as safe havens for learning and personal development. Secondary schools, once considered safe havens for learning and character development, are increasingly becoming hotspots for violence, cultism, and criminal activities (Abaa, 2022). Gangsterism undermines the purpose of education by promoting fear, insecurity, and academic decline among students and staff. As Rivers State continues to grapple with broader security challenges, addressing gangsterism at the secondary school level becomes critical for attaining an enduring peace, tolerance, safety, and respect that would culminate to the corresponding attainment of the goal of sustainable educational and societal development.

The acts of gangsterism in the form of bullying, extortion, substance abuse, armed violence, and cultism have been found to exist in senior secondary schools across urban and rural areas of Rivers State. This makes, such a pressing social issue that has crept into the educational sector to threaten the safety, moral integrity, and academic focus of students. For instance, the rise in student involvement in cult-like groups, violent behaviours, bullying, drug abuse, and organized peer intimidation in some senior secondary schools in Ahoada, Eleme, Abua/Odual, Emohua, Khana, Okrika, and Degema Local Government Areas of Rivers State. Thus, the prevalence of gangsterism has become a source of concern for parents, educators, and policymakers alike. Against this backdrop, gangsterism among students in senior secondary schools has become a growing concern for educators, parents, and society at large. Once considered a problem confined to urban slums or external social environments, it has gradually found its way into the walls of educational institutions, threatening education's very purpose, the nurturing of knowledge, discipline, and character.

From the foregoing, gangsterism among secondary school students is and remained a social scourge and menace that has also become an increasingly challenging or troubling phenomenon with serious implications for effective teaching and learning in virtually every education level. In light of these challenges, this study seeks to explore the roots, manifestations, and consequences of gangsterism among secondary school students in Rivers State. It also aims to highlight the sociological and educational implications of the phenomenon and propose actionable strategies for promoting a safer and more conducive learning environment. In this light, understanding the dynamics of student gangsterism is crucial to restoring discipline, enhancing academic performance, and safeguarding the future of education in the region. Thus, this understanding would help in the integrating multifaceted approach, including community engagement, educational reforms, and targeted interventions to provide youth with alternative pathways and support systems against their indulgence in gangsterism in any society at any given time. This is the crux of the study.

Statement of the Problem

Gangsterism among students in secondary schools in Rivers State, Nigeria, has emerged as a critical concern, with significant implications for both the educational environment and students' overall development. In recent years, reports from educators and security personnel have highlighted an alarming rise in the prevalence of gang-related activities could accentuate violence, bullying, extortion, and substance abuse that disrupts the academic environment in secondary schools. This situation is further compounded by a lack of adequate support systems

for students at risk of gang involvement, such as counseling services, extracurricular programmes, and community engagement initiatives

The root causes of gangsterism among students are multifaceted and include factors such as peer pressure, lack of parental involvement, economic hardship, and the influence of violent media and societal role models. Also, the problem of gangsterism among students has the tendency to undermine the attainment of school safety, as a template for academic success, proper administration, and cordiality in senior secondary schools in Rivers State. Thus, the continuous perpetuation of the cycle of violence, arson and criminal behaviours from gang-related acts would have long-term consequences or implications for students effective learning, schooling success, professionalism, community development and societal stability. It is based on this premise that this study will attempt to examine the implications of gangsterism among students on effective learning in secondary schools in Rivers State.

Aim and Objectives of the Study

The aim of the study was to examine the implications of gangsterism on effective learning among students in secondary schools in Rivers State, Nigeria. The specific objectives are to:

- To identify the factors contributing to gangsterism among secondary school students in Rivers State.
- To assess the impact of gangsterism on the academic performance of secondary school students in Rivers State.
- To evaluate the implications of gangsterism on the overall school environment, including student discipline and school safety.
- To explore the role of school management, parents, and the community in curbing gangsterism among students.

Research Questions

The following research questions guided the study:

- What are the factors contributing to gangsterism among secondary school students in Rivers State?
- What is the impact of gangsterism on the academic performance of secondary school students in Rivers State?
- What are the implications of gangsterism on the overall school environment, including student discipline and school safety?
- What are the roles of school management, parents, and the community in curbing gangsterism among students?

Significance of the Study

This study on gangsterism among secondary school students in Rivers State is significant for several reasons. It highlights a growing social problem that threatens the core purpose of education effective learning. By exploring the prevalence, causes, and impacts of gangsterism,

the study offers insight into how it disrupts the academic environment, weakens school authority, and hampers students' intellectual and moral development.

The findings would benefit school administrators and teachers by providing knowledge on how gangsterism manifests and affects discipline, safety, and learning. This can guide the development of targeted disciplinary measures, student engagement strategies, and security initiatives within schools.

For policymakers and education authorities, the study supports informed decision-making on school reforms, youth-focused interventions, and collaboration with community and security agencies. It emphasizes the importance of addressing root causes such as poverty, peer pressure, and family instability.

The study was also relevant to parents, highlighting their role in guiding and monitoring their children. Additionally, it contributes to academic discourse by addressing a relatively under-researched issue in the Nigerian context, particularly in Rivers State. Ultimately, the study affirms that combating gangsterism is vital to ensure a safe and positive learning environment.

LITERATURE REVIEW

Gangsterism

Gangsterism refers to the activities, behaviours, and influence of organized criminal groups, commonly known as gangs, who often operate outside the law and use violence, intimidation, or coercion to achieve their goals. In the context of youth and education, gangsterism typically involves the formation of youth gangs within or around schools, engaging in acts such as bullying, extortion, substance abuse, and violent confrontations (Jumbo et al., 2023) According to Abrahams and Louw (2020), gangsterism is "a pattern of criminal behaviour and activities characterized by group identity, territorial control, and the use of violence to assert dominance or achieve objectives." It is often driven by factors such as poverty, lack of parental supervision, peer pressure, and the need for social belonging.

Gangsterism describes the actions, behaviours, and influence of organized criminal groups, commonly called gangs, that frequently operate outside legal boundaries and rely on violence, intimidation, or coercion to accomplish their objectives (Ajayi & Afolabi, 2020). Equally, within the context of youth and education, it often involves the emergence of youth gangs in or near schools, participating in activities such as bullying, extortion, drug abuse, and violent encounters (Jumbo, Emeodu & Chukwu, 2023).

Gangsterism, in this context, refers to organized violent behaviours by groups of students that involve bullying, cult-related activities, extortion, fighting, intimidation of peers and teachers, and even criminal acts within and around school premises (Adebayo & Amosun, 2022). This rise in violent and disruptive student behaviour undermines the fundamental purpose of education, which is the transmission of knowledge, skills, and values necessary for personal and societal development. In this light, addressing gangsterism would require a multifaceted approach, community engagement, educational reforms and targeted mediations to provide youth with alternative pathways and support systems (Umesi & Ikechukwu, 2023).

Gang-related activities include violence, bullying, extortion, and substance abuse. These activities has the tendency to disrupt the academic environment, negatively impacting the quality of learning and the safety of students and staff members alike in secondary schools (Akinsola & Ajayi, 2021). In schools, gangsterism disrupts learning environments, threatens safety, and

undermines both academic achievement and psychological well-being (Mncube & Madikizela-Madiya, 2019). The root causes of gangsterism among students are multifaceted and include factors such as peer pressure, lack of parental involvement, economic hardship, and the influence of violent media and societal role models. In a study by Akinsola and Ajayi (2021), it was found that peer influence played a central role in the initiation and perpetuation of gang activities, with many students joining gangs as a means of social belonging or protection. Additionally, the erosion of traditional values and the weakening of the family unit have left many students vulnerable to negative influences outside the school setting.

Causes of Gangsterism among Students

Umesi and Ikechukwu (2023) reiterated that inadequate monitoring, lack of counseling services, and overburdened teachers make it difficult to identify and address these problems early. Accordingly, the situation is further worsened in areas where poverty, unemployment, and crime are already prevalent in the community.

Abah and Eze (2022) stated that the lack of strict enforcement of anti-cultism laws within educational institutions emboldens gang activities that could disrupt seamless conduct of schooling processes such as teaching, learning, assessment, etc. Socioeconomic challenges, including poverty and unemployment, have been identified as significant drivers. The lack of basic needs, such as food and shelter, coupled with peer influence and negative teacher-student relationships, create an environment conducive to the growth of cultism and related activities (Jumbo et al., 2023).

The absence of effective disciplinary measures and moral guidance within schools exacerbates the problem. Umesi and Ikechukwu (2023) observed that indiscipline among students is often linked to the lack of corporal punishment, diminished emphasis on religious and moral education, and inadequate teacher remuneration. These factors collectively undermine the authority of educators and the implementation of discipline, allowing deviant behaviours to flourish.

Poor parental upbringing, broken homes, and poverty contribute significantly to youths seeking belonging and protection in gang affiliations (Umesi & Ikechukwu, 2023). Peer pressure, unemployment prospects, the allure of material wealth, and societal glorification of violence exacerbate the issue (YEAC-Nigeria, 2023). In their study on youth violence in Nigerian schools, Abah and Eze (2022) observed that inadequate guidance and counseling services leave many students vulnerable to deviant influences could have implications for effective learning, especially in secondary schools.

The infiltration of cult-related activities into secondary schools has been particularly alarming. Jumbo, Emeodu, and Chukwu (2021) highlight the proliferation of cultism in Rivers State's secondary schools, noting its severe negative implications on educational development. These activities have rendered schools unsafe, leading to disruptions in academic activities and instilling fear among students and educators alike. Incidents of violence, intimidation, and even fatalities have been reported, with some schools experiencing closures due to cult-related disturbances.

Further compounding the issue, the Youths and Environmental Advocacy Centre (YEAC-Nigeria) has identified a surge in organized crimes among students, including drug abuse, examination malpractice, and violent extremism. In a sensitization campaign conducted in Oyigbo Local Government Area, YEAC-Nigeria emphasized the role of societal failures, such as

poor parenting, a corrupt educational system, and undue emphasis on academic results over knowledge acquisition, in fostering these vices (YEAC-Nigeria, 2023). Other causes of gangsterism among secondary school students include:

- Broken Homes and Parental Neglect: Lack of parental supervision and emotional support predisposes students to deviant peer groups.
- Peer Pressure: Adolescents seek acceptance and may join gangs to gain social recognition.
- Poor School Management: Schools with weak disciplinary systems and ineffective leadership experience higher rates of gangsterism.
- Economic Challenges: Poverty pushes students to gangs that promise material benefits.
- Weak Law Enforcement: Inconsistent enforcement of laws against cultism in schools has emboldened gangs.

Despite various efforts by educational authorities and school administrators to address these issues, gangsterism continues to be a pervasive challenge. Several studies have shown that secondary school students involved in gangs exhibit higher rates of absenteeism, poor academic performance, and behavioural problems, leading to a decline in the overall educational standards within these schools (Ajayi & Afolabi, 2020). This situation is further compounded by a lack of adequate support systems for students at risk of gang involvement, such as counseling services, extracurricular programmes, and community engagement initiatives (Okeke & Ugochukwu, 2020; Obilor & Ikechukwu, 2021; Jumbo et al., 2023). Given these realities, addressing gangsterism in Rivers State secondary schools requires a multi-stakeholder approach involving administrators, teachers, parents, community leaders, and law enforcement. Effective strategies include stronger discipline policies, student counseling, mentorship programmes, community awareness campaigns, and safe reporting channels for school violence victims. Incorporating values education and life skills training into the school curriculum, as recommended by Adeyemi and Bello (2021), would also help in promoting positive behavioural change among students.

THEORETICAL FRAMEWORK

Social Learning Theory (SLT)

The Social Learning Theory (SLT), proposed by Albert Bandura (1977), suggests that behaviour is learned through interactions with the environment, particularly through observation, imitation, and modeling. In the context of gangsterism among students, Social Learning Theory explains how students may engage in deviant behaviours such as gang involvement due to the influence of their peers, family members, or role models who reinforce these behaviours. Bandura's (1977) framework emphasizes that children and adolescents are particularly susceptible to learning behaviors through observation, particularly when they witness positive reinforcement for such behaviours. In the case of gangsterism, students may observe older peers, family members, or influential figures in their communities who engage in criminal activities and may replicate these behaviours, believing that they too will gain rewards such as respect, power, or financial benefits.

In secondary schools, the influence of peer groups and school environments can facilitate the spread of gang-related behaviours. According to Akinsola and Ajayi (2021), peer pressure in

school environments is a significant contributor to the formation of gangs among adolescents. Students may form or join gangs as a way of gaining social acceptance, protection, or status within their school community. Furthermore, the lack of adequate supervision and support systems in schools, as observed by Okeke and Ugochukwu (2020), can exacerbate this situation by enabling gang behaviours to flourish.

The implications of gangsterism for effective learning are profound. According to Ajayi and Afolabi (2020), when students become involved in gangs, it can severely disrupt their educational progress. Gang-related activities such as bullying, extortion, and substance abuse can create a hostile and unsafe environment, which hinders concentration, reduces school attendance, and promotes a culture of fear and violence. Moreover, gang involvement often leads to school dropouts, further hindering the educational outcomes for these students (Akinsola & Ajayi, 2021). Thus, the Social Learning Theory (SLT) can be a valuable tool for understanding the processes by which gangsterism develops among secondary school students in Rivers State. By focusing on how students learn these behaviours through social interaction, the study can provide insights into how to create environments that discourage gang formation and promote positive learning outcomes.

METHODOLOGY

This study adopted a qualitative approach, which intends to utilize recent scholarly literature reviews, observational reports, and expert interviews with teachers, principals, and security personnel in selected secondary schools across Rivers State. Also, the population of the study comprised studies that examined violence, bullying, arson, cultism, among other forms of gang-related activities among the 73, 164 students in all the 287 senior secondary schools in Rivers State, Nigeria (Rivers State Senior Secondary Schools Board, 2023).

The data for this study was collected using secondary data source from text books, journals, newspaper publications, constitutional provisions, and other articles. In order achieve the objectives stated in this study, these data sources was reviewed to unravel the related variables that were discussed in this study.

The data collected was analyzed using trend and content analysis. Content analysis is a research technique that is used to make replicable and valid inferences by interpreting and coding textual materials. Content analysis is a method used to analyze qualitative data (non-numeric data). In its most common form, it is a technique that allows the researcher to take qualitative data and transform it into quantitative data (numeric data). It is important to state that when using content analysis, the aim was to build a model to describe the phenomenon in a contextual form (Nwankwo, 2016). Thus, the use of content analysis in this study is justified because the source of data used for the study is non-numerical data mainly comprising of information from scholars and scholarly articles on the implications of gangsterism among students on effective learning in secondary schools in Rivers State, Nigeria. Thus, such qualitative data can easily and possibly be analyzed using content analysis for this study.

RESULTS

Factors Contributing to Gangsterism in Secondary Schools in Rivers State

Several factors have been identified as contributing to the prevalence of gangsterism in schools. Family dysfunction, poor parental supervision, exposure to violence in the community, peer pressure, and the lack of effective disciplinary structures in secondary schools are major enablers of gangsterism in Rivers State schools (Okon & Udofia, 2023). In Rivers State, where issues of urbanization, unemployment, and political instability are pronounced, young people are particularly vulnerable to recruitment into violent groups as a way to assert power, gain social recognition, or seek protection (Jumbo et al., 2023).

Obilor and Ikechukwu (2021) found that violence in secondary schools adversely affects students' academic performance, leading to decreased concentration, absenteeism, and a general decline in educational outcomes, especially in Rivers State. Furthermore, the presence of gangs instills fear among students and teachers, disrupting the learning process and compromising the integrity of educational institutions, especially secondary schools. Jumbo et al. (2023) highlight that factors such as drug abuse, peer pressure, lack of basic needs, and negative influences from teachers contribute to the proliferation of cultism among students. These elements foster an environment where students are susceptible to joining gangs, seeking a sense of belonging and protection.

Impact Gangsterism on the Academic Performance of Secondary School Students in Rivers State

The impact of gangsterism in schools are far-reaching. Victims of gang violence often suffer from trauma, low self-esteem, and poor academic performance. Some drop out of school entirely, while others retaliate and become perpetrators themselves. Teachers, too, may feel unsafe, unmotivated, or powerless to intervene, leading to a general breakdown in the school’s structure and academic integrity. The implications of gangsterism are profound (Okon & Udofia, 2023). Additionally, the problem of gangsterism in secondary schools presents a complex challenge for educational policymakers and school administrators. It not only undermines the academic success of affected students but also perpetuates a cycle of violence and criminal behaviour, which has long-term consequences for community development and societal stability (Ajayi & Afolabi, 2020). Thus, understanding the dynamics of gangsterism among students in Rivers State and its implications for effective learning is essential for developing targeted interventions that can mitigate the adverse effects of this issue (Jumbo et al., 2023). Implicitly, gangsterism, encompassing cultism, organized crime, and related social vices, has become an escalating concern within secondary schools in Rivers State, Nigeria. This phenomenon undermines the educational environment, leading to disruptions in academic activities and posing significant threats to students' safety and well-being. Research indicates that cultism has permeated secondary schools in Rivers State, transforming educational institutions into arenas of violence and fear.

Implications of Gangsterism for Effective Learning in Secondary schools in Rivers State

The implications of gangsterism for effective learning are profound, and they include:

- Generates an intense climate of fear and insecurity in secondary schools: Gangsterism generates a climate of fear and insecurity in schools. Students who are victims or witnesses of violence often experience trauma, leading to absenteeism, declining academic performance, and, in some cases, complete withdrawal from school (Chukwuma & Okechukwu, 2022). Thus, the continuity of this scenario, can lead to high dropout rates that has the tendency to affect students educational development.
- Increases teachers' insecurity and reluctance to enforce discipline: Students' involvement in gangsterism could manifest in teachers' apprehension from insecurity or unsafe issues accentuated by students' indulgence in cultism, bullying, arson, and hooliganism, among other forms of gangsterism. This implies that students' indulgence in gangsterism could also make teachers face threats to their safety, leading to their reluctance to enforce discipline or carry out instructional activities effectively. As noted by Eze and Nwankwo (2022), learning environments that are perceived as unsafe diminish students' cognitive engagement and motivation to learn.
- Leads to less study time that increases poor academic performance: Additionally, the involvement of students in gangster activities often means that they devote less time and energy to academic pursuits, further entrenching cycles of academic failure and social delinquency (Ibe & Nwachukwu, 2023).
- Creates intense psychological burdens: The psychological burdens accentuated by students' involvement or indulgence in gangsterism could interfere with cognitive processes such as attention, memory, and critical thinking, which are essential for successful learning outcomes. Implicitly, this scenario can cause psychological trauma for students and staff, especially in secondary schools in Rivers State.
- Erodes Discipline in secondary schools: The erosion of discipline in secondary schools creates chaotic classrooms, reducing the quality of teaching and the focus required for effective learning (Ibe & Nwachukwu, 2023). Accordingly, this also leads to the erosion of moral and civic values.
- Disrupt the seamless conduct of school activities: Gangsterism disrupts school activities and undermines the authority of school management. In schools where gang influence is strong, teachers' authority is often challenged, making the enforcement of school rules and policies difficult.
- Increases emotional issues like depression, anxiety, etc., among students: The socio-emotional impact of gangsterism cannot be overlooked. Students who engage in or are affected by gangsterism often suffer from low self-esteem, anxiety, depression, and a sense of hopelessness about their future prospects (Obi & Alade, 2023).

CONCLUSION

Gangsterism in Rivers State secondary schools poses a serious social and educational challenge, fostering violence, cultism, and intimidation, which disrupt learning, lower student concentration, and increase fear among stakeholders. Gangsterism among students in Rivers State secondary schools is thus, a pressing concern that threatens educational and societal

progress. Consequently, by employing multi-dimensional strategies involving parents, schools, communities, and governments, it is possible to curb the menace. In this light, the following suggestions were proffered to reclaim school as safe spaces for learning, growth, emotional advancement, and moral development:

- Secondary school administrators should strengthen their guidance and counseling units and collaborate with parents, community leaders, and law enforcement to create awareness and enforce preventive measures that would dissuade students from indulging in bullying, arson, cultism among other forms of gangsterism.
- Students must be taught values such as empathy, respect, and conflict resolution from an early age. Educational policies should also emphasize character development and civic education alongside academic achievement.
- The Rivers State Government should domesticate the "Safe Schools Initiative" (SSI) by implementing comprehensive school safety programmes, strengthening school-community relationships, and providing ongoing professional development for teachers, which are very essential steps in mitigating the impact of gangsterism on education.
- The print, mass, electronic, and even social media should streamline the airing, publication or popularizing violent contents and lifestyles such as looting, bullying, arson, etc. that can desensitize youth to aggression, which can imply the media potentially promoting and normalizing gang-related behaviours among secondary school students.

EDUCATIONAL POLICY IMPLEMENTATION BARRIERS IN RURAL SCHOOLS: THE WAY FORWARD

Judith Anaye AFONYAA-HARRY
Department of Educational Management
Faculty of Education
Ignatius Ajuru University of Education, Nigeria
anagarsh2001@yahoo.com

ABSTRACT

The paper assessed the educational policy implementation barriers in rural schools: the way forward. The educational policies aimed to promote equitable learning opportunities across all regions, yet rural schools continue to face persistent challenges during implementation. This paper ascertained the major barriers that hinder the effective application of educational policies in rural contexts. These include inadequate infrastructure, shortage of trained teachers, limited financial resources, and weak administrative capacity. Moreover, the top-down nature of many policies often results in a disconnect between national frameworks and local realities. Additionally, cultural and linguistic factors are frequently overlooked, reducing policy relevance and effectiveness in rural areas. The paper also highlighted the absence of reliable monitoring systems and insufficient community involvement as further constraints on implementation. In response, the paper outlined practical suggestions for key stakeholders, including government agencies, school administrators, teachers, community leaders, and development partners. Emphasis is placed on context-based planning, increased funding, teacher support, and inclusive decision-making. The paper concluded by advocating for localized, sustainable strategies that are grounded in the lived experiences of rural communities. Addressing these barriers through collaborative and targeted actions remains essential to achieving effective educational policy implementation in rural schools. Amongst others the paper suggested that Government Agencies should ensure that policies are flexible enough to reflect the realities of rural education. Moreover, budget allocations should prioritize rural schools to address infrastructure gaps, teacher shortages, and learning material deficits

Keywords: Educational policy, rural schools, policy implementation, teacher shortage, infrastructure.

INTRODUCTION

Educational policies are often designed to provide equitable learning opportunities across diverse regions; however, their implementation in rural schools remains a major concern in many countries. Although policies may be formulated with the intent to bridge educational gaps, rural communities frequently encounter barriers that hinder the translation of policy into practice. These barriers are not simply the result of weak enforcement but are often rooted in the physical,

administrative, financial, and human resource challenges prevalent in rural environments. In many cases, rural schools lack the essential infrastructure such as safe buildings, electricity, and access roads, all of which limit the operational capacity of school systems and directly affect how policies are implemented (UNESCO, 2021).

Moreover, the shortage of qualified teachers in rural areas is a continuing barrier to effective policy execution. Many teachers are unwilling to relocate to remote communities due to poor living conditions, lack of career progression opportunities, and limited social amenities. This results in high attrition rates, especially where educational reforms require specialized training or continuous professional development. In addition, local governments often face difficulties attracting and retaining experienced educators, making it challenging to sustain any meaningful policy changes (Akyeampong, 2017). Furthermore, insufficient financial investment remains a major constraint. Rural schools frequently operate under underfunded budgets, limiting their ability to acquire materials, implement innovations, or meet targets laid out in educational reforms.

Additionally, rural communities may hold cultural beliefs or practices that conflict with formal education policies, especially when such policies are not adapted to local realities. In some regions, language of instruction policies are introduced without consideration for the linguistic background of learners, leading to poor comprehension and disengagement. Policy makers sometimes adopt a top-down approach that neglects the specific needs of rural schools, thus creating a disconnect between policy objectives and actual classroom realities (Chikoko, 2018). Although national frameworks emphasize inclusive education, the mechanisms to monitor rural schools are often weak or inconsistently applied, which leads to limited accountability.

Furthermore, lack of reliable data from rural contexts results in the design of policies that do not reflect the on-ground challenges. Without accurate information, the implementation process lacks direction and responsiveness. Despite these barriers, rural schools remain central to national development goals, making it essential to explore practical ways forward. Efforts to overcome these challenges must be rooted in a clear understanding of rural realities, stronger support systems, and localized strategies that prioritize sustainability and relevance (Spreen & Vally, 2010).

THEORETICAL UNDERPIN

Bottom-Up Theory

Bottom-Up Theory, developed by Michael Lipsky in 1980 and later cited in the work of Beryl Radin (2020), offers a grounded and practical lens through which the process of policy implementation can be understood, particularly in settings where structural, social, and institutional limitations are prominent. Lipsky's Bottom-Up Theory challenges traditional assumptions that policies are simply executed as designed by higher authorities; instead, it asserts that the real shaping of policy occurs at the point of interaction between public service providers and citizens. In this framework, Lipsky introduces the concept of "street-level bureaucrats" a term used to describe frontline public workers such as teachers, social workers, police officers, and other implementers who are responsible for carrying out policies in real-life contexts. These individuals, according to Lipsky, are not passive followers of top-down instructions but rather active interpreters and negotiators of policy content, influenced by practical constraints, resource limitations, and the specific needs of the communities they serve.

Radin (2020) reinforces this position by emphasizing how the decisions and coping mechanisms of street-level workers often shape the actual outcomes of policies more than the formal policy documents themselves.

The relevance of this theory to the study of educational policy implementation in rural schools lies in its attention to the lived realities and discretion of those tasked with making policies work in contexts marked by persistent shortages and local diversity. Rural schoolteachers and headmasters, for example, often operate with limited access to materials, inconsistent administrative support, and minimal infrastructure. In such circumstances, they are compelled to adapt policies to fit their environments, balancing national expectations with local capacities. Bottom-Up Theory explains how these adaptations are not necessarily failures but essential responses to contextual demands. Teachers in rural schools may interpret curriculum reforms, teacher training directives, or language policies in ways that reflect local linguistic norms, cultural values, or logistical barriers such as classroom size and time constraints. Rather than resisting policy, they may be re-shaping it to ensure that it remains usable and relevant to their students. This discretion, while sometimes seen as non-compliance from a top-down perspective, is framed by Lipsky as a central function of policy implementation itself.

Furthermore, Bottom-Up Theory provides a valuable tool for analyzing why many well-intentioned education policies do not yield the desired impact in rural communities. It shifts the focus from blaming frontline workers to understanding how the broader system either enables or restricts meaningful engagement with policy. Applying this theory to the study allows for a more realistic understanding of implementation gaps by foregrounding the voices and decisions of rural educators as key policy actors. It also highlights the need for policy designs that allow flexibility and responsiveness, acknowledging that uniform solutions may not suit every school context. Ultimately, the Bottom-Up approach encourages inclusive policymaking that listens to and learns from those on the ground, making it particularly suited to rural education studies where adaptation and improvisation are often the rule rather than the exception.

CONCEPTUAL ELUCIDATION

Concept of Policy

Policy is broadly understood as a deliberate system of principles that guide decisions and achieve rational outcomes. It functions as a framework for action, offering direction and boundaries within which institutions or individuals operate. Moreover, policy is often formulated in response to identified problems, serving as a tool to resolve public or organizational challenges through structured decision-making. In the public domain, policy is not simply a written document but a course of action or inaction chosen by political or organizational actors to address an issue of societal importance (Dye, 2017). Furthermore, policy can be viewed as a dynamic and continuous process involving formulation, adoption, implementation, and evaluation. Each of these stages is influenced by a range of factors including political interests, stakeholder involvement, and resource availability.

In addition, policy is shaped through formal and informal interactions among various actors, including government officials, interest groups, professionals, and citizens. According to Anderson (2015), policies are shaped within institutional frameworks and reflect the values, priorities, and goals of those in authority. This highlights the fact that policy is not value-neutral; it reflects the dominant ideologies and power structures of a society. Moreover, policies often

emerge from negotiations and compromises among competing interests, making them instruments of both governance and contestation.

Public policy can exist in different forms such as laws, regulations, guidelines, and programs. Each form serves a specific purpose and has varying levels of enforceability. For instance, laws and regulations are legally binding, while strategies and plans may provide direction without legal consequences. Additionally, policies may be written or unwritten, formal or informal, yet they all serve to shape organizational behavior and resource allocation. Cochran and Malone (2014) argue that a well-formulated policy must clearly define its objectives, target population, implementing mechanisms, and expected outcomes.

In real-world contexts, the effectiveness of a policy depends not only on its design but also on how well it is implemented and received. This means policies must be context-sensitive, inclusive, and flexible enough to accommodate local variations without compromising core objectives. Furthermore, a good policy must include feedback mechanisms to enable learning and adaptation over time. In conclusion, policy as a concept is fundamental to governance and institutional planning. It serves as a roadmap that aligns actions with goals and provides a structure for addressing collective challenges in a systematic and measurable way.

Educational Policy

Educational policy refers to the principles and rules that guide the operation, management, and development of education systems. It is concerned with decisions made by governments and educational authorities on matters such as curriculum, teacher training, funding, school structure, assessment, and access to education. Furthermore, educational policy provides a roadmap for achieving national goals related to literacy, equity, inclusion, and economic development through education. According to Levin (2011), educational policy serves both normative and administrative functions, defining what should be taught, how schools should be organized, and what values education systems should promote.

Moreover, educational policy is shaped by a range of factors including political ideologies, economic priorities, social demands, and international frameworks. In addition, policy decisions in education are influenced by data on student outcomes, labor market trends, and societal expectations. Ball (2012) points out that educational policy is often the product of a complex process involving multiple stakeholders, including policymakers, educators, unions, parents, and international donors. These actors influence policy content, design, and implementation, each bringing their own interests and perspectives.

Educational policies can be categorized into several areas such as access and equity, quality and standards, governance and accountability, and resource allocation. In developing countries, educational policy often focuses on expanding access to basic education, reducing disparities among rural and urban populations, and improving teaching quality. Additionally, the role of educational policy extends beyond instruction and learning to include the regulation of teacher recruitment, infrastructure development, and student welfare services. According to Haddad and Demsky (2015), the design and implementation of educational policy must be systematic, evidence-based, and responsive to changing needs.

Furthermore, educational policy serves as a tool for social transformation and national development. Governments use policy instruments to reduce inequality, promote social inclusion, and build human capital. For example, universal primary education policies are designed to eliminate barriers to schooling and ensure that every child receives a minimum level

of education. In addition, policies addressing gender parity, special needs education, and language of instruction are essential for fostering inclusive education systems. However, policy effectiveness depends on proper implementation, monitoring, and periodic evaluation.

Educational policy plays a central role in shaping the direction and quality of education systems. It provides a formal mechanism for articulating national goals, mobilizing resources, and holding institutions accountable for results. Furthermore, effective educational policy must be context-sensitive, stakeholder-driven, and adaptable to both local and global educational challenges.

Educational Policy Implementation

Educational policy implementation refers to the practical processes through which education-related laws, regulations, and guidelines are put into operation in schools and learning systems. It moves beyond the formulation of policy documents to involve interpretation, adaptation, and execution by various actors such as education officers, school leaders, teachers, and local communities. Although the design of policy often occurs at national or sub-national levels, its actualization happens within specific institutional, cultural, and socio-economic contexts. The success of any educational reform thus depends largely on how effectively it is implemented, especially in diverse settings such as rural communities.

Furthermore, policy implementation is not a linear or mechanical process. It involves translating broad goals into actionable steps within schools and classrooms, requiring cooperation among multiple levels of government and frontline practitioners. Challenges often emerge during this stage due to mismatches between policy expectations and ground realities. For instance, policies that require inclusive education or ICT integration may falter if schools lack trained teachers, digital infrastructure, or necessary teaching materials. Lipsky (2020) asserted in his theory of street-level bureaucracy, frontline workers like teachers interpret and sometimes modify policies in response to the limitations and pressures they face. Their discretionary choices shaped by training, workload, local norms, and available resources have a major influence on the outcomes of policy implementation.

Moreover, the quality of implementation is influenced by clarity, resources, capacity, and political support. When policy directives are vague or overly ambitious without corresponding resource commitments, implementers are left to navigate ambiguities. Lack of funding, inadequate teacher deployment, and weak monitoring mechanisms are common obstacles in low-resource settings. In rural schools, such gaps are exacerbated due to remoteness, infrastructural challenges, and limited administrative oversight. According to O'Toole (2000), successful implementation requires more than compliance; it demands a well-structured support system that enables schools to make context-sensitive decisions while staying aligned with policy goals.

Additionally, implementation involves ongoing engagement rather than a one-time event. It requires feedback loops to assess whether objectives are being met and to make timely adjustments. Monitoring and evaluation are essential components that ensure policies are not only delivered but adapted in ways that maintain fidelity to their intent. In this regard, participatory implementation involving school communities, local authorities, and teachers enhances ownership and sustainability. When stakeholders understand, internalize, and commit to the goals of a policy, its execution becomes more responsive and impactful (Spillane eta al., 2022).

Educational policy implementation is a dynamic, context-driven process that hinges on the readiness of institutions, the capacities of educators, and the inclusiveness of planning. Without deliberate strategies to address practical barriers, even the most progressive policies may struggle to bring about meaningful change in educational outcomes.

Overview of Educational Policy Goals in Rural Areas

Educational policy goals in rural areas are designed to address systemic disparities and promote equitable access to quality education for underserved populations. Rural education policy frameworks are often centered on expanding educational opportunities, ensuring inclusive participation, improving infrastructure, and raising learning outcomes. Furthermore, these goals aim to eliminate the persistent educational gap between rural and urban learners, which is often shaped by differences in resource availability, teacher distribution, school accessibility, and socio-economic conditions. According to UNESCO (2021), one of the primary goals in rural educational policy is to ensure that all children, regardless of geographic location, have access to free and compulsory basic education. In many developing countries, rural communities face unique challenges such as long distances to school, lack of trained teachers, poor learning environments, and cultural barriers, all of which necessitate specialized policy interventions.

Moreover, educational policy in rural settings focuses on achieving equity by removing barriers that hinder marginalized groups such as girls, children with disabilities, and those from minority backgrounds. Governments and educational planners adopt policies that prioritize gender-sensitive teaching, provision of learning materials in local languages, and infrastructural development to meet these goals. According to Lewin (2017), rural educational policy goals include improving the recruitment and retention of qualified teachers by offering incentives such as housing, rural allowances, and professional development opportunities. This is based on evidence that teacher shortages are more pronounced in rural areas due to harsh living conditions and limited career prospects. In addition, rural policy goals often incorporate the use of community-based strategies and local governance structures, recognizing the need to involve families, local leaders, and non-governmental organizations in improving school accountability and participation.

Educational policy goals in rural regions also emphasize curriculum relevance and cultural appropriateness. Policies are increasingly designed to reflect the linguistic and cultural realities of rural learners, with the aim of making education more meaningful and engaging. According to Aikman and Unterhalter (2015), integrating local knowledge and practical life skills into the curriculum is essential for fostering learner retention and community support. Furthermore, rural policy frameworks aim to close digital divides by promoting access to technology and connectivity. In contemporary policy planning, digital inclusion is now a recognized goal to support distance learning and bridge the knowledge gap created by isolation. Additionally, improving school infrastructure such as classrooms, water facilities, and sanitation forms a critical goal of rural educational policy. Poor physical conditions of schools are known to negatively affect student motivation and learning outcomes, making infrastructure investment a top priority in many rural education strategies.

Another goal embedded in rural education policy is the development of flexible and alternative learning systems. These are targeted at children who cannot attend formal schools due to work obligations, migration, or family responsibilities. Non-formal education programs, mobile schools, and literacy campaigns are policy responses that aim to bring learning

opportunities closer to children in remote areas. According to the World Bank (2018), aligning educational policy with local needs and realities is key to achieving Sustainable Development Goal 4, which seeks to ensure inclusive and equitable quality education for all. In conclusion, educational policy goals in rural areas are multifaceted in approach yet unified in purpose to guarantee that every child, regardless of location or background, has the opportunity to benefit from a quality education that is accessible, inclusive, and responsive to their environment.

VARIOUS BARRIERS IN EDUCATIONAL POLICY IMPLEMENTATION IN RURAL SCHOOLS

Structural and Infrastructural Barriers

Structural and infrastructural barriers present major obstacles to effective implementation of educational policy in rural settings. Rural schools often operate under conditions that lack adequate physical facilities, including poorly constructed classrooms, broken furniture, and inadequate ventilation. These deficiencies create an environment that discourages learning and affects both teacher and student motivation. Many rural schools function without access to basic amenities such as electricity, clean water, and toilets, further deteriorating the quality of educational experience. According to Adefeso-Olateju (2013), the absence of these essentials severely hampers concentration and attendance, particularly among female students who face additional privacy and safety concerns. Moreover, schools in rural communities are frequently located in remote, hard-to-reach areas where road networks are poor or non-existent. This limits student attendance and the regular supervision of educational activities by local authorities, resulting in low policy monitoring and accountability.

In addition, infrastructural barriers are deeply connected to how resources are distributed within national education systems. Centralized systems often allocate funds based on political interests or population density, leaving sparsely populated rural regions underfunded and neglected. According to Amutabi (2013), such disparities result in policies being formulated at national levels with minimal consideration for rural-specific challenges. This disconnect makes many education reforms ineffective when implemented in non-urban contexts. Rural schools are also often left out of digital innovation efforts. While urban institutions benefit from technology integration policies, rural schools remain excluded due to lack of internet access and digital equipment. According to Tichnor-Wagner, Harrison, and Cohen-Vogel (2016), this digital divide not only limits educational access but also widens the achievement gap between urban and rural learners, particularly in contexts requiring remote or technology-assisted learning.

Furthermore, structural challenges include bureaucratic inefficiencies such as delayed budget approvals, corruption in procurement processes, and lack of transparency in school project implementation. These systemic issues weaken the delivery of well-intentioned policies and delay infrastructure development in rural locations. Komba and Nkumbi (2008), rural schools often receive instructional materials and textbooks long after academic sessions begin, undermining the continuity of learning. Additionally, structural problems affect data collection and educational planning, as many rural areas are not adequately represented in official statistics due to logistical limitations. Inaccurate data leads to poor policy targeting, making it difficult to design interventions that reflect ground realities. School maintenance is also neglected, leading to rapid deterioration of facilities and eventual abandonment of buildings that could otherwise serve educational purposes.

Structural and infrastructural barriers are not merely logistical issues but are deeply embedded in how educational systems are organized, financed, and governed. Addressing these barriers requires targeted investments in rural infrastructure, transparent policy execution, and inclusive planning processes that reflect the needs of marginalized communities. Without these changes, educational policies will continue to fall short in rural areas, perpetuating inequality and undermining the goal of universal basic education.

Human Resource Challenges

Human resource challenges are among the most persistent issues obstructing educational policy implementation in rural schools. These challenges include shortages of qualified teachers, low teacher motivation, unequal distribution of staff, and poor professional development support. Rural schools often suffer from severe teacher shortages due to the reluctance of professionals to accept postings in isolated communities. This reluctance is influenced by harsh living conditions, lack of housing, absence of healthcare, and limited access to urban amenities. According to Okurut (2010), teachers assigned to rural schools frequently request transfers shortly after deployment, leading to instability and inconsistency in classroom instruction. Furthermore, rural schools are often staffed with teachers who lack the required certification or training, particularly in specialized subjects such as mathematics and science, which negatively affects policy outcomes related to curriculum improvement.

In addition, teacher absenteeism is more common in rural settings, partly due to difficult transport routes, but also due to low levels of supervision and administrative support. According to Muralidharan et al. (2017), absenteeism correlates strongly with poor policy compliance and weak accountability structures in rural schools. These gaps allow teachers to ignore curriculum implementation schedules, testing policies, and other directives that form the core of educational reforms. Another challenge is the lack of continuous professional development for rural teachers. Unlike their urban counterparts, rural educators have limited access to workshops, training sessions, and exposure to new teaching methodologies. According to Schwille and Dembele (2007), this gap contributes to a disconnect between policy design and classroom practices, as teachers are often unaware of or unprepared to implement new policies introduced by education ministries.

Furthermore, rural areas face unequal staffing distributions, where highly qualified teachers cluster in urban schools while rural schools rely on inexperienced or underqualified personnel. This inequity is exacerbated by ineffective deployment policies and weak enforcement mechanisms. According to Verspoor (2008), failure to design and implement fair teacher deployment strategies undermines rural education systems and weakens overall policy implementation. Additionally, many teachers working in rural areas report low job satisfaction due to salary delays, lack of promotion opportunities, and limited involvement in decision-making processes. These issues erode commitment to policy goals and lead to high turnover rates, further destabilizing rural school environments.

In some regions, language and cultural barriers between teachers and students further complicate policy implementation. Teachers from outside the community may lack familiarity with local customs, languages, and learning styles, making it difficult to foster engagement and comprehension. According to Ukeje (2006), building culturally responsive education systems requires training that goes beyond curriculum and includes socio-cultural sensitivity, which is often lacking in rural teacher preparation. In conclusion, overcoming human resource challenges

requires comprehensive reforms that go beyond recruitment. These include fair deployment, supportive working conditions, ongoing professional development, and incentives that make rural teaching more attractive. Without addressing these foundational issues, educational policies will continue to face resistance and failure in rural contexts.

Financial and Resource Constraints

Financial and resource constraints present one of the most persistent challenges to the effective implementation of educational policy in rural areas. Many rural schools operate on shoestring budgets that barely cover basic operational needs, let alone policy reform or development initiatives. In low-income settings, education budgets are generally stretched thin, and what little is allocated often fails to reach rural schools due to political, administrative, or logistical bottlenecks. According to Ofoegbu (2012), rural schools frequently receive insufficient funding, leading to shortages in textbooks, learning materials, laboratory equipment, and other essential resources necessary for policy goals to be realized. This underfunding directly impacts students' learning experiences and renders many educational policies ineffective in practice.

Moreover, most rural schools are financially dependent on local contributions, which are highly unreliable due to the widespread poverty in rural communities. Parents and guardians in these areas often lack the financial capacity to support school initiatives, pay levies, or contribute to development projects. According to Osei (2006), heavy reliance on community fundraising and voluntary support makes rural schools especially vulnerable to economic shocks and income disparities, which limits their capacity to respond to new policies or directives. For instance, policies that introduce new curricula or require technology integration cannot be realistically implemented in rural schools lacking the necessary infrastructure and financial backing to support such changes.

Additionally, many educational policies are formulated without a realistic assessment of the costs involved in implementation at the grassroots level. Policymakers often assume that once a policy is passed at the national or state level, its execution will follow smoothly. However, without adequate resource planning, such policies remain aspirational. As observed by Lincove (2009), cost underestimation and unrealistic budgeting often lead to abandoned projects and unfulfilled policy promises. Furthermore, bureaucratic inefficiencies and financial mismanagement, including misallocation of funds and corruption, compound the resource gap and prevent even well-intentioned financial allocations from reaching rural classrooms.

The shortage of human resources is also a financial issue. Hiring qualified teachers, training staff, maintaining school infrastructure, and ensuring access to instructional resources require substantial investment. In many rural schools, financial limitations prevent the hiring of additional staff, leaving one teacher to handle multiple grade levels or subjects. This reduces instructional quality and creates environments where new educational policies cannot be properly implemented. According to Oduro (2009), the shortage of support personnel such as guidance counselors, special education staff, and administrators in rural schools stems largely from inadequate funding and poor planning, not simply human capital scarcity.

Without adequate and sustained investment, educational policy implementation in rural areas remains a daunting challenge. Addressing financial and resource constraints requires more than just increasing education budgets; it demands a transparent, decentralized, and need-based funding approach that accounts for the unique financial realities of rural communities. Without

this, rural schools will continue to operate on the margins of the educational system, disconnected from national policy objectives and broader development goals.

Sociocultural and Community-Related Barriers

Sociocultural and community-related barriers are deeply embedded challenges that shape how educational policies are received and implemented in rural areas. Cultural beliefs, traditional values, and social norms influence educational attitudes and practices, often determining whether policies succeed or fail at the community level. In many rural regions, long-standing cultural perceptions about the value of formal education can conflict with national education policies. For instance, where child labor or early marriage is culturally normalized, educational policies promoting universal basic education and gender equality face resistance. According to Nudzor (2013), some rural families view schooling as a threat to traditional gender roles or household labor needs, leading to low enrollment or high dropout rates, particularly for girls.

Moreover, community engagement and acceptance play a central role in education delivery. In many cases, rural communities are excluded from policy planning and decision-making processes, resulting in mistrust or apathy toward government-led educational reforms. When policies are introduced without local consultation, they are often seen as imposed or irrelevant, leading to passive resistance or poor participation. According to Boissiere (2014), community involvement in education enhances ownership, accountability, and commitment to policy objectives, but such involvement is frequently absent in rural policy rollouts. In the absence of culturally sensitive approaches, even well-funded policies can fail to resonate with rural stakeholders.

Additionally, language barriers present a major obstacle to effective policy implementation. Many rural communities have distinct local languages or dialects, while most official education policies and materials are designed in national or foreign languages. This disconnect hampers comprehension and reduces the relevance of education, especially in early childhood and primary schooling. According to Brock-Utne (2011), language mismatch between home and school environments contributes to high repetition and dropout rates in rural schools and undermines efforts to standardize curriculum delivery. Multilingual education policies often exist on paper but are rarely implemented due to lack of trained personnel and instructional materials in local languages.

Social hierarchies and traditional leadership structures also influence educational practices. Community leaders, elders, and religious figures often hold sway over educational decisions and can either facilitate or hinder policy uptake. Where such leaders are not actively engaged or where their values contradict educational aims such as gender equality or science education implementation efforts may be met with passive resistance. Jansen (2011), overlooking the power dynamics within rural societies leads to disjointed implementation, where policy fails to penetrate actual classroom or household behaviors.

Furthermore, rural communities frequently lack exposure to the benefits of long-term education, particularly where poverty and subsistence living dominate daily life. Short-term economic survival tends to take precedence over long-term educational goals. This reality makes it difficult for communities to prioritize or support policies that require sustained commitment, such as full attendance, curriculum reform, or digital learning adoption. According to Somerset (2017), unless communities perceive tangible value in schooling, policies promoting equity and quality remain abstract ideas disconnected from lived experiences.

Sociocultural and community-related barriers must be understood and addressed within the context of local realities. Policymakers need to engage rural stakeholders actively, respect cultural identities, and design strategies that bridge the gap between national policy intentions and local worldviews. Without this, educational policies may continue to struggle in reaching rural learners meaningfully.

Administrative and Governance Issues

Administrative and governance challenges are central to understanding why educational policies often fail in rural settings. Effective policy implementation depends not only on design but also on competent institutional mechanisms, leadership, and accountability frameworks that ensure translation from paper to practice. However, in many rural contexts, administrative systems are weakened by poor coordination, limited capacity, and bureaucratic inefficiencies that hinder educational progress. According to Bray and Varghese (2011), the decentralization of educational governance in many developing nations was intended to enhance local control and responsiveness, but in rural areas, it often results in confusion over roles, responsibilities, and accountability.

Moreover, school management in rural communities is frequently hampered by limited administrative autonomy. Head teachers and principals lack decision-making powers in financial planning, staffing, and curricular adjustments, which severely constrains their ability to adapt policies to local contexts. Dyer (2020), when schools are governed through centralized systems, rural administrators face significant delays in resource allocation and approval processes, which stifles innovation and rapid response to community needs. Additionally, administrative appointments are often influenced by political patronage rather than merit, affecting leadership quality and morale at the school level.

Furthermore, weak data systems contribute to flawed planning and misinformed policy choices. In many rural settings, the absence of reliable education data makes it difficult to monitor policy outcomes, identify gaps, or target interventions effectively. Without accurate student records, teacher deployment statistics, or infrastructure inventories, planning becomes reactive rather than strategic. According to Crouch and Winkler (2018), education management information systems (EMIS) are either underutilized or entirely lacking in many rural districts, limiting the scope for evidence-based policy implementation.

Corruption and mismanagement also undermine educational governance. Funds earmarked for rural schools often disappear in transit through multiple administrative layers. Procurement processes lack transparency, and irregularities in the recruitment and posting of staff create further inefficiencies. As noted by Hallak and Poisson (2017), governance failures in education are not only fiscal in nature but also ethical, involving a lack of transparency and weak enforcement of policy mandates. In such environments, local education authorities may ignore directives, and school leaders may act in ways that benefit personal or political interests rather than institutional goals.

In addition, there is often a detach between national policymakers and rural implementers. Policies designed at the top are frequently delivered to the grassroots without contextual adaptation, training, or guidance. This leads to a compliance-based approach where administrators focus on checking boxes rather than meaningful change. According to Verspoor (2018), educational reforms in rural areas falter when local administrators are viewed merely as conduits rather than stakeholders in decision-making. Moreover, without effective

communication channels and professional development, rural administrators are unable to internalize or align their practices with broader policy objectives.

Addressing administrative and governance issues requires more than technical adjustments; it calls for systemic reform that promotes transparency, builds local leadership capacity, strengthens monitoring systems, and enhances stakeholder participation. Without resolving these challenges, rural schools will remain poorly governed, disconnected from national priorities, and incapable of delivering on the promise of educational equity.

Technological Limitations in Rural Settings

Technological limitations in rural areas present another major barrier to the successful implementation of educational policy. While technology integration is increasingly emphasized in education reform agendas, rural communities often lack the necessary infrastructure, access, and training to take advantage of these innovations. Schools in these areas frequently operate without electricity, internet connectivity, or even basic computer equipment. Trucano (2015), digital initiatives such as e-learning platforms, educational management systems, and online training modules fail to reach rural schools due to infrastructural constraints and limited government investment.

Moreover, technological literacy among teachers and students remains low in many rural settings. Teachers are often not trained to integrate digital tools into their instruction, and in-service training programs that focus on ICT use are rarely available in remote areas. According to Farrell and Isaacs (2017), technology-related capacity building is frequently concentrated in urban or peri-urban schools, leaving rural educators without the skills or confidence to adopt new instructional models. As a result, policies promoting the use of ICT in classrooms become irrelevant in environments where both human and material resources are lacking.

In addition, affordability is a major concern. Most rural schools operate under financial constraints that prevent them from purchasing or maintaining technological equipment. Even when government or donor agencies provide initial hardware, ongoing costs related to repairs, upgrades, and electricity are often unsustainable. According to Leach (2018), rural schools that receive computers without adequate funding for maintenance or technical support experience rapid deterioration of equipment, rendering the original investment ineffective. Furthermore, internet data costs are often prohibitively expensive for both schools and students, making digital learning impractical in daily use.

Another barrier is the lack of localized and culturally relevant content. Educational software and digital platforms are often designed in national or foreign languages, with curricula aligned to urban standards and learning styles. In rural contexts where learners speak different languages and live in distinct cultural settings, the one-size-fits-all nature of digital content hinders student engagement and comprehension. According to Wagner et al. (2015), without contextualization, technology can widen rather than bridge learning disparities between urban and rural students.

Additionally, policy planning for ICT use in education often overlooks the rural context. Policymakers frequently assume uniform access to electricity and broadband, leading to the rollout of programs that are doomed to fail in resource-poor environments. Isaacs (2017), national ICT policies tend to be overly ambitious and underfunded, particularly in terms of rural outreach and capacity development. Moreover, the lack of collaboration between ministries of

education, telecommunications, and energy sectors further delays the extension of digital infrastructure to rural areas.

The technological gap between rural and urban schools poses a direct threat to equitable education policy implementation. Bridging this divide requires targeted investment in infrastructure, teacher training, localized content development, and multi-sectoral collaboration. Without such efforts, technological policy innovations will remain out of reach for rural learners, further entrenching educational inequalities.

Policy-Practice Gaps and Local Adaptation Issues

The gap between educational policy and its practical implementation is a recurring obstacle, particularly in rural areas where conditions differ greatly from national assumptions. Policies are often conceived at the national level with a standardized vision that fails to account for the unique challenges and cultural diversity of rural communities. This disconnect leads to ineffective application, where well-intentioned policies struggle to deliver the intended outcomes at the grassroots. According to Ball (2018), education policies are not implemented in a vacuum but are interpreted and reshaped during implementation by local actors who operate within complex socio-cultural and institutional environments.

Moreover, rural schools frequently lack the flexibility to adapt central policies to their local context. Education officers, school heads, and teachers are often expected to comply strictly with national directives, regardless of their relevance to local realities. In environments marked by poverty, language diversity, and traditional social structures, rigid policy implementation often results in resistance or passive compliance. As McLaughlin (2017) argued that the success of any policy depends not only on its formulation but on how it is interpreted and negotiated by implementers on the ground. In rural areas, this negotiation is frequently constrained by lack of autonomy, inadequate training, and insufficient community involvement.

Furthermore, limited local capacity undermines the ability to localize policy effectively. Rural education personnel are often not involved in the policy design process, leading to a lack of ownership and motivation during implementation. This alienation results in policies that appear externally imposed rather than community-driven. Policies that fail to engage local actors in both design and delivery phases often face delays, distortions, or outright rejection. Moreover, training and professional development programs rarely address how teachers and administrators can adapt standard policies to suit their unique school environments. Without context-specific guidance, implementers revert to superficial compliance rather than meaningful change.

In addition, the absence of continuous feedback mechanisms between rural implementers and central policymakers aggravates the policy-practice divide. Implementation challenges, innovations, or context-specific adjustments made by rural schools often go undocumented and unrecognized at the national level. According to Fullan (2017), sustainable policy implementation relies heavily on feedback loops that enable learning from experience and the refinement of strategies. The lack of such systems leads to the persistence of impractical policies and missed opportunities for learning from grassroots innovations.

Language and curriculum issues further highlight the policy-practice gap. Policies promoting mother-tongue instruction or inclusive education are rarely aligned with the available teaching materials, teacher training, or community expectations in rural areas. While policy might call for localized instruction, in practice, schools lack trained bilingual teachers or teaching aids in indigenous languages. As Vavrus and Bartlett (2013) point out, the translation of

policy into practice is often obstructed when local realities are ignored during policy formulation. Consequently, teachers are forced to improvise or default to national language instruction, compromising the quality of learning and student engagement.

Additionally, monitoring and evaluation frameworks are frequently disconnected from the rural context. National benchmarks and indicators often fail to capture the challenges faced by rural implementers, leading to unfair assessments or misdiagnosed failures. Evaluation tools may not consider infrastructural limitations, socio-economic hardships, or cultural practices that shape the learning environment. According to Sabatier and Mazmanian (2020), a realistic understanding of implementation must consider contextual variables that affect how policies are carried out on the ground.

Bridging the gap between policy and practice in rural education requires a shift from top-down policy imposition to a more participatory, context-sensitive model. Local stakeholders must be empowered to interpret and adjust policies meaningfully, supported by adequate resources, training, and continuous communication with policymakers. Without these adaptations, educational reforms will continue to falter at the last mile of delivery where they matter most.

STRATEGIES FOR OVERCOMING BARRIERS IN EDUCATIONAL POLICY IMPLEMENTATION

Educational policy implementation in rural settings faces various systemic and contextual challenges that require deliberate and adaptive strategies. Structural weaknesses, limited infrastructure, and insufficient human resources can derail even the well-designed policies if not adequately addressed. However, these barriers are not insurmountable. Through evidence-based interventions and inclusive governance, policymakers and stakeholders can foster environments where educational reforms thrive. The following strategies provide a roadmap for overcoming these barriers and ensuring that educational policies achieve their intended outcomes, particularly in under-resourced rural areas.

Community Involvement in Policy Design and Execution

Engaging the community in the formulation and implementation of educational policies is essential for ensuring local relevance and commitment. When policies are developed in isolation from those who are directly impacted—such as parents, local leaders, and teachers—they often fail to consider the cultural, social, and economic realities on the ground. Involving community members builds ownership and trust, which are critical for the smooth execution of any reform. In rural settings, community involvement can help bridge gaps between national expectations and local practices. School-based management committees, parent-teacher associations, and local advisory boards can serve as platforms for dialogue and collaboration. When communities understand the purpose of a policy and have had a say in shaping it, they are more likely to support it, mobilize local resources, and participate in its evaluation. This strategy fosters accountability and alignment between policy objectives and grassroots implementation.

Capacity Building for Teachers and Administrators

Teachers and school administrators are the primary agents of educational policy implementation. Without adequate training, mentorship, and ongoing professional development, even the most well-intended policies risk being misapplied or ignored. Capacity building involves more than basic orientation; it requires structured and context-sensitive programs that equip educators with both the technical know-how and critical thinking skills needed to adapt policies to their local environment. In rural areas where teacher shortages and limited qualifications are common, this strategy becomes even more crucial. Training should focus on curriculum adaptation, inclusive education practices, and local language instruction, as well as administrative competencies for school leaders. In-service training, peer learning networks, and distance learning tools can enhance accessibility. When educators are empowered with the right skills and confidence, they are more likely to engage with reforms constructively and drive meaningful change in their classrooms and schools (Villegas-Reimers, 2013).

Decentralization of Administrative Functions

Centralized education systems often struggle to respond swiftly and effectively to local challenges, especially in remote or rural areas. Decentralization, which involves transferring decision-making authority from central governments to regional or local levels, can improve responsiveness and flexibility in policy implementation. When local education offices, school boards, and headteachers are granted more autonomy in managing resources, staff, and school activities, they are better positioned to align national policy with local priorities. Decentralization also allows for context-specific problem solving, where local authorities can make adjustments to policy implementation without waiting for approval from higher offices. In rural communities, this autonomy enables schools to tailor teaching methods, adjust school calendars, or introduce supplementary programs that address local challenges. However, decentralization must be accompanied by adequate funding, accountability mechanisms, and capacity development to ensure effective governance and oversight at the local level (Winkler & Gershberg, 2020).

Strengthening Monitoring and Feedback Systems

An effective monitoring and feedback system is critical to understanding how policies perform in practice. In many rural settings, implementation failures go unnoticed due to weak or absent reporting mechanisms. Strengthening these systems ensures that data from the field is systematically collected, analyzed, and used to inform future decisions. Regular monitoring helps identify bottlenecks, resource gaps, or unintended consequences of policies, while feedback loops provide implementers an opportunity to voice concerns or suggest improvements. This bottom-up communication enhances transparency and allows for timely policy adjustments. Digital tools, mobile surveys, and community scorecards can be useful for collecting real-time feedback even in remote areas. When policymakers receive reliable, locally sourced information, they are more likely to support reforms that are grounded in actual field conditions. This strategy not only improves accountability but also helps build trust between stakeholders across different levels of the education system.

Investment in Rural Infrastructure and Technology

Physical and technological infrastructure form the backbone of successful policy implementation. Without adequate school buildings, classrooms, water facilities, or electricity, even the best educational policies become difficult to implement. Rural areas often suffer from severe infrastructural deficits, leading to overcrowded classrooms, unqualified staff, and poor student retention. Investment in infrastructure should prioritize the construction and renovation of schools, provision of learning materials, and development of safe and inclusive learning environments. Furthermore, technology has become a powerful tool in education, and investing in ICT infrastructure can help rural schools overcome geographic and resource barriers. For example, solar-powered learning centers, offline digital libraries, and virtual training programs can extend access to quality education. However, such investments must be accompanied by training for teachers and maintenance support. When rural schools are equipped with proper infrastructure and technological tools, they are better positioned to implement policies effectively and achieve educational goals (Trucano, 2015).

Policy Contextualization and Local Adaptation

Adapting educational policies to reflect local realities is crucial for successful implementation. National policies are often designed with urban-centric assumptions that do not align with the socio-economic, cultural, or environmental conditions of rural areas. Contextualization involves modifying policies to suit the specific needs of communities without compromising the policy's core objectives. For example, adjusting curriculum content to include local languages or tailoring school calendars around agricultural cycles can increase student engagement and reduce dropout rates. This approach requires flexibility in implementation guidelines and trust in local authorities and educators to interpret policy frameworks. Without such adaptability, policies may be perceived as externally imposed mandates that ignore ground realities. Local adaptation promotes ownership, increases relevance, and enhances the long-term sustainability of reforms (Chikoko, 2018).

Strengthening Intergovernmental Coordination

Coordination between various levels of government federal, state, and local is essential for coherent policy implementation. Disjointed communication, overlapping responsibilities, and fragmented funding streams often disrupt the delivery of education services in rural areas. Strengthening vertical coordination ensures that local governments receive clear guidance, timely disbursements, and technical support. It also clarifies roles and reduces conflicts in authority. Horizontal coordination among different ministries such as education, health, and infrastructure can further ensure that schools benefit from integrated services. Establishing formal frameworks for intergovernmental collaboration, such as education sector working groups or joint planning committees, can facilitate smoother execution and monitoring of policies. Effective coordination promotes synergy, prevents duplication of efforts, and ensures that all levels of government are working toward a shared goal in policy delivery (Ahmed, 2011).

Data-Driven Decision Making

Reliable data is a critical tool for overcoming policy implementation barriers, especially in rural settings where conditions change rapidly and vary widely. Data helps identify where support is most needed, whether in terms of teacher deployment, infrastructure, or student performance. When decisions are based on accurate, disaggregated data broken down by gender, region, or socio-economic status resources can be allocated more equitably. Furthermore, data transparency increases accountability among all stakeholders. Investing in data systems includes training local staff to collect, analyze, and report findings efficiently. Mobile technology and offline data collection tools are particularly useful in rural areas with limited connectivity. Establishing feedback loops allows real-time data to inform adjustments in strategy. Without solid data, policy implementation risks being reactive and uncoordinated, leading to misdirected interventions and wasted resources (GEM Report, 2017).

Public-Private Partnerships (PPPs)

Public-private partnerships offer a practical solution to overcome both resource and capacity limitations in implementing educational policies in rural regions. Governments can leverage the expertise, innovation, and funding of private organizations to improve access and quality of education. For instance, NGOs and private sector actors can help build schools, provide digital tools, or support teacher training programs. These collaborations work best when clearly defined through contracts or memoranda of understanding, with mutual accountability and shared goals. PPPs can also be instrumental in scaling up pilot projects or reaching marginalized populations that are difficult for government systems to access. Transparency, regular evaluations, and community involvement are essential to ensure these partnerships align with public interest. When well-managed, PPPs supplement government efforts without replacing them, offering a cost-effective pathway to strengthen education delivery in underserved areas (LaRocque, 2018).

Incentive Schemes for Rural Educators

Rural schools often struggle to attract and retain qualified teachers due to isolation, poor living conditions, and limited career growth. Implementing incentive schemes is one way to address these challenges. These may include financial bonuses, housing allowances, hardship stipends, or opportunities for accelerated promotion and professional development. Non-monetary incentives, such as recognition awards or access to further education, can also motivate teachers. Importantly, such incentives must be consistent, transparent, and tailored to local needs. When teachers feel valued and supported, they are more likely to stay and invest in their students' success. Effective incentive schemes can reduce turnover, improve morale, and enhance the overall quality of teaching in rural schools. Government policies should formalize these practices and ensure they are monitored for impact and sustainability (Mulkeen, 2015).

CONCLUSION

Educational policy implementation in rural schools is hindered by various challenges, including poor infrastructure, lack of trained teachers, limited funding, and weak administrative structures.

Moreover, policies that overlook local realities often fail to produce expected results. In addition, minimal community involvement and inconsistent monitoring further complicate the process. Advocating for localized, sustainable strategies that are grounded in the lived experiences of rural communities. Addressing these barriers through collaborative and targeted actions remains essential to achieving effective educational policy implementation in rural schools.

Furthermore, financial and human resource constraints restrict rural schools from fulfilling policy requirements. Although reforms may be well-designed, their impact remains limited when not supported by practical strategies. In addition, cultural and linguistic differences are often ignored in policy design, which affects classroom engagement and learning outcomes. Moving forward, implementation must be grounded in local contexts. Moreover, policy makers should involve rural stakeholders in planning and decision-making. In addition, strong support systems, teacher incentives, and reliable monitoring mechanisms are needed to ensure sustainability.

Suggestions

Based on the literature reviewed the following suggestions were made:

- Government Agencies should ensure that policies are flexible enough to reflect the realities of rural education. Moreover, budget allocations should prioritize rural schools to address infrastructure gaps, teacher shortages, and learning material deficits.
- Educational Planners and Policy makers should involve rural educators and community leaders during the planning stages. Furthermore, policies should be written in clear, actionable terms with provisions for local adjustments.
- Local Education Authorities and School Administrators should strengthen school management systems and establish regular monitoring structures. In addition, they should ensure that teachers receive proper support, including access to professional development and fair work conditions.
- Teachers should participate in policy feedback processes to provide insights based on classroom realities. Furthermore, they should engage with the community to bridge cultural or language gaps in instruction.
- Community Leaders and Parents should be encouraged to take ownership of the education process. Moreover, leaders can support awareness campaigns that emphasize the value of schooling.

ABSTRACT

The study investigated alternative funding pathways that could be adopted by university administrators for the attainment of university goals in the universities in Cross River State. The survey research design was adopted for the study. The research question and two hypotheses guided the study. The population of the study comprised 32 university administrators made up of 28 deans of faculties (20 from university of Calabar and 8 from university of Cross River State) 2 deputy vice chancellors administration and 2 deputy bursars (1 each from unical and 1 from unicross). The 32 university administrators were involved in the study as there was no sampling technique since the population is small and manageable. A 18 item 4 point likert type questionnaire titled "Alternative funding pathways questionnaire (AFPQ) was designed and used to collect data that was used for answering the research question and analyzing the hypotheses. The instrument was validated by experts in educational test and measurement and a reliability coefficient of r 0.87" value was yielded for the instrument. Mean scores and t-test statistics were used for data analysis. The findings of the study revealed that alternative funding pathways that could be adopted by university administrators are consultancy services, leasing out institutional facilities and commercialization of research, school farms and school business ventures. The study also revealed that there is no significant difference between the perception of administrators of federal government owned university (UNICAL) and state onward university (UNICROSS) on alternative funding pathways, to be explored by university administers. There is also significant difference in the perception of administrators of UNICAL and UNICROSS on the extent to which exploring alternative funding pathways could help in the realization of university goals. Based on the findings it was recommended that university administrators should not hesitate to start exploring alternative funding pathways revealed by this study inorder to effectively meet their universities goals.

INTRODUCTION

It has become indisputable the world over that education is the tool for national development. This is because human capacities that drive the different sectors of the economy are trained by educational institutions. The indispensability of education has prompted governments to prioritize education in their national budgets.

In the Nigerian context, education is classified into primary, secondary and tertiary levels. The university is of utmost importance to the country because it trains the manpower needed for the economy to thrive (Solo, 2022). The university as a tertiary institution is the level of education after secondary education. A sound and dynamic university education is a formidable instrument for ensuring the development of any nation interms of economic viability and global competitiveness. Universities contribute in the advancement of nations through setting its own goals and targets and implementing actions for achieving them. As a social system, universities receive inputs as students, transforms these students and releases these transformed students to the society as outputs. These outputs inturn uses their expertise, ingenuity, creativity and abilities which have been developed by the university to transform and promote the different sectors of the economy.

The national policy on education, federal republic of Nigeria (2014) outlined the as: goals of universities to contribute to national development through high level manpower training, development and inculcation of proper values for the survival of the individual and the society, develop the intellectual capabilities of individuals to undusted and appreciate their local and external environment enhance the acquisition of both physical and intellectual skills which will enable individuals to be self-reliant and useful member of the society, promote and encourage scholarship and community services for national unity and promotion of national and international understanding and interactions. The policy document further added that university should vigorously pursue these goals through teaching, research and development, knowledge generation, dissemination and international cooperation and dedicated services to the communities through extra-mural and consultancy services.

However, to realize these laudable goals of universities, funds are needed. Funds are all financial resources usually made available to university administrators for use in the day to day running of schools. These funds are used for different purposes which includes; maintenance and development of school facilities, remuneration of school staff, research, community engagements, staff trainings, linkages, and other expenses that might be incurred in the processing of various university services. In the context of financing of educational institutions, proprietors has the responsibility of ensuring that funds are made available for their schools (Bugu, 2020). School owners ensure that quality is maintained in their schools through adequate funding, supervision and staff training (Ukpok, 2021). Lulu (2017) remarked that the ownership of schools after Nigeria independence has been characterized by participation of all stakeholders in the provision, management and funding of education. Stakeholders involved in educational provision through ownership are the government, religions bodies, corporate bodies and private individuals.

Regardless of the ownership of a university in Nigeria, they collectively have the same goals to attain as specified in the national policy on education. This implies that funds must be made available for university operations. However Abraham (2022) have criticized the government at both federal and state levels for not making adequate funds available to public

universities in Nigeria. The association of vice chancellors have lamented that they are stifled in their efforts because of lack of funds (Ayodele, 2019).

Demei (2020) noted that underfunding was the major challenge facing management of higher education institution and that the effects can be seen on the quality and quantity of staff, facilities, research, programme expansion, access, community service, staff training and development, field trips, academic conferences, study fellowship and autonomy. Anyawu (2019) observed that inadequate funding put higher education management under stress and strains, making management ineffective in their roles, thus leading to strike actions by both academic and non-academic staff.

Bugu (2020) blamed underfunding as the reason for the mismatch between the output of higher educational institutions in Nigeria and demands on the labour market. Lulu (2017) expressed his frustration that government has failed in its responsibility to provide adequate funding for public education. Disturbed by the state of education in Nigeria, Umaru (2021) stated that universities cannot meet their goals if adequate funds is not made available for them and in the era of governments in ability to provide adequate funding for public education system, school administrators has to sought for alternative sources. Moses (2021) advised that as a show of patriotism, school administrators at all levels in the Nigeria education system should seek other alternatives to support their schools financially. In the word of Babangida (2019), emergencies in education requires all stakeholders including school administrators to seek external sources other than government to improve their schools. In a study carried out by Munroe (2019) on school administrators management styles and school effectiveness, findings showed that by seeking external sources of support, public and private school principals in Texas were able to provide their schools with variety of health safety materials and other educational materials such as washing basins, laptops, hand sanitizers and internet modems during the covid-19 pandemic. This shows that it is possible for school administration to seek alternative funding sources at the university level.

Lawal (2020) opined that in the 21st century digital era when schools are competing for leadership in the e-learning paradigm, school administrations must be creative and innovative to propel their schools toward goal attainment. Umaru (2021) found out that the problem of poor funding of public education is becoming a phenomena in Nigeria which is challenging school administrators to consider using their creativity to fund their schools. In study on financial resources management and effectiveness of principals in secondary schools in Enugu Education Zone, Enugu State, Nigeria stated that Ogbodo (2022) discovered that funds were inadequate for principals to carry out necessary repair works on broken staff desks and chairs. The study recommend that principals of public schools agreed that there are other funding sources principals can explore to support their schools. Having adequate funds in school cuffers will go a long way to enable school management to effectively procure and utilize both human and material resources that will make their schools thrive (Swen, 2021). A school administrator who tactically seeks for other sources of funding will not starve their school of funds especially in times of emergencies such as a pandemic or other disasters (Akogu, 2019). According to Mimmo (2017), delays and bureaucratic bottlenecks of government funds will be relatively averted if school management are innovative enough to seek outside funding for their schools.

Ejidike (2017), suggests that schools can employ entrepreneurial strategies to generate funds for their schools instead of solely depending on government funding. This implies that school administrators are to explore alternative funding pathways. These funding pathways are; consultancy services, leasing out institutional facilities, establishment of school business

ventures, investment in farming, research commercialization and franchising. Consultancy services is the practice of providing professional or expert advice in a particular field for a fee. Universities can through its various departments and faculties coordinate and provide consultancy services to various sectors and fields of human endeavour for a fee. Types of consultancy services range from management, human resource, financial, information technology, health environmental, educational and various other fields, (Kparini, 2017). Leasing of institutional facilities is the renting or hiring out of school facilities for a fee. These facilities include sports field, school halls, library books, chairs, buses, etc. Leasing of school properties will add to the resource base of the institution, (Avdegbu & Alonge, 2016). Farming encompasses livestock, crop or fish farming. Tarri (2022) noted that schools will benefit greatly if they are committed to developing agricultural practices.

Research commercialization is the practice of monetizing and selling research findings and results. Punyi (2022) made it known in a study that universities in the developed world earn huge revenues through research and development efforts. Franchising is the business model in which two organizations enter into business relationship for one of the organizations to market the products of the other partner organizations for a fee. Universities can decide to be a Franchisee or Franchisor to other organizations in order to generate funds.

The issue of funding universities has become a subject of discussion, debate and analysis on mass media and scholarly publications among education stakeholders. While the government makes efforts to fund public schools, it is obvious from all indications that the funds allocated to schools by the government who are the sole proprietors of these schools especially the universities seem to be inadequate. Lamentations and labour disputes seem not to have yielded much results interms of increased funding to universities. It is on this premise that this study is carried out to examine alternative funding pathways which university administrators can explore in order to ensure the attainment of university goals.

The problem

A university that is achieving her goals will have adequate infrastructural facilities; safe and secured environment, motivated academic and non-academic staff and well as the graduation of graduates skilled in their field of trainings.

Unfortunately, universities in Cross River State is plagued by numerous issues such as poor teaching and learning, poor and dilapidated classrooms, hostels, offices, infrastructures, continuous students failures in sessional courses, low CGPAs, insecurity, alteration of school calendar, lack of information and communication technology resources and poor funding. These scenarios calls for concern as the products from these universities do not live up to the standard that shows that the universities have really achieved their goals of producing a quality manpower for the economy.

Several reports also indicate that poor government funding is the cause of majority of the problems bedeviling Nigerian universities and public universities in Cross River State is no exception. This study is therefore carried out to identify alternative funding pathways that university administrators can explore to generate funds and also determine the extent to which exploring these alternative funding pathways could help in the attainment of university goals.

Research Question

The research question that guided the study is:

- What is the perception of university administrators on the alternative funding pathways that university administrators can explore to generate funds in universities in Cross River States.

Hypotheses

- There is no significant difference in the perception of administrators of federal government owned university (UNICAL) and state owned university (UNICROSS) on the alternative funding pathways that could be adopted by university administrators generate additional funds.
- There is no significant difference in the perception of administrators of federal government owned university (UNICAL) and administrators of state owned university (UNICROSS) on the extent to which exploring alternative funding pathways could help in the attainment of university goals.

METHODOLOGY

The study adopted a survey research design. The research area was two government owned universities in Cross River State; university of Cross River State (UNICROSS) and university of Calabar (UNICAL). UNICROSS is a state owned university while UNICAL is a federal government owned university. The population of the study comprised all deans of academic faculties in both universities, the university deputy bursars (1 each from both universities) and the two deputy vice chancellor administration from both universities. This is made of 28 deans (20 from unical, 8 from unicross), 2 deputy bursars and 2 vice deputy vice chancellor administration from both universities. This gave a total of 32 subjects. The 32 subjects were all involved in the study as there was no sampling because the population is small and manageable. The instrument used for data collection is a self-developed questionnaire named "alternative funding pathways" and university goal attainment questionnaire (AFPSUGAQ).

The instrument is an 18 item 4 point liker-type scale of strongly agree (SA) – 4, agree (A)-3 Disagree (D)-2 and Strongly disagree (SD)-1 for answering the research questions and very high extent (VHE)-4, high extent (HE)-3, low extent (LE)-2 and very low extent (VLE)-1 for the data on hypotheses. The instrument was validated by two experts who are lecturers in educational measurement and evaluation of the department of educational foundations, university of Calabar. The reliability of the instrument was established using cronbach Alpha Analysis. The reliability coefficient value yielded 'r' 0.86 which was considered adequate for the study. A total of 32 copies of the questionnaire were distributed personally by the researcher to the respondents.

The researcher chose one month for the administration of the questionnaires. This was to ensure proper coverage of the institutions and also to give the busy respondents ample time to fill the questionnaires. The 32 completed questionnaires were all returned from the correspondents. The data was analyzed using mean rating and t-test statistics for the research questions and hypothesis respectively. Any mean score equal to or higher than 2.50 represents high extent whereas any means score lower than 2.50 represents low extent. Thus, 2.50 is the decision rule, while the hypothesis was test at 0.05 significant level.

RESULTS AND FINDINGS

Research Question 1: What is the perception of university administrators on the alternative funding pathways that could be explored by university administrators to generate funds?

Table 1: Mean ratings on the perception of university administrators on the alternative funding pathways could be explored by university administrators

S/N	Item	UNICAL			UNICROSS		
		Mean	**SD**	**Decision**	**Mean**	**SD**	**Decision**
1.	Consultancy services	3.85	0.51	Agreed	3.89	0.52	Agreed
2.	Leasing out institutional facilities	3.95	0.62	Agreed	3.60	0.48	Agreed
3.	School business ventures	3.70	0.44	Agreed	4.00	0.00	Agreed
4.	School farms	3.92	0.52	Agreed	3.80	0.61	Agreed
5.	Research commercialization	4.01	0.50	Agreed	3.62	0.48	Agreed
6.	Franchising	2.41	0.42	Disagreed	2.31	0.30	Disagree

Table 1 revealed that items 1-5 obtained high mean scores above the criterion mean of 2.50 for both UNICAL administrators and UNICROSS administrators. This implies that administrators from both universities agreed that consultancy serves, leasing out institutional facilities, establishment of school business ventures, school farms and research commercialization are alternative funding pathways university administrators can explore to generate funds. Low mean scores were obtained for item 6 which implies that university administrators disagreed that franchising is an alternative funding pathway for generating funds by university administrators.

Hypothesis 1: There is no significant difference between the perception of university administrators of UNICAL and university of Cross River State on the alternative funding pathways that could be adopted by university administrators for fund generation.

Table 2: Independent t-tes analysis of the perception university administrators of UNICAL and UNICROSS on the alternative funding pathways by university administrators

Respondents	N	Mean	SD	Df	t-cal	t-crit.	Prob	Decisions
UNICAL administrators	22	0.28	0.43	30	1.42	2.05	.05	H_o Accepted
UNICROSS administration	10	2.06	0.37					

Table 2 showed that t-calculated value of 1.42 is less than t-critical value of 2.05. The null hypothesis is accepted. This means, there is no significant different between the perception of administrations of Unicross on the alternative funding pathways that could be adopted by university administrators for fund generation.

Hypothesis 2: There is no significant difference between the perception of administrators of UNICAL and UNICROSS on the extent to which exploring alternative funding pathways could help in the attainment of university goals.

Table 2: Independent t-test analysis of the difference between the perception of administrators of UNICAL and UNICROSS on the extent to which exploring alternative funding pathways could help in realization of university goals

Respondents	N	Mean	SD	Df	t-cal	t-crit.	Prob	Decisions
UNICAL administrators	22	3.77	0.34	30	1.08	2.05	.05	H_o Accepted
UNICROSS administration	10	3.65	0.36					

Table 3 showed that calculated of 1.08 is less than t-critical of 2.05. Therefore, the null hypothesis is accepted. This implies that there is no significant difference between the perception of administrators of UNICAL and UNICROSS On the extent to which exploring alternative funding pathways could help in the attainment of university goals.

DISCUSSION OF FINDINGS

The results in table 1 the research question revealed that administrators of both a federal owned university (UNICAL) and state owned university (UNICROSS) agreed that consultancy services, leasing out institutional facilities, establishing school business ventures, school farms and commercialization of research are alternative funding pathways that could be adopted by university administrators to generate funds for their schools. This result is in agreement with that of Anoma (2022) who found out in a study that school funds were inadequate for school administration and school administrators agreed that there are other sources of funding that principals can explore to support their schools. This implies that university administrators are not limited to only government allocations for survival. These other funding pathways should be explored inorder to boost their revenue base.

Findings of hypothesis one also showed that there is no significant difference between the perception of administrators of UNICAL and UNICROSS on the alternative funding pathways that could be adopted by university administration for fund generation. This finding is in agreement with Munroe (2019) whose own study revealed that all school administrators desire to have adequate funds to run their schools. This shows that university administrators understands the hardship and stress they pass through without adequate funds at their disposal. It also shows that university administrators regardless of ownership of their schools truly lack adequate funds. This finding also corroborates. Moses (2021), who advised that as a show of patriotism, school administrators at all levels in the Nigerian education system should seek other alternatives to support their schools.

Findings of hypothesis two revealed that there is no significant difference in the perception of administrators of UNICAL and UNICROSS on the extent to which exploring alternative funding pathways by school administrators could help in the attainment of university goals. This is in agreement with Munroe (2019) who found out in a study that by seeking external sources of support, public and private school principals in texas were able to attract funds and provide their schools with variety of health safety materials and other educational materials.

The findings also agree with that of Anoma (2021) who assessed school funding patterns in Scotland and discovered that sourcing funds from external bodies enabled tertiary institutions in Scotland to effectively achieve university strategic targets. This finding is also in consonant with Lawal (2020) opined that in the 21st century digital era when schools are competing for leadership in the e-learning paradigm, school administrators must be creative and innovative to

propel their schools towards good attempt. This implies that the goals of university can be achieved when there is adequate funds to hire and train qualified academic staff, sponsor research and development efforts, build school infrastructures and facilities, engage in modern pedagogy using modem technologies and adequate remuneration of staff. Sound graduated with adequates skills and knowledge to robustly contribute to the Nigerian economy will be produced by university given adequate funds.

CONCLUSION

This paper has established that university administrators need to explore alternative funding pathways in other to generate additional funds and complement government funding so as to be able to meet the goals of their institutions. University administrators in Cross River and across Nigeria should not hesitate to use consultancy services, leasing, school business ventures, school farms and commercialization of research to generate funds for their institutions. This paper therefore concludes that the failure to meet university goals owing to inadequate funds would be resolved if university administrators will explore alternative funding pathways as found in this study.
